

Myxomycetes (acellular slime moulds) collected during the Central North Field Naturalists outing to the Meander Falls Track on Sunday November 6th 2016.

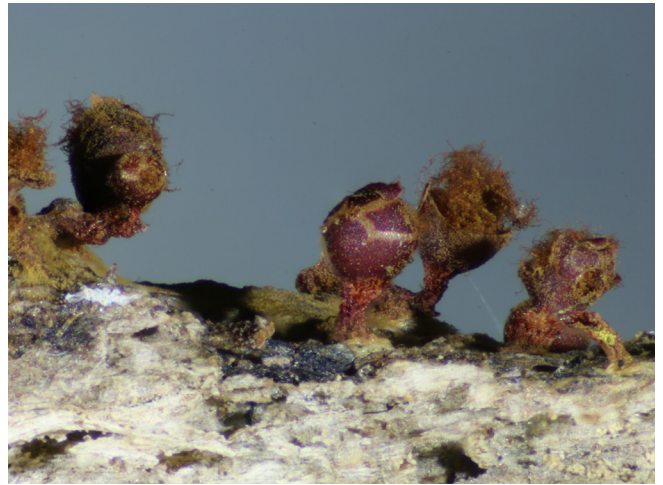

Date: 6 November 2016. **Location:** Meander Falls Track. 41°32'33.7"S 32°49.7"E Alt: 650 m.

Habitat: Mixed *Eucalyptus* sp. and *Nothofagus cunninghamii* forest. **Substrate:** All species were collected from woody substrates.

Notes Collected by Brianna, Martha, Ron, Peter and Sarah. Identified and photographed by Sarah Lloyd.

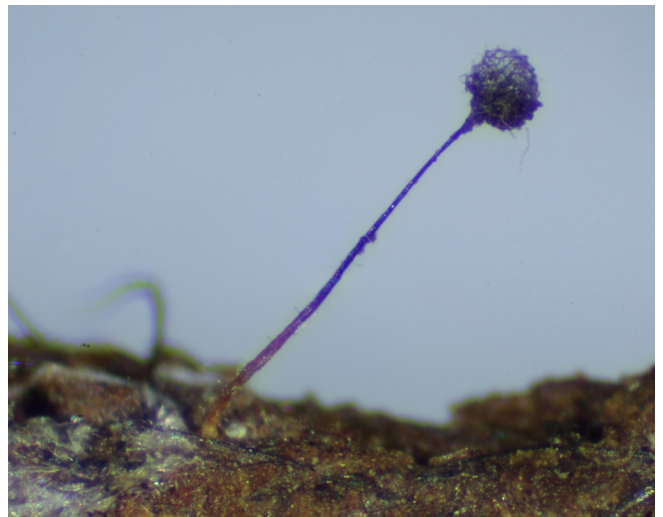

Calomyxa metallica

Trichia botrytis

Several colonies of *Trichia verrucosa* (whose type specimen was collected from Tasmania) were seen on large old rotten logs.

This tiny 1.1 mm high *Macbrideola* sp. was found on the same substrate as *Calomyxa metallica*.

This *Trichia erecta* is infected with *Polycephalomyces tomentosus*, a fungus that is found only on *Trichia* species.
