

Cinnamomum camphora

Camphor tree

Introduction

The genus *Cinnamomum*, with approximately 250 species, occurs in Australia, the Pacific islands, and in the tropics and subtropics of East Asia. In China, 46 species and one variety occur primarily in the south, with Shaanxi and southern Gansu as the northern boundary^[94].

Alternate leaves are ovate-elliptic, 6-12 cm long and 2.5-5.5 cm wide, margin entire or occasionally repand, with acute apices and broadly cuneate to subrounded base. Upper leaf surface is shiny green to yellowish green, while the underside is opaque and lighter in color. The leaves are glabrous on both surfaces or sparsely puberulent beneath only when young; triplinerved or sometimes inconspicuously five-nerved, with conspicuous midrib on both surfaces and 1-5(7)-paired lateral nerves from the midrib. The axils of lateral nerves and veins are conspicuously bullate above, dome-shaped, and always villous beneath. The axillary panicle is 3.5–7 cm long. Greenish white to yellow flowers are glabrous or downy and pale to yellowish brown, and about 3 mm in length. The perianth is glabrous or puberulent outside and densely pubescent inside. The purplish-black fruit is an ovate or subglobose drupe, 6-8 mm in diameter. The perianth-cup in fruit is cupuliform, 5 mm long, longitudinally sulcate, with truncate apex up to 4 mm wide and base 1 mm wide^[94]. Flowers appear in April to May, and fruits in August to November^{[94][95]}.

Taxonomy

Family: Lauraceae

Genus: *Cinnamomum* Trew

Description

Cinnamomum camphora is a large evergreen tree that can grow to 30 m

in height and 3 m in diameter, with a broadly ovate crown. Terminal buds are broadly ovoid or globular, and covered with sericeous scales. Bark is yellowish brown with irregular vertical splits. Branches are light brown, cylindrical, and glabrous.

Habitat

Cinnamomum camphora occurs in valleys and on mountain slopes. It is also widely cultivated^[94].

Distribution

C. camphora is found in southern and southwestern China including Anhui, Fujian, Guangdong, Guangxi, Guizhou, Hainan, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Shandong, Sichuan, Yunnan, and Zhejiang provinces^[94].

Economic Importance

Roots, branches, leaves, and wood of *C. camphora* can be used for extracting camphor and camphor oil for pharmaceutical use and as a flavoring. The core of the fruit, which has both industrial and medicinal uses, is approximately 40 percent oil. The wood is used for construction, shipbuilding, and cabinet-making^[94].

Natural Enemies of Cinnamomum

The reported natural enemies found on

members of the genus *Cinnamomum* number 22 fungi and 92 arthropods covering 33 families in 7 orders. Most arthropods in the list are reported to

infest *C. camphora* and possibly other species within the genus.
