*New Zealand Threat Classification Series* is a scientific monograph series presenting publications related to the New Zealand Threat Classification System (NZTCS). Most will be lists providing NZTCS status of members of a plant or animal group (e.g. algae, birds, spiders). There are currently 23 groups, each assessed once every 3 years. After each three-year cycle there will be a report analysing and summarising trends across all groups for that listing cycle. From time to time the manual that defines the categories, criteria and process for the NZTCS will be reviewed. Publications in this series are considered part of the formal international scientific literature.

This report is available from the departmental website in pdf form. Titles are listed in our catalogue on the website, refer [www.doc.govt.nz](http://www.doc.govt.nz) under *Publications*, then *Science & technical*.

## Abstract

The conservation status of 644 freshwater invertebrate taxa, across five Phyla, 28 Orders and 75 Families, was assessed using the New Zealand Threat Classification System (NZTCS) criteria. Forty-six species were ranked Nationally Critical, 11 Nationally Endangered and 16 Nationally Vulnerable. One hundred and seventy-two taxa were listed as Data Deficient. A full list is presented, along with summaries and brief notes on the most important changes. This list replaces all previous NZTCS lists for freshwater invertebrates.

Keywords: New Zealand Threat Classification System, conservation status, freshwater invertebrates.

# 1. Summary

The conservation status of freshwater invertebrates was assessed using the New Zealand Threat Classification System (NZTCS) criteria (Townsend et al. 2008). This is the first freshwater invertebrate list to be prepared under the Townsend et al. (2008) system. The previous freshwater invertebrate list was prepared in 2005 using the Molloy et al. (2002) New Zealand Threat Classification System and published in Hitchmough et al. (2007). Prior to this, 79 freshwater species were ranked in 2001 (Hitchmough 2002), and two species were assessed by Molloy & Davis (1992).

Hitchmough et al. (2007) assessed the conservation status of 143 freshwater invertebrate taxa while the 2013 panel expanded this by assessing the conservation status of 644 taxa, across five Phyla, 28 Orders and 75 Families. This is the first time a systematic approach has been taken to assess the conservation status of all native taxa in most of the Orders that have freshwater taxa within them, rather than just those that might be threatened. In some other Orders, not all of the taxa could be assessed, but possibly threatened taxa were. A more detailed analysis of the coverage of this process will be published elsewhere.

The 2005 list (Hitchmough et al. 2007) had two species listed that are now not considered valid species and they were removed from the list (Table 1), and another eight freshwater species that have subsequently been assessed by other expert panels (two Diptera in Andrew et al. (2012) and six Coleoptera in Leschen et al. (2012)) so they were omitted from this assessment (Table 2). One other species; the nematode *Micconchus rex*, also listed on the 2005 freshwater invertebrate list was re-ranked in 2012 by a terrestrial expert panel as Not Threatened (Yeates et al. 2012), but this ranking was not agreed by our panel. This poorly known aquatic species is only known from collections in 1904 from Lakes Manapouri and Wakatipu, and the panel felt it was more appropriately listed on the freshwater invertebrate list. Due to the lack of information about this nematode it has been listed as Data Deficient. This assessment of *Micconchus rex* replaces the assessment for it in Yeates et al. (2012).

Table 1. Freshwater invertebrate taxa considered Taxonomically Indistinct and not assessed.

NAME AND AUTHORITY	COMMON NAME	FAMILY
<i>Latia climoi</i> Starobogatov, 1986	Limpet	Latiidae
<i>Cucumerunio websteri delli</i> (Simpson, 1902)	Mussel	Hyriidae

Table 2. Freshwater invertebrate taxa ranked by other expert panels and excluded from this assessment. Beetles were assessed by Leschen et al. (2012) and net-winged midges (Blephariceridae) by Andrew et al. (2012).

NAME AND AUTHORITY	FAMILY	2005 RANKING	2012 RANKING
<b>Beetles</b>			
<i>Rhantus plantaris</i> Sharp, 1882	Dytiscidae	Nationally Critical	Naturally Uncommon
<i>Rhantus schauinslandi</i> Ordish, 1989	Dytiscidae	Nationally Critical	Nationally Critical
<i>Gyrinus convexiusculus</i> Macleay, 1871	Gyrinidae	Not ranked	Naturally Uncommon
<i>Orchymontia dugdalei</i> Ordish, 1984	Hydraenidae	Not ranked	Naturally Uncommon
<i>Orchymontia laminifera</i> Ordish, 1984	Hydraenidae	Not ranked	Naturally Uncommon
<i>Horelophus walkeri</i> d'Orchmont 1913	Hydrophilidae	Not ranked	Nationally Endangered
<b>Net-winged midges</b>			
<i>Neocurupira chiltoni</i> (Campbell, 1921)	Blephariceridae	Range Restricted	Naturally Uncommon
<i>Nothohoraiia micrognathia</i> Craig, 1969	Blephariceridae	Data Deficient	Naturally Uncommon

Since Hitchmough et al. (2007), 70 species have been taxonomically revised (Table 3). Considerable work has been done by Ian Henderson, Kjell Johanson and John Ward on caddisflies and by Martin Hasse on snails, particularly Tateidae (formerly Hydrobiidae).

Table 3. Name changes affecting New Zealand freshwater invertebrates since the publication of Hitchmough et al. (2007).

<i>Saganoa inflata</i> (Climo, 1974)	<i>Kuschelita inflata</i> Climo, 1974	Snail
<i>Saganoa mica</i> (Climo, 1974)	<i>Kuschelita mica</i> Climo, 1974	Snail

In 2005 (Hitchmough et al. 2007), 143 taxa were assessed; the panel increased this number fourfold to 644 (Table 4). The largest increases were seen in caddisflies, stoneflies and beetles. The increase in number of taxa reviewed was due to a more intensive review process, greater use of databases and wider consultation rather than through advances in taxonomy.

While the number and type of species assessed can be compared between listings, presenting summaries of the changes in threat status between lists for all taxa is problematic, as they have been compiled under different threat classification systems and because a large number of taxa (501) have been added in this assessment. However, a summary comparison of the threat status of the 143 taxa that were assessed in 2005 with their status in 2013 is presented in Table 4.

The number and proportion of taxa assigned to each category in 2005 and 2013 is presented in Table 5. In 2005, the majority of taxa classified were designated as Naturally Uncommon, whereas in 2013, Naturally Uncommon taxa declined and the number of Data Deficient taxa increased to 26.7% of the total taxa assessed.

Table 4. Summary of freshwater invertebrate taxa assessed in 2005 and the threat categories to which they have been assigned in 2013.

CONSERVATION STATUS 2005			CONSERVATION STATUS 2013							
	Total	Data Deficient	Nationally Critical	Nationally Endangered	Nationally Vulnerable	Declining	Naturally Uncommon	Not Threatened	Taxononomically Indistinct	Evaluated by other panel
Data Deficient	27	14	1	2			4	3	2	1
Acutely Threatened										2
Nationally critical	11	6	2				1			
Nationally vulnerable	1							1		
Nationally endangered	2				1					
Chronically Threatened							2		1	
Gradual decline	3						1			
At Risk								16	1	1
Range restricted	86*	39	18	5	4					
Sparse	11	2		1			1	4		3
Not Threatened					1			1		
Total	143	61	20	8	8	5	25	9	2	4

\* Note that in 2005 *Catapyrgus spelaeus* and *Hydrobiidae* sp. 37 were assessed as two separate species, but in 2013 they are considered the same Naturally Uncommon species. Therefore, the Conservation Status 2013 columns in the Range Restricted row sum to 85 not 86.

Table 5. Comparison of the status of New Zealand freshwater invertebrates assessed in 2005 (Hitchmough et al. 2007) and 2013 (this document).

Note: the 2005 categories (Molloy et al. 2002) are not directly comparable with the 2013 categories (Townsend et al. 2008), but they have been aligned with their nearest 2013 equivalent.

CATEGORY	TOTAL 2005	TOTAL 2013
Extinct	0	0
Data Deficient	27	172

Non-resident native—Coloniser	0	5
Not Threatened	2	296
Introduced and Naturalised	0	0
Evaluated by other expert panels	0	8
<b>Total</b>	<b>143</b>	<b>644</b>

\* This figure includes 11 taxa listed as Sparse and 86 listed as Range Restricted according to the categories of Molloy et al. (2002).

Table 6 summarises the threat category distributions of the 644 taxa assessed in 2013 in comparison with those in 2005.

No freshwater invertebrate taxa have been listed as Extinct, although four species may be. To our knowledge, there have been no recent collections of these species, so two were assessed as Nationally Critical using available information (the caddisfly *Edpercivalia dugdalei* and the snail *Potamopyrgus acus*) and the other two were listed as Data Deficient (the caddisfly *Psilochorema spiniharpax* and the mayfly *Oniscigaster intermedius*). In addition, a number of other species are known from one specimen or have not been seen since they were described.

Four of the 11 freshwater invertebrate taxa listed as Nationally Critical in 2005 have remained in the Nationally Critical category while six have been re-classified as Data Deficient and one as Naturally Uncommon. The large number of taxa classified as Data Deficient (172) combined with taxa that have the qualifier Data Poor highlights the need for more distribution surveys to make informed assessments. Of the 27 taxa listed as Data Deficient in 2005, 14 remain Data Deficient, while the others have now been assigned to a threat category.

Taxa can change status between listings either as a result of better understanding of distribution and population trend, or genuine changes in abundance or range, or, with this being the first listing of freshwater invertebrates using the Townsend et al. (2008) criteria, as a result of changes to the categories and criteria themselves. A more detailed analysis of the changes between the two listings and the drivers of changes in status will be published elsewhere.

Table 6. Summary of status changes of freshwater invertebrate taxa between 2005 (Hitchmough et al. 2007) and 2013 (this document).

## 2. Conservation status of New Zealand freshwater invertebrates

The revised threat ranking for freshwater invertebrate taxa is provided in this section and replaces all previous NZTCS lists for freshwater invertebrates.

Taxa were assessed according to the criteria of Townsend et al. (2008). They have first been grouped by conservation status, then alphabetically by Phyla, then alphabetically by common name, then alphabetically by family and scientific name so that the large variety of invertebrates can be quickly located in the tables. Categories are ordered by degree of loss, with Extinct at the top of the list and Not Threatened at the bottom. The Data Deficient table is inserted between Extinct and Threatened categories. Although the true status of Data Deficient taxa will span the entire range of available categories, taxa are often included because they are very seldom collected, so many are likely to end up being considered threatened and some may even already be extinct. Therefore, the Data Deficient list is likely to include many of the most threatened species in New Zealand. The Non-resident Native categories (Migrant, Vagrant and Coloniser) are listed below the At Risk and above the Not Threatened categories.

See Townsend et al. (2008) for details of criteria and qualifiers, which are abbreviated as follows:

CD	Conservation Dependent
De	Designated
DP	Data Poor
EF	Extreme Fluctuations
EW	Extinct in the Wild
IE	Island Endemic
Inc	Increasing
OL	One Location
PD	Partial Decline
RF	Recruitment Failure
RR	Range Restricted
SO	Secure Overseas
Sp	Sparse
St	Stable
TO	Threatened Overseas

### 2.1 Taxonomically determinate

#### Extinct (0)

Taxa for which there is no reasonable doubt—following repeated surveys in known or expected habitats at appropriate times (diurnal, seasonal and annual) and throughout the taxon's historic range—that the last individual has died.

No freshwater invertebrate taxa were ranked as Extinct.

#### Data Deficient (145)

Taxa that are suspected but not definitely known to belong to any particular category due to a lack of information about their current distribution and abundance. It is hoped that listing such taxa will stimulate research to find out the true category or threat. For a fuller definition, see Townsend et al. (2008).

## Threatened (66)

Taxa that meet the criteria specified by Townsend et al. (2008) for the categories Nationally Critical, Nationally Endangered and Nationally Vulnerable.

### Nationally Critical (42)

Criteria for Nationally Critical:

#### *A—very small population (natural or unnatural)*

- A(1) <250 mature individuals, regardless of cause
- A(2) ≤2 subpopulations, ≤200 mature individuals in the larger subpopulation
- A(3) Total area of occupancy ≤1 ha (0.01 km<sup>2</sup>)

#### *B—small population (natural or unnatural) with a high ongoing or predicted decline*

- B(1/1) 250–1000 mature individuals, predicted decline 50–70%
- B(2/1) ≤5 subpopulations, ≤300 mature individuals in the largest subpopulation, predicted decline 50–70%
- B(3/1) Total area of occupancy ≤10 ha (0.1 km<sup>2</sup>), predicted decline 50–70%

#### *C—population (irrespective of size or number of sub-populations) with a very high ongoing or predicted decline (>70%).*

C Predicted decline >70%

### Nationally Endangered (9)

Criteria for Nationally Endangered:

**A—small population (natural or unnatural) that has a low to high ongoing or predicted decline**

- A(1/1) 250–1000 mature individuals, predicted decline 10–50%
- A(2/1) ≤5 subpopulations, ≤300 mature individuals in the largest subpopulation, predicted decline 10–50%
- A(3/1) Total area of occupancy ≤10 ha (0.1 km<sup>2</sup>), predicted decline 10–50%

**B—small stable population (unnatural)**

- B(1/1) 250–1000 mature individuals, stable population
- B(2/1) ≤5 subpopulations, ≤300 mature individuals in the largest subpopulation, stable population
- B(3/1) Total area of occupancy ≤10 ha (0.1 km<sup>2</sup>), stable population

**C—moderate population and high ongoing or predicted decline.**

- C(1/1) 1000–5000 mature individuals, predicted decline 50–70%
- C(2/1) ≤15 subpopulations, ≤500 mature individuals in the largest subpopulation, predicted decline 50–70%
- C(3/1) Total area of occupancy ≤100 ha (1 km<sup>2</sup>), predicted decline 50–70%

<i>Hadopyrgus expositus</i> Haase, 2008	Snail	Tateidae	A(3)	RR, DP

**Nationally Vulnerable (15)**

Criteria for Nationally Vulnerable:

**A—small, increasing population (unnatural)**

- A(1/1) 250–1000 mature individuals, predicted increase >10%
- A(2/1) ≤5 subpopulations, ≤300 mature individuals in the largest subpopulation, predicted increase > 10%
- A(3/1) Total area of occupancy ≤10 ha (0.1 km<sup>2</sup>), predicted increase >10%

**B—moderate, stable population (unnatural)**

- B(1/1) 1000–5000 mature individuals, stable population
- B(2/1) ≤15 subpopulations, ≤500 mature individuals in the largest subpopulation, stable population
- B(3/1) Total area of occupancy ≤100 ha (1 km<sup>2</sup>), stable population

**C—moderate population, with population trend that is declining**

- C(1/1) 1000–5000 mature individuals, predicted decline 10–50%
- C(2/1) ≤15 subpopulations, ≤500 mature individuals in the largest subpopulation, predicted decline 10–50%
- C(3/1) Total area of occupancy ≤100 ha (1 km<sup>2</sup>), predicted decline 10–50%

**D—moderate to large population, and moderate to high ongoing or predicted decline.**

- D(1/1) 5000–20 000 mature individuals, predicted decline 30–70%
- D(2/1) ≤15 subpopulations and ≤1000 mature individuals in the largest subpopulation, predicted decline 30–70%
- D(3/1) Total area of occupancy ≤1000 ha (10 km<sup>2</sup>), predicted decline 30–70%

**E—large population, and high ongoing or predicted decline.**

- E(1/1) 20 000–100 000 mature individuals, predicted decline 50–70%
- E(2/1) Total area of occupancy ≤10 000 ha (100 km<sup>2</sup>), predicted decline 50–70%

## At Risk (82)

Taxa that meet the criteria specified by Townsend et al. (2008) for Declining, Recovering, Relict and Naturally Uncommon.

### Declining (8)

Taxa that do not qualify as ‘Threatened’ because they are buffered by large population size and/or a slower rate of decline than the trigger points.

Criteria for Declining:

#### *A—moderate to large population and low ongoing or predicted decline*

- A(1/1) 5000–20 000 mature individuals, predicted decline 10–30%
- A(2/1) Total area of occupancy ≤1000 ha (10 km<sup>2</sup>), predicted decline 10–30%

#### *B—large population and low to moderate ongoing or predicted decline*

- B(1/1) 20 000–100 000 mature individuals, predicted decline 10–50%
- B(2/1) Total area of occupancy ≤10 000 ha (100 km<sup>2</sup>), predicted decline 10–50%

#### *C—very large population and low to high ongoing or predicted decline.*

- C(1/1) >100 000 mature individuals, predicted decline 10–70%
- C(2/1) Total area of occupancy >10 000 ha (100 km<sup>2</sup>), predicted decline 10–70%

## **Recovering (o)**

Taxa that have undergone a documented decline within the last 1000 years and now have an ongoing or predicted increase of >10% in the total population or area of occupancy, taken over the next 10 years or three generations, whichever is longer. Note that such taxa that are increasing but have a population size of <1000 mature individuals (or total area of occupancy of <10 ha) are listed in one of the Threatened categories, depending on their population size (for more details see Townsend et al. (2008)).

Criteria for Recovering:

- A 1000–5000 mature individuals or total area of occupancy ≤100 ha (1 km<sup>2</sup>), and predicted increase >10%
- B 5000–20 000 mature individuals or total area of occupancy ≤1000 ha (10 km<sup>2</sup>), and predicted increase >10%

No freshwater invertebrate taxa were ranked as Recovering.

## **Relict (o)**

Taxa that have undergone a documented decline within the last 1000 years, and now occupy <10% of their former range and meet one of the following criteria:

Criteria for Relict:

- A 5000–20 000 mature individuals; population stable ( $\pm 10\%$ )
- B >20 000 mature individuals; population stable or increasing at >10%. The range of a relictual taxon takes into account the area currently occupied as a ratio of its former extent. Relict can also include taxa that exist as reintroduced and self-sustaining populations within or outside their former known range (for more details see Townsend et al. (2008)).

No freshwater invertebrate taxa were ranked as Relict.

## **Naturally Uncommon (74)**

Taxa whose distribution is confined to a specific geographic area or which occur within naturally small and widely scattered populations where this distribution is not the result of human disturbance.

## Non-resident Native (6)

Taxa that periodically and cyclically visit New Zealand as part of their normal life cycle but do not breed here (Migrant) or taxa whose natural presence in New Zealand is either sporadic or temporary (Vagrant) or taxa that have succeeded in recently (< 50 years) establishing themselves beyond their point of introduction (Coloniser).

### Migrant (0)

No freshwater invertebrate taxa were ranked as Migrant.

### Vagrant (1)

Taxa whose occurrences, though natural, are sporadic and typically transitory.

NAME AND AUTHORITY	COMMON NAME	FAMILY	QUALIFIERS	IUCN STATUS
<b>Phylum Arthropoda</b>				
<i>Pantala flavescens</i> (Fabricius, 1798)	Dragonfly	Libellulidae		Least concern

### Coloniser (5)

Taxa that otherwise meet the criteria for Threatened categories because of small population size, but have arrived in New Zealand without direct or indirect help from humans and have been successfully reproducing in the wild only since 1950.

NAME AND AUTHORITY	COMMON NAME	FAMILY	QUALIFIERS	IUCN STATUS
<b>Phylum Arthropoda</b>				
<i>Ischnura aurora</i> (Brauer, 1865)	Damselfly	Coenagrionidae		Least concern
<i>Hemicordulia papuensis</i> (Burmeister, 1839)	Dragonfly	Aeshnidae		Least concern
<i>Hemicordulia australiae</i> Rambur, 1842	Dragonfly	Corduliidae		Least concern
<i>Tramea loewii</i> Kaup in Brauer, 1866	Dragonfly	Libellulidae	RR	Least concern
<i>Tramea transmarina</i> Brauer, 1867	Dragonfly	Libellulidae		Least concern

## Not Threatened (287)

Resident native taxa that have large stable populations.

## Introduced and Naturalised (O)

No freshwater invertebrate taxa were ranked as Introduced and Naturalised, as the panel focused on assessing native species.

## 2.2 Taxonomically Indeterminate

This section includes described taxa whose taxonomic status is uncertain and requires further investigation, and also possibly distinct invertebrates whose taxonomic status has yet to be determined. Definitions of threat categories follow those given in the Taxonomically Determinate section above.

### Extinct (o)

No taxonomically indeterminate freshwater invertebrates were ranked as Extinct.

### Data Deficient (27)

NAME AND AUTHORITY	COMMON NAME	FAMILY	QUALIFIERS
<b>Phylum Arthropoda</b>			
<i>Hydora</i> n. sp.	Beetle	Elmidae

<i>Paranephrops</i> sp.	Crayfish/koura	Parastacidae	

## Introduced and naturalised (0)

No taxonomically indeterminate freshwater invertebrates were listed as Introduced and Naturalised, as the panel focused on assessing native species.

## 3. Acknowledgements

We would like to acknowledge the contribution of the late Stephen Moore who sat on the panel when this list was first re-visited in 2010 and, despite being unable to participate in the 2013 assessment, provided the panel with valuable information. The following people have contributed information about their specialist taxa: Carolyn Burns, Ian Duggan, Claudine Gibson, Graham Fenwick, Martin Fikácek, Duncan Gray, Martin Haase, Ian Henderson, Terry Hitchings, Ian Hogg, Juergen Kolb, Paul Lambert, Richard Leschen, Bruce Marshall, Stephen Pohe, John Ward, Mike Winterbourn and Zheng Zhao. Their assistance has been incredibly helpful when the panel made its assessments. Avi Holzapfel helpfully translated a German manuscript to verify the information we had on the nematode *Miconchus rex*. Jeremy Rolfe assisted with preparation of the manuscript.
