RACE DM training session: Immunosuppressive treatment for aplastic anemia

EBMT 17, Marseille, France

26 - 29 March 2017

Antonio M. Risitano, M.D., Ph.D.
*Head of Bone Marrow Transplantation Unit
Federico II University of Naples*

- Orphan disease.
- Incidence rates present geographic variations.
- 2 to 3-fold higher rates in Asia than Europe and the United States
- Global incidence rates range 0.7-7.4 cases per million inhabitants.

Aplastic anemia: AA

- **AA: what does it mean?**
- **How we do the diagnosis?**
- **When should we treat?**
- **How we treat?**

Pathophysiology of aplastic anemia

Hematopoietic stem cell

The immune system

Aplastic anemia: AA

- AA: what does it mean?
- **How we do the diagnosis?**
- When should we treat?
- How we treat?

How we do the diagnosis

To eliminate something else
(leukemia, lymphoma etc)

Full blood counts:

- Pancytopenia
- At least 2 cellular lines are decreased

How we do the diagnosis: peripheral blood

Full blood counts:

- **Pancytopenia**
- **Anemia** is accompanied, by reticulocytopenia
- Macrocytosis is common
 - No impact on rate of response and OS.
 - [Li et al. Zhonghua Xue Ye Xue Za Zhi. 2013 Feb;34\(2\):117-21.](#)
- **Lymphocyte** count is usually preserved
- Early stages isolated cytopenia, particularly **thrombocytopenia**

Careful examination of the blood film to exclude:

- dysplastic neutrophils
- abnormal platelets
- blasts and other abnormal cells, such as hairy cells, LGL

How we do the diagnosis: marrow sampling

■ **bone marrow aspirate**

- **dry-tap: suspicion of a diagnosis other than aplastic anemia**
 - fragments and trails are **hypocellular**
 - **prominent fat spaces**
 - variable amounts of residual hemopoietic cells
 - megakaryocytes and granulocytic cells are:
 - reduced or absent
 - without dysplasia

How we do the diagnosis: marrow biopsy

■ Bone marrow

- hypocellularity (<25%) (rather than aplastic)
- “hot spots” with dominating erythropoiesis
- *dyserthropoiesis*
- few or no megakaryocytes
- mast cells
- lymphoid hyperplasia
- plasma cells
- macrophages

- Pancytopenia
- Persistent, unexplained marrow aplasia
 - Hematopoiesis replaced by fat cells
- No specific marker
 - Diagnosis by exclusion
- Severity need to be defined

- Due to hypocellular bone marrow frequently insufficient metaphases
- FISH for chromosomes 5 and 7 should be considered
- isolated del(13q) favorable long-term outcome
- An abnormal cytogenetic clone does not imply the diagnosis of MDS or AML
- Cytogenetic abnormalities can be present in up to 12% of typical AA patients
- Detection of small PNH clones has implications for defining the disease.
 - About 50% are 'aplastic' with small clones and no hemolysis.
- PNH clone size measurements:
 - at presentation
 - serial monitoring should be performed at least yearly

Characteristics	AA	hypoplastic MDS
dyserythropoiesis	sometimes	yes
abnormal neutrophil	no	yes
dysplastic megakaryocytes	no	yes
fibrosis	no	occasional
increased blasts	no	Sometimes (ALIPS)
CD34+ cells in BM	< 1.0%	sometimes increased
clonality	possible	sometimes
splenomegaly	absent	occasional

Bennett et al. Sem Hemato 2000;37:15-29

Bennett & Orazi. Haematologica 2009 Feb; 94(2):264-843-70

Hama A et al. Rinsho Ketsueki 2011 Aug ;52(8) :653-8

■ Fanconi anemia:

- Positive chromosomal breakage test (MMC or DEB) that still represents the diagnostic gold standard.

■ Screening: telomere length

■ Dyskeratosis congenita

- Asymptomatic:
 - Frequent association with TERC, TERT mutation
 - (10% all idiopathic forms)
 - Rarely, with TINF2 gene mutation
- Recognizable phenotype of DC:
 - TINF2, NHP2, NOP10, DKC1 mutation

Based on peripheral values and bone marrow findings

Severe AA (SAA)

At least two of the following three criteria have to be fulfilled:

- Reticulocytes $<60 \times 10^9/L$ (using an automated analyzer) or $< 20 \times 10^9/l$ (manual count)*
- Platelets $< 20 \times 10^9/L$
- Neutrophil count $< 0.5 \times 10^9/L$

Very severe AA (vSAA)

Same criteria of SAA have to be fulfilled; but the neutrophil count has to be $< 0.2 \times 10^9/l$

Non- severe AA

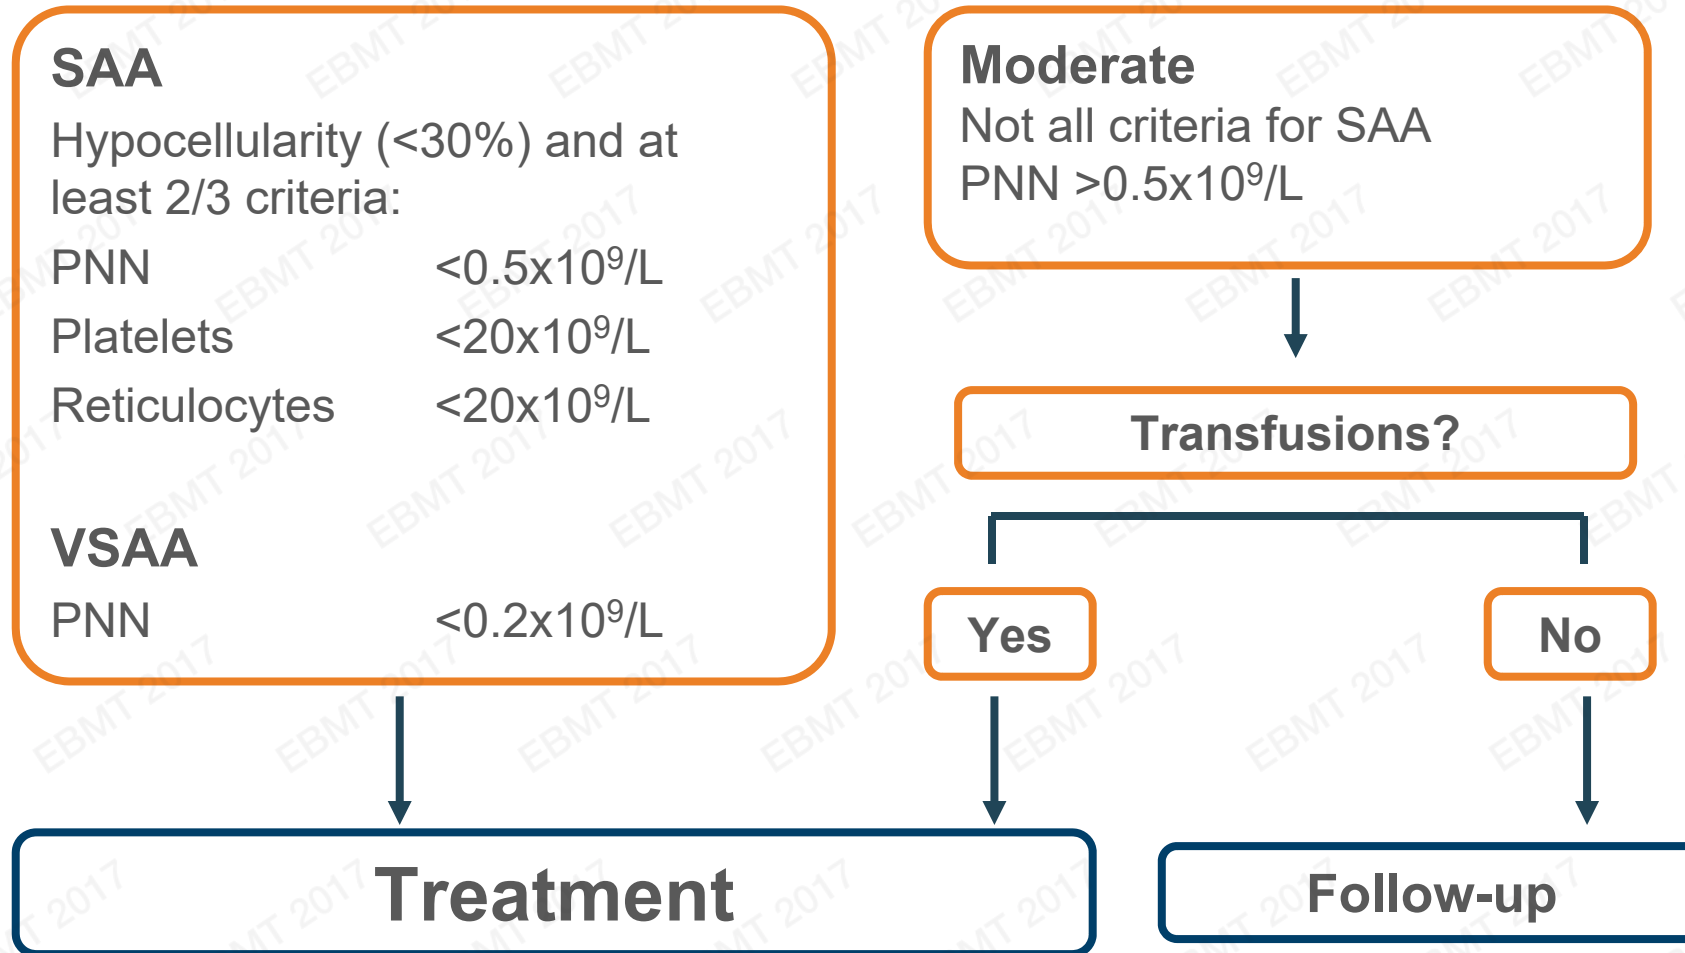

Patients not fulfilling the criteria for SAA and vSAA.

* The different values are because automated count may over-estimate the counting at low level of reticulocyte counts, i.e. it reads $50 \times 10^9/L$ but in reality they are less

Aplastic anemia: AA

- AA: what does it mean?

Treatment options for aplastic anemia

Original Article

Outcome of patients with acquired aplastic anemia given first line bone marrow transplantation or immunosuppressive treatment in the last decade: a report from the European Group for Blood and Marrow Transplantation

Anna Locasciulli, Rosi Oneto, Andrea Bacigalupo, Gerard Socié, Elisabeth Korthof, Albert Bekassy, Hubert Schrezenmeier, Jakob Passweg, Monika Führer on the Behalf of the Severe Aplastic Anemia Working Party of the European Blood and Marrow Transplant Group (SAA-WP BMT).

Locasciulli et al, Haematologica 2007

Idiopathic AA: how we treat?

1. Immunosuppressive treatment

(Oligo) clonal CD8+ T cells

Auto-immunity = immune disorder =
idiopathic AA

Idiopathic AA: how we treat?

Idiopathic AA: how we treat?

2. Bone marrow transplantation

Auto-immunity = immune disorder =
idiopathic AA

Idiopathic AA: how we treat?

2. Bone marrow as source of stem cells

Conditionnement

1. Reduced intensity conditioning regimen

3. No need for GvHD

4. infections

Idiopathic AA: how we treat?

Inherited AA: how we treat?

Bone marrow transplantation

Constitutional = inherited disorder
(FA, dyskeratosis congenita)

Conclusion: AA

- **AA: marrow empty, nothing else**
- **Diagnosis is very important**
- **Treatment if SAA or trasnfusions**
- **Immunosuppressive therapy (acquired) or BMT (acquired and inherited)**

AA and...

*... supportive
care*

Supportive care

The improvement in anti-infectious management

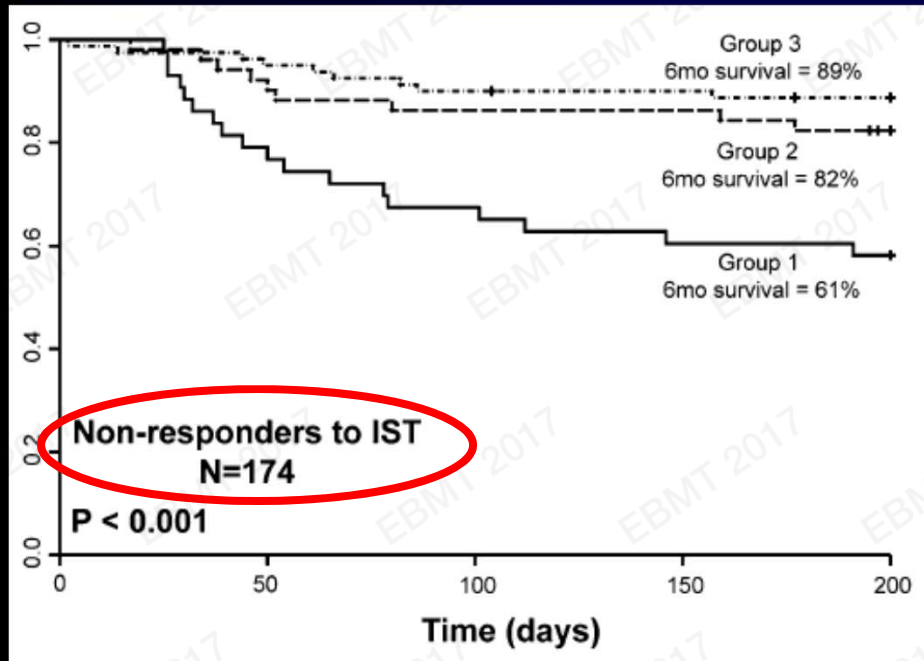

CID 2011

- ✓ n=420 (174 non-responders)
- ✓ Infection-related mortality from 37% to 11%
- ✓ Incidence of IFIs from 49% to 8%

Group 1: 12/1989-10/1986

Group 2: 11/1986-10/2002

Group 3: 11/2002-04/2008

The most relevant breakthrough in AA treatment was the anti-infectious supportive care: keeping AA patients alive until they recover (IST or SCT)

Supportive care

The role of steroids

- ✓ Steroids are broadly used as ancillary therapy of SAA
 - ✓ Based on old data on potential therapeutic efficacy (Bacigalupo et al NEJM 1982)
 - ✓ Drawn from empirical use (and possible efficacy) of steroids in other immune-mediated cytopenias (Ab-mediated)

BUT

- ✓ No clinical evidence of efficacy
- ✓ Increased risk of severe infectious complications (mostly IFI)
- ✓ May mask ongoing/overt infections (including sepsis)
- ✓ Short-term toxicity (cumulative with CsA): hypertension, diabetes, fluid retention
- ✓ Long-term toxicity: avascular necrosis, cataracts, etc

In the context of SAA, steroids should be used only as prophylaxis of serum sickness during ATG treatment, using the lowest effective dose and the faster tapering

- ✓ Start with 1 mg/kg/day, eventually doubled in case of serum sickness or other allergic manifestations*; then taper by 25% every 2-4 days

***ATG-related allergic infusion reactions should rather be considered manifestations of Complement Activation Related Pseudo-Allergy (CARPA), which eventually derive from massive activation of the classical pathway due to the exogenous antibodies and their immune-complexes**

AA and...

*... immunosuppressive
treatment*

OUTCOME OF IMMUNOSUPPRESSION FOR SAA

Improvement over the years

EBMT Database

N=3202

2000-10

1990-00

1980-90

1975-80

Survival improved with years, mostly due to:

- ✓ *Better supportive therapy*
- ✓ *Better salvage treatment (SCT)*

Blood 2003

✓ CyA reduces early treatment failure but not long-term relapse rate

RELAPSES AFTER IST

The role of maintenance CyA therapy

Maintenance CyA is required to sustain blood counts after initial response to IST

Aplastic Anemia: Management of Adult Patients

Jaroslav P. Maciejewski and Antonio M. Risitano

REASONS FOR TREATMENT FAILURE

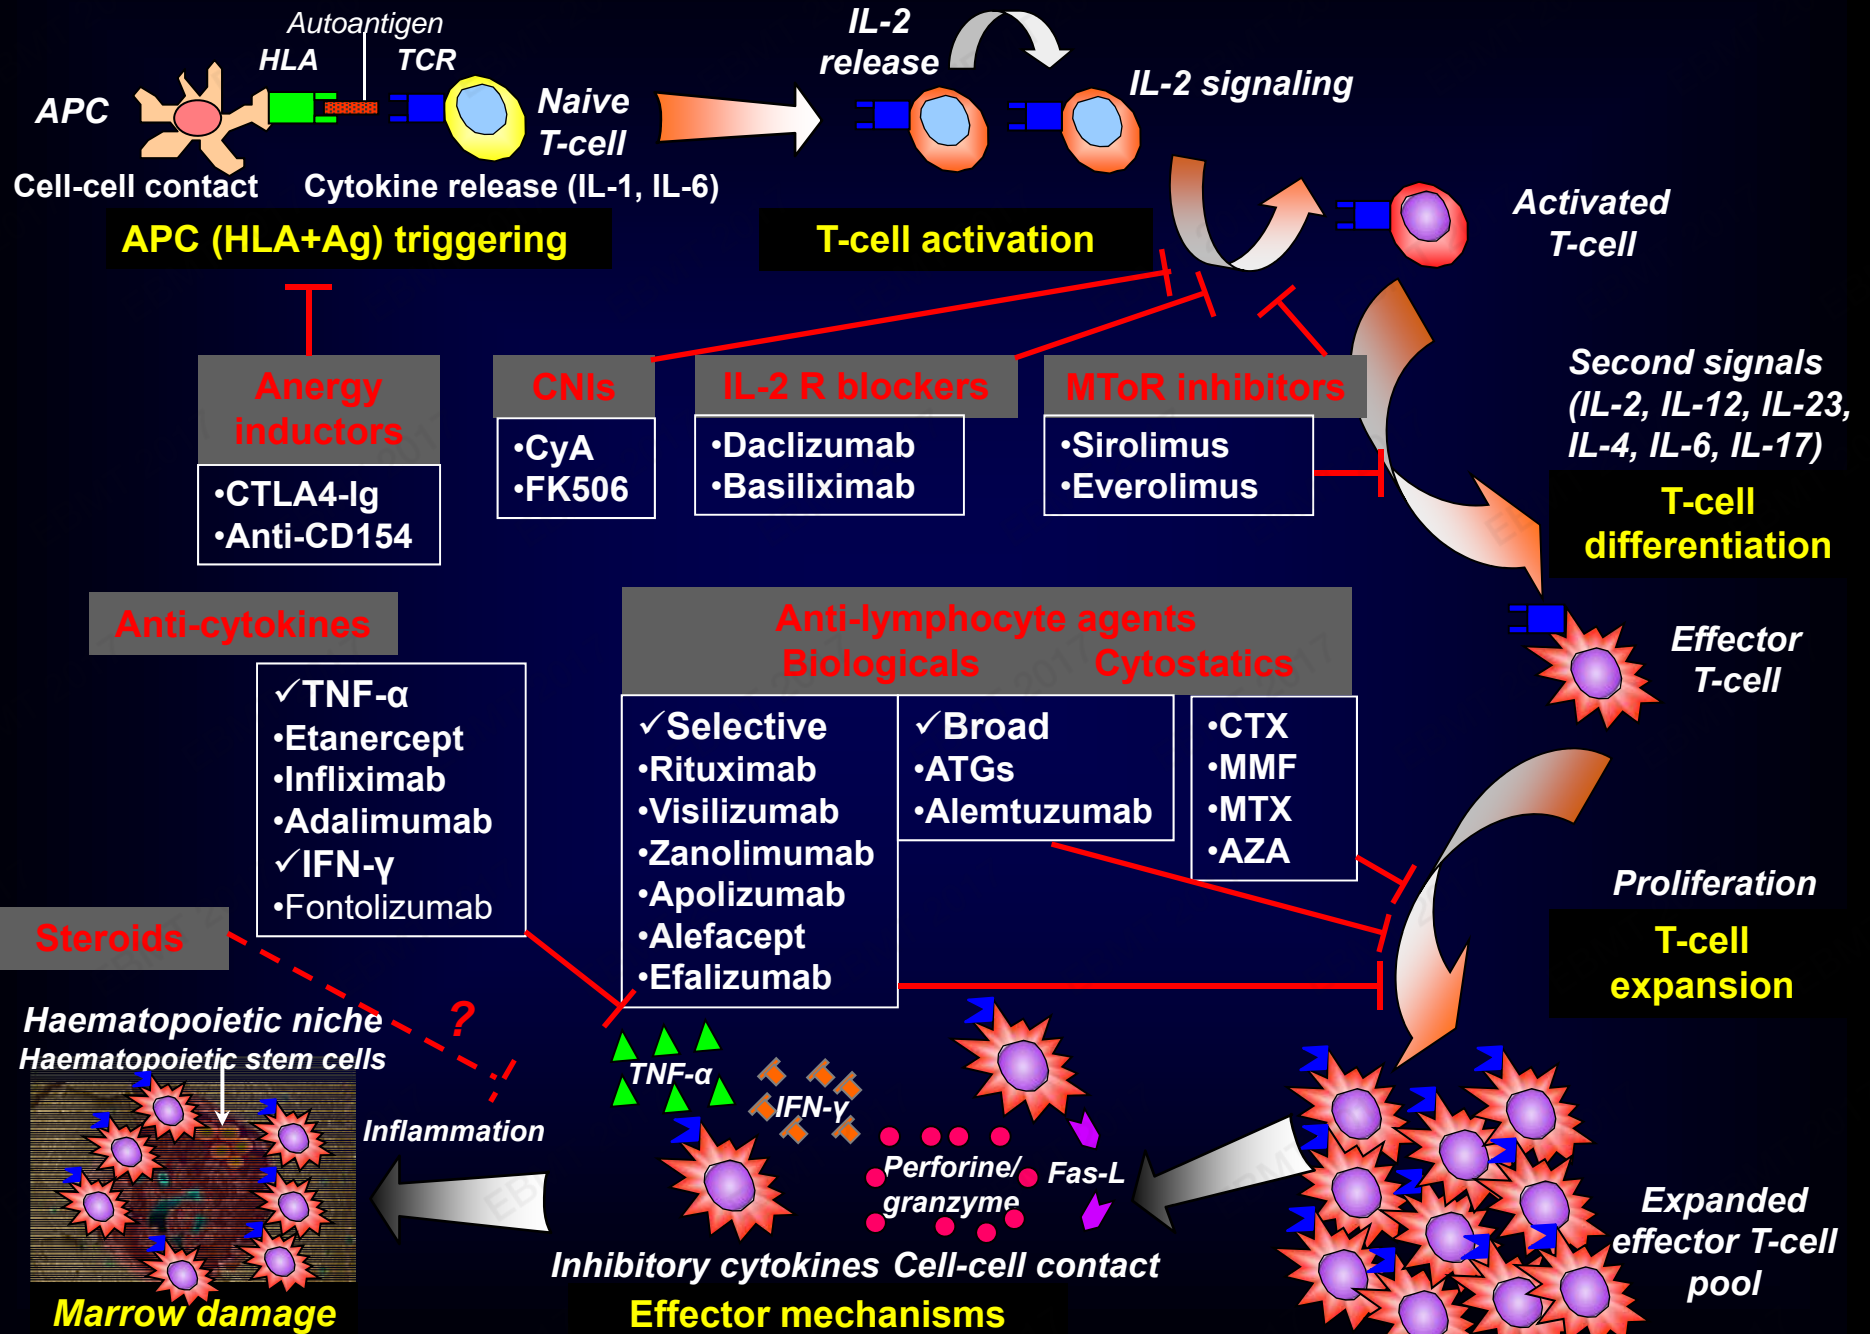

- Pathophysiology other than immune-mediated
- Irreversible stem cell deficit
- **Insufficient immunosuppression**

Improve front line immunosuppressive therapies

*Improving IST for AA:
chronicle of a failure*

STRATEGIES OF IMMUNOSUPPRESSION (Risitano, BJH 2010)

IMPROVING IMMUNOSUPPRESSIVE TREATMENT FOR AA

The history of a failure

1. No benefit from the addition of a third drug over the hATG-CsA platform

- ✓ Mycophenolate mofetil (randomized NIH trial)
- ✓ Rapamicine (open-label NIH trial)

2. No benefit from using non-hATG based regimens

- ✓ Rabbit ATG (NIH, EBMT, etc)
- ✓ Alemtuzumab (NIH, Naples)
- ✓ Cyclophosphamide (John Hopkins, NIH)

3. Novel immunosuppressive strategies

- ✓ Anti-cytokine mAbs (TNF, IFN, IL2/IL23, etc)
- ✓ Daclizumab (anti-IL2R), alefacept (anti-LFA-3), efalizumab (anti-LFA-1)
- ✓ Mesenchymal stem cells
- ✓ Anti-CD26 (Begecina®): in development for aGvHD

NEJM 2011

Horse versus Rabbit Antithymocyte Globulin in Acquired Aplastic Anemia

Phillip Scheinberg, M.D., Olga Nunez, R.N., B.S.N., Barbara Weinstein, R.N., Priscila Scheinberg, M.S., Angélique Biancotto, Ph.D., Colin O. Wu, Ph.D., and Neal S. Young, M.D.

- ✓ Phase III prospective randomized study, first-line treatment
- ✓ **hATG + CyA** (n=60) vs **rATG + CyA** (n=60)
- ✓ **OR @ 6m 68% vs 37%** (p<0.001)

FDA Approvals > Medscape Medical News

FDA OKs Eltrombopag (Promacta) for Severe Aplastic Anemia

HIGHLIGHTS OF PRESCRIBING INFORMATION

These highlights do not include all the information needed to use PROMACTA safely and effectively. See full prescribing information for PROMACTA.

PROMACTA (eltrombopag) tablets, for oral use

Initial U.S. Approval: 2008

WARNING: RISK FOR HEPATIC DECOMPENSATION IN PATIENTS WITH CHRONIC HEPATITIS C

See full prescribing information for complete boxed warning

In patients with chronic hepatitis C, PROMACTA in combination with interferon and ribavirin may increase the risk of hepatic decompensation.

(5.1)

- **Chronic ITP:** Initiate PROMACTA at 50 mg once daily for most patients. Reduce initial dose in patients with hepatic impairment and/or patients of East Asian ancestry. Adjust to maintain platelet count greater than or equal to $50 \times 10^9/L$. Do not exceed 75 mg per day. (2.1)
- **Chronic Hepatitis C-associated Thrombocytopenia:** Initiate PROMACTA at 25 mg once daily for all patients. Adjust to achieve target platelet count required to initiate antiviral therapy. Do not exceed a daily dose of 100 mg. (2.2)
- **Severe Aplastic Anemia:** Initiate PROMACTA at 50 mg once daily for most patients. Reduce initial dose in patients with hepatic impairment or patients of East Asian ancestry. Adjust to maintain platelet count greater than $50 \times 10^9/L$. Do not exceed 150 mg per day. (2.3)

----- **DOSAGE FORMS AND STRENGTHS** -----
12.5-mg, 25-mg, 50-mg, 75-mg, and 100-mg tablets. (3)

Danielle Townsley

EBMT studies for AA

	moderate AA (EMAA)	vSAA / SAA (RACE)
Primary objective	PR + CR at 6 months	CR at 3 months
Inclusion criteria	<ul style="list-style-type: none"> - age \geq 18 years - Treatment requiring MAA (transfusion dependency or ANC < 1G/l or Thrombo < 30G/l or Hb < 8,5g/dl & Reti < 60G/l) 	<ul style="list-style-type: none"> - age \geq 15 years - SAA/ vSAA - No primary allo-SCT
Treatment	CsA + Eltrombopag versus CsA + Placebo	hATG (ATGAM) + CsA + Eltrombopag versus h ATG + CsA
Eltrombopag Dosage	150 mg (225 mg)	150 mg
Design	Placebo controlled	Open lable
Patient number	2 x 58	2 x 100
Sponsor	University hospital Ulm	EBMT

THE RACE trial

A prospective **R**andomized multicenter study comparing horse
Antithymocyte globuline (hATG) + **C**yclosporine A (CsA) ±
Eltrombopag as front-line therapy for severe aplastic anemia
patients.

PRINCIPAL INVESTIGATORS

Regis Peffault de Latour (Paris)

Antonio M Risitano (Naples)

A prospective **R**andomized multicenter study comparing horse **A**ntithymocyte globuline (hATG) + **C**yclosporine A (CsA) with or without **E**ltrombopag as front-line therapy for severe aplastic anemia patients – **RACE STUDY**(1)

RACE Trial

11 March 2016

Working party	Principal investigators	Trial Coordinator
	Antonio M Risitano / Regis Peffault de Latour	Marleen van Os
SAA-WP	<p>To investigate whether Eltrombopag (Revolade, GSK) added to standard immune-suppressive treatment, CsA + hATG (ATGAM, Pfizer) increases the rate of early complete response in untreated AA patients*</p> <p>* Patients will be stratified by age and disease severity</p>	
Participating countries		

THE EBMT RACE STUDY

Study design

- ✓ An **EBMT Severe Aplastic Anemia Working Party study** (approved by the CTO), entirely funded by Novartis and Pfizer
- ✓ Aim of the study: to improve the current standard treatment for SAA
 - ✓ To improve the **robustness of hematological response** of SAA patients receiving IST
- ✓ Prospective, open label, phase III randomized study
 - ✓ Control arm: horse ATG (40 mg/kg x 4dd, iv) + cyclosporine (5 mg/kg, os)
 - ✓ Investigational arm: horse ATG + cyclosporine + eltrombopag (150 mg/die, os)
- ✓ Type B trial, because eltrombopag may theoretically result in a somewhat higher risk (mostly clonal evolution) in comparison to standard medical care
- ✓ Participating centers: 30 sites from 7 EU Countries (France, Italy, UK, Germany, Spain, Netherlands, Switzerland)

THE EBMT RACE STUDY

Statistical design

✓ Superiority study

✓ Sample size calculation

- ✓ Aiming to increase the 3m CR rate from **7%** (*Scheinberg, Haematologica 2010*) to **21%** (*current NIH data*)
- ✓ Sample size to reject the null hypothesis at 5% significance level (alpha-error) and with 80% power (two-sided test) is n=96 patients for treatment arm
- ✓ Sample size increased by 4% to compensate for possibly not evaluable patients: **total number of 200 patients (100 each arm)**

✓ Randomization

- ✓ **1:1 randomization, including a stratified block design**
- ✓ Stratification according to:
 - **Disease severity:**
 - Severe aplastic anemia (SAA)
 - Very severe aplastic anemia (VSAA: SAA plus ANC <200/ μ L)
 - **Age:**
 - ≥ 15 and <40 year old
 - ≥ 40 year old

✓ No stopping rules (study continuation led to discretion of the DMSB)

✓ No interim analysis

RACE STUDY (2)

SAA-WP

TREATMENT Scheme

THE EBMT RACE STUDY

Study flow-chart

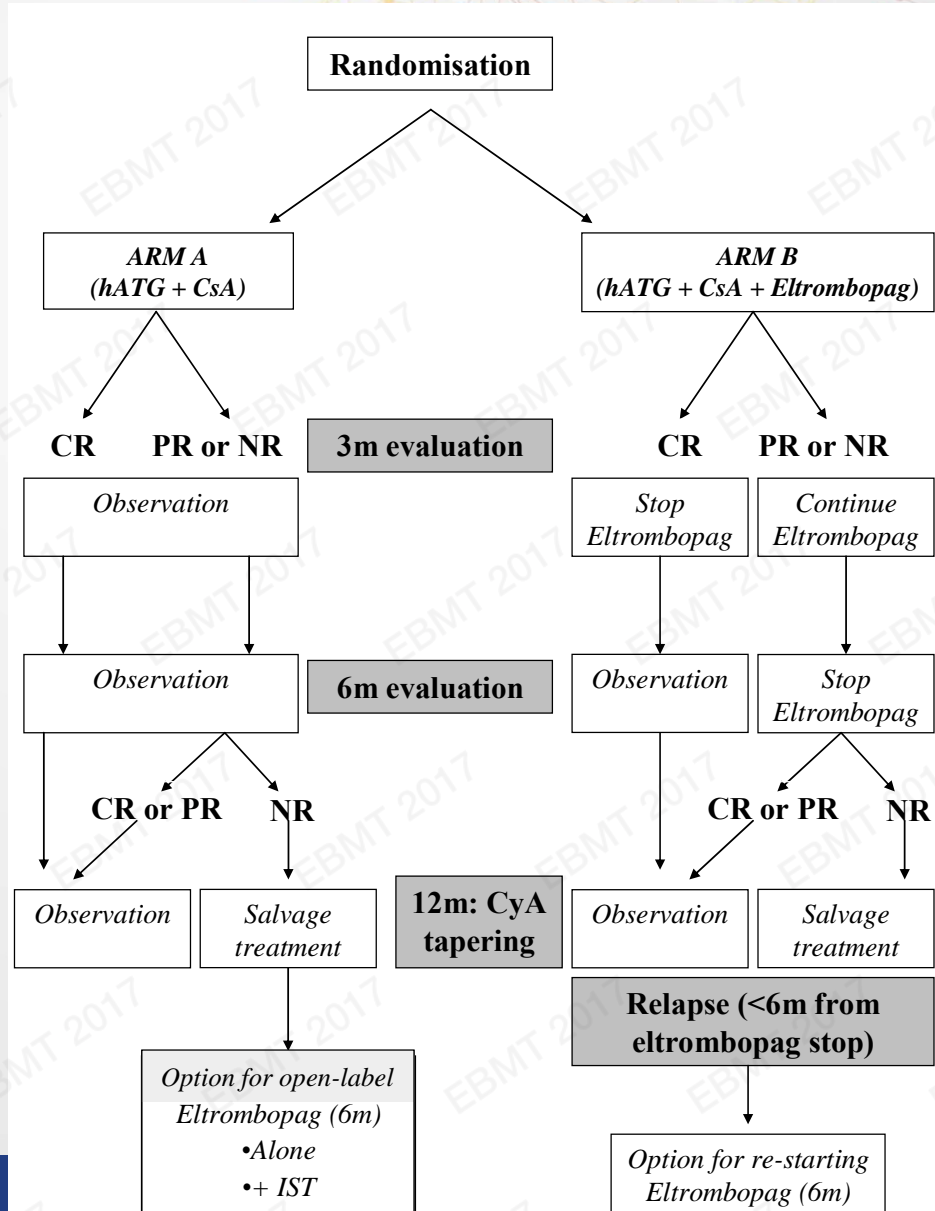

Initial treatment

3 month evaluation:
primary endpoint

6 month evaluation:
stop eltrombopag
Possible cross-over
(standard arm only)

12 month evaluation:

Relapse: possible eltrombopag re-starting (investigational arm only)
24 month evaluation: end of the study

RACE trial – participating sites

Country	# sites
France	6 (6 open) +2
Germany	5 (on hold)
Italy	6 (2 open) +3
Netherlands	4 (3 open)
Spain	5 (1 open)
Switzerland	1 (0 open) +1
United Kingdom	5
Total	32 (up to 40)

Brazil Back up site?

Patient recruitment (October 10, 2016)

-

Patient recruitment is excellent for the number of sites

Delays are in site opening (contracts and regulatory hurdles) – improving

-

Target of 50 patients (10 sites open (10 sites recruiting) out of 27 sites) by end of October – on track
 (September 4 patients, October 10 so far)

RACE trial – ancillary biological study (King’s College)

Table 3. Details of all the somatic mutations in the study

UPN	Gene	Mutant allele burden (%)	Variant class	Nucleotide and protein change	Constitutional DNA
2*	ASXL1	30	Frameshift insertion	c.1927_1928insG:p.G643fs	Skin
2*	DNMT3A	42	Nonsynonymous SNV	c.C1540G:p.L514V	Skin
2*	ERBB2	44	Nonsynonymous SNV	c.G922A:p.V308M	Skin
5*	TET2	5	Stopgain SNV	c.C3100T:p.Q1034X	Skin
6*	ASXL1	38	Stopgain SNV	c.C2242T:p.Q748X	Buccal
10*	SRSF2	43	Nonsynonymous SNV	c.C284T:p.P95L	Buccal
16*	ASXL1	23	Frameshift insertion	c.2469_2470insAG:p.L823fs	Skin
18*	DNMT3A	31	Nonsynonymous SNV	c.C2644T:p.R882C	Skin
19*	IKZF1	14	Nonsynonymous SNV	c.C640G:p.H214D	Skin
21*	BCOR	5	Stopgain SNV	c.C526T:p.Q176X	Buccal
29*	ASXL1	41	Stopgain SNV	c.G4068A:p.W1356X	Skin
33*	BCOR	68	Stopgain SNV	c.G4832A:p.W1611X	Skin
40*	ASXL1	31	Nonframeshift deletion	c.2894_2896del:p.965_966del	Buccal
46*	MPL	10	Nonsynonymous SNV	c.G1544T:p.W515L	Buccal
64	DNMT3A	47	Nonsynonymous SNV	c.C2644T:p.R882C	Skin
66	ASXL1	37	Frameshift deletion	c.2433delT:p.N811fs	Skin
67	U2AF1	19	Nonsynonymous SNV	c.C101A:p.S34Y	Skin
69	ASXL1	34	Stopgain SNV	c.C2077T:p.R693X	Buccal
70	ASXL1	2	Stopgain SNV	c.G2026T:p.E676X	Buccal
70	BCOR	14	Stopgain SNV	c.T912G:p.Y304X	Buccal
73	BCOR	6	Frameshift insertion	c.4834_4835insC:p.L1612fs	Skin
79	ASXL1	36	Stopgain SNV	c.G2026T:p.E676X	Buccal
81	ASXL1	3	Stopgain SNV	c.T2324G:p.L775X	Skin
88	ASXL1	7	Frameshift deletion	c.2126delC:p.A709fs	Skin
93	DNMT3A	8	Stopgain SNV	C2311T:p.R771X	Skin
94	BCOR	30	Splice site	splice site c.3052-2A>G	Skin
97	DNMT3A	7	Nonsynonymous SNV	c.C2644T:p.R882C	Buccal
107	ASXL1	30	Stopgain SNV	c.T2468G:p.L823X	Buccal
129	DNMT3A	5	Nonsynonymous SNV	c.G2207A:p.R736H	Skin
130	DNMT3A	5	Nonsynonymous SNV	c.G2645A:p.R882H	Skin
140	BCOR	5	Frameshift deletion	c.4760delC:p.P1587fs	Buccal
142	DNMT3A	1.5	Nonsynonymous SNV	c.C2644T:p.R882C	Buccal

CLONAL EVOLUTION

A matter of definition

Consider **oligoclonal** hematopoiesis
in AA due to HSC reduction

Pre-existing vs subsequent?

**Fixation of neutral mutation
(founder effect)
vs
true clonal complication**

The actual meaning of somatic mutations in hematology

Do all mutations imply cancer (especially in marrow failure)?

Chiba, H. Tanaka, Y. Nagata, T. Katagiri, A. Kon, M. Sanada, P. Scheinberg, S. Miyano, J.P. Maciejewski, S. Nakao, N.S. Young, and S. Ogawa

CONCLUSIONS

Clonal hematopoiesis was prevalent in aplastic anemia. Some mutations were related to clinical outcomes. A highly biased set of mutations is evidence of Darwinian selection in the failed bone marrow environment. The pattern of somatic clones in individual patients over time was variable and frequently unpredictable.

SOMATIC MUTATION IN HSC

The lesson from ageing

ORIGINAL ARTICLE

Age-Related Clonal Hematopoiesis Associated with Adverse Outcomes

- ✓ 17,182 individuals unselected for hematologic phenotypes
- ✓ detectable mutations in 746 persons (4.3%)
- ✓ Most common variants in three genes: DNMT3A, TET2, and ASXL1
- ✓ The presence of a somatic mutation was associated with increased risk:
 - hematologic cancer (hazard ratio, 11.1; 95% CI 3.9-32.6)
 - all-cause mortality (HR 1.4; 95% CI 1.1-1.8)
 - incident coronary heart disease (HR 2.0; 95% CI 1.2-3.4)
 - ischemic stroke (HR 2.6; 95% CI 1.4-4.8)
