

Spribille, T., Thor, G., Bunnell, F. L., Goward, T. and Björk, C. R. 2008. Lichens on dead wood: species-substrate relationships in the epiphytic lichen floras of the Pacific Northwest and Fennoscandia. – Ecography 31: 741–750.

## Supplementary material

Appendix 1. Crustose lichens restricted to wood in the Pacific Northwest (PNW) and Fennoscandia (FS), and types of dead wood they colonize. – denotes species not reported since their description. Life forms: C = calicioid; CR = crust; M = macrolichen. Order: IS = placement uncertain (*incertae sedis*). Rep. mode: reproductive mode S = sexual, AS = asexual by soredia, AI = asexual by isidia. Substrate affinity: \* obligately lignicolous in region specified; \*\* facultatively lignicolous, also known to occur on bark or other substrates; \*\*\* not known to occur on wood in the region specified. Ang/Con: occurs on A = angiosperms or C = conifers. Microsite type: AW = anthropogenic wood; BR = decorticated branches; BS = beaver scars; BW = burnt wood; FD = freshwater driftwood; L = logs; MD = maritime driftwood; SC = dead wood scars on living trees; SN = snags; ST = stumps. Inclusion on Red Lists: FI = Finland; MT = Montana; NO = Norway; NW = Northwest Forest Plan (USDA 2001); OR, Oregon; SE, Sweden. nd = no data available.
