

Supplementary material

Appendix 1

SUPPLEMENTARY INFORMATION

Supplementary Table A1. Species list and data set.

Supplementary Table A2. Means and standard errors (SE) of trait for the twenty-two species collected from two elevations, shown for each elevation.

Supplementary Table A3. Tests for phylogenetic signal in seed traits.

Supplementary Table A4. Results of Analyses of Variance to test for life cycle differences in seed traits across elevation.

Supplementary Table A5. Results Multiple Linear Regression and Phylogenetic Generalized Mixed Model to test whether seed traits predict the elevation at which species occur.

Supplementary Table A6. Results of Analysis of Variance to test whether seed morphological traits influence germination, and whether that influence differs across elevations.

Supplementary Table A7. Results of Phylogenetic Generalized Mixed Model to test how seed morphological traits predict germination proportion.

Supplementary Figure A1. Histogram of collection sites across the elevation.

Supplementary Figure A2. Annual temperature and precipitation across elevation in 86 study sites.

Supplementary Figure A3. Visualization of the phylogenetic tree and ECV (Environmental Coefficient of Variation) on variation in seed traits in 22 species collected at two elevations.

Supplementary Figure A4. Visualization of the distribution of traits across the elevation gradient and community phylogeny for the 408 species.

Supplementary Table A1. Species list and data set for 442 species-sites. Species life history (LF) were annual herbaceous (AH), perennial herbaceous (PH) and perennial shrub (PS) and perennial tree (PT). SVR = Surface area:volume ratio; GP = germination proportion; GT = germination time.

Species name	Family	Elevation (m)	LF	Mass (mg)	Shape	SVR (cm ⁻¹)	GP	GT (d)	Longitudes	Latitude

Supplementary Table A3. Phylogenetic signal (Pagel's λ and Blomberg's K and their associated P-values from a randomization test) for each trait, using a phylogenetic tree with branch lengths set to unity. Seed mass values were \log_{10} -transformed; SVR = surface area:volume ratio (\log_{10} -transformed); GP = germination proportion (logit-transformed); GT = germination time (ln-transformed). Significant P -values ($P < 0.05$) are indicated in boldface.

Traits	n	Pagel's λ (P -values)	Blomberg's K (P -values)
Mass	442	0.8973 (3.49×10^{-50})	0.2226 (1×10^{-4})
Shape	442	0.8907 (9.75×10^{-78})	0.3136 (1×10^{-4})
SVR	442	0.8982 (6.95×10^{-51})	0.1979(1×10^{-4})
GP	442	0.5454 (1.41×10^{-20})	0.0650 (0.023)
GT	442	0.5698 (7.56×10^{-20})	0.1080 (2×10^{-4})

Supplementary Table A4. Results of Analyses of Variance to test for life-history differences in seed traits across elevation, for life cycle was divided two categories: Annual and Perennial. Mass (\log_{10} -transformed); SVR = surface area:volume ratio (\log_{10} -transformed); GP = germination proportion (logit-transformed); GT = germination time (ln-transformed).

Traits	Elevation			Life cycle			Life cycle × Elevation		
	Df	F-value	P-value	Df	F-value	P-value	Df	F-value	P-value
Mass	1	10.67	0.001	1	10.67	0.001	1	0.11	0.74
Shape	1	4.62	0.032	1	27.08	3.0×10⁻⁷	1	0.00	0.999

GT	1	13.85	2.0×10⁻⁴	1	11.87	6.2×10⁻⁴	1	0.31	0.58

Supplementary Table A5. Results of Multiple Linear Regression ($R^2=0.064$, $P=2.23\times10^{-5}$) and Phylogenetic Generalized Linear Model ($R^2=0.057$, $P=1.07\times10^{-5}$) to test whether seed traits of 442 species-sites predict the elevation (dependent variable) from which species were collected. Mass values were \log_{10} -transformed; SVR = surface area:volume ratio (\log_{10} -transformed); GP = germination proportion (logit-transformed); GT = germination time (ln-transformed). Significant P-values are indicated in bold type. Elevation is a continuous dependent variable.

Supplementary Table A7. Results of Phylogenetic Generalized Linear Model to test whether seed morphological traits of 442 species-sites predict germination, and whether that effect differs across elevations. Mass values were \log_{10} -transformed; SVR = surface area:volume ratio (\log_{10} -transformed); GP = germination proportion (logit-transformed); GT = germination time (ln-transformed). The analysis controls for phylogenetic relationships across 442 species-sites.

Supplementary Figure A1. Histogram of 86 study sites across the elevation.

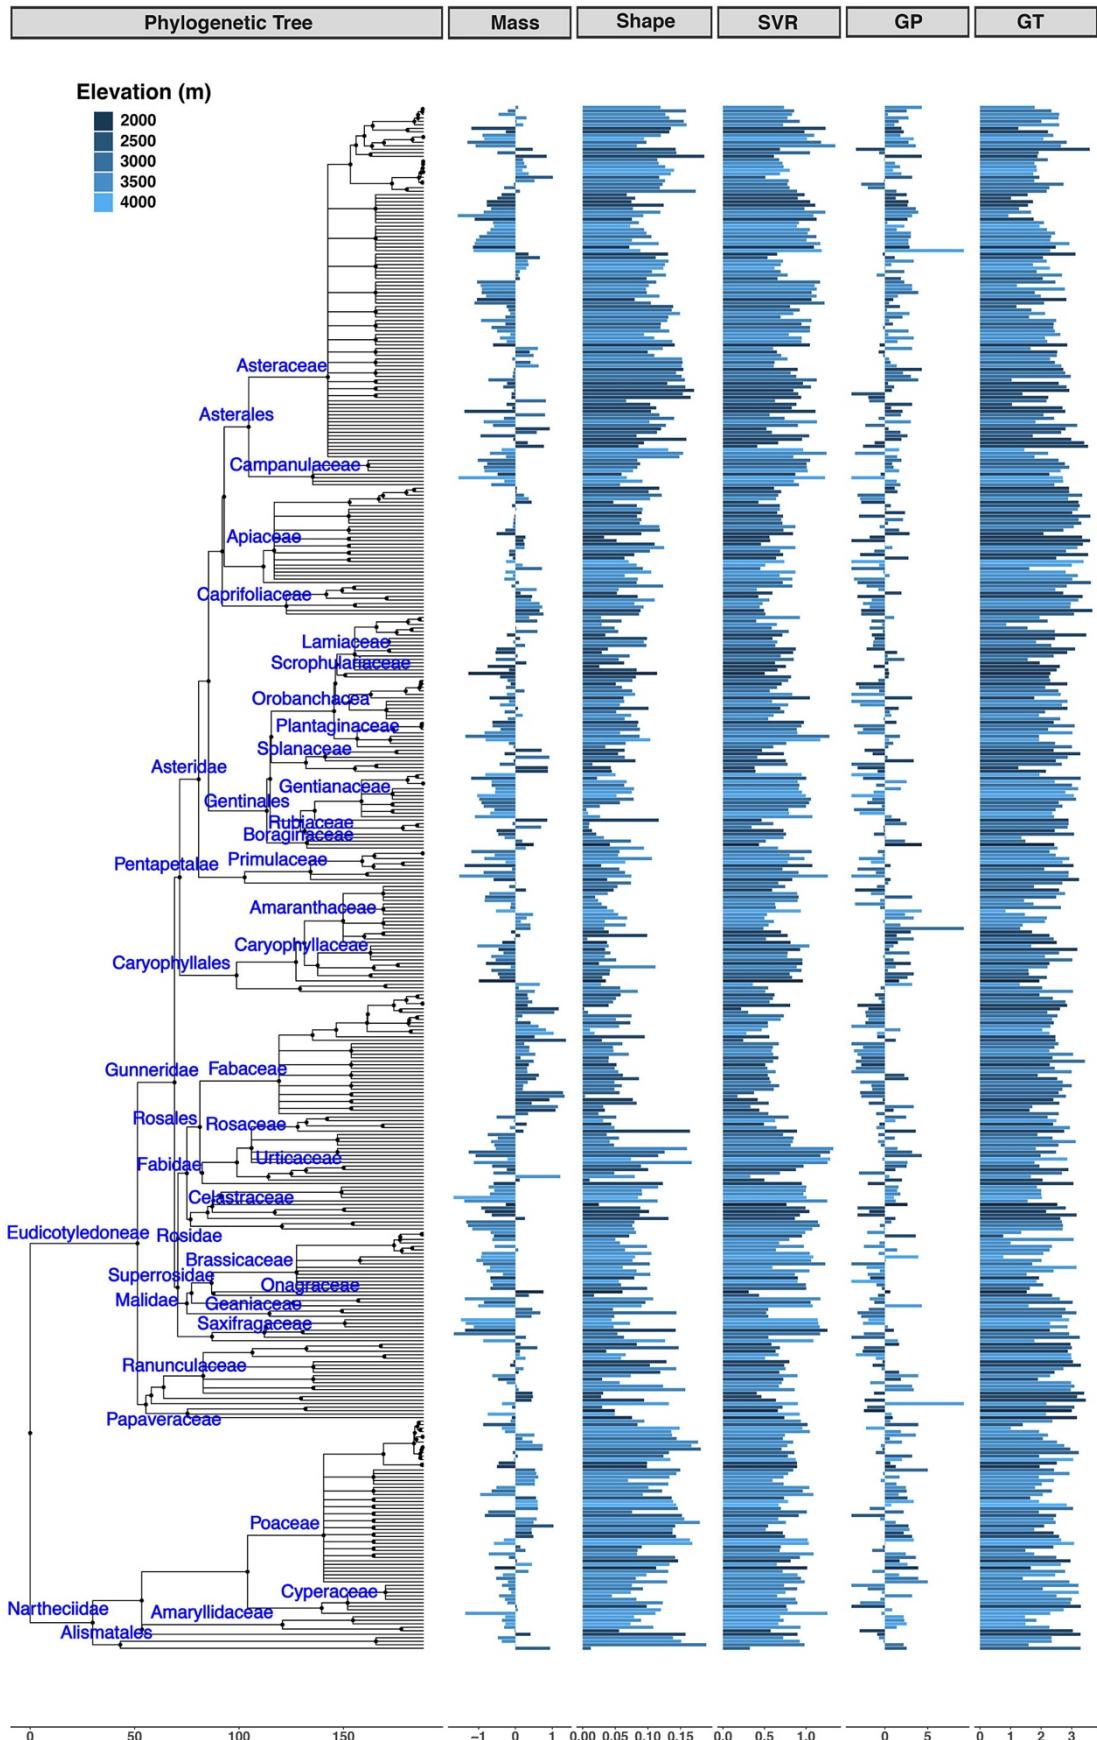

Supplementary Figure A2. Linear regression analysis of annual temperature and precipitation as a function of elevation across 86 study sites. (a) red points show the maximum temperature of the warmest month at different elevations ($\beta = -0.0024$, $R^2 = 0.70$, $P < 2 \times 10^{-16}$); black points show the annual mean temperature at different elevations ($\beta = -0.0023$, $R^2 = 0.70$, $P < 2 \times 10^{-16}$); blue points show the minimum temperature of the coldest month at different elevations ($\beta = -0.0033$, $R^2 = 0.72$, $P < 2 \times 10^{-16}$). (b) black points show the annual precipitation at different elevations ($\beta = 6.90 \times 10^{-5}$, $R^2 = 0.31$, $P < 1.7 \times 10^{-8}$). Annual precipitation values were ln-transformed in linear regression analysis. The data of annual temperature and precipitation in the 86 study sites was collected from the WorldClim database (<http://www.worldclim.org/>) using the R package “raster” (Hijmans and van Etten 2016).

Supplementary Figure A3. Variation in seed traits across elevation within 22 species collected at two elevations. The phylogenetic tree is shown on the right, and the Environmental Coefficient of Variation (ECV) is show for each trait on the left. The ECV measures the magnitude of the effect of elevation on variation in seed traits. Positive values indicate that species vary more across elevation than within elevation. Negative values indicate the opposite. Mass values were \log_{10} -transformed; SVR = surface area:volume ratio (\log_{10} -transformed); GP = germination proportion (logit-transformed); GT = germination time (ln-transformed).

Supplementary Figure A4. Visualization of the distribution of traits across elevation gradient and phylogeny ($n = 408$ species). The phylogenetic tree represents the evolutionary relationships among the 408 species studied, generated from the megatree of Zanne *et al.* (2014) using Phylomatic version 3.0 (Webb and Donoghue, 2005) and R package ‘ggtree’ (Yu *et al.* 2017). Seed mass values were \log_{10} -transformed; SVR = surface area:volume ratio (\log_{10} -transformed); GP = germination proportion (logit-transformed); GT = germination time (ln-transformed).
