An updated checklist of scarabaeoid beetles (Coleoptera: Scarabaeoidea) of Pench Tiger Reserve, Madhya Pradesh, India

Devanshu Gupta, Kailash Chandra and Salma Khan

Abstract

An updated checklist of 61 species of Scarabaeoid beetles (Coleoptera: Scarabaeoidea) belonging to 30 genera, 19 tribes and 7 subfamilies under 3 families (Geotrupidae, Hybosoridae and Scarabaeidae) from Pench Tiger Reserve (Madhya Pradesh, India) is provided for the first time. The details of specimens examined and distribution of the recorded species in India and abroad are provided which is further supplemented with the illustrations of 54 species. The study reports 22 species as new records for the tiger reserve. Out of the total species, *Delopleurus parvus* and *Onthophagus coeruleicollis* (Scarabaeinae) have been recorded for the first time from the state of Madhya Pradesh. The present study is not only a faunistic report but also an illustrated field guide for the identification of the Scarabaeoid beetles occurring in the tiger reserve which will help in conservation planning, protected area justification and design and development of management plans.

Keywords: Beetles, Distribution, India, Madhya Pradesh, New state records, Scarabaeoidea.

1. Introduction

The superfamily Scarabaeoidea comprises a large, diverse and cosmopolitan group of beetles which are fungivores, herbivores, necrophages, coprophages, saprophages, and sometimes carnivores in feeding habit [1]. The superfamily is divided into 12 families, 43 subfamilies, 118 tribes, and 94 subtribes [2] and includes approximately 37,268 species under 2498 genera worldwide [3]. Based on the position of the abdominal spiracles, the Scarabaeoidea is divided in two groups; the laparosticti and pleurosticti. The laparosticti group is characterized by having most of the abdominal spiracles located on the pleural membrane between the tergites and sternites and the pleurosticti group by having most of the abdominal spiracles situated on the upper portion of the sternites [4, 5]. The pleurosticti group is strictly phytophagous with various feeding habits, while the laparostict group includes coprophagous beetles or lamellicorn scavengers which have also earned popular name dung beetles [4].

The first taxonomic and faunal studies on the scarabaeoid beetles of the state, Madhya Pradesh (MP) were carried out by Arrow [6, 7, 8] in the Fauna of British India wherein 58 species were reported. Later Balthasar [9, 10, 11] wrote monographs on the Oriental and Palaearctic Coprinae (Scarabaeinae) and Aphodiinae, but did not concentrate much on the fauna of Central India. Later after years, Newton and Coe [12] published information on the distribution of 15 species of the dung beetles (Scarabaeinae) from Kanha Tiger Reserve. Further faunal studies on the Scarabaeoid diversity of MP include Chandra [13, 14, 15, 16, 17], Chandra and Gupta [18], Chandra and Singh [19], and Chandra and Ahirwar [20, 21, 22]. Chandra [13] published an inventory of 94 species belonging to 30 genera under 9 subfamilies. Subsequently Chandra and Ahirwar [22] presented a comprehensive account of the scarab beetles of MP and Chhattisgarh and recorded 124 species/subspecies belonging to 45 genera under 11 subfamilies. So far as the faunal diversity in different protected areas of the state is concerned, 53 species have been recorded from Bandhavgarh Tiger Reserve [17, 20], 61 species from Kanha Tiger Reserve [21], 64 species from Pachmarhi Biosphere Reserve [16, 18, 19, 23], 28 species from Veerangana Durgawati Wildlife Sanctuary [24] and 26 species from Singhori Wildlife Sanctuary [25]. Chandra [14] listed 34 species of the scarabaeoid beetles from Pench Tiger Reserve. Recent publications made by Chandra and Gupta [25, 26, 27, 28, 29, 30, 31] added 8 species from the tiger reserve and reported the occurrence of *Onthophagus spinifex*, *O. orissanus*, *O. abacus*, *Garreta smaragdifer* [Scarabaeinae], *Oryctes rhinoceros*, *Dipelicus bidens* [Dynastinae], *Bolbohamatum calanus*

and *B. phallosum* [Bolboceratinae] making the list of the recorded species to 42. Still the information on the collection of data, distribution of each species in the tiger reserve and illustrations of the beetle species for identification is lacking. Thus, the aim of our study was to document, inventorise and illustrate the scarabaeoid beetle fauna of the tiger reserve providing the details of specimens examined and distribution of recorded species in the tiger reserve, in India and abroad, supplemented with the illustrations.

During the study, 61 species of the scarabaeoid beetles belonging to 30 genera, 19 tribes and 7 subfamilies under 3 families (Geotrupidae, Hybosoridae and Scarabaeidae) of superfamily Scarabaeoidea were examined and their morphotaxonomy was done. *Trox* sp. and *Apogonia* sp. have not been included in the updated inventory. The classification adopted for superfamily Scarabaeoidea is after Smith [2] and the scientific names for the recorded species are being used as given by Lobl and Smetana [32].

2. Materials and Methods

2.1 Study Area (Figure 1)

Pench Tiger Reserve is located in the Seoni and Chhindwara districts of the state, Madhya Pradesh between $21^{\circ} 37'$ to 21°

$50.30'$ N latitudes and $79^{\circ}07.45'$ to $79^{\circ}22.30'$ E longitudes with a total area of 757.907 sq. km. It consists of southern tropical slightly moist teak forests, southern tropical dry teak forest and southern dry mixed dry deciduous forests. It includes Pench National Park (PNP) and Pench Wildlife Sanctuary (PWLS) along with a buffer zone area of Seoni and Chhindwara districts. The PNP is located in the Seoni and Chhindwara districts whereas PWLS is confined to the Kurai block of Seoni district only. The total area of PNP is 292.86 sq. km. out of which 145.24 sq. km. is in Seoni and the remaining in Chhindwara. The total area of PWLS is 118.307 sq. km. The tiger reserve is quite rich in faunal diversity with 342 species of invertebrates and 350 species of vertebrates [33].

2.2 Collection, identification and illustrations

The specimens includes the collections of the scarabaeoid beetles present in the Zoological Survey of India (ZSI), Jabalpur collected by the scientific teams of ZSI from PTR during 2001-2002 in different seasonal periods using light trap and handpicking methods. They were collected from 26 localities in the Seoni district and 14 localities in the Chhindwara district.

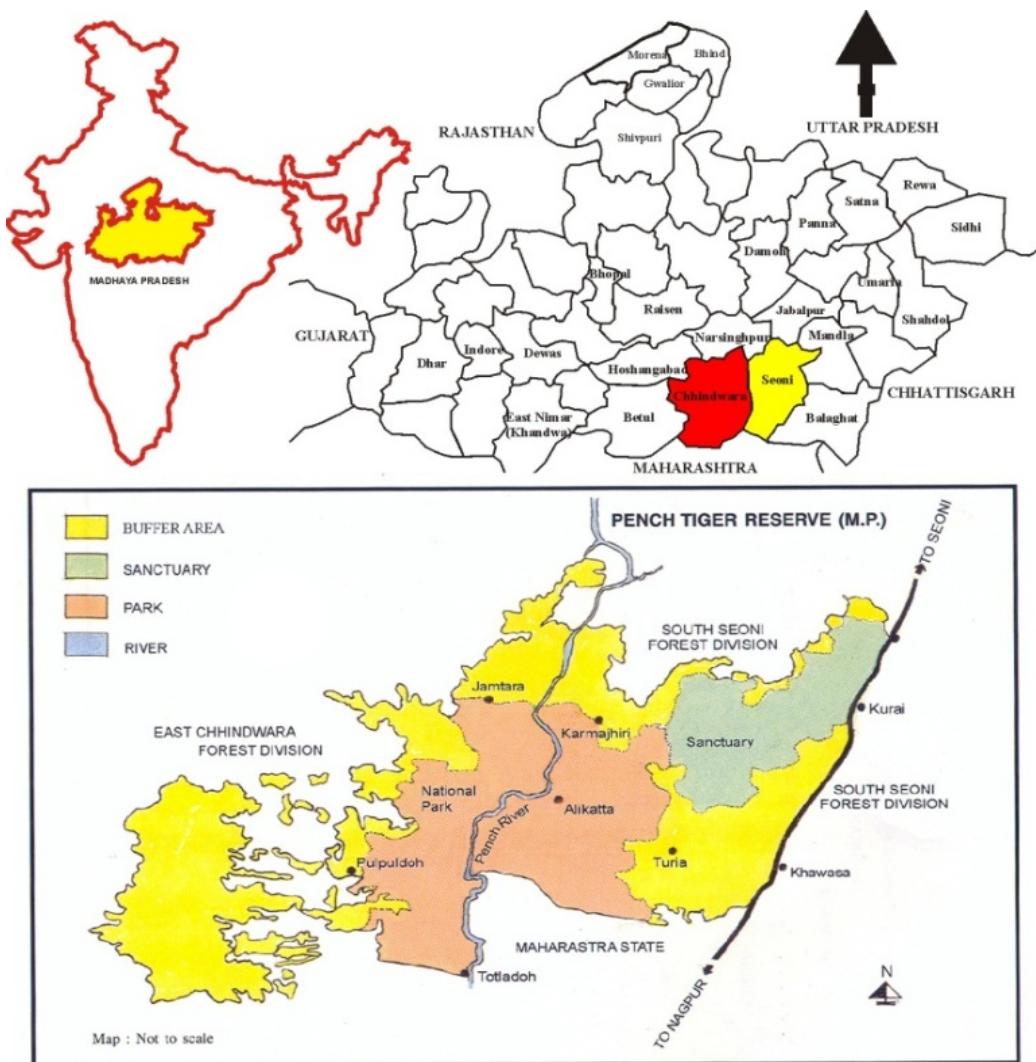

Fig 1: Map showing Pench Tiger Reserve (Study area).

After collection, they were killed in Benzene vapours and preserved dry pinned. They were later identified using the literature [6-10; 34-42]. The illustrations were made with the use of digital camera attached to Leica M205A stereomicroscope and

Nikon DSLR D-7000. The species listed with single asterisk are newly recorded from tiger reserve and with double asterisks for the first time from the state of MP.

4. Discussion

A total of 376 specimens of the scarabaeoid beetles collected from 40 localities of the Pench Tiger Reserve were examined which resulted in the identification of 61 species. As a result, the updated inventory incorporates 61 species belonging to 30 genera, 19 tribes and 7 subfamilies under 3 families (Geotrupidae, Hybosoridae and Scarabaeidae) of superfamily Scarabaeoidea. The present study reports 22 species [*Paragymnopleurus sinuatus assamensis*, *Garreta mundus*, *Onitis subopacus*, *Catharsius molossus*, *Paracopris surdus*, *Copris (C.) carinicus*, *Delopleurus parvus*, *Phalops divisus*, *Onthophagus (C.) bengalensis*, *O. (C.) dama*, *O. (C.) ramosus*, *O. (C.) hindu*, *O. (C.) ramosellus*, *O. coeruleicollis*, *O. griseosetosus*, *O. quadridentatus*, *Sisyphus (S.) longipes*, *Holotrichia fissa*, *Adoretus (A.) bengalensis*, *A. (A.) bicaudatus*, *A. (A.) bimarginatus* and *Dipelicus bidens*] as new records from the tiger reserve. *Delopleurus parvus* and *Onthophagus coeruleicollis* have been newly recorded from the state of MP, each represented by only a single specimen. Out of the total 61 species, 38 species were coprophagous or dung beetles belonging to the families; Geotrupidae, Hybosoridae and subfamily Scarabaeinae of Scarabaeidae. The family Geotrupidae is represented by 3 species belonging to 2 genera (*Bolbohamatum* and *Bolboceras*) under subfamily Bolboceratinae. The family Hybosoridae includes a single species, *Hybosorus orientalis*. Scarabaeinae includes 34 species belonging to 14 genera and 7 tribes. Depending up on the nesting strategies, both rollers and tunnellers were collected from the tiger reserve. The species belonging to the genera; *Scarabaeus*, *Sisyphus*, *Gymnopleurus*, *Garreta* and *Paragymnopleurus* were rollers while species in the genera; *Helicopris*, *Paracopris*, *Catharsius*, *Copris*, *Delopleurus*, *Phalops*, *Onitis* and *Onthophagus* were tunnellers. The species in the subfamilies; Rutelinae, Melolonthinae, Dynastinae and Cetoniinae were phytophagous in feeding habit. Rutelinae includes 12 species, Melolonthinae 3 species, Dynastinae 5 species and Cetoniinae 3 species. In terms of species diversity among genera, the most diverse genus comes out *Onthophagus* (14 species) followed by *Anomala* (7 species), *Adoretus* (4 species), *Catharsius* and *Paracopris* (3 species each) and *Garreta* (2 species). The rest other genera are represented by only a single species. As biodiversity surveys provide fundamental information needed for conservation planning, protected area justification and design, and development of management plans, the rich biodiversity of the scarabaeoid beetles in PTR needs to be conserved and protected so as to maintain the biological health of the tiger reserve.
