

Checklist of the Trees Native to Florida

by Daniel B. Ward

Trees are the dominant elements of any flora. The State of Florida is blessed with an abundance of trees, not only as to the proportion of our land that they cover, but as to the many species that they represent. All persons who value the environment, and gain satisfaction from understanding of their natural surroundings, take pride in knowing the names of the trees around them. And, since one always has greater pride in what is one's own, the trees native to Florida, in contrast to those introduced to the state from other lands, are of paramount importance and greatest interest to Floridians.

The following listing consists of the 276 tree species native to Florida, each with its accepted scientific name, its usual common name, and its family. This listing was obtained by querying the computerized data files in which information on the state's flora has been stored, a technique that permits rapid preparation of accurate and complete tabulations of plants with special characteristics. In a previous article in *The Palmetto* (Ward, 1990), this procedure was used to count the number of species represented in the Florida vascular flora (3448), the number of species native to Florida (2,523), and the number of species introduced to the state (925).

These numbers, of course, are valid only for the moment, and will require revision as investigation of Florida's plants continues. Additional species are certain to be found, most of them newly introduced but perhaps a few that have resided here for many years without being encountered by a botanist. The numbers can also be predicted to change as new understanding of familiar species causes some names to disappear or arise as species are combined or divided.

With the current numbers, the 276 tree species native to Florida represent 11% of the state's native flora. Although not listed here, the data files also contain the names of 68 introduced trees that have become naturalized and are now properly a part of our flora. The entire Florida tree flora therefore consists of 344 species, 80% of which are native and 20% introduced. The earlier study suggested 27% of the Florida flora is introduced; the trees—notwithstanding

the impression given by the massive intrusion of the cajeput, or punk-tree (*Melaleuca quinquenervia*) into the Everglades—are resisting domination by introduced species somewhat better than the flora as a whole.

Judgments will differ somewhat as to exactly which species, as found in Florida, are large enough to merit the designation of "tree." The present listing generally accepts the definition provided by the *Checklist of United States Trees* (Little, 1979), which considers trees to be "woody plants having one erect perennial stem or trunk at least 3 inches (75 centimeters) in diameter at breast height (4½ feet or 1.3 meters), a more or less definitely formed crown of foliage, and a height of at least 13 feet (4 meters)." However, a number of the species included in that national checklist seem never to reach tree size in Florida and are omitted from the present listing; among these are small-flowered pawpaw (*Asimina parviflora*), witch hazel (*Hamamelis virginiana*), and bluestem palmetto (*Sabal minor*). At least two species that generally are not thought to attain tree stature are included here—several spindly but tree-sized plants of indigo-bush (*Amorpha fruticosa*) are known in Marion County, and the Florida privet (*Forestiera segregata*) is sometimes found as a small tree along the northeast Florida coast.

Several excellent books addressing the state's trees are available. The familiar classic, *The Native Trees of Florida* (West & Arnold, 1956), illustrates and briefly describes most of the tree species native

Sand Pine
Pinus clausa

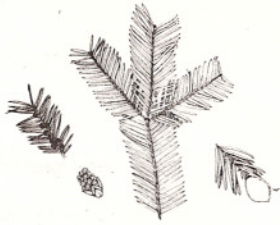

to the state, though often with scientific names that differ from current usage. The informative but little known, *The Biology of Trees Native to Tropical Florida* (Tomlinson, 1980), and the authoritative *Trees, Shrubs, and Woody Vines of Northern Florida and Adjacent Georgia and Alabama* (Godfrey, 1988)—though, as their titles indicate, restricted to only the trees of selected portions of the state—provide detailed descriptions, keys, and numerous illustrations.

Dr. Daniel B. Ward, a founding member of FNPS, is a professor of botany at the University of Florida. He has written many papers and publications on the flora of Florida. His Checklist of the Woody Cultivated Plants of Florida, which lists 1,979 species, written with Derek Burch and David W. Hall, is available from your local Cooperative Extension Service.
