P R E F A C E .

My aim in the compilation of this work has been to give to the drug trade a reliable, convenient, and *quick* reference book, *containing all of the botanical drugs* known up to the present time, giving all of their *Botanical, Common, Pharmacopæial* and *German Common* (in German) *Names*, and *Medical Properties*. The author has consulted the best standard authorities, and works on *Materia Medica*, and an experience of fifteen years in the drug business materially assisted in the *convenient* arrangement of this work. To make the book practically useful, the subject has been treated with plainness and simplicity, as far as possible. I am well aware that druggists are, almost daily, perplexed by the use of common names, as applied to botanical drugs, and even *botanical names* (as many have two or more); and in the absence of a book to which you can readily refer, a sale is often missed, when you have the goods wanted, in your stock, but not known to you or your assistant, by the botanical or common name applied to it by your customer, (the *only one* known to him). By close examination of this work, you will see the author has surmounted all of these difficulties, and believes it is a Reference Book, that will be fully appreciated, and has long been needed by the drug trade.

SUGGESTIONS

—FOR—

GATHERING AND PREPARING BOTANICAL DRUGS FOR MARKET.

Perennial Roots and Barks of Roots (which embraces most of the list of medicinal roots) should be gathered after the leaves and flowers, or tops, have fully matured—in the late summer and fall, or before they commence growing in the spring.

Biennial Roots (as Burdock, Poke Root, Yellow Dock, and a few others of this class). Only the first year's growth from the seed should be gathered, as after the first year's growth the strength of the root is exhausted by the stalk, and leaves the root woody, pithy, hollow and worthless. The new roots that grow from the old ones, although sound, are not succulent and rich like the seedling root, but if properly trimmed from the old root, make a fair merchantable article. Roots should never be gathered while growing, as they then contain about twenty per cent. of water, and have not acquired the properties which render them valuable for medical purposes.

All large roots (except Ginseng) should be cut or sliced in small pieces when green, as they dry and cure more easily, not so apt to mould, and bring a better price in the market. Roots dried in dark rooms are lighter in color and more sightly, and a tincture made from it will be of a lighter color. A root, when thoroughly dry, will snap in two if slightly bent. If it does not, it is not ready for market. All roots and barks of roots must be washed clean before drying.

Ginseng Root should never be broken or cut (even stringing it on strings reduces its value), and for that reason it should never be shipped in sacks. The larger, whiter and more perfect the root, the more valuable it is.

Barks of Trees should be gathered when the sap flows, or when the second growth begins. Many of them, however, are of greater value if gathered in the winter, when they can be easily peeled, if gently heated by a fire, care being taken not to burn or scorch them. The Ross, or outside bark (on such as Cherry, Oak, Elm, Hemlock, Sassafras [bark of root], etc.), must be cut or shaved off, as it is worthless, the inner bark being the only part used.

Herbs and Leaves should be gathered before they attain their full growth, when the flowers are in bloom. In gathering herbs, all the coarse and large stems, or stalks, must be rejected, and only the tender tops and leaves collected.

Flowers should be gathered when they first open or very soon thereafter.
