Aptroot, A. (2002). New and interesting lichens and lichenicolous fungi in Brazil. *Fungal Diversity* 9: 15-45.

New and interesting lichens and lichenicolous fungi are reported from two regions in Brazil, mainly from the Serra do Caraça (Minas Gerais), but also from the Serra da Mantiqueira (São Paulo). These are some of the results of an international field meeting aimed at collecting topotype material from taxa described from the region by Vainio a century earlier. The following species are described as new: *Acarospora oligyrophorica* Aptroot, *Fellhanera antennophora* Aptroot, *Graphina coccospora* Aptroot, *Lepraria multiacida* Aptroot, *Placiopsis hypothallina* Aptroot, *Pyrenula fusoluminata* Aptroot, *Pyrenula quarzitica* Aptroot, *Sulcopyrenula cruciata* Aptroot & *Topeliopsis globosa* Aptroot. The following new combinations are proposed: *Bacidiopsora temuisecta* (Vainio) Aptroot comb. nov., *Brigantiae subobscurata* (Vainio) Aptroot comb. nov., *Caloplaca subrubelliana* (Vainio) Aptroot comb. nov., *Campylothelium megalostomum* (Vainio) Aptroot comb. nov., *Graphina subvestita* (Vainio) Aptroot comb. nov., *Micarea poliocheila* (Vainio) Aptroot comb. nov., *Micarea subgranulans* (Vainio) Aptroot comb. nov., *Micarea subternaria* (Vainio) Aptroot comb. nov., *Ocellularia piperis* (Vainio) Aptroot comb. nov., *Ocellularia stylothecium* (Vainio) Aptroot comb. nov., *Pyrenula crassiuscula* (Malme) Aptroot comb. nov., *Rinodina atrofuscata* (Vainio) Aptroot comb. nov. and *Scoliosporum campitosporum* (Vainio) Aptroot comb. nov. For many other species the first records from the Southern hemisphere or from (South) America are given.

Key words: *Acarospora*, ascomycetes, Brazil, *Fellhanera*, *Graphina*, *Lepraria*, lichens, lichenicolous, *Placiopsis*, *Pyrenula*, *Sulcopyrenula*, taxonomy, *Topeliopsis*.

Introduction

In September 1997, an international lichen collecting trip was organized to the Serra do Caraça in Brazil. This is the region where, more than a century earlier, Vainio collected many of his Brazilian lichens. The area consists of low mountains with exposed granitic rock outcrops and gullies with forest remnants and has been relatively unchanged since Vainio's time, no question a result of the unchanged management by the landowner, a monastery, where we (and Vainio) also stayed.

The main aim of the trip was to see what remained of the lichen flora from a century earlier, and especially to collect topotypes of taxa Vainio (and others)

described from the area. These are to be kept in Brazil, so that representative materials become readily available to researchers in the country of origin.

The recollecting of Vainio's taxa was indeed very successful, and many topotypes were collected and deposited in Brazil in the SP herbarium. Other collections were identified with taxa not currently known to occur in Brazil, or even in (South) America or the Southern hemisphere, and are therefore published. Several species were also found that prove to be new species. These are therefore described. Several of the topotypes proved that the taxa described by Vainio are valid, but should be placed in different genera according to current practice. Therefore, some new combinations are also proposed.

Materials and Methods

All material was collected in duplicate, with one specimen in ABL and one in SP. Holotypes of the newly described taxa are in SP, isotypes in ABL. The numbers starting with 4 are the running collecting numbers of the author; the numbers starting with a letter denote the collecting locality as explained below and the collecting-number of that site. Example: 41014 c37 means: collected by A. Aptroot no. 41014 at site c, where it is the 37th collection made.

Species new to science***Acarospora oligyrophorica* Aptroot sp. nov.**

(Fig. 1)

Thallus saxicola, areolata, pallida, acido gyrophorico continens. *Apothecia* perithecioidea, ascis circa 40-sporis.

Type: BRAZIL, Minas Gerais, Catas Altas, Serra do Caraça, Parque Natural do Caraça, Near monastery Santuário do Caraça, altitude ca. 1300 m, 15-21 September 1997, A. Aptroot no. 40758 a158 (SP, holotype; ABL, isotype). Additional material: 40745 a145.

The species grows on siliceous rock along mountain streams, but is not regularly submerged. It is accompanied by *Usnea* and *Xanthoparmelia* species.

Thallus crustose, 1-3 cm diam., sandy brown, partly with a pale hue, areolate, surrounded by a ca. 0.5 mm wide brown hypothallus, in which a few isolated areoles are often visible. *Algae* chlorococcoid, ca. 5-10 µm diam. *Areoles* 0.3-0.6 mm diam., ca. 100-200 µm thick, flat, with usually 1, but occasionally 2-4 (in that case usually immature) ascomata and/or 2-5 pycnidia (especially towards the margin of the thallus). *Ascomata* cupulate but nearly perithecioid with a narrow disc, 0.2-0.5 mm diam., chocolate-brown to nearly black, hemispherically protruding above the areole. *Epihymenium* brownish. *Hymenium* clear, hyaline, ca. 50-55 µm high. *Hypothecium* hyaline. *Asci* cylindrical, ca. 35-50 × 10-17 µm, wall relatively thick (1-1.5 µm). *Paraphyses* anastomosing, up to 1 µm wide, tips not clavate. *Ascospores* ca. 40 in one ascus, hyaline, simple, ovoid to long-ellipsoid, very variable in shape, but constant within one ascus, 10-15 × 3-5 µm, surrounded by a 1 µm wide gelatinous sheath. *Pycnidia* mostly immersed, hyaline, ca. 60-100 µm diam., protruding with a dark brown, ca. 30-50 µm wide ostiole. *Conidia* hyaline, bacillar, 3.5-5.5 × 1 µm. *Chemistry:* K-, C+ red (gyrophoric acid).

This is the only species of the *Acarospora oligospora*-group (with fewer than 50 spores/ascus) with gyrophoric acid, and is furthermore characterized by the pale areoles and protruding perithecioid apothecia, together giving it the appearance of a *Staurothele* of the *S. fissa*-group.

***Fellhanera antennophora* Aptroot sp. nov.**

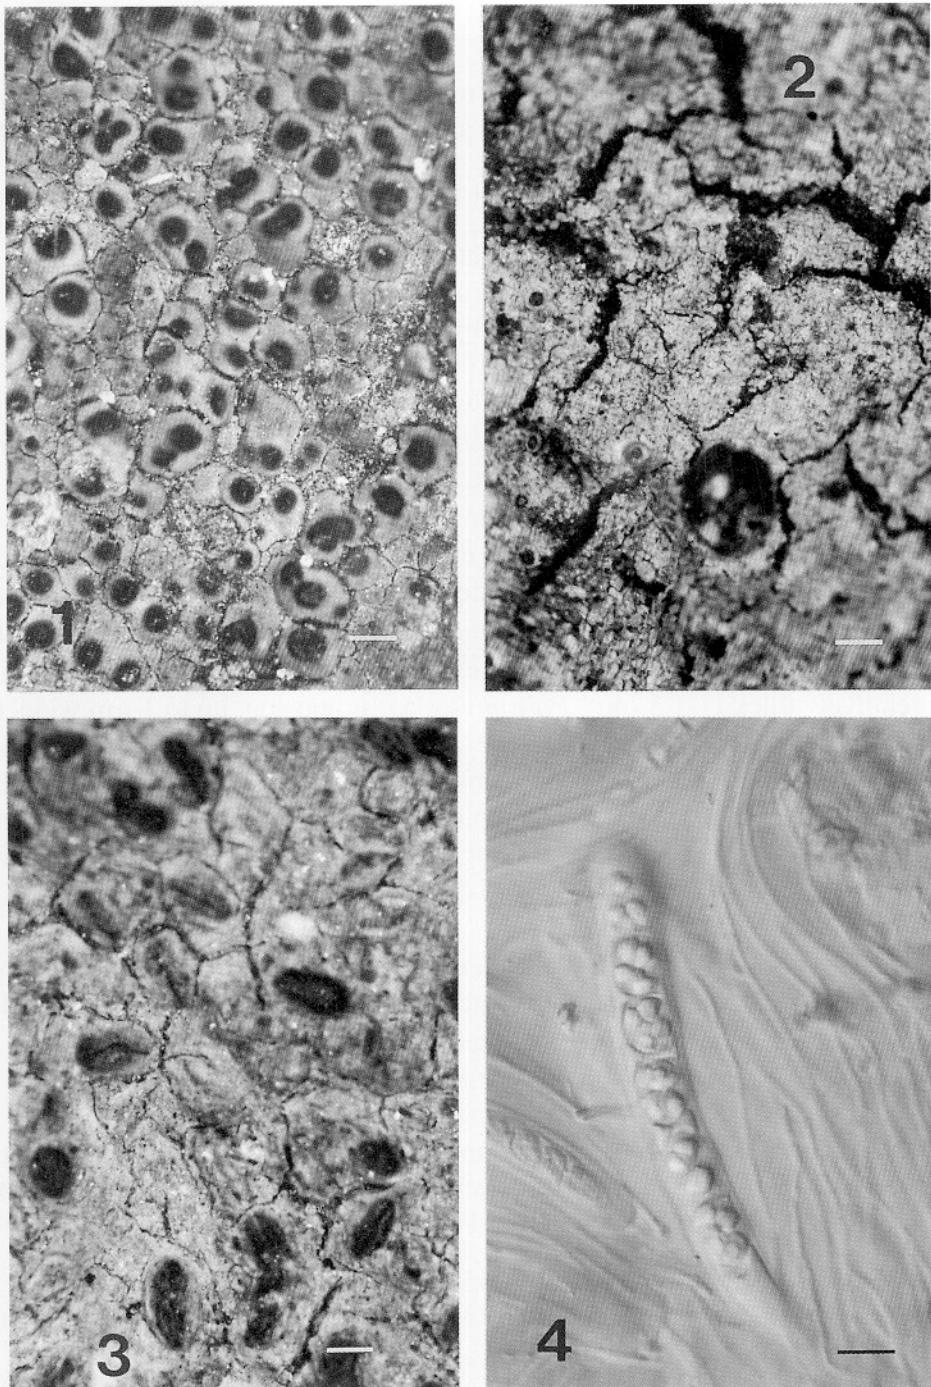

(Fig. 2)

Thallus corticola, granulosa, Lecidea hypomela similis. *Campylidia* corniformes, saepe arcuata, ad 1 mm alta. *Apothecia* ad 1 mm lata, hypothecio fusco, ascosporis fusiformibus triseptatis.

Type: BRAZIL, Minas Gerais, Catas Altas, Serra do Caraça, Parque Natural do Caraça, Near Banho do Belchior, altitude ca. 1250 m, 17 September 1997, A. Aptroot no. 41186 d143 (SP, holotype; ABL, isotype).

The species was found on an upright liana in one of the richest forest remnants in the area, together with *Bulbothrix* and *Dimerella* species.

Thallus crustose, up to 13 cm diam., sandy-brown, partly with a pale hue, finely granular so as to be nearly continuous, surrounded by an inconspicuous

Figs. 1-4. Brazilian lichens. 1. *Acarospora oligyrophorica* Aptroot (from holotype). 2. *Fellhanera antennophora* Aptroot (from holotype). 3-4. *Graphina coccospora* Aptroot (from holotype). Bars: 1-3 = 1 mm; 4 = 10 µm.

brown hypothallus, on which a few isolated granules are often visible. *Algae* chlorococcoid, mostly ellipsoid, ca. 3-7 µm diam. *Granules* 20-50 µm diam., globose. *Apothecia* sitting on the thallus, flat to slightly convex, 0.5-1 mm diam., 0.2-0.4 mm high, disc chocolate-brown, often with some nearly black spots, margin greyish-white, disappearing at maturity. *Epihymenium* pale brown. *Hymenium* clear, hyaline, ca. 50-55 µm high. *Hypothecium* cellular, dark brown, ca. 30-50 µm high. *Excipulum* paraplectenchymatous, ca. 50-55 µm wide, hyaline outside, with hyaline, KOH-soluble crystals, with isolated dark brown hypothecium cells inside. *Asci* cylindrical, ca. 45-50 × 10-13 µm, tholus *Pilocarpaceae*-type. *Paraphyses* simple or branched at the tips, up to 1 µm wide, tips medium brown and slightly clavate. *Ascospores* 8 in one ascus, hyaline, 3-septate, fusiform to long-ellipsoid, 19-22 × 3-5 µm, without gelatinous sheath. *Pycnidia* stalked, on top of simple or rarely branched, dark brown to black, conical, often bent campylidia of 0.4-1 mm high and 0.2-0.3 mm diam. at the base, mostly covered by a thallus-coloured pruina. *Ostiole* 50-100 µm wide, not much differentiated, black, not pruinose. *Conidia* hyaline, pyriform to clavate, 4-6.5 × 2-3 µm. *Chemistry*: K-, C- (no substances detected in thallus and pruina).

This is the *Fellhanera* species with the longest campylidia reported so far, and is furthermore characterised by the large and stout apothecia with dark brown hypothecium, giving it the appearance of a species of the *Lecidea piperis*-group. Most of the long campylidia were curved upward in nature, suggesting that the pycnidia were exposed for propagation by way of rainwater dripping in the pycnidia.

Graphina coccospora Aptroot sp. nov.

(Figs. 3-4)

Thallus saxicola, nitida. *Apothecia* lirelliformia, immersa, excipulo carbonisato, ascosporis globosis vel ellipsoideis, 4-6-loculatis.

Type: BRAZIL, Minas Gerais, Catas Altas, Serra do Caraça, Parque Natural do Caraça, Near Banho do Belchior, altitude ca. 1250 m, 17 September 1997, A. Aptroot no. 41071 d28 (SP, holotype; ABL, isotype).

The species grows on damp siliceous rock with e.g. *Heterodermia speciosa*.

Thallus crustose, up to 5 cm diam., metallic-greyish, superficial, up to 0.5 mm thick, surrounded by a ca. 1 mm wide hypothallus of thallus colour but glossy. *Algae* *Trentepohlia*-like, sparse. *Apothecia* mostly immersed in the thallus, lirelline, simple, 0.5-1.5 mm long, 0.3-0.6 mm wide, 0.2-0.3 mm high. *Opening* slit-like, black, 50-80 µm wide. *Hymenium* clear, hyaline, IKI-negative. *Exciple* entire, fully carbonised, extending below the hymenium. *Asci* cylindrical, ca. 75-110 × 9-13 µm, tholus IKI-negative (content IKI+ dextrinoid red-brown), without ocular chamber. *Paraphyses* simple, up to 1 µm wide, at the tips up to 1.5 µm. *Ascospores* 8 in one ascus, uniseriate, hyaline, IKI-negative, distoseptate with 4-6 rounded locules in two rows, globose to ellipsoid, (6-)9-12 × 7-10 µm,

without gelatinous sheath. *Pycnidia* not observed. *Chemistry*: K-, C-, UV- (no substances detected).

This is the only species of *Graphina* with globose to ellipsoid 4-6-loculate ascospores and a carbonised hymenium. The only species in the genus with similar ascospores is *G. cinereoalba* (Vainio) Zahlbr. (for which several older epithets are available), which has no carbonisation at all. The saxicolous habitat is remarkable, but not a character per se as many usually corticolous *Graphidaceae* have been found on sandstone rock in the study area.

***Lepraria multiacida* Aptroot sp. nov.**

(Fig. 5)

Thallus saxicola vel terricola, ochraceoalba, acida norsticticum, sticticum, consticticum, salazinicicum, connorsticticum, consalazinicicum, atranorinum, zeorinum et cetera continens.

Type: BRAZIL, Minas Gerais, Catas Altas, Serra do Caraça, Parque Natural do Caraça, Near monastery Santuário do Caraça, altitude ca. 1300 m, 15-21 September 1997, A. Aptroot no. 40640 a40 (SP, holotype; ABL, isotype). Additional material: 40604 a4; 40666 a66; 40683 a83.

This species is locally common on natural sandstone rock outcrops as well as on walls and soil between boulders, growing together with e.g. *Heterodermia speciosa*, *Cladonia* and *Parmotrema* species.

Thallus crustose, occupying areas of up to several decimeters, up to 2 mm thick, crème-whitish, consisting of irregular granules on an often whiter (or occasionally blackened) medulla that sometimes mainly consists of hyphae so as to form a hypothallus; margins often slightly effigurated with up to 0.5 mm wide lobes which are considerably thinner (up to 0.2 mm thick). *Granules* ca. 0.1-0.2 mm diam., with up to 100 µm long, protruding hyphae above. *Algae* chlorococcoid. *Chemistry*: K+ yellow-orange, KC-, C-, UV- (atranorin, zeorin, 2 unidentified terpenoids, norstictic acid, stictic acid and 2 minor accessory substances, constictic acid, salazinic acid, connorstictic acid and consalazinic acid).

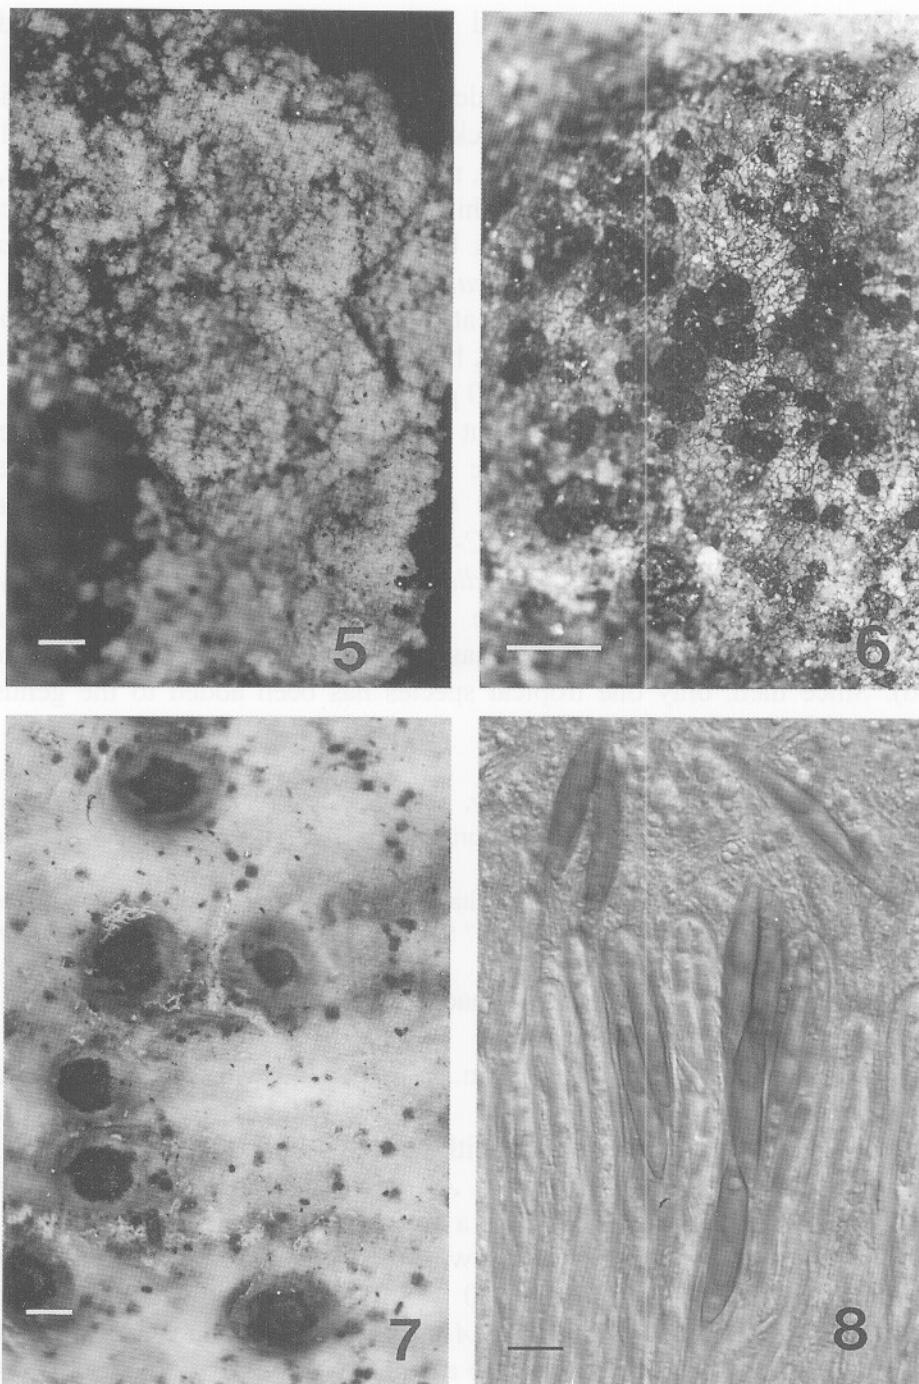

The species is characterized by the thick thallus of a (for a *Lepraria*) coarse texture, but above all by the numerous secondary metabolites present at the same time. It resembles *L. nivalis* J.R. Laundon and especially the sometimes synonymised *L. crassissima* (Hue) Lettau *sensu* e.g. Diederich and Sérusiaux (2000), but differs by the cream colour and the chemistry, visible e.g. by the negative KC and C reactions.

***Placiopsis hypothallina* Aptroot sp. nov.**

(Fig. 6)

Thallus squamulosa, brunnea, ad hypothallo hynhoideo sessilis. *Perithecia* hyalina, immersa, pyriformia, ascis pyriformibus, ascosporis elongato-ellipsoideis vel clavatis.

Type: BRAZIL, Minas Gerais, Catas Altas, Serra do Caraça, Parque Natural do Caraça, Near monastery Santuário do Caraça, altitude ca. 1300 m, 15-21 September 1997, A. Aptroot no. 40720 a120 (SP, holotype; ABL, isotype).

Figs. 5-8. Brazilian lichens. **5.** *Lepraria multiacida* Aptroot (from holotype). **6.** *Placidiopsis hypothallina* Aptroot (from holotype). **7-8.** *Pyrenula fusoluminata* Aptroot (from holotype). Bars: 5-7 = 1 mm; 8 = 10 µm.

The species grows on exposed siliceous rock. It is accompanied by *Xanthoparmelia* species.

Thallus crustose, covering rounded areas of up to 0.5 cm diam. with a hypothallus consisting of loose, blackish hyphae, with numerous, isolated squamules. *Squamules* dark brown, flat, rounded to lobate, 50-200 µm diam., 50-100 µm thick, each surrounded by a thin black margin. *Algae Verrucariaceae-type*, 5-8 µm diam. *Upper cortex* dark brown, 3-5 µm thick, cellular. *Medulla* paraplectenchymatous, hyaline, cells ca. 2 µm diam. *Margin* black, 8-12 µm thick, extending into the lower cortex at the sides of the squamules. *Perithecia* fully immersed in the thallus, pyriform, hyaline, 50-80 µm diam. *Ostiole* central, visible as a black dot from above, 30-50 µm wide. *Hymenium* clear, hyaline. *Asci* pyriform, ca. 25-35 × 8-13 µm, without ocular chamber. *Paraphyses* simple, up to 0.8 µm wide. *Ascospores* 8 in one ascus, irregularly arranged, hyaline, 1-septate, long-ellipsoid to clavate, 8-10 × 2.5-3 µm, without gelatinous sheath. *Pycnidia* not observed. *Chemistry*: K-, C-, UV- (no substances detected).

This is the only species of *Placiopsis* with the thallus dominated by the hyphae of the hypothallus, just like a subiculum in some non-lichenised ascomycetes. The genus *Placiopsis* has been monographed recently by Breuss (1996). Since then, only one tropical species has been added to the genus by Aptroot and Seaward (1999).

***Pyrenula fusoluminata* Aptroot sp. nov.**

(Figs. 7-8)

Thallus corticola, corticata. *Ascis* 4-sporis, ascosporis fusiformibus, apicibus attenuatis, luminibus fusiformibus.

Type: BRAZIL, Minas Gerais, Catas Altas, Serra do Caraça, Parque Natural do Caraça, Near Banho do Belchior, altitude ca. 1250 m, 17 September 1997, A. Aptroot no. 41102 d59 (SP, holotype; ABL, isotype).

The species was found on a shaded tree in a forest remnant and was accompanied by *Phyllopsora* species.

Thallus crustose, up to 10 cm diam., yellowish-brown, superficial, corticate, without pseudocyphellae, somewhat glossy, without hypothallus. *Algae Trentepohlia-like*, sparse. *Perithecia* with the basal half covered by the thallus, hemispherical, black, 0.7-1.2 mm diam. *Ascomal wall* entire, 100-250 µm thick, without crystals, IKI-negative. *Ostiole* a central depression, black, 0.1-0.2 mm wide. *Hymenium* heavily interspersed with oil globules, hyaline, IKI-negative. *Asci* cylindrical to clavate, ca. 95-110 × 8-11 µm, without ocular chamber. *Paraphyses* simple, up to 0.8 µm wide. *Ascospores* 4(-5) in one ascus, irregularly arranged, mostly towards the tips of the ascii, chocolate brown, distoseptate with consistently 4 fusiform, lumina in one row (the middle two about twice as long as the end ones, up to 10 µm long, the end ones up to 5 µm long), fusiform, often the

lower end attenuated, (25-)35-45(-50) × 4-6(-7.5) µm, without gelatinous sheath. *Pycnidia* not observed. *Chemistry*: K-, C-, UV- (no substances).

This is the only species of *Pyrenula* with consistently four fusiform ascospores in the ascus and fusiform lumina. The only species of *Pyrenula* that has ascospores of a somewhat similar shape, *P. flagellata* H. Harada (1993), has 7-septate ascospores.

***Pyrenula quarzitica* Aptroot sp. nov.**

(Figs. 9-10)

Thallus saxicola, corticata. *Ascomata* fusca, ostiolis rufescensibus, ascosporis distoseptatis, *Pyrgillo* similaribus.

Type: BRAZIL, Minas Gerais, Catas Altas, Serra do Caraça, Parque Natural do Caraça, Near Funil, 1.5 km NW of monastery Santuário do Caraça, altitude 1300 m, 18-21 September 1997, A. Aptroot no. 41320 k12 (SP, holotype; ABL, isotype). Additional material: 41324 k16; 41441a k134; 41329 k21.

The species grows on shaded to somewhat exposed sandstone and quarzitic rock in forest remnants.

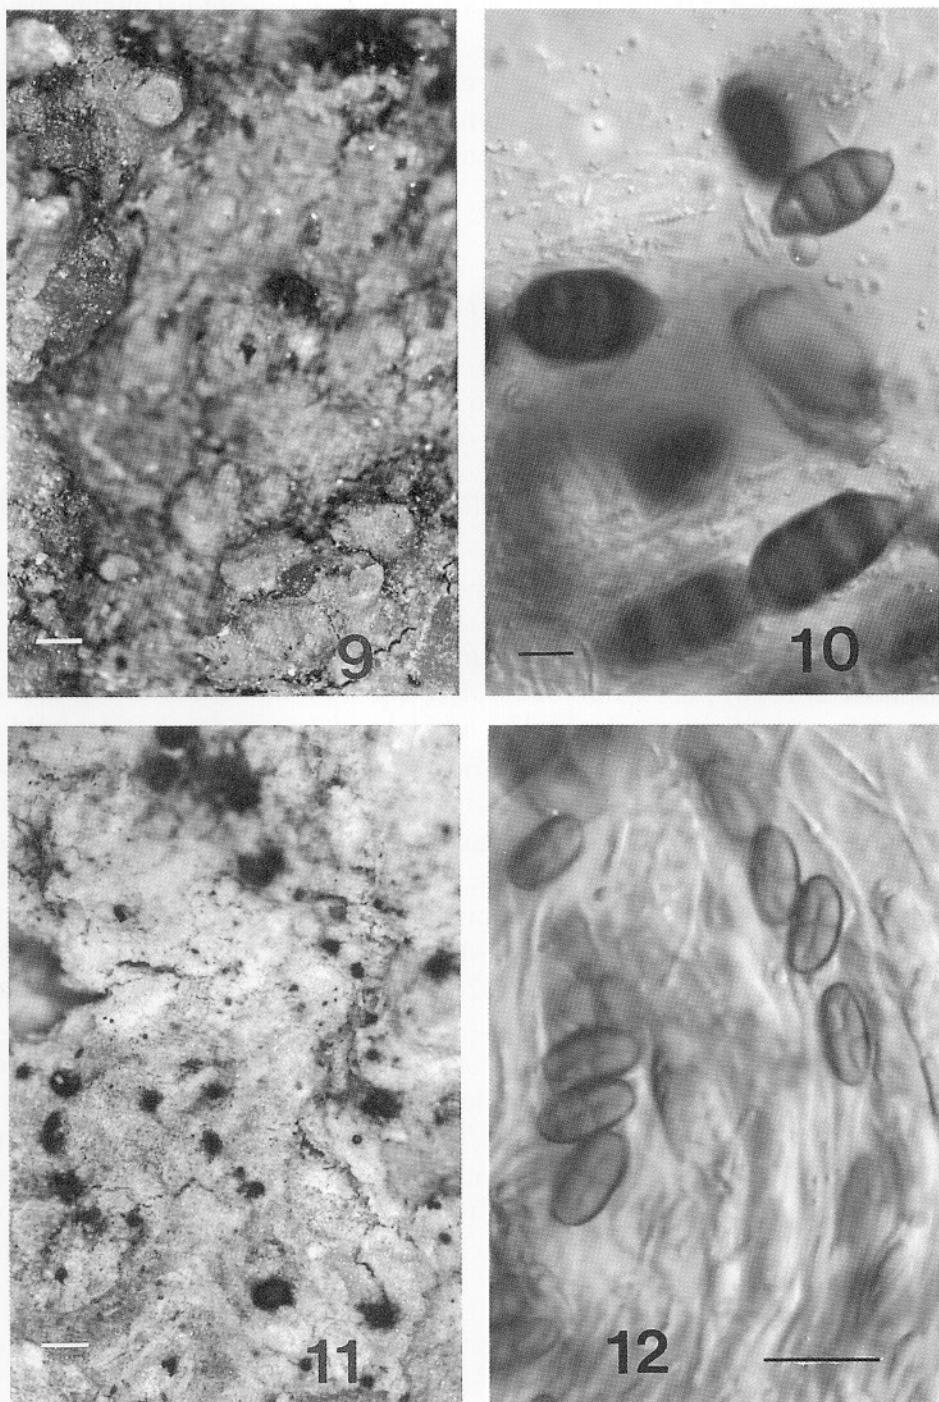

Thallus crustose, up to 10 cm diam., yellowish-brown, superficial, corticate, without pseudocyphellae, somewhat glossy, without hypothallus. *Algae* *Trentepohlia*-like, sparse. Perithecia mostly half covered by the thallus, hemispherical, brown, 0.6-1 mm diam. *Ascomal wall* entire, 100-250 µm thick, with angular, 30-80 µm wide hyaline crystals, IKI-negative, KOH+ reddish. *Ostiole* conical, reddish-brown, 0.1-0.2 mm wide. *Hymenium* not interspersed, hyaline, IKI-negative. *Asci* cylindrical to clavate, ca. 100-150 × 15-20 µm, without ocular chamber. *Paraphyses* simple, a few anastomosing above the asci, up to 0.8 µm wide. *Ascospores* 8 in one ascus, uniseriate, very dark chocolate-brown, distoseptate only, with darker pigmentation in bands around the septa, with 4 lumina (the middle ones about twice as broad as the end ones), ellipsoid, often the ends pointed, (22-)25-30 × (12-)14-17 µm, without gelatinous sheath. *Pycnidia* not observed. *Chemistry*: K-, C-, UV- (no substances).

This is the only really saxicolous species of *Pyrenula*, furthermore characterized by the reddish brown ostioles and the *Pyrgillus*-like ascospores with dark pigmentation around the distosepta. There are only two species of *Pyrenula* that have ascospores of a somewhat similar type, viz. *P. pyrgilliospora* Aptroot (Aptroot *et al.*, 1997) and *P. obvoluta* (Nyl.) R.C. Harris & Aptroot (Aptroot, 1991); both are corticolous and have black ascoma walls; the former has eusepta; the latter contains lichexanthone.

***Sulcopyrenula cruciata* Aptroot sp. nov.**

(Figs. 11-12)

Thallus lichexanthonum continens. *Ascomata* immersa, ascosporis distoseptatis, cruciatis, 4-loculatis, luminibus acutatis.

Figs. 9-12. Brazilian lichens. 9-10. *Pyrenula quarzitica* Aptroot (from holotype). 11-12. *Sulcopyrenula cruciata* Aptroot (from holotype). Bars: 9, 11 = 1 mm; 10, 12 = 10 µm.

Type: BRAZIL, Minas Gerais, Catas Altas, Serra do Caraça, Parque Natural do Caraça, Near rapids Cachoeira da Canjerana near Tanque Grande, altitude 1300 m, 20 September 1997, A. Aptroot no. 41633 m27 (SP, holotype; ABL, isotype).

The species grows on an exposed tree with soft bark without accompanying species.

Thallus crustose, up to 5 cm diam., whitish, nearly immersed in the bark, without pseudocyphellae, without hypothallus. *Algae* *Trentepohlia*-like, sparse. *Perithecia* mostly immersed in the thallus, globose, black, 0.3-0.6 mm diam. *Ostiole* central, conical, black, 30-50 µm wide. *Ascomata* wall entire, 50-100 µm thick, without crystals (but bark full of hyaline crystals), IKI-negative. *Hymenium* clear, hyaline, IKI-negative. *Asci* cylindrical, ca. 45-70 × 8-11 µm, IKI-negative, without ocular chamber. *Paraphyses* simple or branched at the tips, up to 0.8 µm wide. *Ascospores* 8 in one ascus, uniseriate, chocolate-brown, sulcate, distoseptate with consistently 4 fusiform locules in two rows, long-ellipsoid, (6-) 9-12 × 4-6 µm, without gelatinous sheath. *Pycnidia* not observed. *Chemistry:* K-, C-, UV+ yellow (lichexanthone).

This is the only species of *Sulcopyrenula* with lichexanthone, and also the only one with consistently 4-loculate ascospores. The genus *Sulcopyrenula* has been introduced recently by Harada (1999) to accommodate the species of *Anthracotheicum* with sulcate ascospores with distoseptate locules in two rows. One of the species not (yet) combined into the genus, *Anthracotheicum subglobosum* Riddle, comes close in having consistently 4 locules and containing lichexanthone, but differs by the wider, subglobose ascospores that are not sulcate, and by the interspersed hamathecium.

Topeliopsis globosa Aptroot sp. nov.

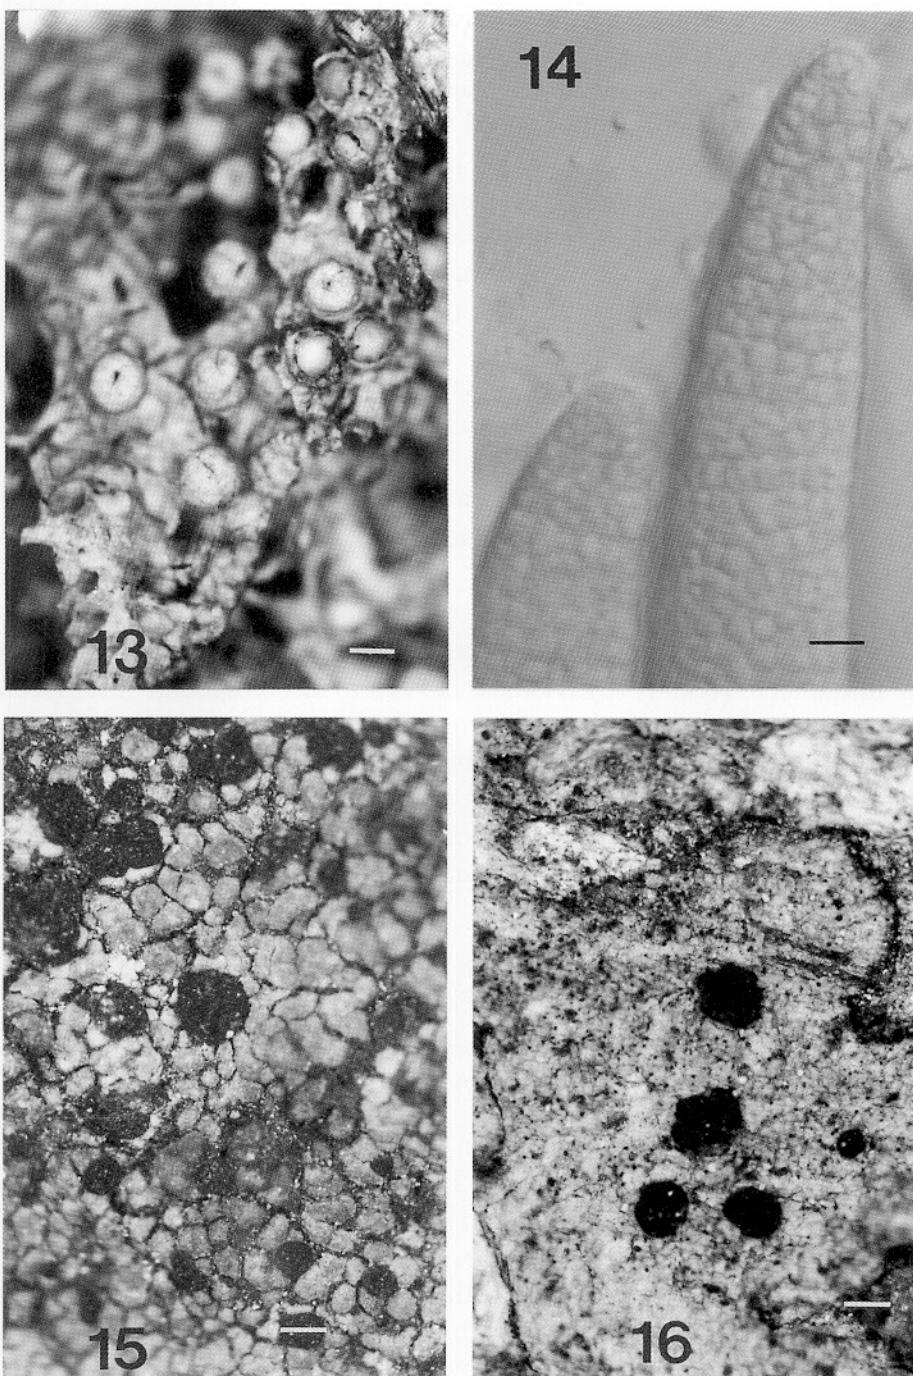

(Figs. 13-14)

Thallus muscicola. *Apothecia* globosa, ostiolis bilobatis vel furcatis, periphysis nullis, ascosporis multiloculatis, iodino violaceis.

Type: BRAZIL, São Paulo, Serra da Mantiqueira, Campos do Jordão, Mirante de São José dos Alpes, altitude ca. 1750 m, 25 September 1997, A. Aptroot no. 41709 t42 (SP, holotype; ABL, isotype).

The species overgrows mosses on trees in cloud forest and is accompanied by *Cladonia* and *Cryptothecia* species.

Thallus crustose, up to 5 cm diam., whitish metallic-grey, without hypothallus. *Algae* *Trentepohlia*-like, sparse. *Ascomata* closed apothecia, superficial on the thallus, globose, wall black, but fully covered by a corticate thallus layer, 0.4-0.6 mm diam. and high. *Ostiole* an unbranched or furcate central slit resulting in a bilobate or trilobate opening, black, 30-50 µm wide. *Hymenium* clear, hyaline, IKI-negative. *Asci* cylindrical, tholus IKI-negative (content IKI+ dextrinoid red-brown), ca. 200-300 × 35-50 µm, with a thickened tholus. *Paraphyses* simple, sparingly anastomosing towards the tips, 1-1.5 µm wide. *Periphyses* not observed. *Ascospores* single in the ascus, hyaline, IKI+ strongly

Figs. 13-16. Brazilian lichens. **13-14.** *Topeliopsis globosa* Aptroot (from holotype). **15.** *Fuscidea kochiana*, Aptroot 40710. **16.** *Fuscidea lightfootii*, Aptroot 40801. Bars: 13, 15-16 = 1 mm; 14 = 10 µm.

violet, densely muriform with in surface view *ca.* 15 locules across and *ca.* 90 locules in length, without any discernable primary septa, fusiform, 160-260 × 30-40 µm, with 1-3 µm wide, hyaline, IKI+ dextrinoid (red-brown), gelatinous sheath; locules cubical and *ca.* 2.5-3.5 µm diam. *Pycnidia* not observed. *Chemistry:* K-, C-, UV- (no substances detected).

This is the only species of *Topeliopsis* without periphyses, and also the only one with consistently bi- to trilobate ascocarps. The genus *Topeliopsis* has been introduced recently by Kantvilas and Vezda (2000) to accommodate the species of the *Thelotremaeaceae* with nearly perithecioid ascocarps opening with lobes and with densely muriform ascospores. The new species fits the generic concept perfectly except for the absence of periphyses. It resembles members of the *Graphidaceae* by its slit-like ostiole, but the ascocarps remain globose.

New records for Brazil, South America, America or the Southern hemisphere

Several species are reported here for the first time from Brazil, South America, America or the Southern hemisphere. Most are relatively well known, but often overlooked, species widespread in the Northern hemisphere or in the Paleotropics. Surprisingly, several other have only recently been described from, e.g., Papua New Guinea. The distribution range of the respective species might in most cases be nearly cosmopolitan.

Agonimia octospora Coppins & P. James. New to the Southern hemisphere and to America. So far known from Europe and Macaronesia. Collection examined: 40685 a85.

Agonimia opuntiella (Poelt & Buschardt) Vezda. New to the Southern hemisphere and to America. So far known from Europe and Macaronesia. Collections examined: 41768 v30; 40642 a42; 40869 a269; 41014 c37.

Agonimia pacifica (Harada) Diederich. New to America. So far known from East Asia. Collection examined: 41795 x2.

Amygdalaria pelobotryon (Wahlenb.) Norman. New to the Southern hemisphere. So far known from Europe, North America and Asia. Collection examined: 40786 a186.

Arthonia tavaresii Grube & Hafellner. New to the Southern hemisphere and to America. So far known only from Europe. Lichenicolous on an unidentifiable *Pyrenula* on *Brunfelsia*. Identified by P. Diederich. Collection examined: 40606 a6.

Arthroraphis grisea Th. Fr. New to S. America. So far known from Europe and North America. Collection examined: 41064 d21.

Aspicilia cinerea (L.) Koerber. New to S. America. Cosmopolitan. Collections examined: 40901c a302; 40771 a171; 40790 a190.

Byssoloma tricholomum (Mont.) Zahlbr. Found repeatedly on unusual substrates: on plastic: 41539 n4; on glass: 41540 n5; on sandstone: 41541 n6.

Caloplaca citrina (Hoffm.) Th. Fr. New to Brazil. Cosmopolitan. Collection examined: 41530 189.

Caloplaca coronata (Krempelh.) Steiner. New to the Southern hemisphere and to America. So far known from Europe and Asia. Collection examined: 40769 a169.

Candelariella reflexa (Nyl.) Lettau. New to S. America. So far known from Europe, North America and Asia (including tropical mountains in East Asia). Collection examined: 40770 a170.

Chaenothecopsis rubina Tibell. New to the Southern hemisphere. So far only known from Costa Rica and Mexico. Collection examined: 41663a r29. Identification confirmed by L. Tibell.

Cliostomum griffithii (Sm.) Coppins. New to S. America. So far known from Europe, North America and Australasia. Collection examined: 41644 r10.

Enterographa praepallens (Nyl.) Redinger. New to America. So far known from Asia and Australasia. Collections examined: 41574 n39; 41073 d30.

Fuscidea kochiana (Hepp) V. Wirth & Vezda. New to the Southern hemisphere. So far known from Europe and North America. Collections examined: 40710 a110; 40739 a139 (Fig. 15).

Fuscidea lightfootii (Sm.) Coppins & P. James. Well-developed material; thallus with divaricatic acid, soredia and apothecia with the characteristic obtuse, medianly constricted ascospores. New to the Southern hemisphere. So far known from Europe and North America. Collection examined: 40801 a201 (Fig. 16).

Heterodermia appendiculata (Kurok.) Swinscow & Krog. New to S. America. So far known from Africa and Australasia. Collection examined: 40688 a88.

Hyperphyscia granulata (Poelt) Moberg. New to S. America. So far known from Africa. Collection examined: 40648 a48.

Lecanactis abietina (Ach.) Koerber. New to Brazil. In temperate regions of both hemispheres. Collection examined: 41769 v31.

Lecanora oreinoides (Koerber) Hertel & Rambold. New to S. America. So far known from Australasia. Collections examined: 41607 m1; 40982 c5.

Lecidea variegatula Nyl. New to Brazil. In the Southern hemisphere only known from Tierra del Fuego; furthermore frequent in Europe, but not known from North America or Asia (Hertel 1997). Collection examined: 41291 j58.

Leptogium californicum Tuck. New to S. America. So far known from North and Central America and Africa. Collection examined: 40671 a71.

Leptogium decipiens P.M. Joerg. New to Brazil. So far known to be restricted to South America. Collection examined: 41785a v0.

Leptogium javanicum Mont. New to America. So far known from Africa, Asia and Australasia. Collection examined: 41698 t31.

Melaspilea diplasiospora (Nyl.) Müll. Arg. New to Brazil. So far known only from Colombia and Australasia, incorrectly reported from Europe. Collection examined: 41440 k132.

Micarea prasina Fr. New to S. America. Cosmopolitan. Collection examined: 41050 d7.

Micarea sylvicola (Flotow) Vezda & V. Wirth. New to the Southern hemisphere. So far known from Europe and North America. Collection examined: 40787 a187.

Mycoporum acervatum R.C. Harris. New to the Southern hemisphere. So far only known from North America. Collection examined: 40973 b72.

Myeloconis fecunda P. McCarthy & Elix. New to Brazil. So far known from South America and East Asia. Collection examined: 41407 k99.

Phaeopyxis punctum (A. Massal.) Rambold, Triebel & Coppins. New to S. America. So far known only from Europe. Lichenicolous on *Cladonia subradiata*. Identified by P. Diederich. Collection examined: 41205 g14.

Physcia lobulata Moberg. New to Brazil. A South American species so far known from Costa Rica and Venezuela. Collection examined: 41729 t62.

Physcia lopezii Moberg. New to Brazil. A South American species so far known from Ecuador, West Indies, Juan Fernandez and Venezuela. Collection examined: 41733 t66.

Placynthiella icmalea (Ach.) Coppins & P. James. New to S. America. Apparently cosmopolitan, as this was the last continent it was not yet reported from. Collection examined: 41625 m19.

Porpidia platycarpoides (Bagl.) Hertel. New to the Southern hemisphere. So far known from Europe, Asia and North America. Collection examined: 40782 a182.

Protoparmelia isidiata Diederich, Aptroot & Sérusiaux. New to America. A surprising record of a species so far known only from high mountains in Papua New Guinea (Aptroot *et al.*, 1997). Collections examined: 41282 j49; 41308a j76; 40621 a21.

Pyrenocollema saxicola (A. Massal.) Coppins. New to the Southern hemisphere and to America. So far known only from Europe. The specimens are associated with cyanobacteria, as fits a *Pyrenocollema*. Collections examined: 40713 a113, 41582 n47.

Pyrenula gahavisukana Aptroot. New to America. A surprising record of a species so far known only from mountains in Papua New Guinea (Aptroot *et al.*, 1997). Collection examined: 41340 k32.

Ramonia microspora Vezda. New to Brazil. So far known from Argentina, Kenya, Papua New Guinea and Indonesia (Aptroot 1998). Collection examined: 41778a v40a.

Verrucaria dolosa Hepp. New to S. America. Apparently cosmopolitan, as this was the last continent it was not yet reported from (Aptroot and Seaward 1999). Collection examined: 40937 b36.

Woessia arvidssonii Sérusiaux. New to Brazil. Previously known only from Ecuador. Collection examined: 41534 l93.

New combinations for some taxa described by Vainio (1890) from the same area

Examination of topotype material in addition to the protologue revealed the systematic position of some taxa described by Vainio (1890) from the area, which were not yet combined in the genera they belong to in the current classification. Most are sufficiently described in the protologue as to be recognizable as valid species, but most were assigned to collective genera now heavily split. For some species, illustrations are made of the habitus. The following new combinations are proposed here:

Bacilopsora tenuisecta (Vainio) Aptroot, **comb. nov.**, basionym: *Lecidea tenuisecta* Vainio, Acta Societatis pro Fauna et Flora Fennica 7(2): 19 (1890). **Topotype**: e.g. 41086 d43.

Brigantiaeia subobscurata (Vainio) Aptroot, **comb. nov.**, basionym: *Lecidea subobscurata* Vainio, Acta Societatis pro Fauna et Flora Fennica 7(2): 26 (1890). **Topotype**: e.g. 40812 a212.

Caloplaca subrubelliana (Vainio) Aptroot, **comb. nov.**, basionym: *Placodium subrubellianum* Vainio, Acta Societatis pro Fauna et Flora Fennica 7(1): 120 (1890). **Topotype**: 41608 m2.

Campylothelium megalostomum (Vainio) Aptroot, **comb. nov.**, basionym: *Heufleria megalostoma* Vainio, Acta Societatis pro Fauna et Flora Fennica 7(2): 193 (1890). **Topotype**: 41334 k26.

Graphina subvestita (Vainio) Aptroot, **comb. nov.**, basionym: *Graphis subvestita* Vainio, Acta Societatis pro Fauna et Flora Fennica 7(2): 103 (1890). Representative collection examined: 41077 d34.

Micarea poliocheila (Vainio) Aptroot, **comb. nov.**, basionym: *Lecidea poliocheila* Vainio, Acta Societatis pro Fauna et Flora Fennica 7(2): 21 (1890). **Topotype**: e.g. 40898 a296 (Fig. 17).

Micarea subgranulans (Vainio) Aptroot, **comb. nov.**, basionym: *Lecidea subgranulans* Vainio, Acta Societatis pro Fauna et Flora Fennica 7(2): 39 (1890). **Topotype**: 41273 j40 (Fig. 18).

Micarea subternaria (Vainio) Aptroot, **comb. nov.**, basionym: *Lecidea subternaria* Vainio, Acta Societatis pro Fauna et Flora Fennica 7(2): 18 (1890). **Topotype**: 40777 a177.

Ocellularia piperis (Vainio) Aptroot, **comb. nov.**, basionym: *Thelotrema piperis* Vainio, Acta Societatis pro Fauna et Flora Fennica 7(2): 78 (1890). **Topotype**: e.g. 40853 a253 (Fig. 19).

Ocellularia stylothecium (Vainio) Aptroot, **comb. nov.**, basionym: *Thelotrema stylothecium* Vainio, Acta Societatis pro Fauna et Flora Fennica 7(2): 80 (1890). Representative collection examined: 41651 r17 (Fig. 20).

Pyrenula crassiuscula (Malme) Aptroot, **comb. nov.**, basionym: *Parthelium crassiusculum* Malme, Arkiv för Botanik 19(1): 20 (1924). **Isotype** seen: Matto Grosso, Guia, Malme 2673 (UPS). The paratypes Malme 2673 (LD) and 2092 (G) were also studied and found to be identical. Additional collection examined: 41727 t60. In addition to the original description it should be noted that the thallus contains lichexanthone (UV+ yellow).

Rinodina atrofuscata (Vainio) Aptroot, **comb. nov.**, basionym: *Buellia atrofuscata* Vainio, Acta Societatis pro Fauna et Flora Fennica 7(1): 169 (1890). **Topotype**: e.g. 40914 b13. the transfer is necessary because of the distoseptate ascospores characteristic of the genus *Rinodina*.

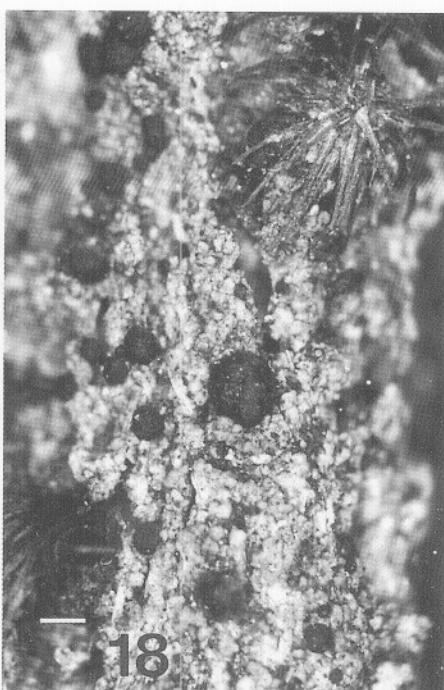

Scoliciosporum campitosporum (Vainio) Aptroot, **comb. nov.**, basionym: *Lecidea campitospora* Vainio, Acta Societatis pro Fauna et Flora Fennica 7(2): 59 (1890). Representative collection examined: 40766 a166.

The flora

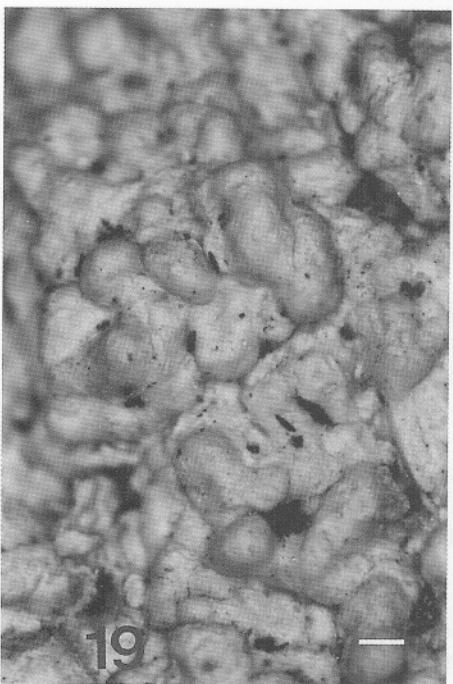

An alphabetic list of all species identified so far is given in table 1. It is a relatively long list of species, showing the enormous variation in some groups like *Cladonia* (for which it is the area with the highest biodiversity worldwide, see Ahti, 2000), *Lecanora* (see Guderley, 1999 for more details), the *Parmeliaceae* and *Graphidaceae* and the corticolous pyrenocarps, and much smaller representation in some other groups, like the cyanophilic lichens and the saxicolous pyrenocarps. Follicolous lichens were deliberately not collected (they will be treated by other specialists) and species mostly known as follicolous are reported below only when they were collected from other substrata, e.g. bamboo. The list is presented here *in extenso*, as it gives a fair idea about the diversity of the lichen flora in the region. It is tempting to estimate how much of the lichen flora in the area is now known. In any case, dozens of recognisable species (including for instance an undescribed, strictly saxicolous red-fruited *Cladonia*) had to be left unnamed and undescribed, e.g. because the taxonomy of the respective groups is unsettled or because the species is already in study elsewhere.

Table 2. Comparison of numbers of taxa in some groups (in Vainio's circumscription).

	Brazil 1885	Brazil 1997	Caraça 1885	Caraça 1997
<i>Anaptychia s.l.</i>	11	10	6	9
<i>Cladonia s.l.</i>	66	51	-	47
<i>Graphidaceae</i>	48	26	22	24
<i>Lecanora s.l.</i>	43	25	20	25
<i>Lecidea s.l.</i>	77	54	23	48
<i>Leptogium</i>	11	11	4	8
<i>Opegrapha</i>	10	7	1	6
<i>Parmelia s.l.</i>	47	37	19	34
<i>Pertusaria</i>	12	10	6	9
<i>Physcia s.l.</i>	14	12	4	11
pyrenocarps	64	54	23	49
<i>Pyxine</i>	5	6	1	6
<i>Thelotremaeaceae</i>	13	18	7	17
Number of species	582	453	-	395

A comparison with the lichen flora in Vainio's time is possible only in a rather general way. See Table 2 for some comparative figures, taken from Vainio's publication and from Table 1. Vainio's circumscription of the genera and families is followed, and all taxa recognized by him (also infraspecific taxa) are counted, as they often turn out to be referable to different species. The main reason for the apparent differences may be that the way of collecting has been different. Vainio spent several months in Brazil, and one month in the Caraça area, but did apparently not try to make a complete collection from Caraça.

Collecting localities, are not given for all species, by Vainio (1890). When a species is cited by Vainio to be common everywhere in Brazil, it is assumed, here to be found by him in Caraça. In Table 2, comparisons are made for the Caraça area, but also for Brazil, meaning a larger area, in Vainio's case mainly including Sitio and lowland areas towards the coast, in my case mainly including an additional mountain area near Campos do Jordão. Another source for differences is that Vainio probably collected mainly specimens that were large enough to be distributed in exsiccate series. Moreover, different collectors have different preferred habitats and species groups. Still, very many of Vainio's taxa could easily be recollected, often no doubt at the exact locality where they were collected a century earlier. This is without question a result of the virtually unchanged management by the landowner, a very lucky situation indeed. One may hope that the lichen flora of this unique area will continue to be preserved to the benefit of both researchers and lichens.

Acknowledgements

M. Marcelli is thanked for organizing the marvellous field trip. P. Diederich is thanked for the identification of lichenicolous fungi and H. Sipman for the *Hypotrachyna* species.
