# GULF STATES MARINE FISHERIES COMMISSION

## *COMMISSIONERS*

### **ALABAMA**

Mr. James C. Martin  
AL Department of Conservation  
and Natural Resources  
64 North Union Street  
Montgomery, AL 36104

Rep. Taylor F. Harper  
AL House of Representatives  
P.O. Box 229  
Grand Bay, AL 36541

Mr. John Ray Nelson  
Bon Secour Fisheries, Inc.  
P.O. Box 60  
Bon Secour, AL 36511

### **FLORIDA**

Dr. Tom Gardner  
Executive Director  
FL Dept. of Natural Resources  
3900 Commonwealth Boulevard  
Tallahassee, FL 32303

Rep. Sam Mitchell  
FL House of Representatives  
P.O. Box 299  
Chipley, FL 32428

Mr. Clyde Richbourg  
220 Billuree Road  
Pace, FL 32571

### **LOUISIANA**

Mr. J. Burton Angelle  
Executive Secretary  
LA Department of Wildlife  
and Fisheries  
P.O. Box 15570  
Baton Rouge, LA 70895

Rep. Frank J. Patti  
LA House of Representatives  
P.O. Box 53  
Belle Chasse, LA 70037

Mr. Leroy Kiffe  
Route 1, Box 239  
Lockport, LA 70374

### **MISSISSIPPI**

Mr. Vernon Bevil  
Executive Director  
MS Department of Wildlife  
Conservation  
P.O. Box 451  
Jackson, MS 39205

Rep. Ted Millette  
MS House of Representatives  
Box 1177  
Pascagoula, MS 39567

Mr. Holton D. Turnbough  
WGUF Radio Station  
P.O. Box 789  
Gulfport, MS 39501

### **TEXAS**

Mr. Charles D. Travis  
Executive Director  
Texas Parks and Wildlife Department  
4200 Smith School Road  
Austin, TX 78744

Sen. H. Tati Santiesteban  
Texas Senate  
747 East San Antonio, Suite 100  
El Paso, TX 79901

Mr. Charles E. Belaire  
P.O. Box 1210  
Fulton, TX 78358

## *STAFF*

Larry B. Simpson  
Thomas M. Van Devender  
Lucia B. Hourihan  
Nancy K. Marcellus

Virginia K. Herring  
Ronald R. Lukens  
Eileen M. Benton

# **SEAMAP ENVIRONMENTAL AND BIOLOGICAL ATLAS OF THE GULF OF MEXICO, 1985**

## **Edited by**

**Perry A. Thompson**

*National Oceanic and Atmospheric Administration  
National Marine Fisheries Service  
Pascagoula, Mississippi*

**Tom Van Devender**

*Gulf States Marine Fisheries Commission  
Ocean Springs, Mississippi*

**Nathaniel J. Sanders, Jr.**

*National Oceanic and Atmospheric Administration  
National Marine Fisheries Service  
Pascagoula, Mississippi*

## **Manuscript Design and Layout**

**Eileen M. Benton**

*Gulf States Marine Fisheries Commission  
Ocean Springs, Mississippi*

**Lucia B. Hourihan**

*Gulf States Marine Fisheries Commission  
Ocean Springs, Mississippi*

**GULF STATES MARINE FISHERIES COMMISSION**

**June 1988  
Number 17**

This project was supported in part by the National Oceanic and Atmospheric Administration, National Marine Fisheries Service, under State/Federal Project Number SM-14.

## SEAMAP SUBCOMMITTEE

**Mr. Walter M. Tatum, Chairman**  
*Alabama Department of Conservation  
and Natural Resources  
Gulf Shores, Alabama*

**Mr. Barney Barrett**  
*Louisiana Department of  
Wildlife and Fisheries  
Baton Rouge, Louisiana*

**Dr. Scott Nichols**  
*National Oceanic and Atmospheric  
Administration  
National Marine Fisheries Service  
Pascagoula, Mississippi*

**Mr. J. Alan Huff**  
*Florida Department of Natural  
Resources  
St. Petersburg, Florida*

**Mr. Wayne Swingle**  
*Gulf of Mexico Fishery  
Management Council  
Tampa, Florida*

**Dr. Gary Matlock, Vice Chairman**  
*Texas Parks and Wildlife  
Department  
Austin, Texas*

**Mr. Richard S. Waller**  
*Gulf Coast Research Laboratory  
Ocean Springs, Mississippi*

**Mr. Tom Van Devender**  
*SEAMAP Coordinator  
Gulf States Marine Fisheries Commission  
Ocean Springs, Mississippi*

# **SEAMAP DATA COORDINATING WORK GROUP**

## **Mr. Kenneth Savastano**

*National Space Technology Laboratories  
National Marine Fisheries Service  
NSTL Station, Mississippi*

## **Mr. Phil Bowman**

*Louisiana Department of Wildlife  
and Fisheries  
Baton Rouge, Louisiana*

## **Dr. Warren Stuntz**

*National Oceanic and Atmospheric  
Administration  
National Marine Fisheries Service  
Pascagoula, Mississippi*

## **Dr. Thomas McIlwain**

*Gulf Coast Research Laboratory  
Ocean Springs, Mississippi*

## **Mr. Frederick Sutter**

*Florida Department of Natural  
Resources  
St. Petersburg, Florida*

## **Dr. Joanne Shultz**

*Gulf Coast Research Laboratory  
Biloxi, Mississippi*

## **Mr. Walter Tatum**

*Alabama Department of Conservation  
and Natural Resources  
Gulf Shores, Alabama*

## ACKNOWLEDGEMENTS

The 1985 SEAMAP Atlas was developed as a cooperative effort between the five Gulf States fishery management agencies and the National Marine Fisheries Service (NMFS), to present information collected during SEAMAP research survey activities in the Gulf of Mexico. The SEAMAP Data Coordinating Work Group would like to thank the following agencies for their participation in the project: Florida Department of Natural Resources, Alabama Department of Conservation and Natural Resources, Gulf Coast Research Laboratory (representing the Mississippi Department of Wildlife Conservation), Louisiana Department of Wildlife and Fisheries, Texas Parks and Wildlife Department, and NMFS, Southeast Fisheries Center.

Special thanks go to Dr. Andrew J. Kemmerer, Director, NMFS Mississippi Laboratories, to laboratory personnel Rick Minkler, Mark McDuff, Linda Magee, John Brucks and Bennie Rohr; to Leslie Bruce of the Gulf Coast Research Laboratory; and to the Gulf States Marine Fisheries Commission staff for their assistance in preparing this atlas.

## TABLE OF CONTENTS

## LIST OF TABLES

	PAGE
Table 1. Selected environmental parameters measured during 1985 SEAMAP surveys in the Gulf of Mexico, by individual vessel and survey. . . . .	13
Table 2. SEAMAP Summer Shrimp and Bottomfish Survey species composition list, 288 trawl stations. Species with a total weight of less than .05 lb (22.7 g) are indicated on table as 0.0 kg. . . . .	59
Table 3. Statistical Zone 5. Summary of the mean of the environmental data (X), the standard error of the mean (SEM) and the number of samples taken (n) during the June-July 1985 SEAMAP Shrimp/ Groundfish Survey by depth stratum. Temperature in $^{\circ}$ C, salinity in ppt and oxygen in ppm. No trawl sampling was done in statistical zone 5. Plankton station only. No plankton samples were collected below 11 fm. . . . .	71
Table 4. Statistical Zone 6. Summary of the mean of the environmental data (X), the standard error of the mean (SEM) and the number of samples taken (n) during the June-July 1985 SEAMAP Shrimp/ Groundfish Survey by depth stratum. Temperature in $^{\circ}$ C, salinity in ppt and oxygen in ppm. No trawl sampling was done in statistical zone 6. Plankton station only. No plankton samples were collected over 30 fm. . . . .	72
Table 5. Statistical Zone 7. Summary of the mean of the environmental data (X), the standard error of the mean (SEM) and the number of samples taken (n) during the June-July 1985 SEAMAP Shrimp/ Groundfish Survey by depth stratum. Temperature in $^{\circ}$ C, salinity in ppt and oxygen in ppm. No trawl sampling was done in statistical zone 7. Plankton station only. No plankton samples were collected over 20 fm. . . . .	73
Table 6. Statistical Zone 8. Summary of the mean of the environmental data (X), the standard error of the mean (SEM) and the number of samples taken (n) during the June-July 1985 SEAMAP Shrimp/ Groundfish Survey by depth stratum. Temperature in $^{\circ}$ C, salinity in ppt and oxygen in ppm. No trawl sampling was done in statistical zone 8. Plankton station only. No plankton samples were collected below 6 fm and between 21 and 30 fm. . . . .	74
Table 7. Statistical Zone 9. Summary of the mean of the environmental data (X), the standard error of the mean (SEM) and the number of samples taken (n) during the June-July 1985 SEAMAP Shrimp/ Groundfish Survey by depth stratum. Temperature in $^{\circ}$ C, salinity in ppt and oxygen in ppm. No trawl sampling was done in statistical zone 9. Plankton station only. No plankton samples were collected below 11 fm. . . . .	75

## LIST OF TABLES

	PAGE
Table 8a. Statistical Zone 10. 40-ft trawls. Summary of dominant organisms, combined for all zones, taken in shrimp statistical zone 10 during the June-July 1985 SEAMAP Shrimp and Bottomfish Survey by depth stratum. The mean number (NUM) of organisms per hour, the standard error of the mean (SEM) for numbers, the mean weight in kg per hour, the SEM of weight and the number (N) of samples taken. No samples were taken below 6 fm or above 20 fm. . . . .	76
Table 8b. Statistical Zone 10. 40-ft trawls. Summary of dominant organisms taken within statistical zone 10 during the June-July 1985 SEAMAP Shrimp and Bottomfish Survey by depth stratum. The mean number (NUM) of organisms per hour, the standard error of the mean (SEM) for numbers, the mean weight in kg per hour, the SEM of weight and the number (N) of samples taken. No samples were taken below 6 fm or above 20 fm. . . . .	77
Table 8c. Statistical Zone 10. 40-ft trawls. Summary of the mean total catch and environmental data (X), the standard error of the mean (SEM) and the number of samples taken (n) during the June-July 1985 SEAMAP Shrimp and Bottomfish Survey by depth stratum. Catch values in kg per hour, temperature in °C, salinity in ppt, and oxygen in ppm. No samples were taken below 6 fm. . . . .	78
Table 9a. Statistical Zone 11. 40-ft trawls. Summary of dominant organisms, combined for all zones, taken in shrimp statistical zone 11 during the June-July 1985 SEAMAP Shrimp and Bottomfish Survey by depth stratum. The mean number (NUM) of organisms per hour, the standard error of the mean (SEM) for numbers, the mean weight in kg per hour, the SEM of weight and the number (N) of samples taken. . . . .	79
Table 9b. Statistical Zone 11. 40-ft trawls. Summary of dominant organisms taken within statistical zone 11 during the June-July 1985 SEAMAP Shrimp and Bottomfish Survey by depth stratum. The mean number (NUM) of organisms per hour, the standard error of the mean (SEM) for numbers, the mean weight in kg per hour, the SEM of weight and the number (N) of samples taken. . . . .	81
Table 9c. Statistical Zone 11. 40-ft trawls. Summary of the mean total catch and environmental data (X), the standard error of the mean (SEM) and the number of samples taken (n) during the June-July 1985 SEAMAP Shrimp and Bottomfish Survey by depth stratum. Catch values in kg per hour, temperature in °C, salinity in ppt, and oxygen in ppm. . . . .	83

## INTRODUCTION

The Southeast Area Monitoring and Assessment Program (SEAMAP) is a State/Federal/university program for the collection, management and dissemination of fishery-independent data (information collected without direct reliance on statistics reported by commercial or recreational fishermen) in United States waters of the Gulf of Mexico. A major SEAMAP objective is to provide the large, standardized data base needed by management agencies, industry and scientists to wisely manage and develop fishery resources for the least possible cost. To accomplish this goal, survey data must be disseminated in a useful format to SEAMAP participants, cooperators and other interested organizations.

The SEAMAP Program began in March 1981 when the National Marine Fisheries Service (NMFS), Southeast Fisheries Center (SEFC), presented a SEAMAP Strategic Plan (January 1981) to the Gulf States Marine Fisheries Commission (GSMFC). This strategic plan outlined the proposed program organization (goals, objectives, procedures, resource requirements, etc.); within the existing framework of the GSMFC, a SEAMAP Subcommittee was then formed. The Subcommittee consists of one representative from each state fishery management agency [Florida Department of Natural Resources (FDNR); Alabama Department of Conservation and Natural Resources (ADCNR); Mississippi Department of Wildlife Conservation (MDWC), represented by the Gulf Coast Research Laboratory (GCRL); Louisiana Department of Wildlife and Fisheries (LDWF) and Texas Parks and Wildlife Department (TPWD)], one from NMFS Southeast Fisheries Center and a non-voting member representing the Gulf of Mexico Fishery Management Council. The Subcommittee organized and successfully coordinated three assessment activities in 1982 - an April-May plankton survey, a June-July shrimp and bottomfish survey, and environmental sampling, in conjunction with the two surveys (see Stuntz et al. 1985); four assessment activities in 1983 - an April-May plankton survey, a June-July shrimp and bottomfish survey, a December plankton survey and environmental sampling in conjunction with these three surveys (see Thompson and Bane 1986a); and five assessment activities in 1984 - an April-May plankton survey, a June-July shrimp and bottomfish survey, an August plankton survey for mackerel, a December plankton survey and environmental sampling in conjunction with these four surveys (see Thompson and Bane 1986b).

In January 1985, the SEAMAP Subcommittee identified and began to plan the year's SEAMAP survey activities for the Gulf of Mexico. In keeping with the program goal of establishing a coordinated long-term resource data base, it was decided to continue the same types of survey activities conducted in 1982, 1983 and 1984 but with several exceptions. The offshore plankton survey conducted during April-May of 1982, 1983 and 1984 was cancelled due to other NMFS commitments. A coordinated July-August Squid/Butterfish Survey was established by the Subcommittee to collect data on the abundance and distribution of several squid species and butterfish across the northern Gulf of Mexico. The September assessment conducted in 1984 at the request of the Gulf of Mexico Fishery Management Council (GMFMC) for king mackerel eggs and larvae was not requested by the GMFMC in 1985. Finally a Shrimp/Groundfish Survey was added to the SEAMAP survey activities between September and December to assess the abundance and distribution of the fall shrimp and groundfish stocks across the northern Gulf of Mexico. Overall survey objectives as in 1982, 1983 and 1984 were to assess the distribution and abundance of ichthyoplankton and trawl-caught organisms and document environmental factors that might affect their distribution and abundance. The basis for plankton work was primarily assessment of selected finfish

and invertebrate eggs and larvae across the northern Gulf of Mexico (see Sherman et al. 1983), while the Texas Closure formed the basis for trawl-caught shrimp and bottomfish surveys (see Nichols 1982, 1984 and 1987).

A major purpose of SEAMAP is to provide resource survey data to State and Federal management agencies and universities participating in SEAMAP activities. This fourth in a series of SEAMAP environmental and biological atlases presents such data, in a summarized form, collected during 1985 SEAMAP surveys. The area covered in the Gulf of Mexico for all SEAMAP survey activities during 1985 is shown in Figure 1.

## MATERIALS AND METHODS

Methodology for the 1985 SEAMAP surveys is similar to that of the 1982, 1983 and 1984 surveys with the exception of the Squid/Butterfish and Fall Shrimp/Groundfish Surveys. Sampling was conducted within the U.S. Exclusive Economic Zone (EEZ) and state territorial waters.

Plankton abundance and distribution were assessed by three piggyback surveys in the Gulf of Mexico. Inshore and offshore plankton were sampled in June-July (Figure 2), July-August (Figure 3) and September-December (Figure 4). In some cases during each of the surveys, plankton stations were independent of trawl stations.

Vessels that participated in only collecting plankton samples were the Florida vessel BELLOWS in June and small inshore LDWF vessels in November.

Vessels participating in the Summer Shrimp/Bottomfish Trawl Survey and concurrent plankton sampling during June and July included the NOAA Ship OREGON II, GCRL vessel TOMMY MUNRO, an inshore vessel from the ADCNR and vessels of the LDWF (PELICAN and small inshore vessels) which collected samples within state territorial waters. TPWD vessels, MATAGORDA BAY, ARANSAS BAY and LAGUNA MADRE, took no plankton samples in conjunction with their June and July trawl survey samples.

The July-August Squid/Butterfish Survey was conducted jointly by the NOAA Ship OREGON II and the GCRL vessel TOMMY MUNRO.

Vessels participating in the September through December Fall Shrimp/Groundfish Trawl Survey and concurrent plankton sampling included the NOAA Ship OREGON II, an inshore vessel from the ADCNR, the LDWF vessel PELICAN and the GCRL vessel TOMMY MUNRO. The TPWD vessels MATAGORDA BAY, GALVESTON BAY, ARANSAS BAY and LAGUNA MADRE took no plankton samples in conjunction with their fall survey activities. All station locations and dates of sampling by vessel and by survey are listed in Table 1.

### Plankton Surveys

Plankton samples were taken opportunistically from a systematic grid across the Gulf of Mexico during the summer and fall trawl surveys. Such a grid was chosen because of the large survey area. Stations were set at minimum intervals of 30 miles

(1/2 degree), with the exception of those taken by LDWF vessels, which collected plankton samples at each trawl station.

Ichthyoplankton samples were collected during the Squid/Butterfish Survey before dawn at the location of the beginning trawl station for the day and again at night at the location of the last trawl station for the day. When time allowed, another ichthyoplankton station was made midway between successive transects.

Sampling gear and procedures were similar to those recommended by Kramer et al. (1972), Smith and Richardson (1977) and Posgay and Marak (1980). Plankton sampling gear consisted of standard 61-cm bongos and a 2x1-m neuston net for the large vessels. The bongos were fitted with 0.333-mm mesh nets with either hard (PVC) or soft (0.333-mm mesh net) cod ends. A flowmeter was mounted off-center in the mouth of each net to record the volume of water filtered. A 50-lb weight was attached approximately 1 m below the bongo frame attachment. The neuston net consisted of a 2x1-m pipe frame fitted with a 0.948-mm mesh net on which the cod end was tied off.

At each designated plankton station, an oblique bongo tow and surface neuston tow were made. In deep water (more than 95 m) a standard oblique bongo tow was made to 200 m, or to 5 m off the bottom at depths less than 200 m, with a payout speed of 50 m/min, 1-min settling time, and a retrieval speed of 20 m/min, at a vessel speed of 1.5 knots to maintain a 45° angle. In shallow water (less than 95 m), tows were modified to extend tow times to a minimum of 10 min in clear water, or 5 min in turbid water, in order to filter enough water for quantitative purposes. This was accomplished by reducing wire payout and retrieval rates, although during each tow, payout and retrieval rates were held constant so that the water column was sampled uniformly. For all bongo tows, a 45°-wire angle was maintained. Neuston tows were made at the surface with the net half-submerged for 10 min at a vessel speed of 1.5 knots. The Louisiana vessels made plankton tows with small, 20-cm bongo nets with 0.333-mm mesh and soft cod ends.

Samples were preserved initially in 10% buffered formalin. After a 24-hr period, the bongo and neuston samples were transferred to 95% ethyl alcohol for final preservation, and subsequently shipped to the NMFS Miami Laboratory. At that facility, the samples were curated and the sampling data computerized. The right bongo sample and the neuston sample from each station were transshipped to the Polish Sorting Center (PSC) in Szczecin, Poland, for sorting and identification. All ichthyoplankton components (eggs and larvae) were removed from each sample and the fish larvae identified to the lowest feasible taxon (families in most cases).

All sorted ichthyoplankton specimens were returned to the SEAMAP Archiving Center, managed in conjunction with the FDNR, for long-term storage under museum-like conditions. Sorted ichthyoplankton samples from 1982 through 1985 are available for loan to researchers throughout the country. Plankton volumes were determined according to procedures in Smith and Richardson (1977). The alternate bongo sample from each station was retained in Miami as a backup for those samples transshipped to the PSC, in case of loss or damage during transit. These backup unsorted plankton samples containing zooplankton and phytoplankton were sent to the SEAMAP Invertebrate Plankton Archiving Center, managed in conjunction with GCRL, for storage and use by researchers.

## Environmental Surveys

Environmental data stations for the Summer Shrimp/Bottomfish Survey are shown in Figure 5, Squid/Butterfish Survey in Figure 6 and Fall Shrimp/Groundfish Survey in Figure 7. Environmental data are summarized in Figures 5 and 7 by 10-min squares. During transects in deep water for the Squid/Butterfish Survey there was insufficient time to take a hydrocast at each station. Hydrocasts were made at the beginning and end of the days transect. Also during the plankton stations for the Squid/Butterfish Survey an XBT and hydrocast were taken.

Standardized methodology was used although the actual parameters measured varied among vessels participating in each survey. The following parameters were recorded:

Station: Station identifiers varied by state and vessel.

Cruise: Cruise numbers varied by state and vessels.

Date: Month/Day/Year.

Time: Local time and time zone, recorded at the start of sampling.

Latitude/longitude: Recorded to seconds.

Wind speed and direction: Recorded in kilometers per hour with direction recorded in compass degrees from which the wind was blowing.

Wave height: Estimated visually in meters.

Cloud cover: Estimated visually in percent cloud cover.

Barometric pressure: Recorded in millibars.

Secchi depth: Secchi depth in meters, estimated at each daylight station.

Standard oceanographic 50-cm white discs were lowered until no longer visible, then raised until visible. If different depths were recorded, an average was used.

The following parameters were measured at the surface, mid-depth and bottom; for bottom depths greater than 200 m, a maximum depth of 200 m was recorded:

Water temperature: Temperatures were measured by a hand-held thermometer onboard ship, in situ electronic sensors, and in situ reversing thermometers. No attempt was made to intercalibrate the various instruments used on individual vessels although several vessels did sample together to calibrate other sampling gear. Some error can be expected.

Salinity: Salinity samples were collected by Niskin bottles and stored for laboratory analysis with a salinometer. Conductivity probes and refractometers were used on some vessels.

Chlorophyll: Chlorophyll samples were collected and frozen for later laboratory analysis. The general procedure for shipboard collection of chlorophyll was to collect 3 liters of sea water. The water sample, to which 1 ml 1% (W/V) suspension of  $MgCO_3$  was added, was filtered through GF/C filters, and the filters were subsequently wrapped in opaque material and frozen.

Laboratory analyses for chlorophyll a and phaeophytin a (chlorophyll degradation product) were conducted by fluorometry and spectrophotometry. The general extraction procedures prior to measurement were similar. Samples analyzed by spectrophotometer included other chlorophyllous products but have not been included as data in this report. The methodology used is described in Strickland and Parsons (1972) and Jeffrey and Humphrey (1975). Approximately 10 percent of the values have been deleted from the data base because of analytical errors.

Dissolved oxygen: Dissolved oxygen values were measured by electronic probes (depending on the vessel) or by the standard Winkler method. No attempts were made to intercalibrate the methods. When oxygen was measured in samples collected from a Niskin sampler, the oxygen bottles were allowed to overflow a minimum of 10 seconds to eliminate oxygen contamination. The tubing which delivered the water sample was inserted to the bottom of the bottle and withdrawn while the sample was still flowing. The oxygen bottles were sealed with a ground-glass stopper and analyzed onboard the vessels.

## Satellite Images

Thermal data were collected by the Advanced Very High Resolution Radiometers (AVHRR) carried on the NOAA Polar Orbiter series of satellites. The data were analyzed by the National Environmental Satellite Data and Information Service (NESDIS).

## TRAWL SURVEYS

### Summer Shrimp/Bottomfish Survey

Shrimp and bottomfish sampling was carried out from Pensacola, Florida to Brownsville, Texas (Figure 8). Trawl stations made with a standard 40-ft SEAMAP net covered NMFS shrimp statistical zones 10 through 21 (Figure 9), to a depth of 50 fm.

The sampling strategy and a description of the statistical rationale for the sampling design are described by Nichols in the 1982 SEAMAP Atlas (Stuntz, et al 1985). Briefly, the strategy was as follows: sampling sites were chosen randomly in three areas (east of the Mississippi River, west of the Mississippi River to the Louisiana-Texas border and off Texas) stratified by depth and statistical area (two areas per stratum). In depths of 5-25 fm, stations consisted of 1-fm strata; out to 30 fm, stations covered 2.5-fm strata; and to 50 fm, stations consisted of 5-fm strata. Trawls were towed perpendicularly to the depth contours and covered the entire depth stratum on each station. Single tows were for a maximum of 30 min; for certain stations, a series of consecutive trawl tows was necessary to cover a given depth stratum, with a minimum individual tow across each stratum of 10 min and a maximum tow of 30 min. All offshore stations were sampled at night using a 40-ft shrimp trawl (Gutherz et al. 1985). The Texas and Louisiana vessels did not cover a complete depth stratum on several stations, but did make one maximum 30-min tow for that particular stratum. In areas off Texas and Louisiana the 1-fm strata can cover a distance of 15-20 miles and take 5-7 tows to complete.

The LDWF used small vessels (less than 30 ft) to sample seven study areas in NMFS statistical zones 12, 13, 14, 16 and 17, utilizing 16-ft shrimp trawls during daylight hours. Statistical Zone 15 was not sampled, as stations were made along set transects occurring only in the five other zones with the 16-ft trawl. Six samples were taken weekly in each study area during the survey period. A sampling station consisted of a 1-fm increment at depths from 1-5 fm. Tows were made perpendicularly to shore. Alabama vessels using 16-ft trawls in daylight hours sampled passes

leading from Mobile Bay to the Gulf of Mexico, with nine stations made in June and nine in July.

All Penaeus spp. shrimp were separated from the trawl catch at each station. Total count and weight by species were recorded for pooled trawls within 1-fm strata. A sample of up to 200 shrimp of each species from every trawl tow was sexed and measured to obtain length-frequency information. Estimated total numbers were derived from the total weights of those processed. Other species of fishes and invertebrates were identified, enumerated and weighed. Weights and individual measurements on selected species other than commercial shrimp were also recorded.

### Squid/Butterfish Survey

The July-August Squid/Butterfish sampling was conducted from the Florida shelf west of Tampa, Florida to the south Texas shelf northeast of Brownsville, Texas (Figure 10). Trawl stations are summarized in Figure 10 by 10-min squares. Ten stations were sampled along each transect line. Transect lines were separated 30 miles apart across the survey area in depths that ranged from 20-269 fm. The OREGON II used 60- and 80-ft nets and the TOMMY MUNRO used 80-ft nets.

The 80-ft net was a two-seam fish trawl. The net was spread with a pair of 3m<sup>2</sup> steel "V" doors. The bridles used were 50 fm in length. Warp length was generally 3:1 except at the shallowest stations where a 4:1 ratio was used. Towing speed was 3 knots.

The 60-ft net was a two-seam fish trawl. This net was only intended as backup for the 80-ft trawls, but it became necessary to use the 60-ft trawls when the 80-ft nets were lost and/or damaged beyond repair at sea. The 60-ft trawl was spread using 2.6m<sup>2</sup> steel "V" doors. The bridles were 50 fm in length. Warp lengths were the same as for the 80-ft trawls.

Trawl tows were made during daylight hours along the selected depth contours for each station. Tows made in depths of greater than 100 fm were of 60-min duration. In depths of less than 100 fm tows were 30-min in duration.

On both the OREGON II and the TOMMY MUNRO species of fish and invertebrates were identified, enumerated, weighed and measured identically to the procedures outlined for the Summer Shrimp/Bottomfish Survey.

### Fall Shrimp/Groundfish Survey

The Fall Shrimp/Groundfish sampling was conducted between September and December from Pensacola, Florida to Brownsville, Texas (Figure 11). Trawl stations are summarized in Figure 11 by 10-min squares.

Two component activities were conducted, an expanded pilot Fall Shrimp/Groundfish Survey and a comparative gear test between TPWD 20-ft trawl and NMFS 40-ft SEAMAP trawl. The comparative gear test data will not be listed in this Atlas. The

data can be obtained by contacting the SEAMAP Data Manager. During the fall survey trawl stations were made with a standard 40-ft SEAMAP net and covered NMFS shrimp statistical zones 10 through 17. Also SEAMAP stations made with a Texas 20-ft net covered statistical zones 18 through 21.

All tows were 15 min in duration paralleled to the depth strata out to 100 fm. A modified random sample design was developed to evaluate day-night variation in catch rates of fish and shrimp. This sample design included an equal number of day/night stations with a replicated number of day/night stations. With the same geographic area sampled, both day and night within a 24-hr period, areal variation was reduced for analysis of day-night catch rates.

Catch rates on all the vessels sampling were treated in the same manner as the Summer Shrimp/Bottomfish and Squid/Butterfish Survey.

## RESULTS

### Plankton Surveys

Approximately 490 identified ichthyoplankton samples taken during 1985 surveys were returned from the PSC to the SEAMAP Archiving Center in May 1988. The data will be verified and incorporated into the SEAMAP data system. Distribution plots, by key families, will appear in the separate 1985 SEAMAP Ichthyoplankton Atlas (in preparation).

Plankton stations for June-July Shrimp/Bottomfish are shown in Figure 2, for July-August Squid/Butterfish Figure 3 and for September-December Fall Shrimp/Groundfish in Figure 4.

### Environmental Surveys

As detailed previously, environmental data are collected in conjunction with Summer Shrimp/Bottomfish, Squid/Butterfish and Fall Shrimp/Groundfish surveys (Figures 5, 6 and 7). A complete listing of selected environmental parameters for all SEAMAP surveys is shown in Table 1.

During the Summer Shrimp/Bottomfish Survey an extensive (more than 2,000 sq. mi.) area of hypoxia was found offshore Louisiana from Bastion Bay westward to Calcasieu Lake. Bottom oxygen levels of less than 2 parts per million were measured throughout this area. It was later reported by the Louisiana Universities Marine Consortium Research Center in Cocodrie, Louisiana that the hypoxic area had increased by another 1,000 sq. mi. and measured about 3,000 sq. mi.

Additional environmental information (Secchi readings, Forelule, cloud cover, etc.) may be obtained from the SEAMAP Information System by contacting the SEAMAP Data Manager.

Satellite-derived sea-surface temperatures, averaged over a few days, are shown for the months of June (Figure 12), July (Figure 13), August (Figure 14), September (Figure 15), October (Figure 16) and November (Figure 17).

## Shrimp/Bottomfish Survey

The June-July Shrimp/Bottomfish Survey consisted primarily of biological trawl data (Figure 8), and concomitant environmental and plankton data. A species composition listing from the trawls is presented in Table 2, ranked in order of abundance, within the categories of finfish, crustaceans and other invertebrates. Biological distributions of the ten most abundant finfish plus red snapper, three main penaeid shrimps, five most abundant non-Penaeus invertebrates and squid species, taken from Table 2, are displayed in plots of number/hour and lb/hour in Figures 18-57. Data for the biological plots were computed from both the 40-ft trawl data, and from 16-ft trawl data, standardized to 40-ft trawls using relative headrope length. In the plots of lb/hour, a zero value indicates less than 0.5 lb/hr taken; only stations where at least some of the species were taken are shown. No trawl stations were made by the state of Florida during this survey. Tables 3-7 summarizes environmental data taken in statistical zone 5 through 9 during Florida June-July Plankton Survey.

Tables 8a-18a present the biological data from the 40-ft nets of the eight most abundant fish, six most abundant invertebrates and squid combined for all NMFS statistical zones by depth stratum. Tables 8b-18b present the biological data, from the 40-ft nets, of the eight most abundant fish, six most abundant invertebrates and squid within each NMFS statistical zone by depth stratum. Tables 8c-18c list the total catch and environmental data from the 40-ft nets by NMFS statistical zone and depth stratum.

Tables 19a-25a present the biological data from the 16-ft nets of the eight most abundant fish, six most abundant invertebrates and squid combined for all NMFS statistical zones 10, 11, 12, 13, 14, 16 and 17. Tables 19b-25b present the biological data from the 16-ft nets of the eight most abundant fish, six most abundant invertebrates and squid within these NMFS statistical zones. Tables 19c-25c present the total catch and environmental data from the 16-ft nets, by NMFS statistical zones listed above.

For all tables, the standard error of the mean (SEM) was calculated with the equation:

$$SEM = \sqrt{\frac{\alpha}{n}}$$

where  $\alpha$  is the population standard deviation  
and n is the number of the sample.

On all tables, NUM = number per hour; all weights shown are in kilograms per hour.

## Squid/Butterfish Survey

The Squid/Butterfish Survey consisted predominately of biological trawl data (Figure 10), and environmental and plankton data. A species composition listing from the trawls is presented in Table 26, ranked in order of abundance within the categories of finfish, crustaceans and other invertebrates. The biological catch data were converted to 80-ft trawls by using a conversion factor of 1.3333 for the 60-ft trawl. Catch data were divided into four geographical areas: Area 1 - 84°00'W-87°14'W (Table 27); Area 2 - 87°15'W-89°14'W (Table 28); Area 3 - 89°15'W-92°14'W (Table 29) and Area 4 - 92°15'W-97°00'W (Table 30). Tables 27-30 present the biological data of the eight most abundant finfish, six most abundant invertebrates and squid combined by depth stratum for each geographic area.

The catch rates for the survey were computed with the same equation used to compute the Summer Shrimp/Bottomfish Survey catch rates.

## Fall Shrimp/Groundfish Survey

The September-December Fall Shrimp/Groundfish Survey consisted of biological trawl data (Figure 11) along with environmental data. A species composition listing from the trawls is presented in Table 31, ranked in order of abundance, within the categories of finfish, crustaceans and other invertebrates.

Biological distributions of the ten most abundant finfish plus red snapper, three main penaeid shrimps, five most abundant non-Penaeus invertebrates and squid species, taken from Table 31 are displayed in plots of number/hour and lb/hour in Figures 58-97. Data for the biological plots were computed from the 40-ft trawl data, 20-ft trawl data and from 16-ft trawl data, standardized to 40-ft trawls using relative headrope length. In the plots of lb/hour, a zero value indicates less than 0.5 lb/hr taken; only stations where at least some of the species were taken are shown. No trawl stations were made by the Florida vessel.

Tables 32a-39a present the biological data, from the 40-ft nets, of the eight most abundant fish, six most abundant invertebrates and squid combined for all NMFS statistical zones (10 through 17), by depth stratum. Tables 32b-39b present the biological data, from the 40-ft nets, of the eight most abundant fish, six most abundant invertebrates and squid within each NMFS statistical zone (10 through 17), by depth stratum. Tables 32c-39c list the total catch and environmental data from the 40-ft nets by NMFS statistical zone (10 through 17) and depth stratum.

Tables 40a-43a present the biological data from the 20-ft net used by TPWD of the eight most abundant finfish, six most abundant invertebrates and squid combined for all NMFS shrimp statistical zones 18 through 21. Tables 40b-43b present the biological data from the 20-ft net used by TPWD of the eight most abundant finfish, six most abundant invertebrates and squid within each NMFS shrimp statistical zones 18 through 21. Tables 40c-43c present the total catch data for the TPWD 20-ft net and combined environmental data taken by the Texas vessels and the OREGON II.

Table 44 presents the biological data from the 16-ft nets of the eight most abundant fish, six most abundant invertebrates and squid combined for NMFS statistical zones 10 and 11, inside 10 fm. Tables 45-46 present the biological data from the 16-ft nets of the eight most abundant fish, six most abundant invertebrates and squid within NMFS statistical zones 10 and 11, respectively, inside 10 fm. Tables 47-48 present the total catch and environmental data from the 16-ft nets, by NMFS statistical zone, inside 10 fm.

The catch data were calculated using the same equation that was used to compute catch rates for the Summer Shrimp/Bottomfish and Squid/Butterfish surveys.

### Real-time Data Management

The SEAMAP Subcommittee agreed it was imperative to the success of the SEAMAP Program to distribute data on a near real-time basis to the fishing industry and others interested in SEAMAP. To distribute near real-time data, NMFS, in cooperation with NASA, installed a data communications terminal aboard the NOAA Ship OREGON II. The terminal was designed to operate through the ATS-3 satellite system located in geostationary orbit over the Pacific Ocean. This enabled personnel aboard the vessel to transmit daily catch rates and environmental data to the NMFS computer system through computer hardware located at the NMFS Mississippi Laboratories in Bay St. Louis.

Summarized data were distributed weekly to over 250 individuals, management agencies and industry members as computer plots and data listings. These plots showed stations locations, catches of brown, pink and white shrimp in lb/hr and count/lb, and total finfish catch in lb/hr.

Summarized data from the July-August Squid/Butterfish Survey were provided to over 108 interested individuals in weekly mailouts.

### DISCUSSION

The quasisynoptic SEAMAP sampling program and the intended long-term nature of the sampling programs have been designed to provide the baseline data set needed for fishery management and conservation. In 1985 the intent to continue with SEAMAP long-term baseline data was disrupted by the loss of the April-May Gulf-wide plankton survey. In 1986 the SEAMAP Subcommittee renewed its commitment to urge continued support for the April-May baseline data for collection of plankton data. Also in 1986, the SEAMAP Subcommittee reinstated the September plankton survey for king mackerel and red drum eggs and larvae as a SEAMAP survey activity. These ichthyoplankton samples are and will be used by researchers studying taxonomy, age and growth, bioenergetics, and other life history aspects, as well as spawning biomass and recruitment. Information on species' relative distributions within the Gulf of Mexico can be analyzed with respect to environmental data to assess population abundance as a function of environmental change. In the same way, satellite data can be related to species distribution and changing conditions in the Gulf.

Similar analyses and investigations are being undertaken with Summer Shrimp/Bottomfish Survey data and in the future with the Fall Shrimp/Groundfish Survey which will be an annual SEAMAP Survey activity. These data sets will be utilized in resource management decisions, and because of the program's ability to process data quickly, the capability exists to optimize some fisheries on a real-time basis. The long-term data set on all of the species collected, not just those of commercial and recreational importance, offers an opportunity to examine ecological relationships, with the eventual goal of developing management models that take into account the multi-species nature of most Gulf fisheries. The value of the SEAMAP Program lies in its use for both immediate and long-range management. There are, in addition, many studies and other uses for SEAMAP data that are not mentioned here.

Much use has already been made of SEAMAP data. For example, during the surveys an area of very low dissolved bottom oxygen was found off Louisiana in 1982, 1985 and in May 1986. The presence of this phenomenon and some of the related conditions and biological effects were reported by Leming and Stuntz (1984), and during such occurrences, SEAMAP has distributed special environmental bulletins and news releases to management agencies and the shrimp industry. In addition, SEAMAP data were used by some coastal states to determine the status of shrimp stocks and their movements just as the shrimping seasons were to be opened.

In 1982 to 1984 SEAMAP ichthyoplankton data were used to estimate spawning stock sizes of bluefin tuna in the Gulf of Mexico (McGowan and Richards 1986). The results of this work were recognized by the International Commission for the Conservation of Atlantic Tunas as a reliable index of stock size, thus precluding the need for a longline fishery in the Gulf which was proposed by Japan. Continuation of the ichthyoplankton surveys in the spring by SEAMAP will provide information on Gulf of Mexico tuna stocks.

SEAMAP data collected during the Summer Shrimp/Bottomfish Survey continue to be used extensively for fishery management purposes. In 1981, the Gulf of Mexico Fishery Management Council's plan for shrimp was implemented (Louisiana State University, Center for Wetland Resources 1980), with one management measure calling for the temporary closure to shrimping of the EEZ off Texas. This closure complements the traditional closure of the Texas territorial sea, normally June 1-July 15 of each year. The purpose of the closure is to increase the yield of shrimp and eliminate waste caused by discarding of undersized brown shrimp.

NMFS was charged with evaluating the effects of the Texas Closure and several reports were submitted to the Gulf Council in December 1985. These reports were subsequently summarized by Klima (1986), who reported on size and abundance of commercial shrimp collected by SEAMAP in 1985, and Nichols (1987), and Nichols and Poffenberger (1987), who described the impact of the combined Texas territorial sea and EEZ closures on brown shrimp yields. After review of these data and other information, the Gulf Council voted to continue the Texas Closure in 1986.

## Data Requests

It is the policy of the SEAMAP Subcommittee that all verified non-confidential SEAMAP data, collected specimens and samples shall be available to all SEAMAP

participants, other fishery researchers and management organizations approved by the Subcommittee. This atlas presents, to those individuals interested in the data or specimens, a chance to review the data in a summary form.

Data and specimen requests from SEAMAP participants, cooperators and others will normally be handled on a first-come, first-serve and time-available basis. Because of personnel and funding limitations, however, certain priorities must be assigned to the data and specimen requests. These priorities are reviewed by the SEAMAP Subcommittee. For further information on SEAMAP data management, see the SEAMAP Operations Plan: 1985-1990 (Gulf States Marine Fisheries Commission 1984).

Data requests and inquiries, as well as requests for plankton samples, can be made by contacting the SEAMAP Coordinator, Gulf States Marine Fisheries Commission, P.O. Box 726, Ocean Springs, MS 39564; 601/875-5912.

Table 1. Selected environmental parameters measured during 1985 SEAMAP surveys in the Gulf of Mexico, by individual vessel and survey.

40-ft trawls

Summary of dominant organisms, combined for all zones, taken in shrimp statistical zone 17 during the June-July 1985 SEAMAP Shrimp and Bottomfish Survey by depth stratum. The mean number (NUM) of organisms per hour, the standard error of the mean (SEM) for numbers, the mean weight in kg per hour, the SEM of weight and the number (N) of samples taken. No samples were taken below 11 fm or above 40 fm.

Table 25a  
Statistical Zone 17  
16-ft trawls

Summary of dominant organisms, combined for all zone sampled, shrimp statistical zone 17, taken during June-July 1985 SEAMAP Shrimp and Bottomfish Survey in the 0-5 fm depth stratum. The mean number (NUM) of organisms per hour, the standard error of the mean (SEM) for numbers, the mean weight in kg per hour, the SEM of weight and the number (N) of samples taken in that zone are given.

Table 43c

Statistical Zone 21

20-ft trawls and Environmental Data from OREGON II 40-ft trawls

Summary of the mean total catch and environmental data (X), the standard error of the mean (SEM) and the number of samples taken (n) during the September-December 1985 SEAMAP Groundfish Survey by depth stratum. Catch values in kg per hour, temperature in  $^{\circ}\text{C}$ , salinity in ppt, and oxygen in ppm. No samples were taken below 11 fm or above 30 fm.
