

Crystal Data: Orthorhombic, pseudohexagonal. *Point Group:* $2/m\ 2/m\ 2/m$ or $mm2$. As crystals, to 1 cm, but typically much smaller. *Twinning:* Always twinned in a complex fashion; twin plane {110}; trillings common.

Physical Properties: Hardness = > 3.5 VHN = 79–93, average 87 (100 g load).
D(meas.) = n.d. D(calc.) = 12.98

Optical Properties: Opaque. *Color:* In polished section, creamy white. *Luster:* Metallic.
Pleochroism: Brownish rose-white to creamy white. *Anisotropism:* Distinct.

R₁–R₂: (400) 65.9–67.0, (420) 67.9–69.0, (440) 69.8–70.9, (460) 71.5–72.6, (480) 73.3–74.4, (500) 74.9–76.2, (520) 76.5–77.8, (540) 78.1–79.3, (560) 79.5–80.7, (580) 80.6–81.8, (600) 81.5–82.8, (620) 82.3–83.5, (640) 82.9–84.0, (660) 83.6–84.6, (680) 84.0–85.1, (700) 84.6–85.5

Cell Data: *Space Group:* $Cmcm$ (probable) or $Cmc2_1$. $a = 2.961$ $b = 5.13$
 $c = 4.83$ $Z = 2$

X-ray Powder Pattern: Landsberg, Germany.
2.267 (10), 2.404 (6), 1.263 (6), 1.361 (5), 1.481 (4), 0.8310 (4), 2.564 (3)

Chemistry:	(1)	(2)
Ag	43.2	44.65
Hg	56.6	55.35
Total	100.0	100.00

(1) Landsberg, Germany; by electron microprobe. (2) Ag₃Hg₂.

Occurrence: Formed in the oxidized zone by the alteration of moschellandsbergite (Landsberg, Germany); thought to be a primary mineral (Kremikovci deposit, Bulgaria).

Association: Schachnerite, mercurian silver, acanthite, cinnabar, “limonite”, ankerite (Landsberg, Germany); mercurian silver, cinnabar, many secondary copper minerals (Kremikovci deposit, Bulgaria); schachnerite, sphalerite, chalcopyrite, pyrite, pyrrhotite, gudmundite, cubanite, ilmenite, galena (Sala, Sweden).

Distribution: From the Vertraun auf Gott mercury mine, at Landsberg, near Obermoschel, Rhineland-Palatinate, Germany [TL]. In the Kremikovci deposit, Sofia district, Bulgaria. From Sala, Västmanland, Sweden.

Name: For the relation to schachnerite.

Type Material: Technical University, Berlin, Germany; National Museum of Natural History, Washington, D.C., USA, 145618, 150256.
