## Contribution to the knowledge of the beech-woods mycological flora in the Madonie Mts (N. Sicily)

### Abstract

Venturella, G., Saitta, A. & Mazzola, P.: Contribution to the knowledge of the beech-woods mycological flora in the Madonie Mts (N. Sicily). — Fl. Medit. 9: 17-55. 1999. — ISSN 1120-4052.

The results of the investigations carried out on the mycological flora occurring in a beech-wood of Madonie Mts (N. Sicily) are reported here. 216 taxa were recorded, 30 of which are new for Sicily. The presence of rare taxa such as *Amanita ceciliae*, *Helvella solitaria* and *Macrotyphula fistulosa* is noteworthy.

### Introduction

The knowledge on the mycological flora of the Madonie Mts is so far limited to the data recorded in the second half of XIX century by Minà Palumbo and Inzenga (Venturella & Mazzola 1991).

According to these authors, only 65 taxa (i.e. 4.4 % of the taxa recorded in Sicily) occur in the Madonie Mts. These data are in contrast with the knowledge on the vascular flora, i.e. more than 50 % of tracheophytes recorded in Sicily occur in the Madonie area.

Recently some papers were published, referring to E. Sicily and concerning the wood mycocoenoses of *Betula aetnensis* Rafin. (Napoli 1993), *Pinus laricio* Poiret (Signorello 1996a) and *Quercus ilex* L. (Signorello 1996b).

As far as the beech-woods are concerned, the only data from Sicily are reported in Venturella (1994). They refer to few taxa collected in woods of *Fagus sylvatica* L. in the territories of Geraci Siculo and Polizzi Generosa within the Madonie Park and in the territory of S. Fratello (province of Messina).

Since 1994 periodical observations on the beech-wood mycological flora of the Madonie Mts were carried out in order to widen the knowledge on Sicilian macrofungi.

### Materials and methods

Field investigations were carried out in Piano della Madonna, Cozzo Cerasa, Monte dei

Cervi and Pizzo Colla, localities placed in the territory of Polizzi Generosa, within the Madonie Park (Fig. 1).

Each recorded taxon was included in a list together with the locality, date of collection, habitat and cartographic references. These last data are obtained according to the methodology proposed by Padovan (1994) and refer to the sheets no. 609 (Termini Imerese) of the grid map 1: 50000 (Official Map of the Italian State) divided in 16 subunits. Consequently the localities investigated are numbered as follows: Piano della Madonna (609611 and 609612), Cozzo Cerasa (609612), Monte dei Cervi (609611) and Pizzo Colla (609611). The new records for the Madonie Mts are marked with an asterisk in the list of the data recorded.

Within the subdivisions Ascomycotina and Basidiomycotina each genus is included in the respective family according to Hawksworth & al. (1995), while the scientific binomials and trinomials are got from Moser (1980), Breitenbach & Kränzlin (1981), Dennis (1981), Cappelli (1984), Alessio (1985), Riva (1988), Jülich (1989), Bernicchia (1990), Candusso & Lanzoni (1990), Noordeloos (1992), Bidaud & al. (1993), Courtecuisse (1994) and Antonin & Noordeloos (1997).

### *Fagus sylvatica* woods in the Madonie Mts

In the Madonie Mts, *Fagus sylvatica* woods are mainly widespread in the slopes facing north between 1400 and 1900 m. They are generally discontinuous except for the Monte Mufara, Pizzo Antenna Grande, Piano della Madonna, Cozzo Cerasa, Monte dei Cervi, Pizzo Colla, Monte Daino and Monte San Salvatore beech-woods.

*Fagus sylvatica* L. is dominant in the tree layer and is often associated with *Acer pseudoplatanus* L. In the shrub layer, apart from beech, *Sorbus graeca* (Spach) Kotschy, *Orthilia secunda* (L.) House, *Euphorbia amygdaloides* L. subsp. *arbuscula* Meusel and, sporadically, *Rhamnus catharticus* L., *Crataegus laciniata* Ucria, and *Ilex aquifolium* L. occur.

The herbaceous layer is characterized by few species such as *Doronicum orientale* Hoffm., *Anemone apennina* L., *Cyclamen hederifolium* Aiton, *Lamium flexuosum* Ten. var. *pubescens* Sibth., *Scilla bifolia* L., *Galium odoratum* (L.) Scop., *Corydalis solida* (L.) Swartz, *Monotropa hypopitys* L., *Neottia nidus-avis* (L.) L. C. M. Richard, *Mycelis muralis* (L.) Dumort., *Cardamine chelidonia* L., *Cephalantera rubra* (L.) L. C. M. Richard, *C. damasonium* (Miller) Druce, *Allium pendulinum* Ten., *Ranunculus umbrosus* Ten. et Guss., etc.

According to Gentile (1968), Sicilian beech-woods are referred to the *Aquifolio-Fagetum* Gentile 1969 belonging to the *Geranio versicoloris-Fagion* Gentile 1969.

As regards the calcareous beech-woods of the Madonie Mts, Raimondo (1980) repropoed the previous interpretation given by Hofmann (1960), stating that they are included in the *Anthriscio-Fagetum aceretosum* Hofmann 1960.

The *Geranio versicoloris-Fagion* is also well represented in the Madonie area and it is characterized by more or less scattered plants of *Fagus sylvatica*.

The shrub layer is characterized by *Crataegus laciniata* Ucria, *Rosa sicula* Tratt., *Prunus mahaleb* L. var. *prostrata* Lojac., *Berberis aetnensis* Presl and *Astragalus nebrodensis* (Guss.) Strobl, while in the herbaceous layer, the taxa of the neighbouring mesophilous and xerophilous environments are predominant.

In the beech-wood glades, pastures of *Cachrys ferulacea* (L.) Calestani and *Astragalus nebrodensis* (Guss.) Strobl, occur together with *Euphorbia myrsinites* L., *Cerastium tomentosum* L., *Phleum ambiguum* Ten. and *Artemisia alba* Turra.

*Cacrhietum ferulaceae* Raimondo 1980, occurs in 20% of the mountainous surface of Madonie and it is found from 1100-1200 m to the peak plains. It grows in sunny areas, particularly arid in spring-summer times, in lithosols, where the vegetation occupies the cracks and the superficial deposits of the outcrop rocks and, only in some parts, in not calcareous substrata, or in soils developed on peltic matrix.

The reafforestation made in the whole Madonie area in the '60s justifies the presence in the glades and within the woods of many plants of *Pinus nigra* Arnold, *Cedrus atlantica* (Endl.) Carrière and *Pseudotsuga menziesii* Franco var. *menziesii*.

### General characters of the areas investigated

Beech-woods of Piano della Madonna, Cozzo Cerasa, Monte dei Cervi and Pizzo Colla are distributed from 1501 to 1750 m.

Climate is strongly influenced by altitude and by slopes exposure. Rainfalls are mainly concentrated in autumn-winter, sometimes they also extend to spring while they are very scarce in summer.

As regards temperatures they gradually increase from January to April and reach the highest level from May to July. In the second half of August they lightly decrease to the lowest degrees from October to December. Snowfalls are mainly concentrated between December and February and sometimes they can also occur in spring.

Unfortunately owing to the limited number of the weather-stations in the Madonie territory and their absence in the investigated areas the evaluation of the thermo-pluviometric data is rather approximate.

The nearest weather-station to the areas investigated is Pomieri whose data of which are reported below, although they refer only to the period 1985-1998.

\* Data not available.

Finally it is to be noted that the slopes facing north are influenced by wet currents contributing to increase the water supply as hidden precipitations.

As regards the geological characters, the Madonie territory is mainly represented by calcareous sedimentary rocks which arised, starting from the Triassic, about 200 million years ago. Particularly in the Monte dei Cervi area dolomitic breccias of the Fanusi formation are present. According to Fierotti & al. (1988) the Monte dei Cervi area is characterized by lithosols, rock outcrop and brown soils.

### Discussion and conclusions

216 infrageneric taxa (213 species and 3 varieties) belonging to 85 genera and 46 families were recorded in the beech-woods of Piano della Madonna, Cozzo Cerasa, Monte dei Cervi and Pizzo Colla in the Madonie Park. This Mycota consists of 193 basidiomycetes and 23 ascomycetes, i.e. 89.4 % and 10.6 % of the taxa recorded, respectively. *Tricholomataceae* with 48 taxa is the most representative family followed by *Russulaceae* (20), *Boletaceae* (18), *Agaricaceae* (12), *Cortinariaceae* (11), *Strophariaceae* and *Coprinaceae* (9), *Amanitaceae*, *Hygrophoraceae* and *Lycoperdaceae* (7). All the taxa collected are unpublished for the Sicilian *Fagus sylvatica* woods, 30 of which are new records for the Sicilian mycological flora. These are *Agrocybe pediades*, *Bertia moriformis*, *Clavariadelphus flavoimmaturus*, *Collybia alcalivirens*, *C. aquosa*, *Cerocorticium confluens*, *Coprinus vousostii*, *C. impatiens*, *Cortinarius meridionalis*, *Crocicreas cyathoideum* var. *cacaliae*, *Dacrymyces minor*, *D. stillatus*, *Dasyscyphus bicolor*, *Helvella solitaria*, *Hygrocybe aurantioviscida*, *Hypoxylon cohaerens*, *Lactarius fluens*, *Marasmiellus candidus*, *M. ramealis*, *Melanoleuca pseudoevenosa*, *Melanogaster tuberiformis*, *Mollisia melaleuca*, *Mycena galopus* var. *candida*, *M. supina*, *Panaeolus rickenii*, *Phaeomarasmius erinaceus*, *Polyporus mori*, *Tarzetta catinus*, *Tuber excavatum* and *Tricholoma orirubens*. As reported in Fig. 2, 96 taxa were collected during 1994, 125 taxa in 1995 and 1996, 144 in 1997 and 22 in the spring of 1998.

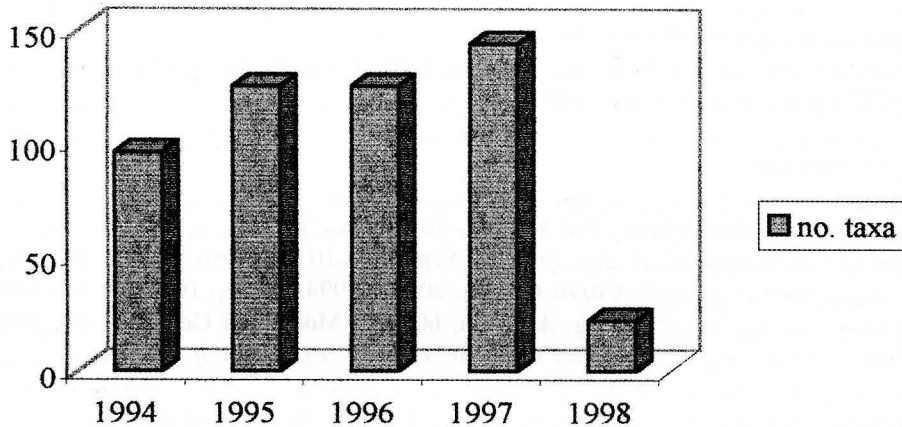

Fig. 2. Number of taxa recorded in each year of investigation.

As shown in Fig. 3 the fructification period is concentrated from May to December and the higher number of taxa was recorded from September to November. The presence of snow from January to April did not permit any sporophore occurrence in any of the areas investigated.

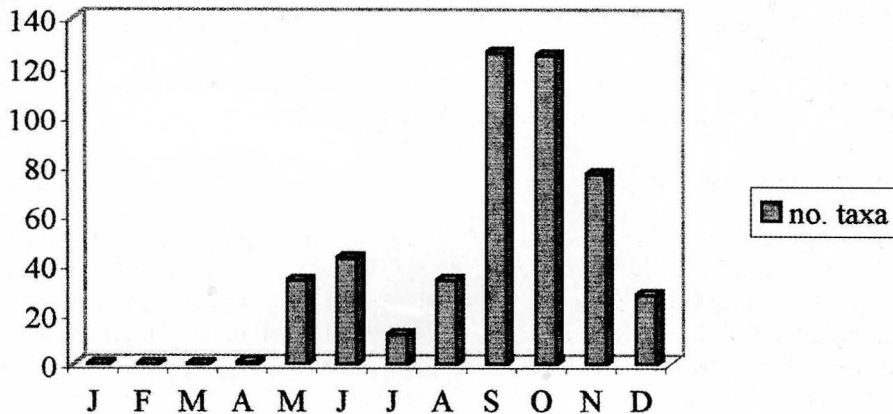

Fig. 3. Number of taxa recorded per each month during the investigation period.

The taxa exclusively growing in spring are 26: *Agrocybe pediades*, *A. praecox*, *Bjerkandera adusta*, *Collybia aquosa*, *C. hariolorum*, *Coprinus vosoustii*, *C. micaceus*, *Crocicreas cyathoides* var. *cacaliae*, *Helvella lacunosa*, *H. acetabulum*, *H. solitaria*, *Hypoxylon serpens*, *Inocybe rimosa*, *Langermannia gigantea*, *Mollisia melaleuca*, *Melanoleuca pseudoevenosa*, *Morchella elata*, *M. esculenta*, *Mycena galopus* var. *candida*, *Otidea cochleata*, *Oudemansiella pudens*, *Peziza badia*, *P. badiocconfusa*, *Pleurotus nebrodensis*, *Polyporus arcularius* and *Tarzetta catinus*.

The reforestation made in the '60s, particularly in the Piano della Madonna area, with plants of *Pinus nigra* and *Cedrus atlantica* justifies the presence of alien species, *sensu* Arnolds (1981), such as *Cortinarius cedretorum*, *Chroogomphus rutilus*, *Hydnum rufescens*, *Lactarius deliciosus*, *L. semisanguifluus*, *Suillus granulatus*, *S. luteus* and *Tricholoma terreum*.

As regards *Pleurotus nebrodensis*, a rare spring species strictly related to the presence of *Cachrys ferulacea*, it was included in the present study since it is characteristic of the *Cacrhietum ferulaceae* distributed in the glades and in the wood of all the investigated areas.

On the stems of *C. ferulacea* the ascomycetes *Crocicreas cyathoides* var. *cacaliae* was also recorded. *P. eryngii*, too, contributes to characterize the mycological flora of Monte dei Cervi area occurring during autumn in the *Eryngium campestre* pastures located just near the valley.

Although grazing is strictly forbidden sometimes animals are present in the pastures near the wood causing the permanence of bovine and equine dung in the soil on which *Coprinus niveus*, *Panaeolus sphinchtrinus*, *Crucibulum laeve* and *Bolbitius vitellinus* were found.

Fig. 4. Basidiomata of *Helvella solitaria*.

Fig. 5. Basidioma of *Macrotypula fistulosa*.

Comparing the data published by Ceruti & al. (1987-88), Ubaldi & al. (1990), Clericuzio & Fanelli (1992), Orsino (1991, 1993), Riess & De Colle (1995), Violante & Roca (1995) and Orsino & Dameri (1996) 32 taxa are new records for the Italian beech-woods. They are *Agaricus xanthoderma* var. *griseus*, *Amanita ceciliae*, *A. lividopallescens*, *Boletus fechtneri*, *B. fragrans*, *B. legaliae*, *B. radicans*, *B. torosus*, *Byssomerulius corium*, *Cerocorticium confluens*, *Clavariadelphus truncatus*, *Dasyscyphus bicolor*, *Entoloma lividum*, *Geastrum triplex*, *Hygrophorus melizeus*, *Hypoxylon serpens*, *Lepiota cortinarius*, *Marasmiellus candidus*, *Melanogaster variegatus*, *M. tuberiformis*, *Morchella elata*, *M. esculenta*, *Mycena galopus* var. *candida*, *M. viscosa*, *Otidea cochleata*, *Oudemansiella pudens*, *Peziza badia*, *Polyporus mori*, *Rigidoporus ulmarius*, *Russula xerampelina*, *Sarcoscypha coccinea*, *Tricholoma albobrunneum*.

Some taxa are to be considered as strictly linked with beech or at least showing a marked preference towards this species. According to Orsino & Dameri (1996) the following taxa seem to prefer mesophilous or acidophilous beech woods: *Clavariadelphus pistillaris*, *Collybia hariolorum*, *Hygrophorus cossus*, *H. eburneus*, *Lactarius blennius*, *L. pallidus*, *Marasmius wynneae*, *Mycena pelianthina*, *Oudemansiella radicata*, *Psilocybe squamosa*, *Russula cyanoxantha*, *R. faginea* and *Xerocomus badius*.

The wood species growing on fallen beech branches, stumps, wood debris and cupules are well represented too. They are *Armillaria mellea*, *Bertia moriformis*, *Bjerkandera adusta*, *Byssomerulius corium*, *Calocera cornea*, *Cerocorticium confluens*, *Collybia fusipes*, *Coprinus micaceus*, *Crepidotus variabilis*, *Crucibulum laeve*, *Dacrymyces minor*, *D. stillatus*, *Dasyscyphus bicolor*, *D. virgineus*, *Diatrype disciformis*, *Hymenoscyphus caliculus*, *Hypholoma fasciculare*, *H. sublateritium*, *Hypoxylon cohaerens*, *H. serpens*, *Lycoperdon pyriforme*, *Marasmiellus candidus*, *M. ramealis*, *Marasmius rotula*, *Mollisia cinerea*, *M. melaleuca*, *Mycena galericulata*, *M. viscosa*, *Oudemansiella pudens*, *O. radicata*, *Phaeomarasmium erinaceus*, *Pluteus atricapillus*, *Polyporus arcularius*, *P. brumalis*, *P. mori*, *Psathyrella candolleana*, *Psilocybe squamosa*, *Radulomyces confluens*, *Rigidoporus ulmarius*, *Sarcoscypha coccinea*, *Stereum gausapatum*, *S. hirsutum*, *Trametes versicolor*, *Tremella foliacea* e *Xylaria hypoxylon*.

Many taxa, not exclusive of the *F. sylvatica* woods, i. e. *Amanita rubescens*, *A. pantherina*, *Armillaria mellea*, *Boletus edulis*, *Cantharellus cibarius*, *Clitocybe nebularis*, *Clitopilus prunulus*, *Collybia butyracea*, *C. butyracea* var. *asema*, *C. peronata*, *Cortinarius subfulgens*, *Hypholoma fasciculare*, *H. sublateritium*, *Laccaria amethystina*, *Lactarius piperatus*, *L. vellereus*, *Lepista nuda*, *Lycoperdon perlatum*, *Mycena pura*, *M. rosea*, *Russula foetens*, *Tricholoma saponaceum* and *Xerocomus chrysenteron* contributed to characterize the mycological flora of the areas investigated.

The finding of *Amanita ceciliae*, *Helvella solitaria* (Fig. 4) and *Macrotyphula fistulosa* (Fig. 5) is particularly interesting. The first two species are recorded for the first time for Italy in the beech-woods, while *M. fistulosa* was recorded up to present time only for Liguria by Orsino & Dameri (1996) and by Napoli (1995) in an ilex-wood of Nebrodi Mts (N. Sicily).
