

# *Stellaria media*

## Common chickweed

### Introduction

The genus *Stellaria* contains approximately 190 species, occurring primarily in the temperate regions. Sixty-four species have been reported in China<sup>[12]</sup>.

### Taxonomy

Order: Centrospermae  
 Suborder: Caryophyllineae  
 Family: Caryophyllaceae  
 Subfamily: Alsinoideae Vierh.  
 Tribe: Alsineae Pax  
 Subtribe: Stellarinae Aschers. et Graebn.  
 Genus: *Stellaria* L.  
 Section: *Stellaria*  
 Subsection: *Stellaria*  
 Series: Petiolares Fenal  
 Species: *Stellaria media* (L.) Cyr.

### Description

*Stellaria media* is an annual or biennial herb that can reach 10-30 cm in height. The stem is light purplish red with one or two rows of hairs on the surface, and procumbent or erect branches at the base. Leaves are broad ovate or ovate, margin entire, 1.5-2.5 cm long and 1-1.5 cm wide, with acuminate or abrupt

UGA1196235

apex and attenuate or subcordate base, lower leaf is petioled. The inflorescence is a terminal cyme. The sepals are, ovate lanceolate, about 4 mm in length, slightly obtuse or suborbicular apically and covered with short glandular hairs outside. Shorter than sepals, each petal is white, oblong, nearly bisected. Shorter than petals, stamens are 3-5 with 3 linear styles. Slightly longer than the persistent calyx, capsules are ovate, 6-lobed apically. The flowers bloom from June to July and followed by fruits in July through August. The plentiful seeds are reddish brown, ovate to suborbicular, nearly compressed, 1-1.2 mm in diameter<sup>[12, 187]</sup>.

stage of crop growth of wheat, rape and some vegetables. It is also poisonous to poultry<sup>[39, 108, 187]</sup>.

### Related Species

*S. media* var. *micrantha* (Hayata) T. S. Liu & S. S. Ying, native to Taiwan, is a perennial herb. Its petals are nearly equal to sepals, which are 2-2.5 mm long, whereas *S. media* var. *media* has longer sepals and shorter petals<sup>[12]</sup>. *S. media* and five additional members of the genus *Stellaria* are regarded as unwelcome plants in China. They are *S. alsine* Grimm, *S. pallida* (Dumortier) Crépin, *S. dichotoma* L., *S. discolor* Turcz., and *S. neglecta* Weihe ex Bluff et Fingerh<sup>[108]</sup>.

### Natural Enemies of *Stellaria*

Eleven fungi and eighteen arthropods have been found on the members of the genus *Stellaria*. Four fungal species are reported to infect *S. media*. One out of seven insects that attack *S. media*, *Hypera basalis* (Voss) is considered to be a potential biological control agent<sup>[116]</sup>.

### Distribution

*Stellaria media* occurs in Anhui, Fujian, Gansu, Guangdong, Guangxi, Guizhou, Hebei, Henan, Hubei, Hunan, Jiangsu, Jiangxi, Jilin, Liaoning, Inner Mongolia, Ningxia, Qinghai, Shaanxi, Shandong, Shanxi, Sichuan, Xizang, Yunnan, and Zhejiang provinces<sup>[12, 187]</sup>.

### Economic Importance

Although the stems, leaves and seeds of *S. media* are reported to be medically useful and edible, *S. media* is a bothersome weed during the early through middle

## Species of *Stellaria* in China<sup>[12, 187]</sup>
