

# The GeoNet project: Combination of IPv6 & GeoNetworking

*Geographic addressing and routing for vehicular communications*  
*<http://www.geonet-project.eu>*

**Dr. Thierry Ernst** INRIA – Mines ParisTech (LaRA)  
GeoNet Technical Coordinator

# Why IPv6 GeoNetworking ?

- V2V: **GeoNetworking** is the addressing & routing packet forwarding approach favored in ITS communication architectures

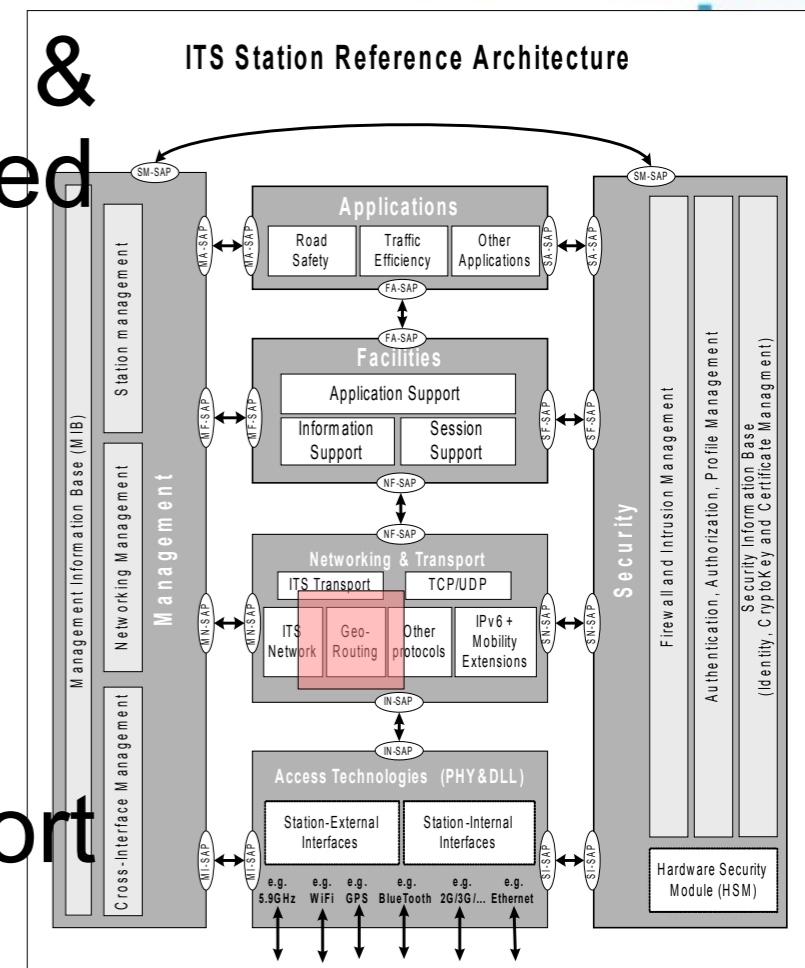

- ◆ C2C-CC
- ◆ COMeSafety
- ◆ ETSI TC ITS
- ◆ ISO TC204 WG16 (CALM)

- ITS Architectures must also support **Internet-based communications**

- ◆ **IPv6**: Internet Protocol version 6

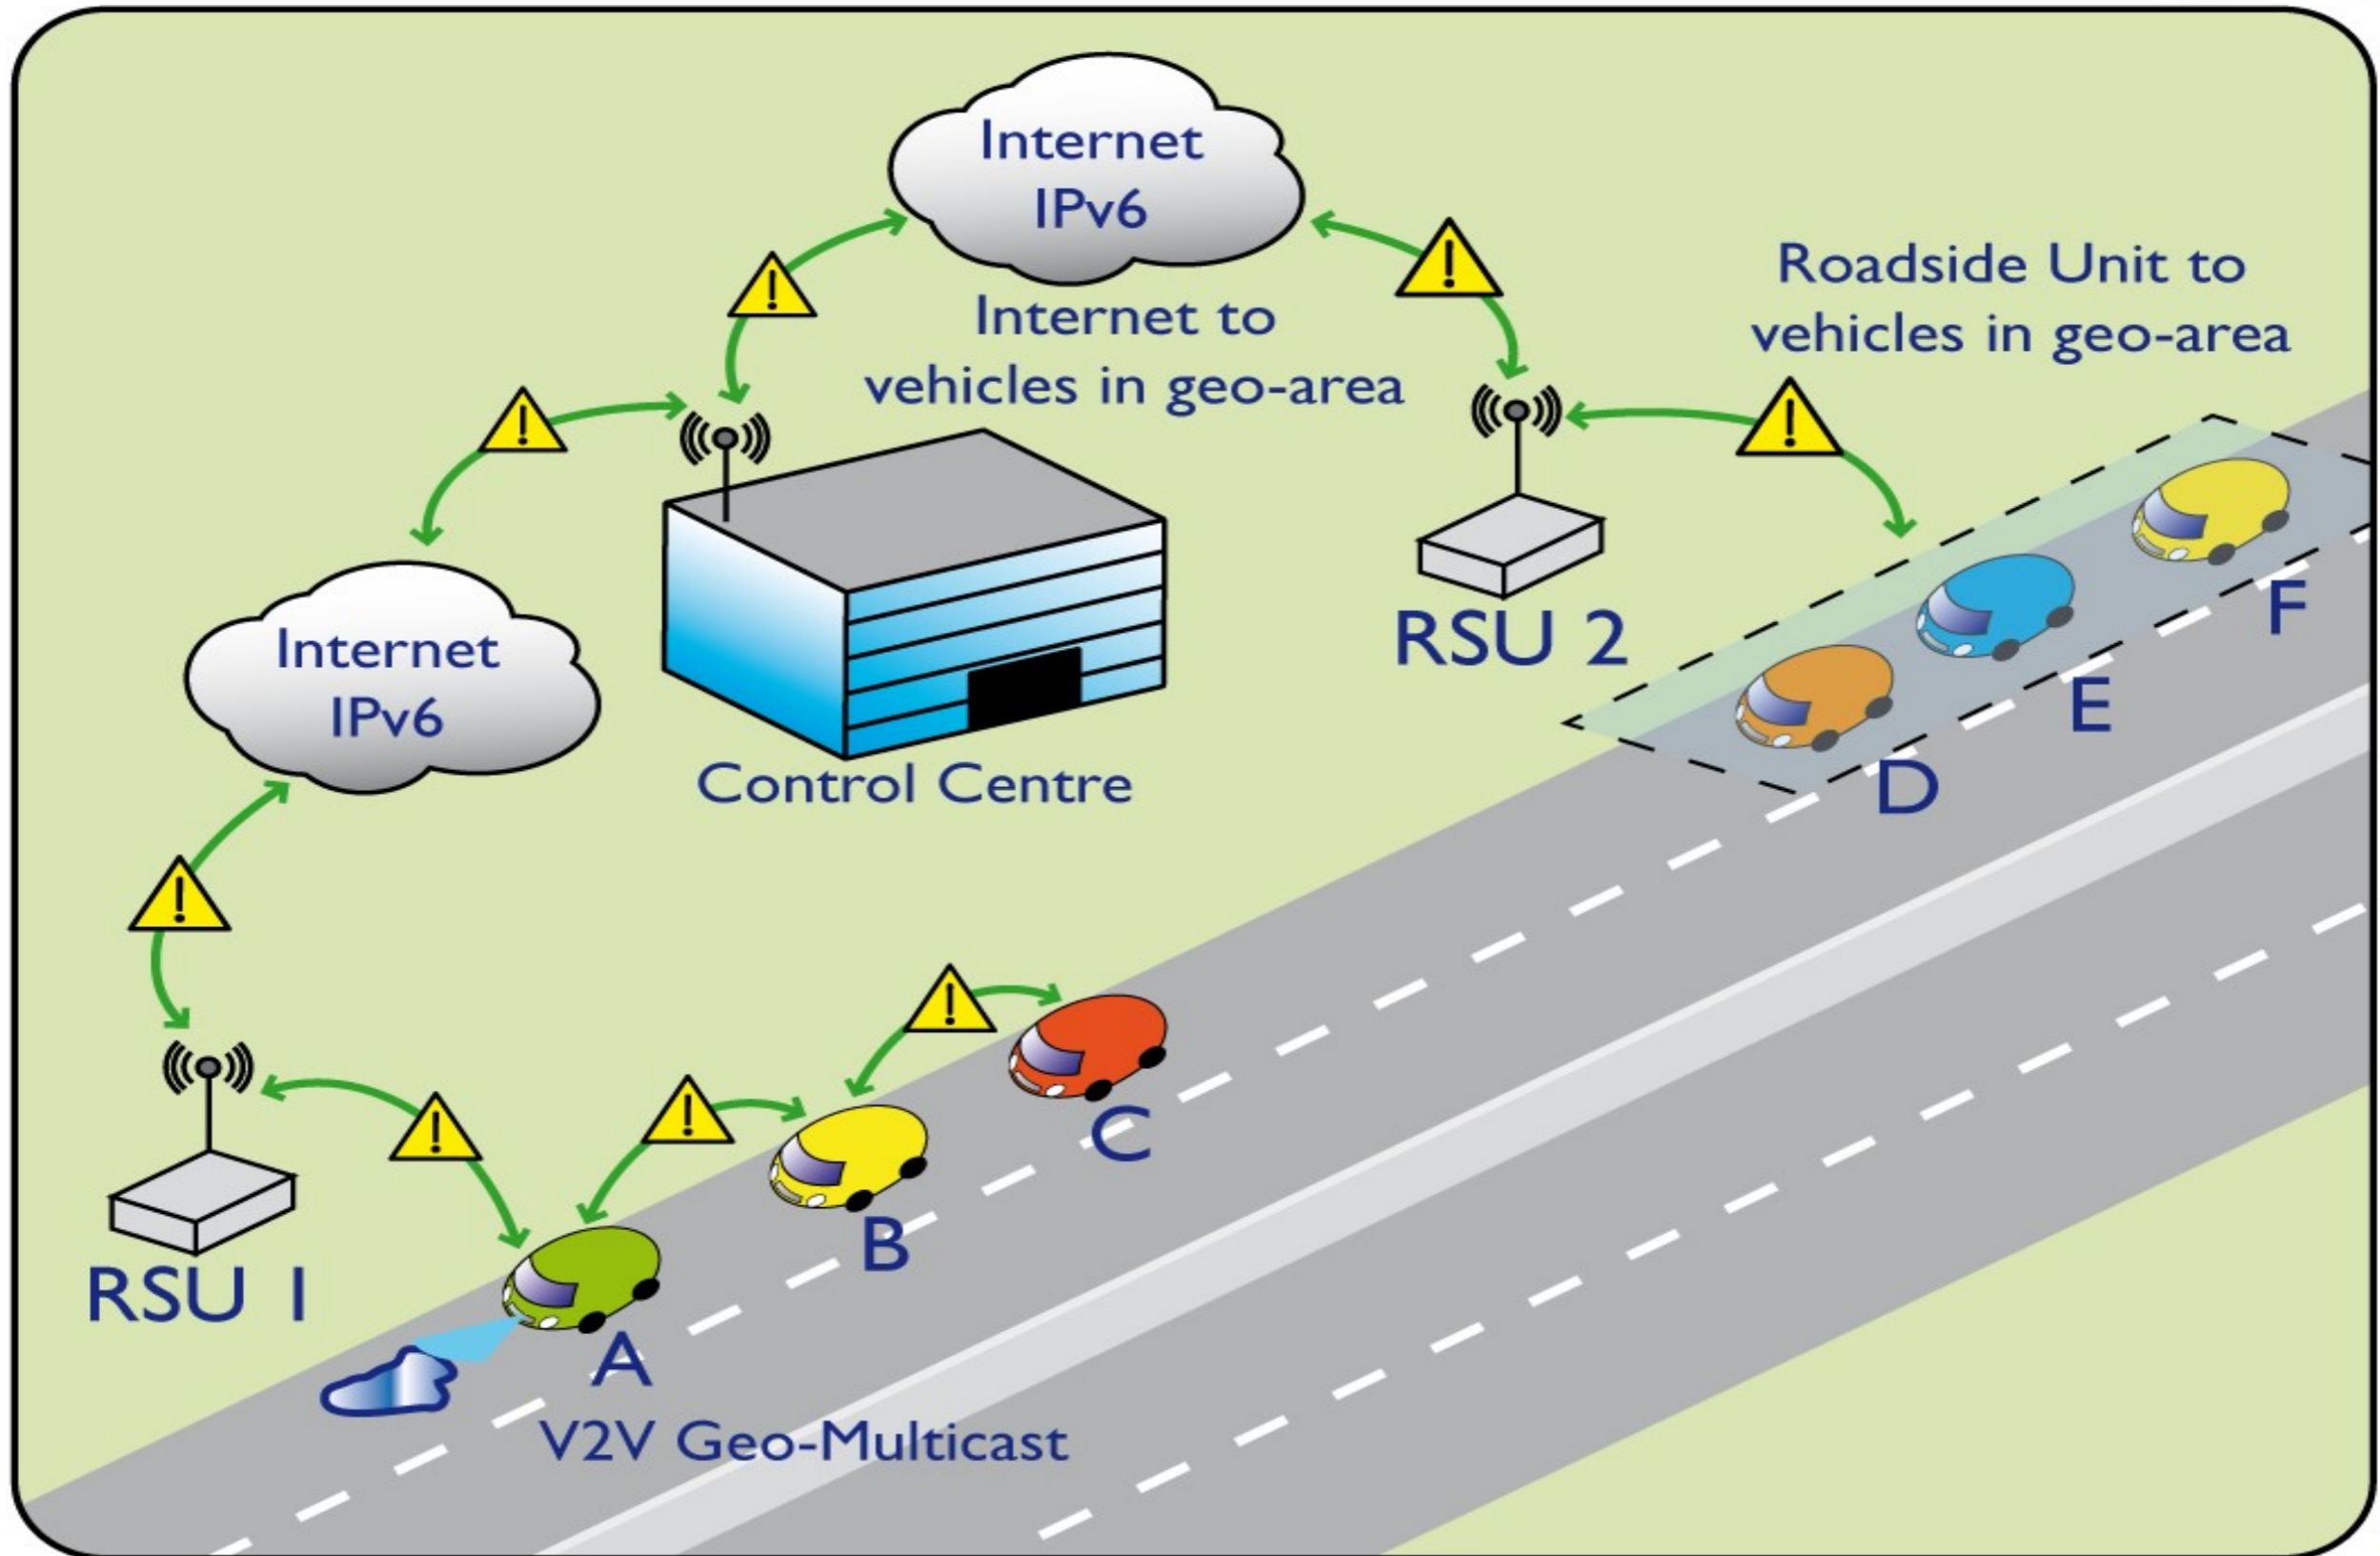

- GeoNet: **IPv6** and **GeoNetworking** must be combined in a common architecture

- ◆ **IPv6** expands the capabilities of GeoNetworking
- ◆ **GeoNetworking** expands the capabilities of IPv6

*ITS Station*

# Why IPv6 GeoNetworking ?

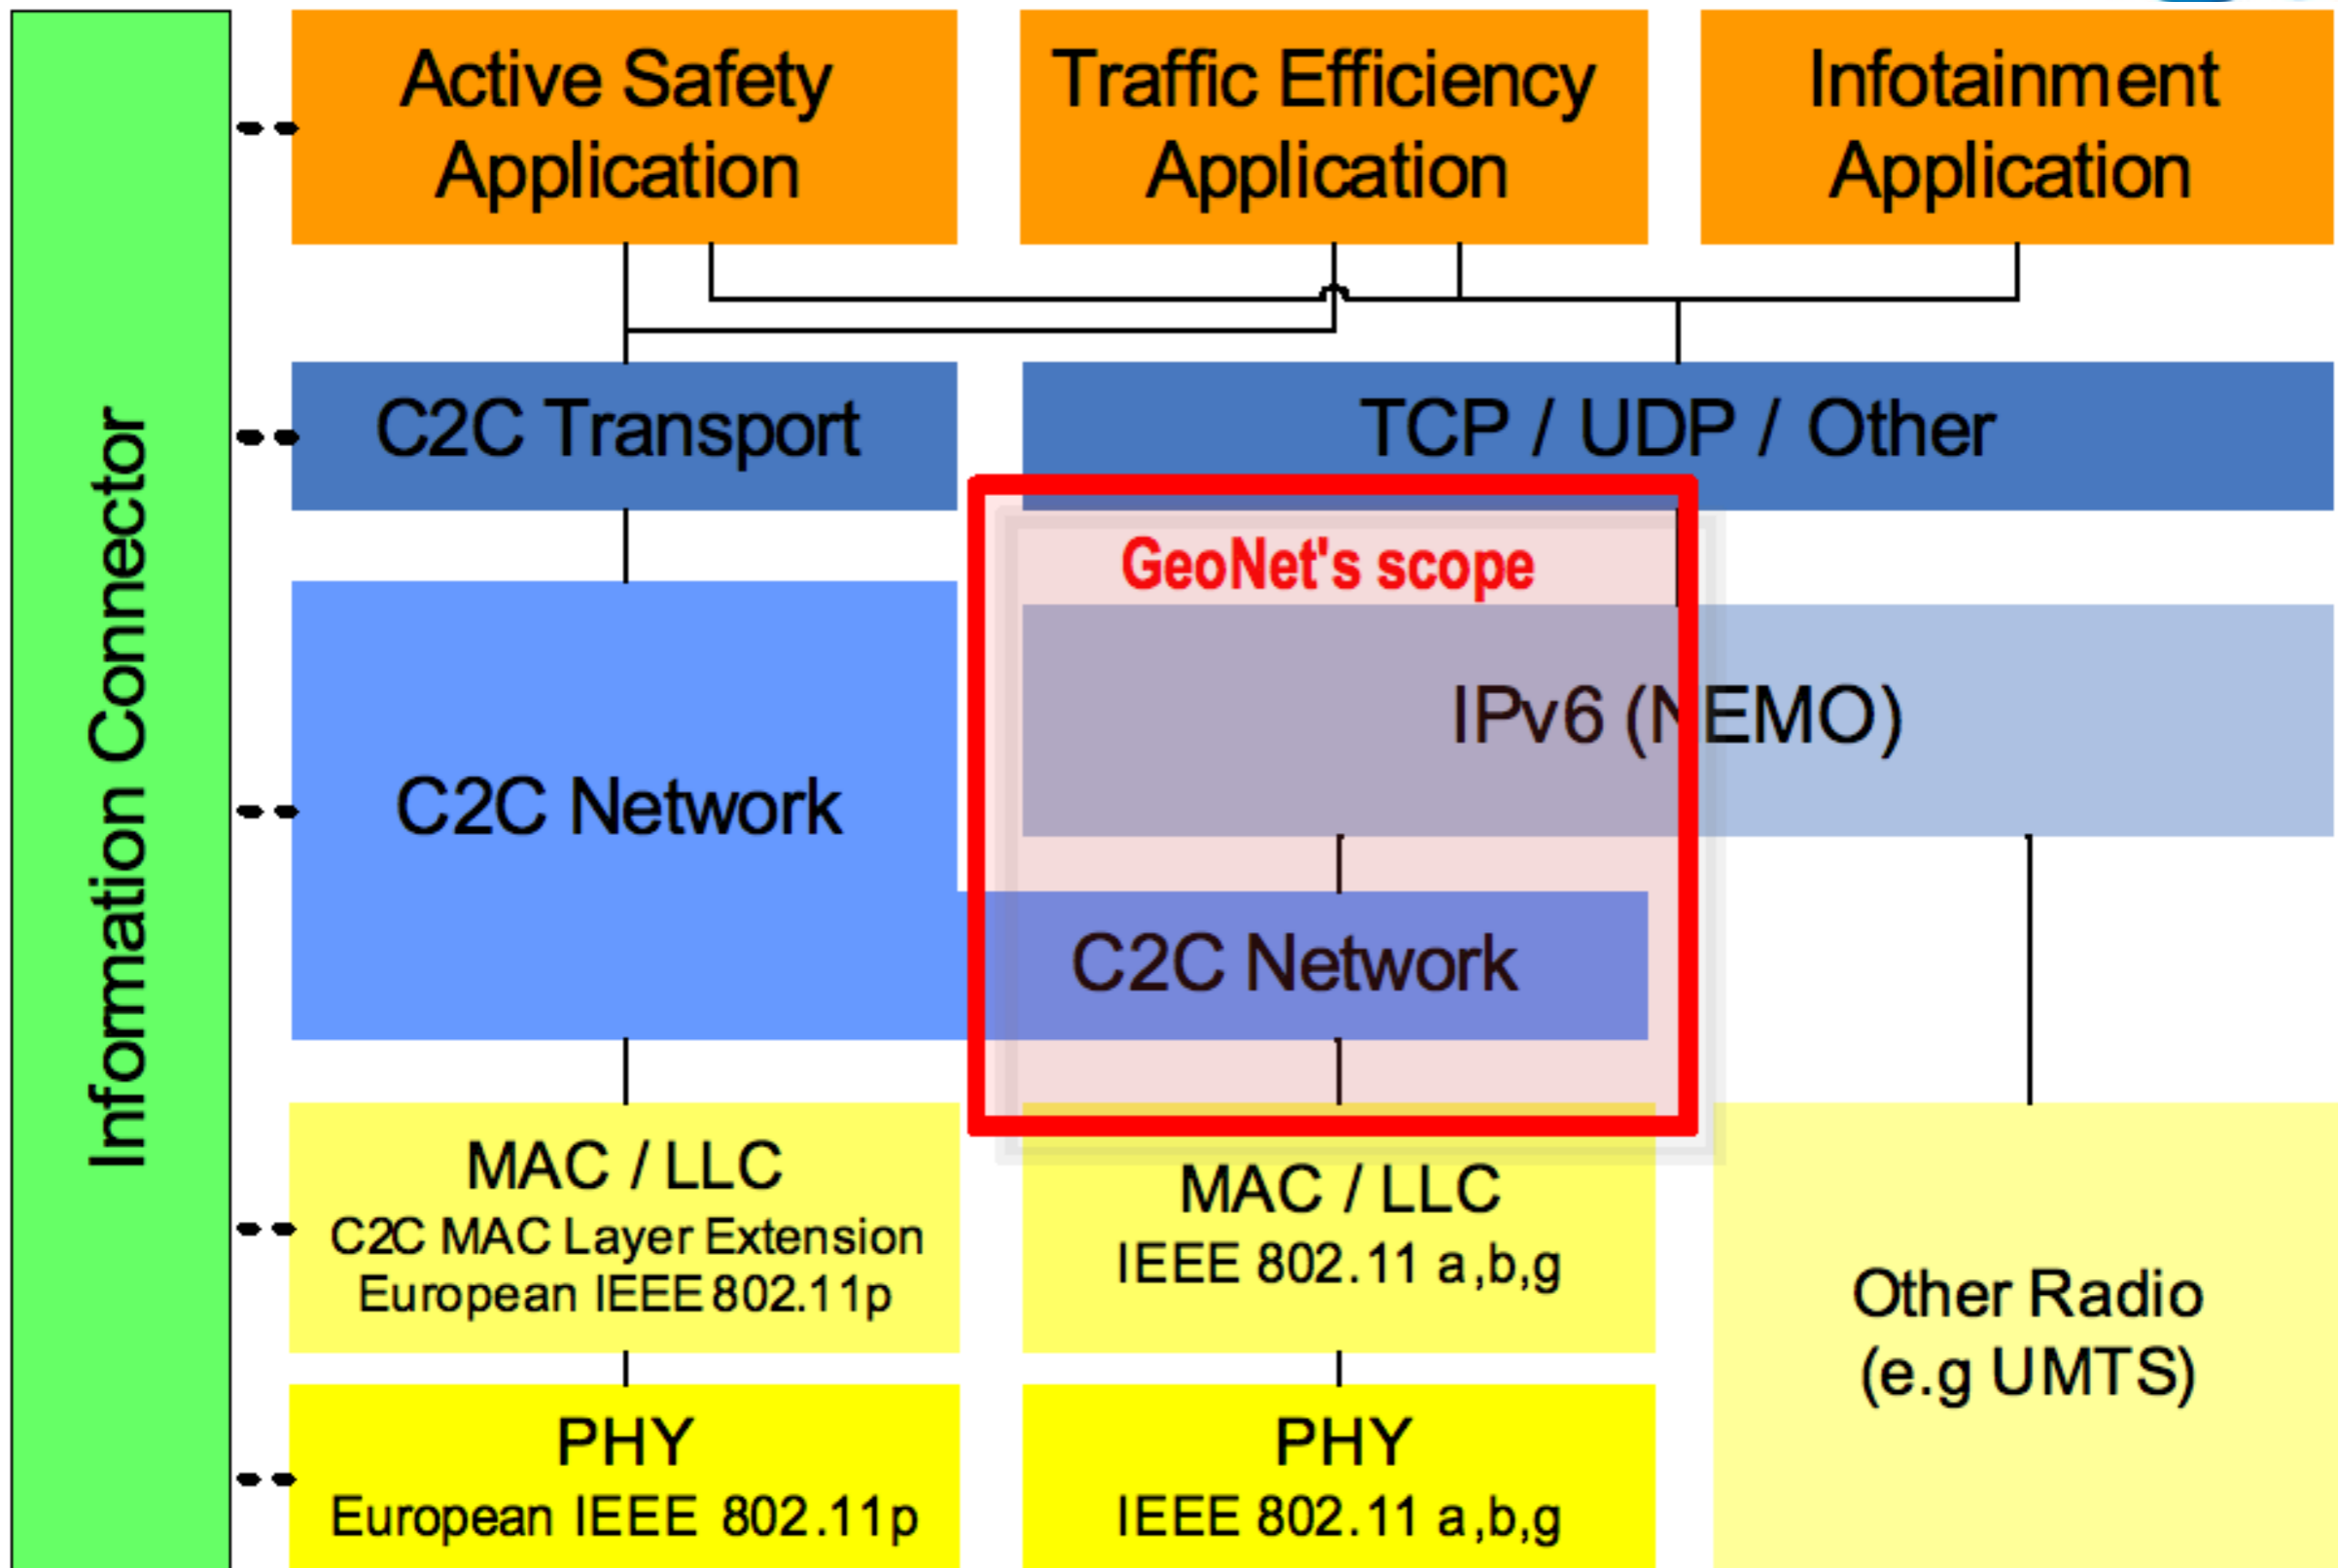

# Why IPv6 ?

- IPv4 does not fit to ITS requirements
  - ◆  $2^{32} = 4,294,967,296$  addresses only
  - ◆ IPv4 address exhausted by 2011 / 2012
- IPv6: an evolution of IP
  - ◆ New IP header
  - ◆ Fully specified, implemented - operational deployment started
- IPv6 addressing
  - ◆ 128 bits instead of 32 ( $2^{128}$  addresses instead of  $2^{32}$ )
  - ◆ Up to 3 911 873 538 269 506 102 addresses /  $m^2$
  - ◆ An address for everything on the network
- IPv6 comprises new features absolutely needed for ITS
  - ◆ Auto-configuration
  - ◆ IP session continuity (NEMO)
  - ◆ Multiple wireless media supported at once (McoA)
  - ◆ Enhanced security
  - ◆ Embedded multicast

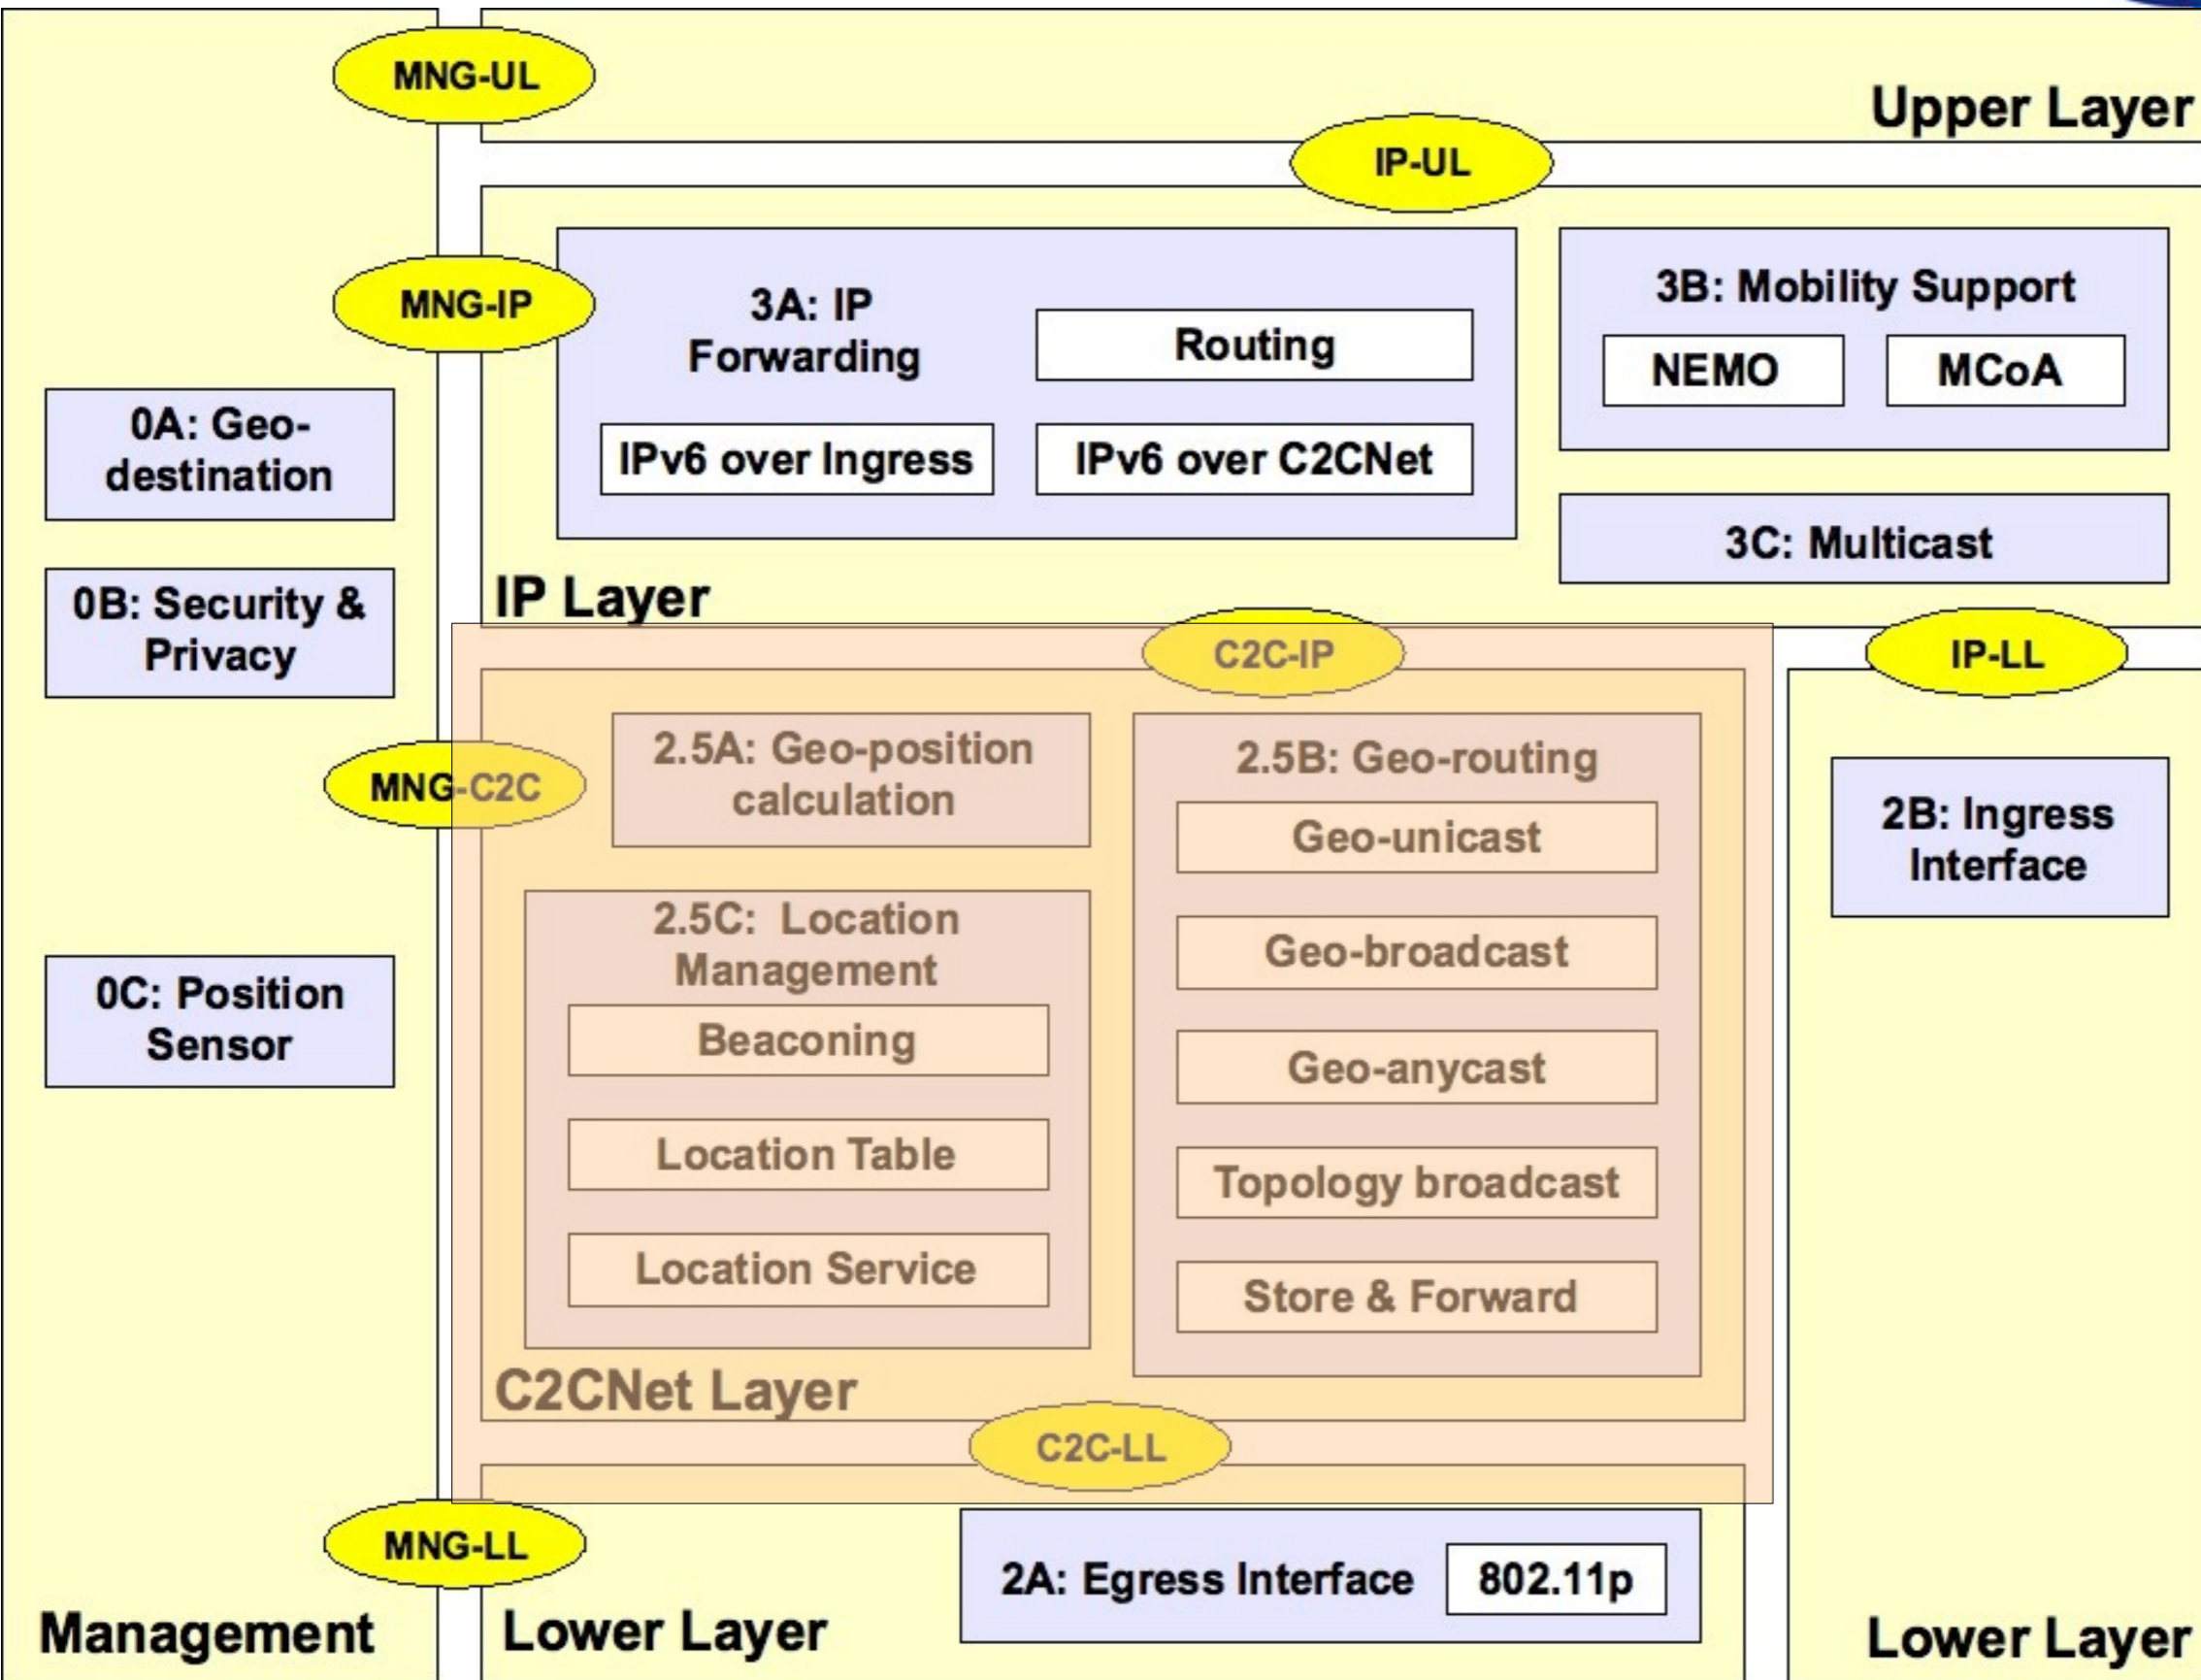

# GeoNet: Scope

# GeoNet: Functional Modules

# GeoNet: C2CNet Layer

# GeoNet: C2CNet GeoNetworking

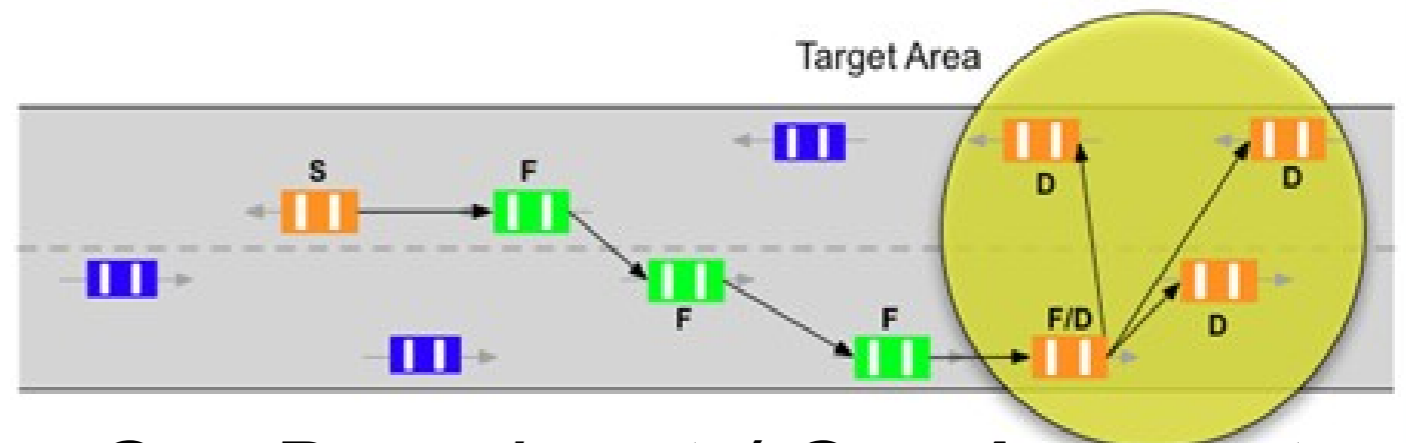

## ▪ Packet forwarding

- **GeoUnicast**: from one node to a single node
- **GeoAnycast**: from one node to any node in area
- **GeoBroadcast**: from one node to all nodes in area
- **TopoBroadcast**: from one node to all nodes n-hop away
- Message buffering (with GeoNetwork triggered re-evaluation)

*GeoUnicast*

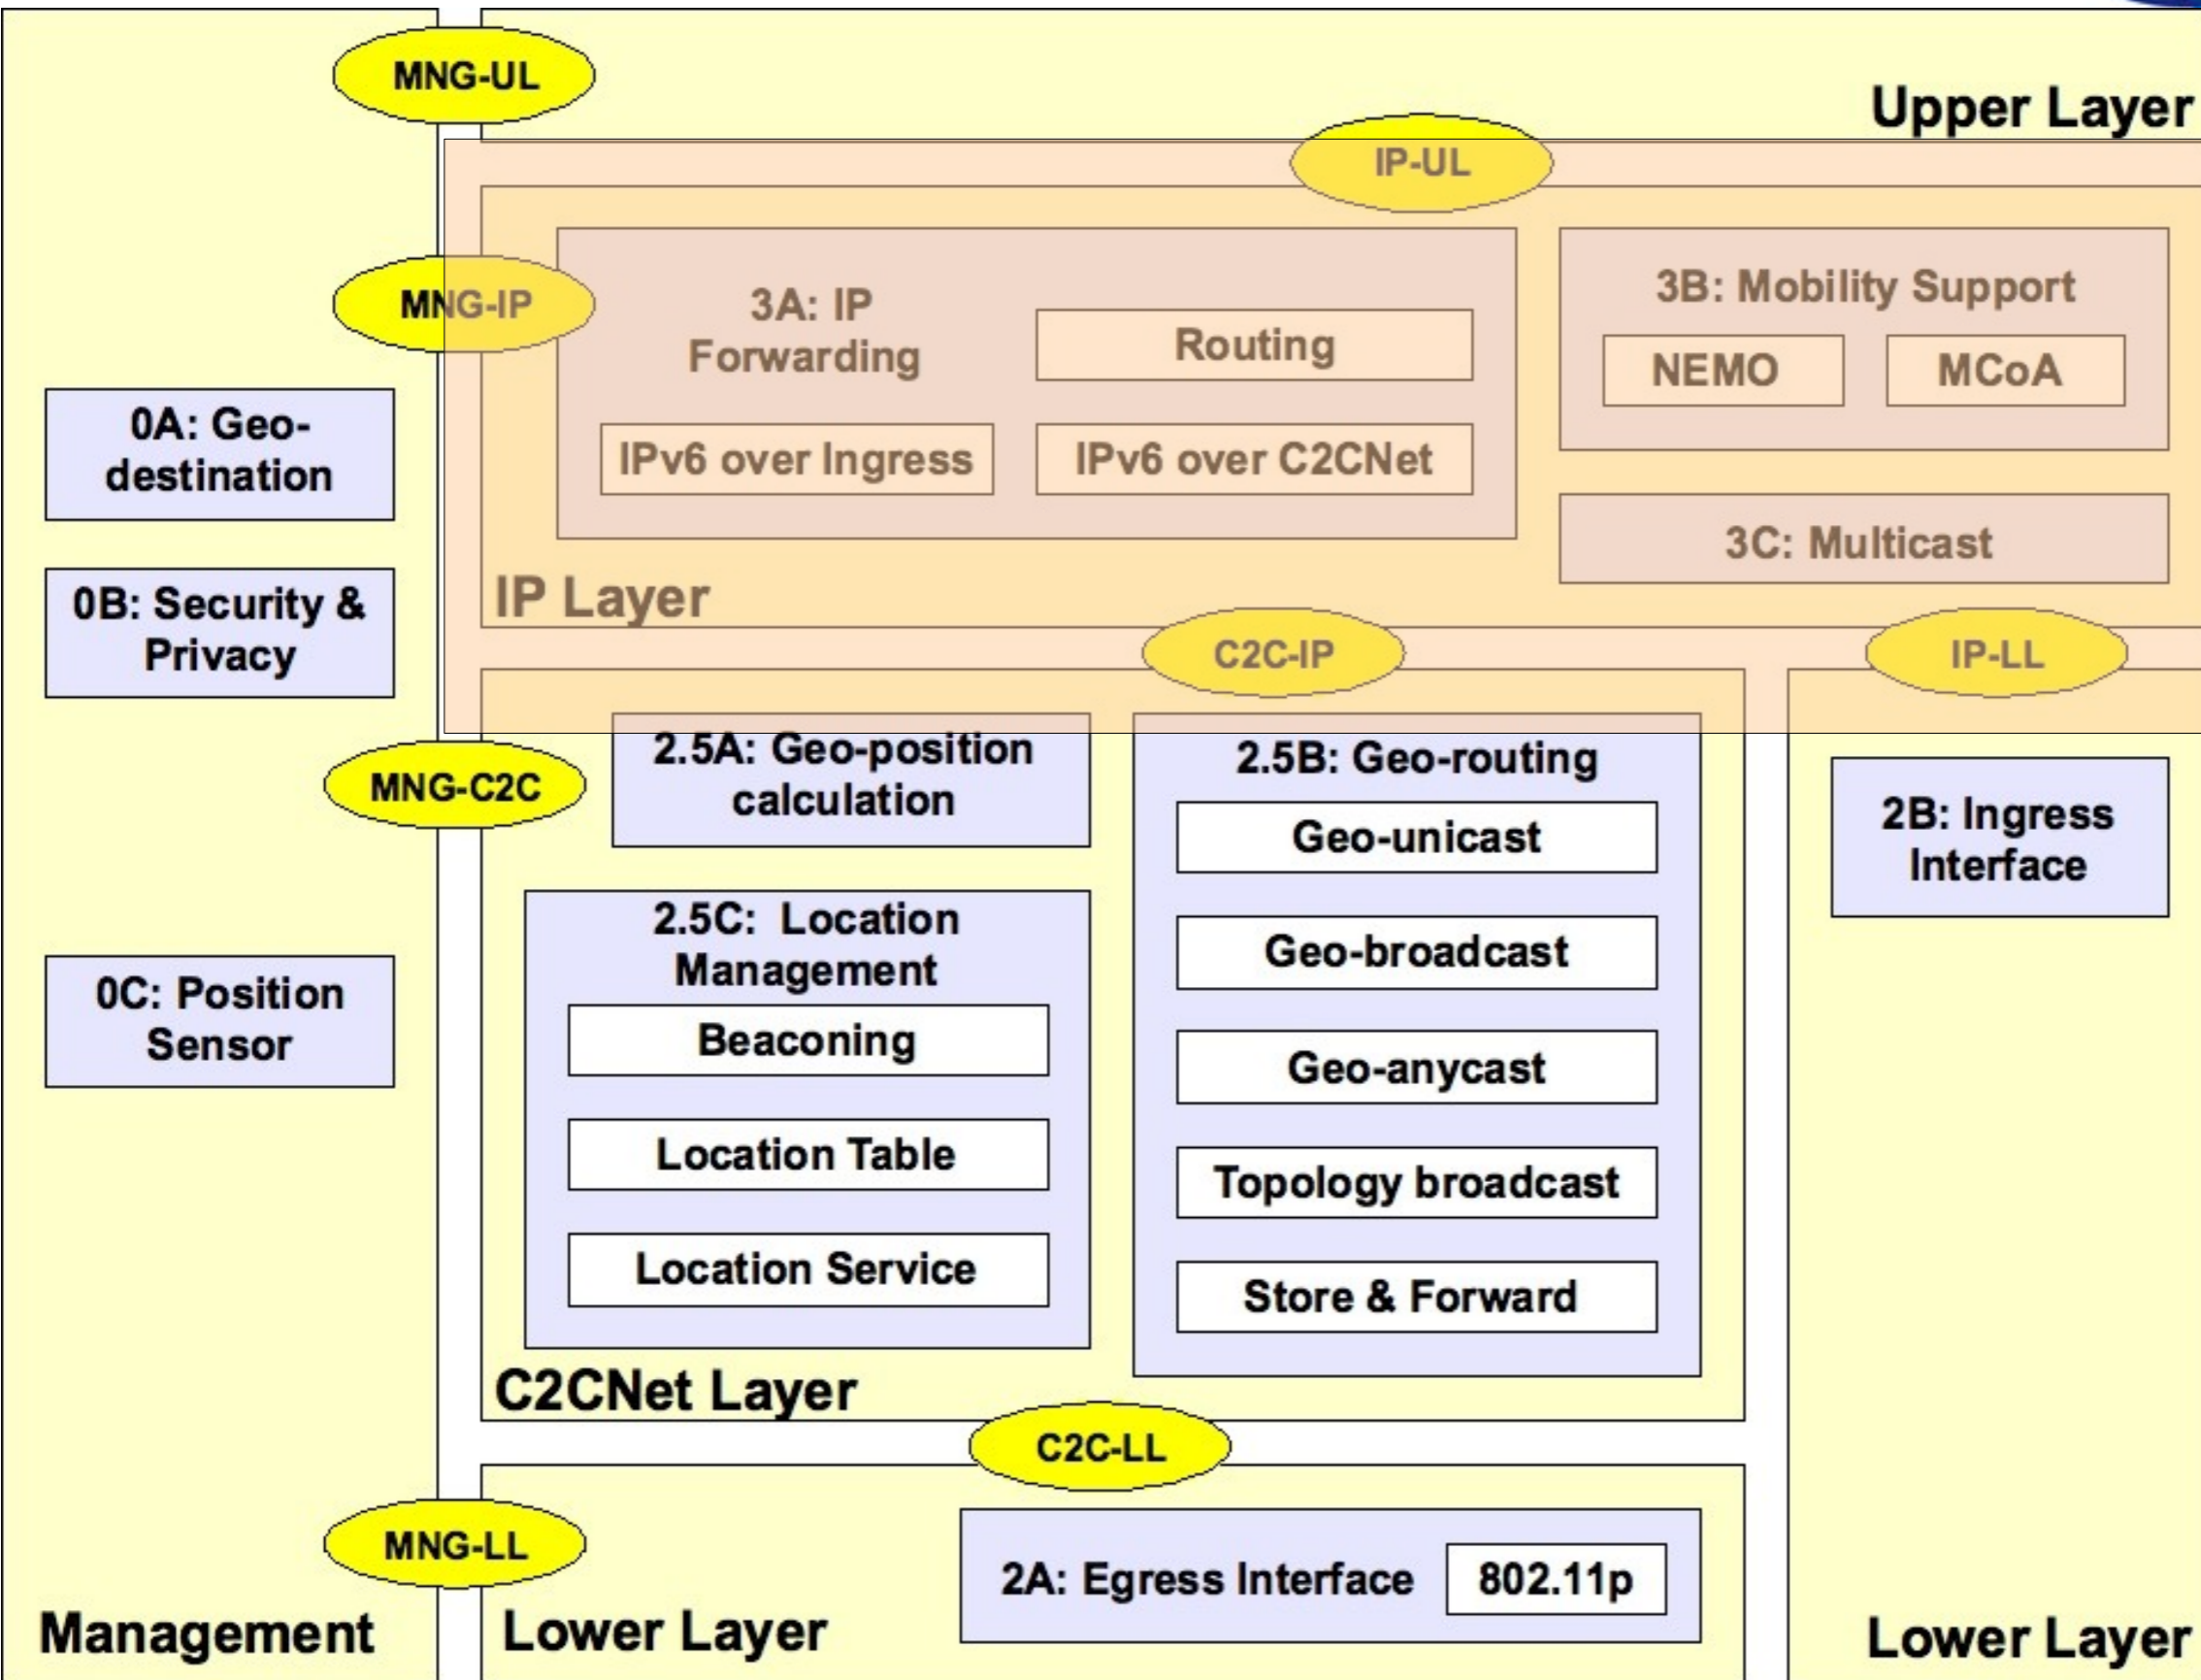

*GeoBroadcast / GeoAnycast*

## ▪ Location management

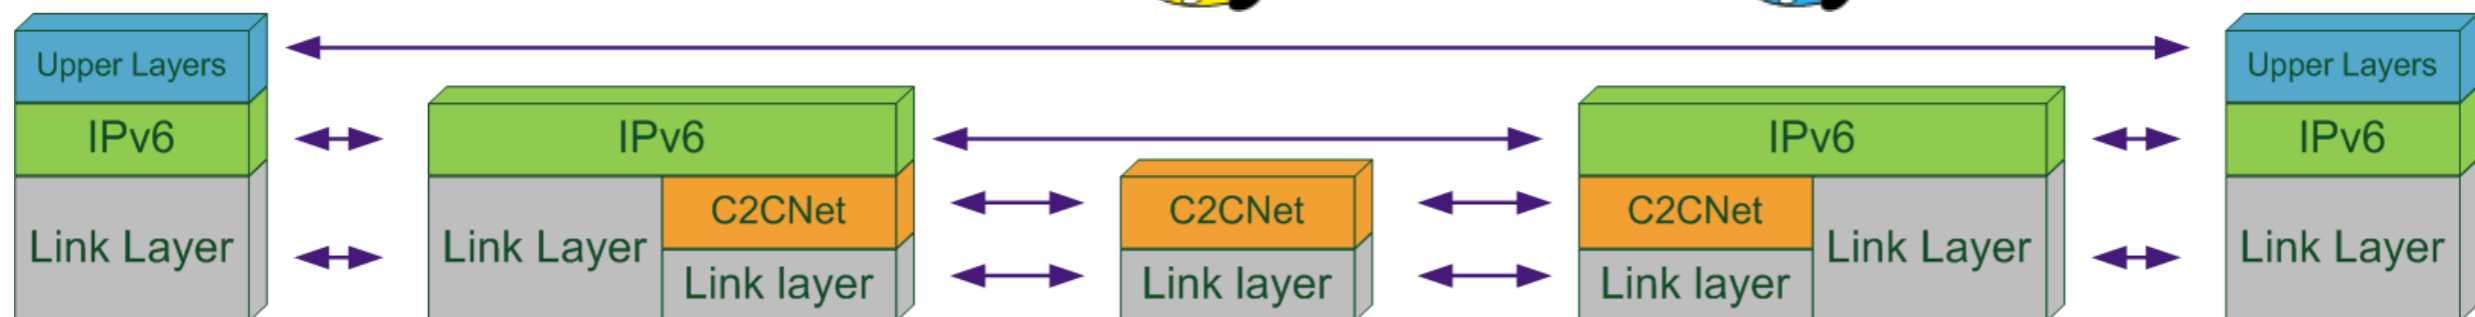

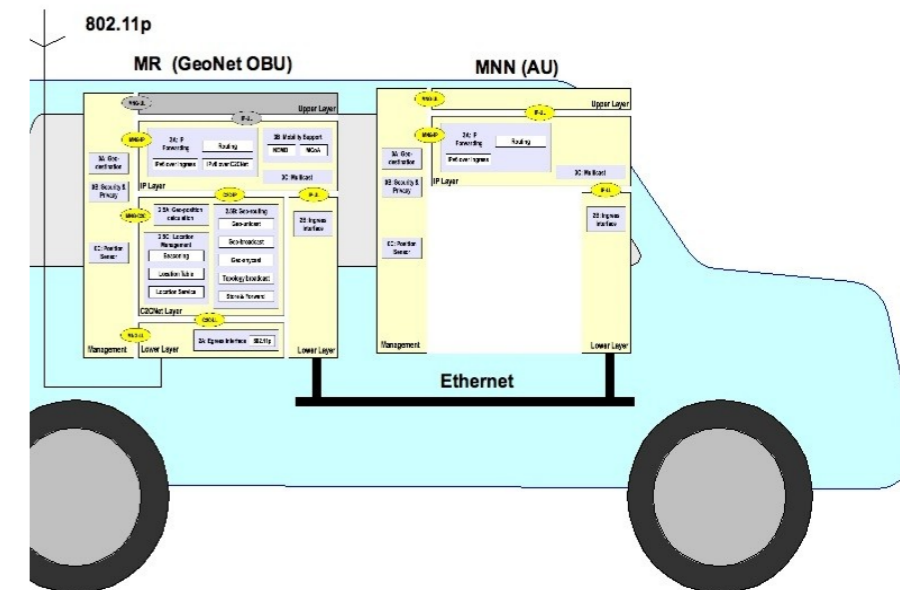

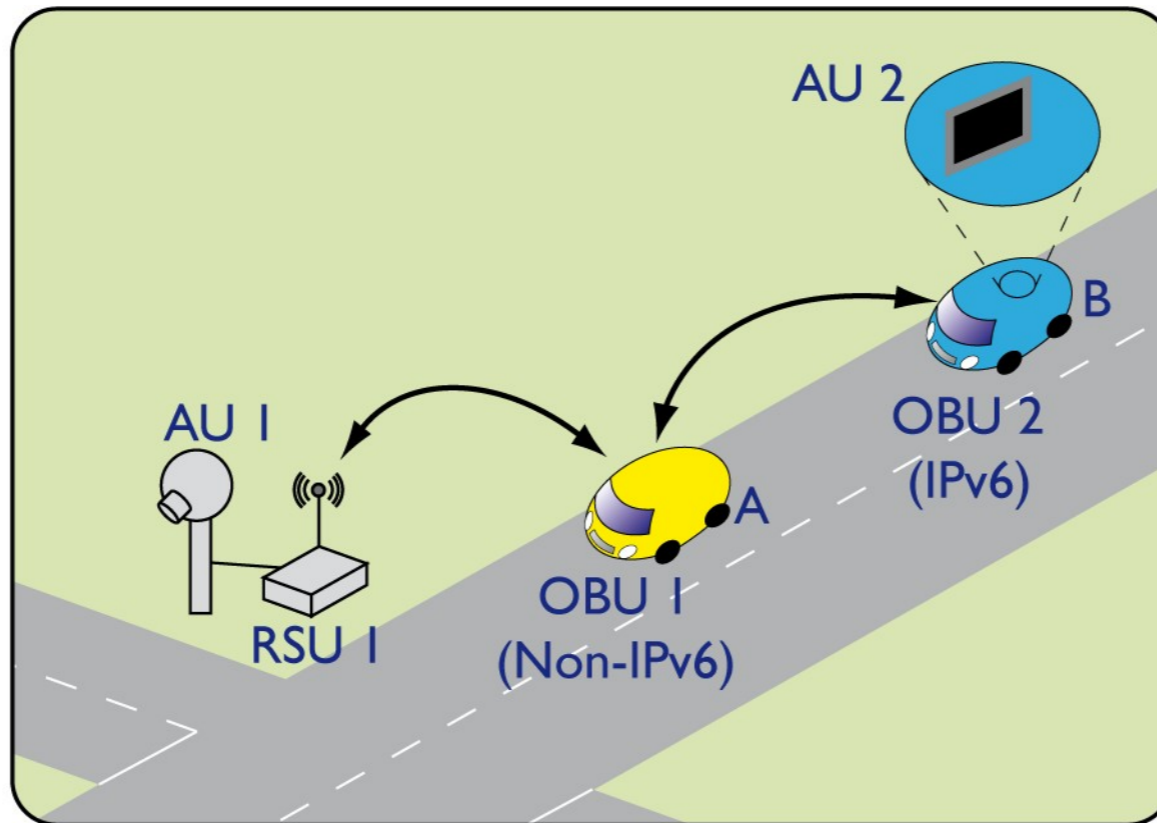

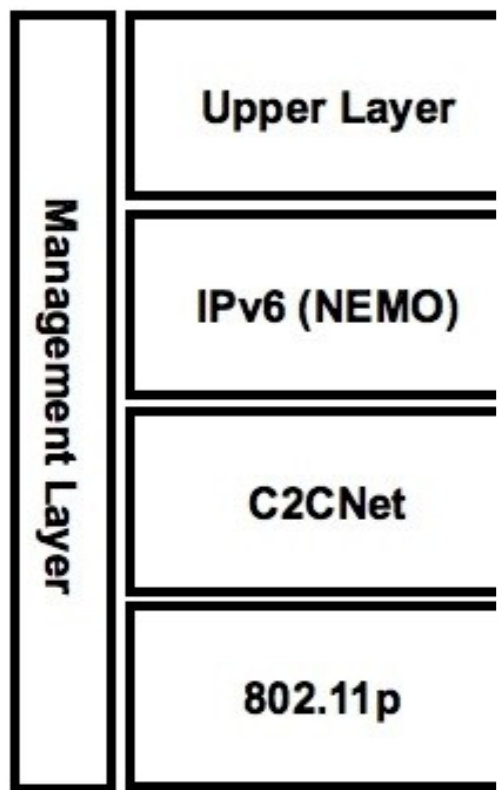

- Beacons (periodic single-hop broadcast)
- Location Table
- Location Service (lookup of unknown destinations)

# GeoNet: IP Layer

# IPv6 over C2CNet

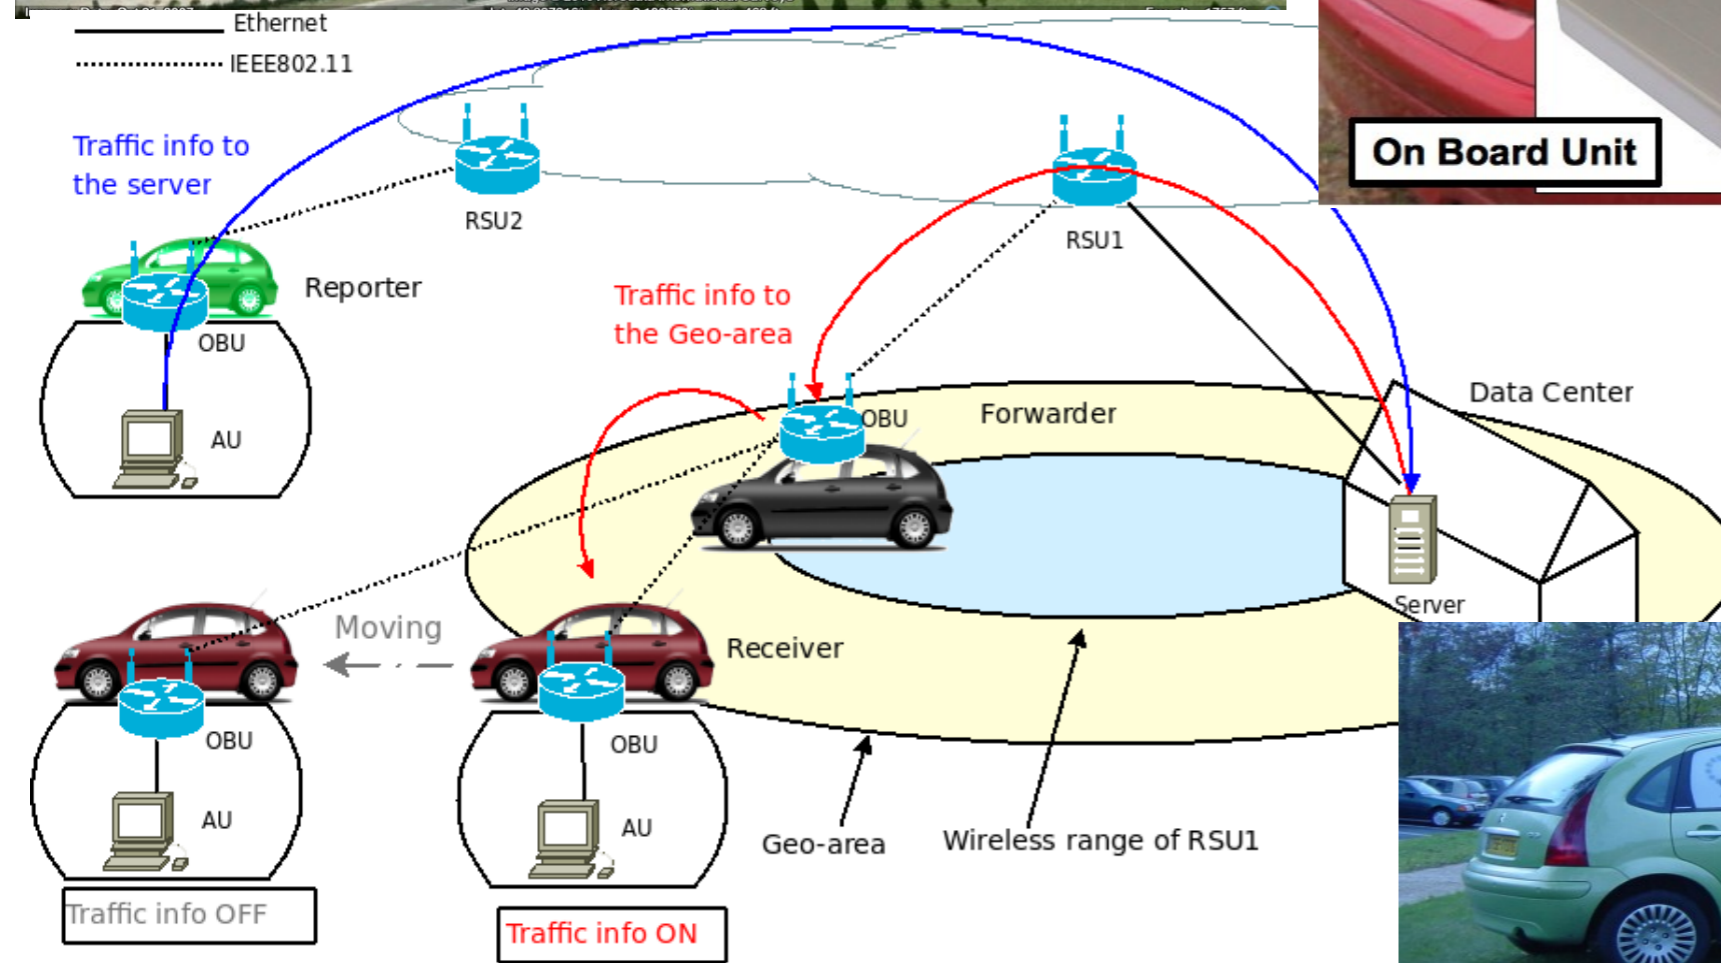

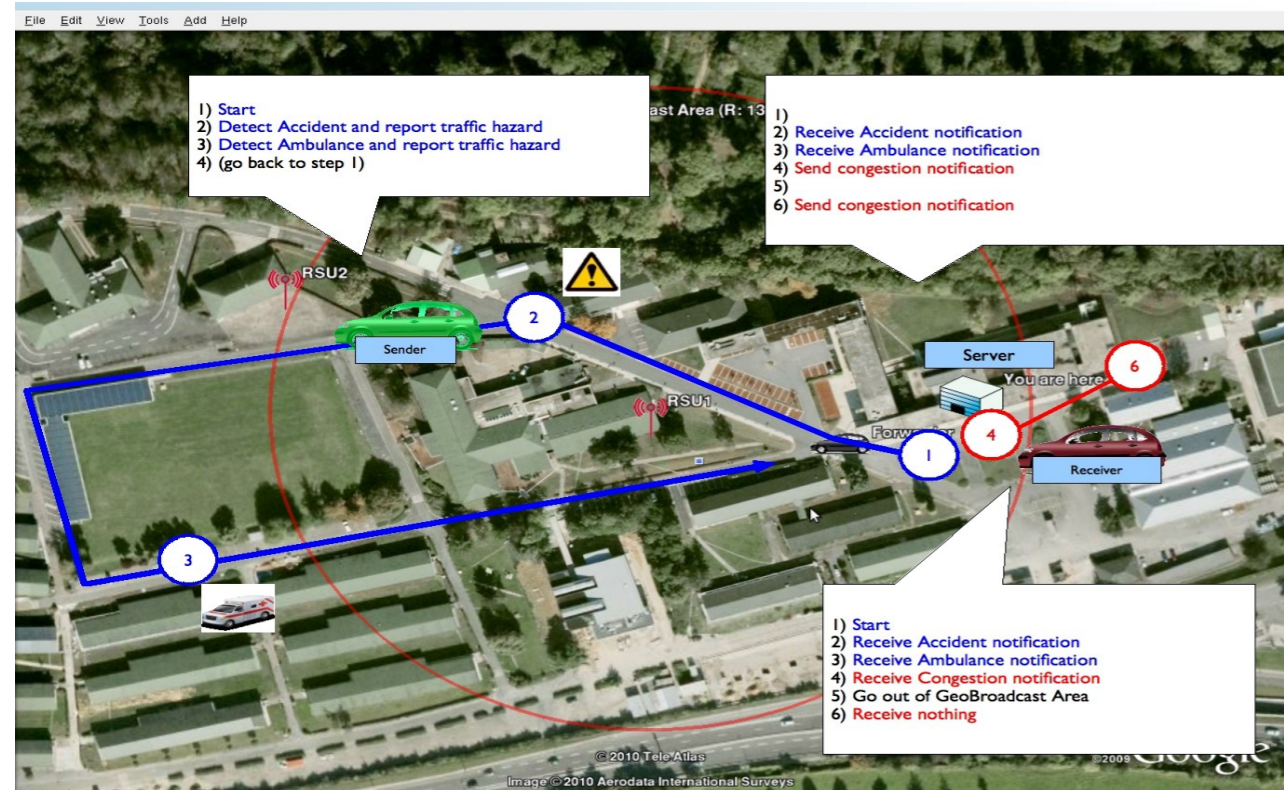

- **IPv6 C2CNet link:** viewed as virtual link with GeoNetworking capabilities

# GeoNet: Management Layer

# GeoNet: Workshop Demo

# GeoNet: Summary

- IPv6 + GeoNetworking = Enabling technology for better:
  - ◆ Road safety
  - ◆ Traffic efficiency
  - ◆ Value added services
  
- Well supported at time of set-up
  - ◆ C2C-CC, SafeSpot, Coopers, CVIS
  
- Status
  - ◆ 1 reference specification
  - ◆ 2 prototype implementations (Linux 2.6 / UMIP)
  - ◆ Experimentation on a fleet of 4 vehicles
  - ◆ Conformance tests: TTCN-3
  - ◆ Emulation with NCTUns
  - ◆ CVIS selected as the target platform
  
- Effective dissemination in SDOs (ISO, ETSI, IETF)

# Thank you for your attention

*Most deliverables are public and will be available on*

<http://www.geonet-project.eu>

Dr. Thierry Ernst INRIA – Mines ParisTech (LaRA)  
GeoNet Technical Coordinator

ETSI ITS Workshop – February 2010 – Sophia-Antipolis

# GeoNet Fact Sheet

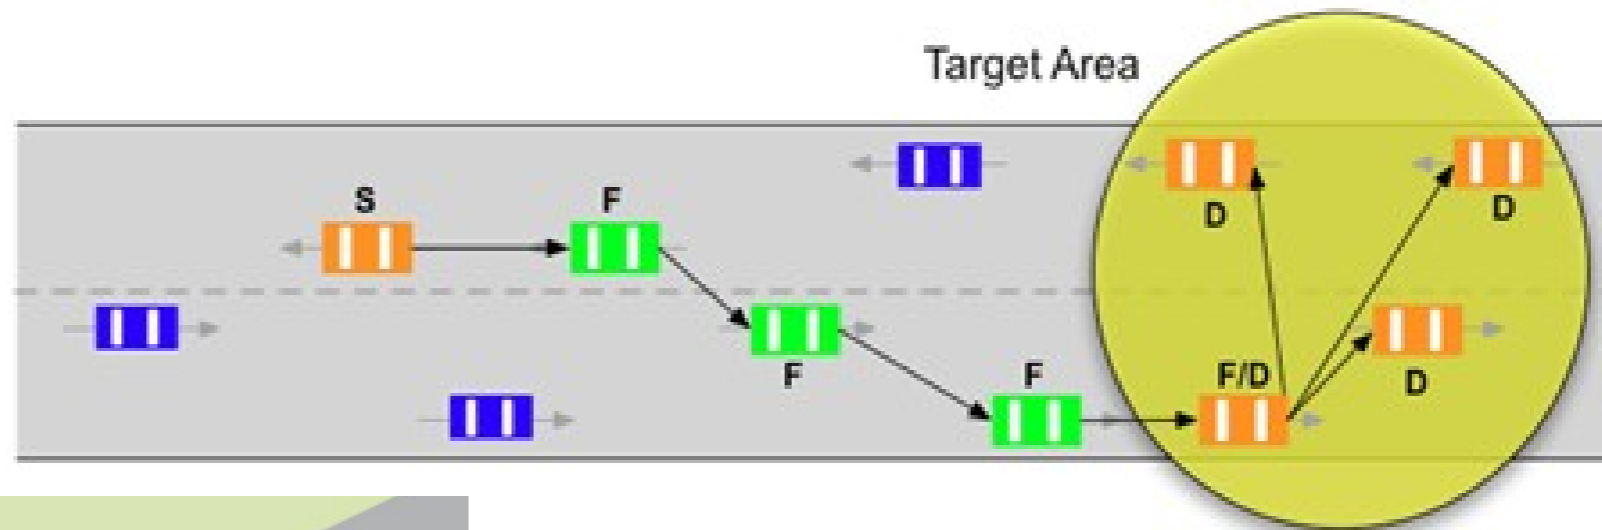

- Feb. 2008 – Jan. 2009
- Budget: 3 M€
- Funding: 1.9 M€
- 7 partners
  - ♦ 2 Research Institutes ([INRIA](#) and IMDEA)
  - ♦ 1 SME (Broadbit)
  - ♦ 4 industrial partners (Hitachi, NEC, Lesswire & Eikon)
- Web: <http://www.geonet-project.eu>
  - ♦ News, deliverables, presentations
- Objective: Design the concepts linking geographic addressing and routing with IPv6 mobility mechanisms ([IPv6 GeoNetworking](#))

- 3 main axes:
  - ♦ **Knowledge:** elaborate a unified IPv6 GeoNetworking architecture compliant with best practices in vehicular communications;
  - ♦ **Standards:** produce a [reference IPv6 GeoNetworking specification](#) and push it to SDOs (ISO, ETSI, IETF);
  - ♦ **Software:** produce two [prototype implementations](#) and disseminate it to existing consortia (particularly SafeSpot, [CVIS](#), COOPERS and C2C-CC).

# Why GeoNetworking ?

**Position Table**

ID	Position
2	[5,0]
4	[10,0]
5	[12,1]

Destination 6 at [15,1] Source 1 at [0,0]

# Why IPv6 GeoNetworking ?

- GeoNet: scenarios requiring both IPv6 and geonetworking
- Scenario Type 1: **sender is in the Internet**
  - ♦ Packets are transmitted in IPv6 until the RSUs serving the geographic area where they are GeoRouted through intermediate vehicles to the final destination(s).
- Scenario type 2: **receiver is in the Internet**
  - ♦ Packets are GeoRouted through intermediate vehicles (using GeoUnicast) until a RSU where they are transmitted in IPv6 to the final destination.
- Scenario type 3: **sender and receiver(s) are only reachable through the Internet**
  - ♦ Combination of Scenarios Type 1 & 2 where source and destination(s) are out of multi-hop wireless range

# GeoNet: Design Goals (D1.2)

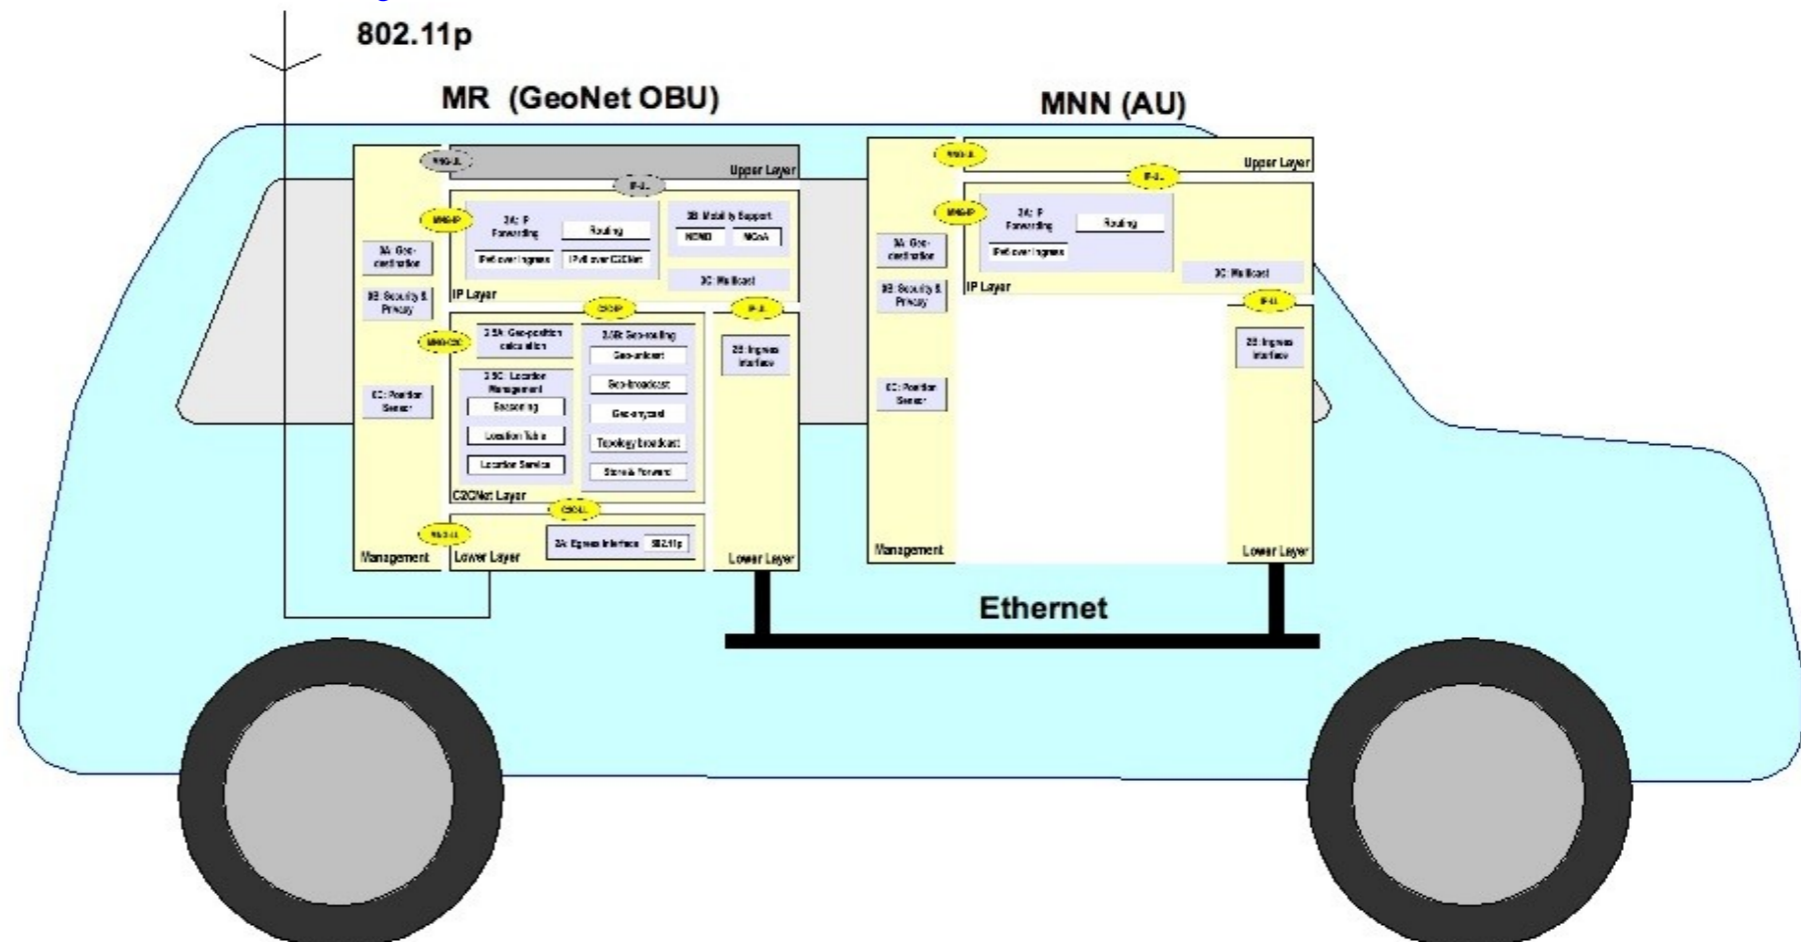

- Architecture combining IPv6 and GeoNetworking
- Communication modes
  - ♦ **Vehicle-based**: without infrastructure (V2V)
  - ♦ **Roadside-based**: with roadside infrastructure (V2I)
  - ♦ **Internet-based**: with the Internet
- Destination set
  - ♦ Single destination
  - ♦ Multiple destinations
- Preserve security and location privacy
- Compatibility and interoperability

# Why IPv6: address requirements

- Vehicles will be connected to the Internet
- In-vehicle IP network => **Several IP addresses / vehicle**
- Number of cars worldwide
  - ◆ 1997: 600 millions
  - ◆ 2030: 1200 millions (at present trend)
- IPv4 does not fit to ITS requirements
  - ◆  $2^{32} = 4,294,967,296$  addresses only
  - ◆ **IPv4 address exhausted by 2011 / 2012**

- Most deliverables are public and will be uploaded as soon as they are completed (this month)
  - ♦ Check <http://www.geonet-project.eu>
  
- D1.2 Final GeoNet Architecture Design
  - ♦ [http://www.geonet-project.eu/?download=GeoNet-D1.2-architecture\\_design.pdf](http://www.geonet-project.eu/?download=GeoNet-D1.2-architecture_design.pdf)
  
- D2.2 Final GeoNet Specification
  - ♦ [http://www.geonet-project.eu/?download=GeoNet-D2.2-final\\_specification.pdf](http://www.geonet-project.eu/?download=GeoNet-D2.2-final_specification.pdf)
  
- GeoNet Final Workshop
  - ♦ <http://www.geonet-project.eu/?p=223>

# GeoNet: IPv6 Layer

- IPv6 is not **Geo-Aware**
  - ♦ How IPv6 packets could be transmitted to a destination(s) in a specific geographic location ?
- GeoNet relies on **IPv6 multicast**
  - ♦ Several GeoDestination – IP Group ID encoding approaches
- GeoNet hides GeoNetworking from the IP layer
  - ♦ Enhancements required at the IP layer for **location privacy** (pseudonyms) & direct **V2V** (MNP exchange)
- GeoNet complies with **ETSI** and **ISO** architectures
  - ♦ **NEMO** is used to guarantee reachability at a permanent address and maintaining sessions
  - ♦ The Mobile Router entity at the OBU manages the connectivity on behalf of all the in-vehicle nodes

- Progress work items in SDOs
  - ♦ ETSI: GeoNetworking (TS 102-636-4-1)
  - ♦ ETSI: IPv6 GeoNetworking (TS 102-636-6-1)
  - ♦ ISO CALM
  
- Validation in Field Operational Tests (FOTs) needed
  
- Expand the architecture / specification
  - ♦ Tighter integration of IPv6 & GeoNetworking: Position aware IP applications / GeoDestination encoding within IPv6 multicast
  - ♦ IP-layer security & QoS
  - ♦ Transport layer
  - ♦ Congestion control

# Why IPv6 ?

- **IPv6**: Internet Protocol version 6
  - ◆ Designed by the IETF since 1995 as a replacement of IPv4
- IPv6 is an **evolution of IP**
  - ◆ New IP header
  - ◆ Fully specified, implemented - operational deployment started
- IPv6 addressing
  - ◆ 128 bits instead of 32 ( **$2^{128}$  addresses instead of  $2^{32}$** )
  - ◆ Up to 3 911 873 538 269 506 102 addresses / m<sup>2</sup>
  - ◆ An address for **everything on the network**
- IPv6 comprises **new features absolutely needed for ITS**
  - ◆ Auto-configuration
  - ◆ IP session continuity (**NEMO**)
  - ◆ Multiple wireless media supported at once (**McoA**)
  - ◆ Enhanced **security**
  - ◆ Embedded **multicast**
