

SAS™ RSVAlert Test

CLIA
WAIVED

► **CPT Code:**
87807/87807QW*

► **Sensitivity:**
97%

► **Specificity:**
98%

► **Specimen:**
Nasal Pharyngeal
Washes/Aspirates
& Swabs

SAS™ RSVAlert Test is a rapid lateral-flow, membrane based immunoassay for the qualitative detection of Respiratory Syncytial Virus. RSV is the most common cause of lower respiratory tract infections such as bronchiolitis and pneumonia among infants and young children. RSV can cause serious lower respiratory tract infections throughout life, especially among those with compromised respiratory, cardiac or immune systems.

- CLIA Classification: Waived
- Simple, 15-minute rapid, visual, membrane test
- Optional extraction step for bloody or mucoidal specimens
- Room temperature storage
- 18-month shelf life

*"QW" modifier is added to report use of CLIA-waived test systems for Medicare/Medicaid claims.

SAS™ RSVAlert Test

Test Procedure

Acceptable specimens include nasopharyngeal washes, aspirates, and swabs.

1. Remove the test device from the protective pouch and place it on a flat surface. Label the device with patient or control identifications.
2. Dispense 3-4 drops (approximately 150µL) of the nasopharyngeal specimen into the round sample well (see illustration). Wait for colored lines to appear.

NOTE: For mucoid or bloody samples—mix sample with extraction buffer and dispense 3-4 drops (approximately 150µL) into test device.

Test Results

Read results after 15 minutes and no later than 30 minutes. Positive results may be observed in as short as 30 seconds depending on the concentration of the antigen.

The test is negative if a colored line only appears in the C (control) area. The test is positive if one colored line appears in the C (control) area and one line appears in the S (specimen) area.

Positive

Negative

(See package insert for detailed instructions.)
