The South Fiji basin

- Large depth range
 - >10km
- Abyssal plain surrounded by trenches
- Potential species barriers:
 - Topographic
 - Environmental

Data collection

- Data collected using autonomous free-fall landers
- Mackerel bait attracts animals within view of the camera
- Data is from a stills system 2m above the seabed
- Data from a video system is included when relevant

Deployments

- 22 deployments in the Kermadec Trench
 - Depth range from 1,000 – 6,068m
 - Along and across axis
- 11 deployments in the South New Hebrides Trench
 - Depth range from 2,086-6,898m
 - Across the axis
- 3 deployments in the South Fiji Basin
 - Depth range from 4,078 to 4,100m

Character synopsis

Coryphaenoides armatus

- Ubiquitous
- Scavenger
- Very active

Coryphaenoides yaquinae

- Close relative
- Generally deeper
- Lower metabolic rate

Character synopsis

Bassozetus levistomatus

- Has managed to elude us
- Appears attracted to bait but disinterested
- restricted globally to abyssal depths
- 3,965-5,200m

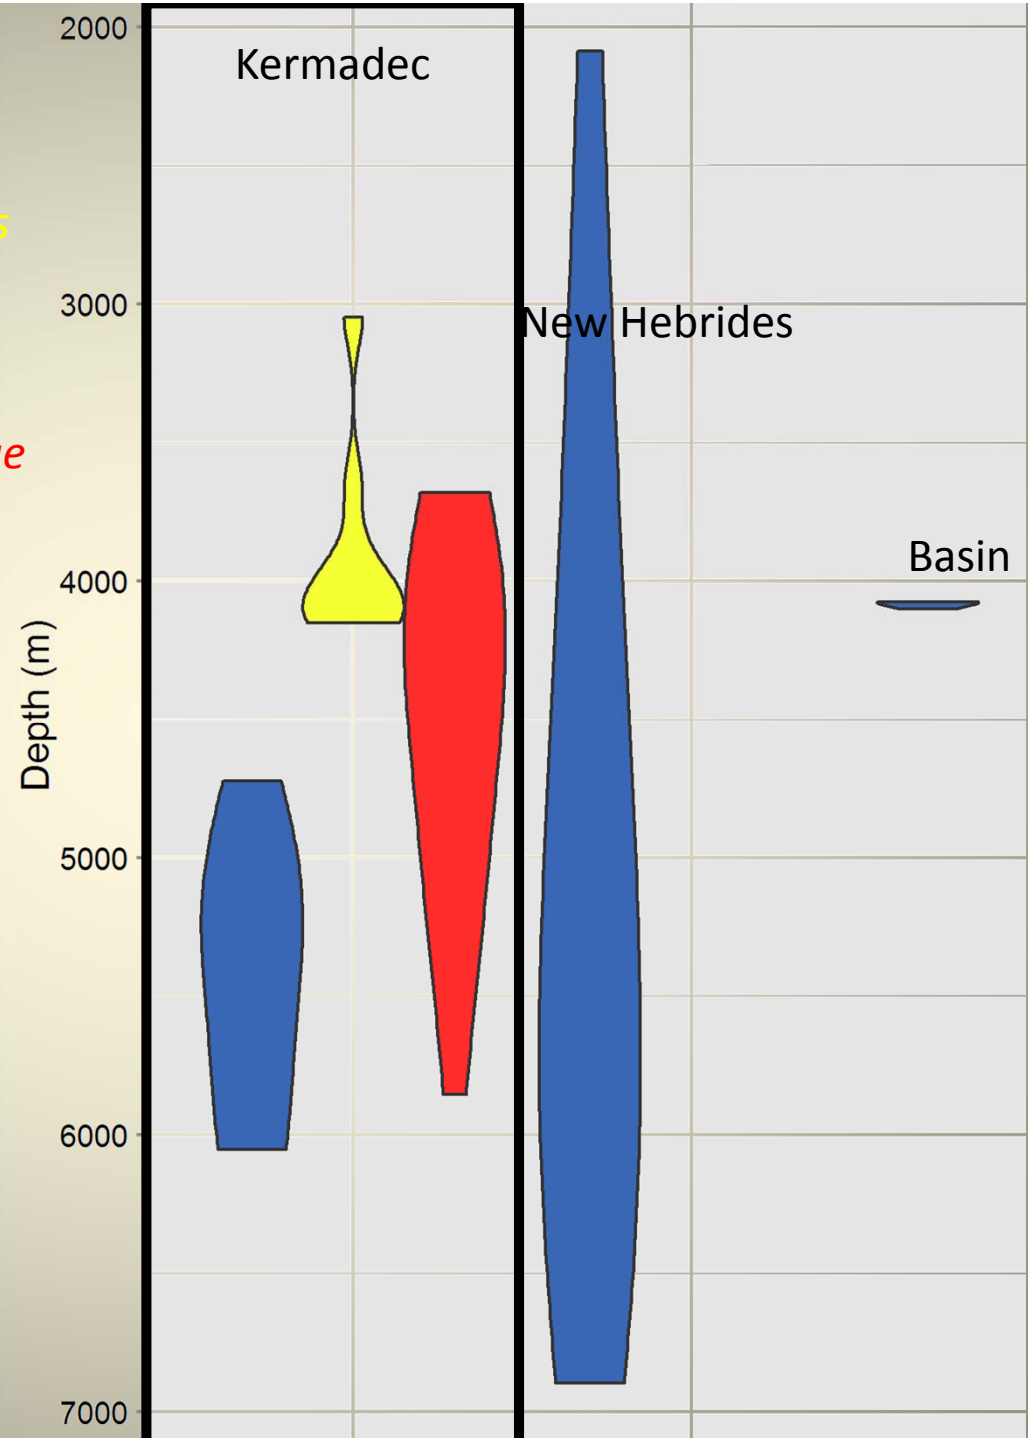

Coryphaenoides armatus

Coryphaenoides yaquinae

Bassozetus levistomatus

Is there a physical barrier?

Coryphaenoides armatus

Coryphaenoides yaquinae

Is there a thermal barrier?

What is different about these fish?

- Video of fish of approximately equal size was accessed
- The **cuskeel** had a significantly lower tail-beat frequency, less than half that of the **rattails**.
 - *B. levistomatus* 29.8 ± 6.6
 - *Coryphaenoides* sp. 77.4 ± 21.0
- The **cuskeel** had a significantly lower speed (body lengths min^{-1})
 - *B. levistomatus* 2.8 ± 2.3
 - *Coryphaenoides* sp. 12.6 ± 4.3

Is energetic input the key factor?

- Kermadec: $1.637 \text{ gC m}^{-2} \text{ y}^{-1}$
- New Hebrides $0.864 \text{ gC m}^{-2} \text{ y}^{-1}$

Conclusions

- There is a switch from a scavenger to a predatory fish community
- This appears dependent on surface input. Below a certain threshold the fish community becomes a predatory one.
- Vertebrate scavengers can no longer exist, relying on scavenging invertebrates to consolidating surface input
- This switch often coincides with depth but that may be a symptom of the dropping input with increasing depth and therefore flexible

Thank you
