

A GPS Based Tree Census 2017-18

Mira Bhaindar Municipal Corporation

FINAL REPORT

**Shree Swami Samartha Enterprises
Thane**

ACKNOWLEDGMENT

We take this opportunity to thank Mr. Balaji Khatgaonkar, Commissioner and Mrs. Dimpal Mehta, Mayor of Mira Bhaindar Municipal Corporation (MBMC) for keeping faith in our abilities and assigning us the task to conduct third tree census for Mira Bhaindar Municipal Corporation.

We are grateful to chairman and members of Tree Authority of MBMC for necessary support and approvals for undertaking this project. This project would have not been completed without moral and active support by Mr. Sambhaji Panpatte, Deputy Municipal Commissioner (Tree Authority), Mr. Nagesh Virkar, Superintendent of Gardens (Bhaindar), Mr. Hansraj Meshram, Superintendent of Gardens (Mira Road).

We hereby thank and appreciate the support and assistance given by the staff of Garden Department during the project field work.

We acknowledge valuable technical support provided by Dr. Rajdeo Singh to the project team during this survey. We place on record our appreciation for the timely field and analytical work completed by all field officers and team members.

Best Regards,

Aditya Bharnuke

Shree Swami Samartha Enterprises

EXECUTIVE SUMMARY

Post 1996, MBMC is carrying out the tree census project for the third time. All 6 prabhags and 24 wards were assessed during the census process except *Ideal Farm house, Kashi gaon, Mira road*. Census was not carried out here as the owner of the property denied the access.

The tree census 2017 has enlisted **6,47,963 number** of total species. A total of 190 species belonging to 53 families were noted during the process. Category wise, approximately **5 lakh ornamental trees, 1 lakh fruiting trees, 19 thousand medicinal trees** were seen in MBMC. Number of exotic trees is more

than native trees. Nearly **4 lakh exotic trees and 3 lakhs native trees** are growing within MBMC jurisdiction. No red listed species that has extinction threat was recorded during the survey. Most of the trees were found healthy. Age of maximum trees is between 1-10 years. Old trees are very rare with MBMC boundary. All the tree data has been uploaded on

the TREE TRACTOR portal. All details of every tree surveyed are available on single click on the portal <https://www.thenaturefirst.com/treetracker/login> A snapshot of the portal is attached in annexure.

MBMC officials need to focus residential areas to maintain and enhance the green cover of the city. Removal of invasive species and its replacement by native trees should be immediate concern to maintain a good ecological balance and to maintain urban biodiversity.

Trees per capita

According to 2011 census the population of MBMC is 8,09,378 and total trees as per current report are 6,47,963. The approximate ratio of human: tree comes to 1:1. As per IISc,2014 human: tree ratio should be 1:7. Countries like China, USA have more than 100 trees per human.

Dedicated efforts and prioritized strategies can help MBMC in future to reach the ideal count of trees per human.

The current report covers health, age, canopy diameter, ownership, indigenous status of each surveyed tree. It has a detailed analysis and quantitative details of the abovementioned parameters. The report also provides broad recommendations to maintain and enhance tree cover in MBMC.

INTRODUCTION

Mira Bhaindar Municipal Corporation (known as MBMC also) is adjacent to the financial capital of India. Mumbai provides plenty opportunities of employment hence population of Mira Bhaindar is increasing steadily in last few years. In the year 1985, a council was formed in Mira Bhaindar by integration of Bhaindar, Kashi, Mira, Navghar and Ghodbunder villages. Later in 1990, four more villages viz. Chena, Varsova, Rai – Murdhe, Dongri – Uttan were added to the council and a Municipal Corporation was formed. Though, Mira Bhaindar Municipal Corporation (MBMC), hereafter termed as project area, is situated near a sprawling city Mumbai, it has a sharp demarcation due to presence of green areas formed by Sanjay Gandhi National Park.

MBMC is blessed to have varied natural landscapes likeforested land, creek and seashores. This city has its own Historic value. It was an important port for business during past. This port has seen some most important Historic Legends right from

Alexander to Peshwas and some great kings who have travelled through this port. The city is surrounded by big mountains on both the side boundaries along with Arabian Sea guarding the west side of the city. The North side of the city is surrounded by Vasai (Basin) Creek. Surprising fact about MBMC is that, though it's a rapidly growing city it has managed to keep its originality like having small scale industries, farming, fishing, sand and salt cultivation as its major businesses which are mainly managed by Agri and Koli castes who are original residents of this area. The small-scale industry situated in Bhaindar (E) ranks Third in Asia.

As compared to other adjoining cities, MBMC is seen to maintain a good green cover in the city. However, to have exact data and a complete picture of the arboreal cover, tree census is proposed for the year 2017-18. Maintaining urban greens is a forthcoming need to have a sustainable future. In world, many cities have effectively managed their urban green areas by planning and implementing strategies of developing green area along with grey areas in a city. This has enabled them to conserve urban greens as well as biodiversity.

Performing census of trees provide a baseline information for managing tree cover. This data can be used for taking decisions on further plantations and budgetary provisions.

What is a tree census?

Before knowing about tree census, its important to know how a tree is defined!!

As per 1975-7(b) Urban Tree Protection and Conservation Act, a tree is defined as a plant having woody stem or trunk (excluding mangroves) with minimum girth of 10 cm and height of 3 meter above the ground level.

Tree census is nothing but surveying all the trees within demarked area. During this process relevant data of each surveyed tree is gathered.

Figure 1: Map of MBMC- Image courtesy - Google earth

Why tree census is needed?

Tree census helps authorities to achieve long term management objectives and take decisions efficiently for further plantation or removal of trees in particular areas. Tree census provides information about the budget that was spent and the budget that will be needed in the future to sustain a healthy tree population. Tree Census information determines number and size of manpower needed to perform the given task. Tree census information can be useful in identifying species composition, tree size, distribution, tree condition and maintenance needs. 1975-7(b) Urban Tree Protection and Conservation Act, places the responsibility on tree authority of Municipal Councils for carrying out a census of the existing trees in all lands within the jurisdiction, once before 1996 and thereafter once in every five years.

METHODOLOGY

MBMC tree census was done in a systematic manner to cover each tree. Project area was divided in different smaller areas according to MBMC ward boundaries. This method ensured that there is no/minimal error while surveying the area. In project area there are 06 prabhags and 24 wards. A GPS instrument with high precision was used by trained botanists on field. This enabled our team to take exact location of each tree. An excel showing different parameters collected on field is attached in annexure. Following categories were taken into consideration while surveying the tree

Category	Details
Location	Ward number / Ward name
	Landmark
	Latitude and longitude
Name and other information	Botanical Name
	Family
	Common Name
Ownership	Government Premises
	Park
	Private
	Roadside
	Others
Physical Parameters	Height
	Girth
	Age
	Canopy Diameter
	Tree Condition
Survey Details	Time
	Date

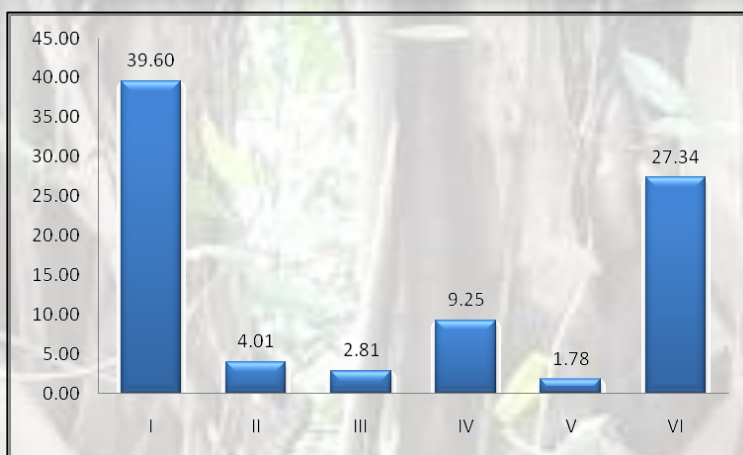

Figure 3: Area (in sq.km.) of Prabhag in project area

OBSERVATIONS AND INTERPRETATIONS

After completing the field work of tree census, all the data from the GPS instruments was compiled and further analysis was done. A total of **190** different species were reported from different parts of

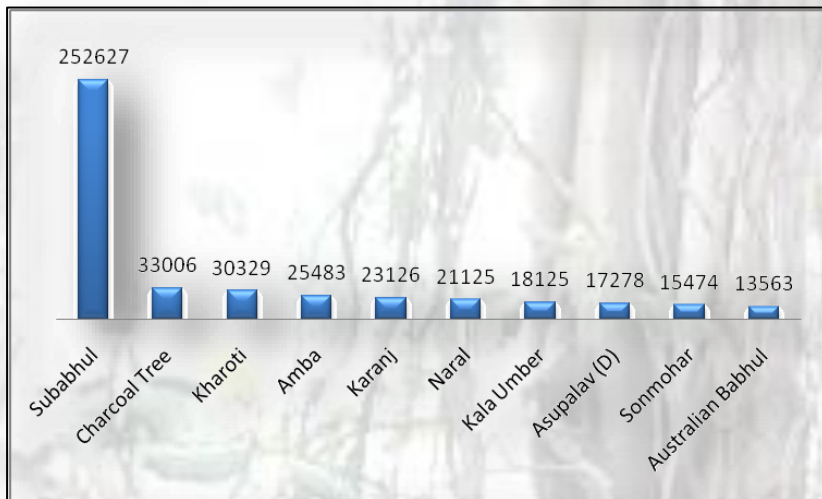

Figure 5: Top ten most dominant species with count

project area. Common name and scientific details and their respective count are given in Count of the trees in MBMC is found to be **6,47,963**. Several trees are frequently distributed in the project area. These trees are seen in all wards of the MBMC. Species count of these trees is 33. **Subabhul** is the most dominant tree

with a count more than 2.5 lacs. Other dominant species in the project area are Charcoal Tree, Kharoti, Amba, Karanj, Naral, Kala Umber, Asupalav (D), Sonmohar and Australian Babhul.

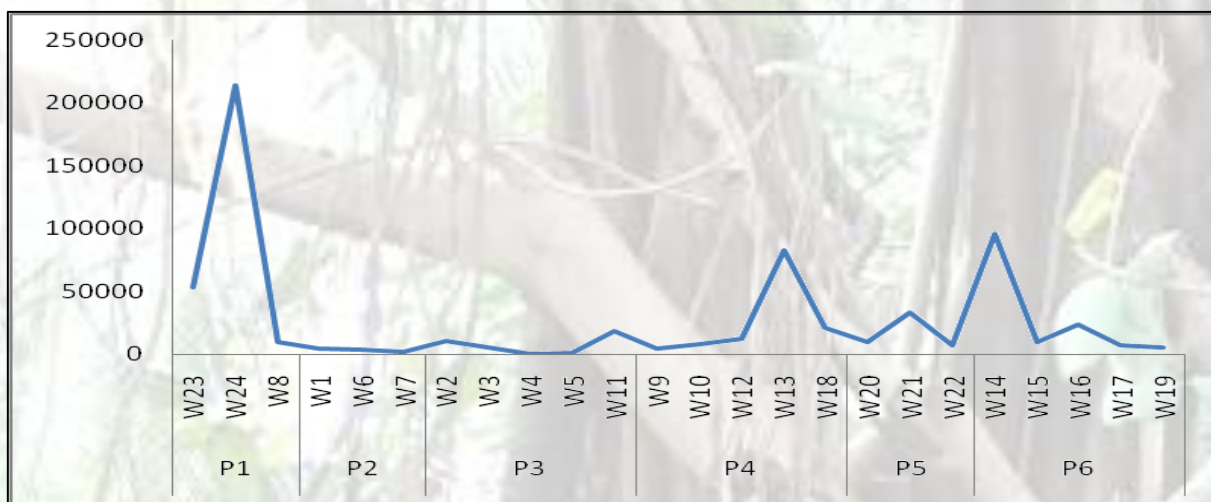

Figure 6: Prabhag wise count of trees

All these species have an individual count of more than 10,000 trees in the project area. On the other hand, 22 different species have an individual count of less than 10 trees. Bibba, Bilambi, Cordia subcordata, Crescentia aata, Devil's Claw, Dikemali, F. tsiela, Papanas, Shami, Star apple tree, Sterculia sp. and Torchwood Ixora have individual count as only one tree in the project area. Maximum population of the trees was seen in the ward number 24 with a count of 2,13,806. It is followed by Ward number 14, 13 and 23 which has tree population of 95,576, 82,847 and 53,164 respectively. Rest all wards have tree population less than 50,000. Most of the trees counted in census have private ownership. Number of trees under government and park ownership is very less. All the trees lie in the age group of 1-150. However, most of them follow in the group of 1-50 years. Number of old trees in the project area is very few.

Know about the dominant species

Most commonly occurring species with highest count and maximum biomass is termed as dominant species. A species which is dominant is most of the times one of the frequent species in the area. Dominant species decides the ecological composition of the area and play crucial role in a ecosystem. If a native species is dominant in an ecosystem, then it provides more advantage as compared to exotic species.

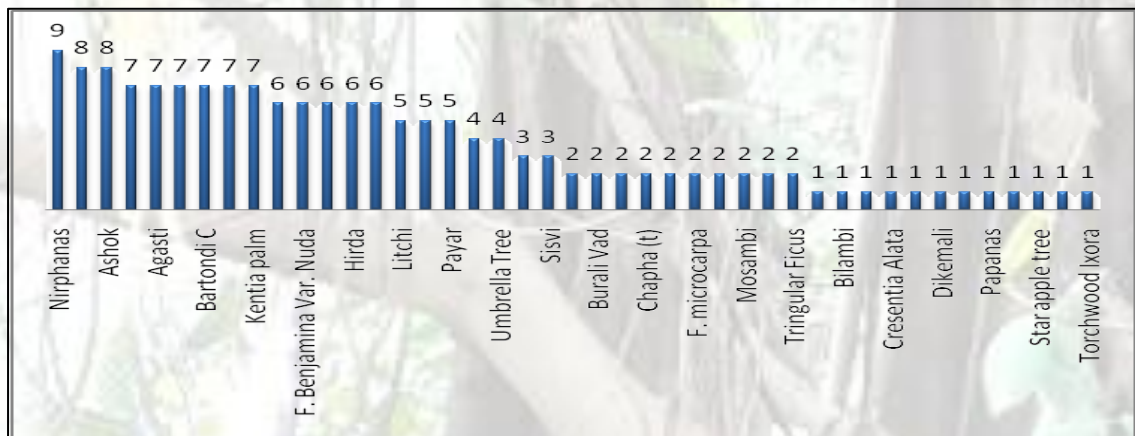

Figure 7: Rare species in project area

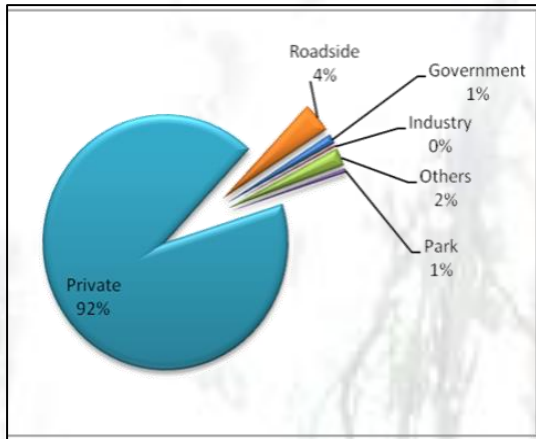

Figure 9: Percentage ownership of trees in MBMC

Tree Age	Count	Tree Age	Count
1-10	519255	71-80	17
11-20	98878	81-90	1
21-30	25826	91-100	17
31-40	3149	101-110	1
41-50	727	111-120	4
51-60	68	121-130	1
61-70	18	141-150	1

Figure 8: Count of trees as per age groups

In the project area, nearly 58% species are exotic. This could be due to plantation of many exotic species for ornamental purpose. When IUCN categories of every species were assessed it was found that, many species belong to the data deficient category. Categories of 27 species were found in the database, none of these species have extinction risk. Detailed list of the same is given in annexure.

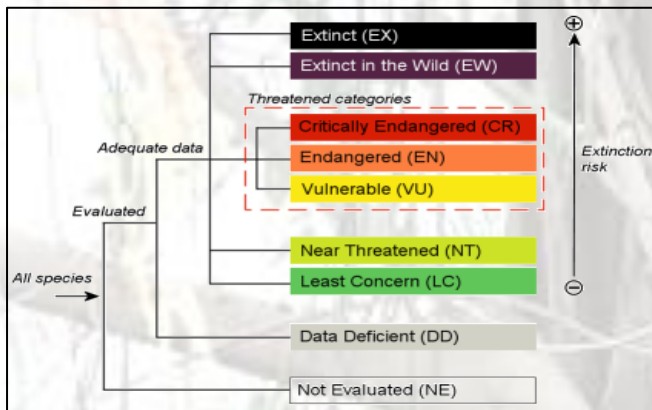

Figure 10: IUCN redlist categories

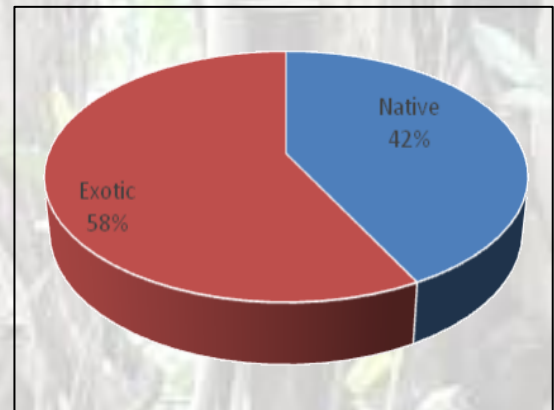

Figure 11: Native: Exotic trees in project area

IUCN Red list database

The IUCN Red List of Threatened Species™ is the world's most comprehensive inventory of the global conservation status of plant and animal species. It uses a set of quantitative criteria to evaluate the extinction risk of thousands of species. These criteria are relevant to most species and all regions of the world. With its strong scientific base, The IUCN Red List is recognized as the most authoritative guide to the status of biological diversity.

Every tree surveyed has been assessed by the health condition during the process. Most of the trees in the project areas were found to be healthy. Almost 500 trees were showing stress condition which could be due to various factors like pollution, breathing space or insect attack etc. Nearly 900 species were mechanically cut.

DISCUSSION AND RECOMMENDATIONS

Plantation

Count of trees in parks is very low. It is essential to develop open, bare patches into parks and gardens to improve the green cover of Mira Bhaindar city. Number of invasive species is very high; hence it is necessary to introduce native species to enhance local arboreal diversity. Out of total 190 species, 5 species come under the category of vulnerable species. Out of 5, count of Khaya and Gulmohar is satisfactory but conservation of Bivla, Chandan, and Sisvi is needed. To develop barren lands, cultivation of native leguminose species like Sisam, Bahava should be preferred. This will not only improve green cover but also conserve biodiversity of Mira bhaindar City. While planting new trees preference should be given to native species.

Removals

Invasive species that has been reported in project area is Subabhul. It is most dominant species in the project area with a count of more than 2 lakh trees. New plantation of Subabhul should be avoided in project area as its existing count is very high and its presence will further affect biodiversity of the area. Plantation of Subabhul should be eventually replaced by native trees. Plantation of any invasive species in forest area should be avoided as it will affect and ultimately replace existing native flora and will reduce biodiversity of the area.

Invasive plants

Invasive plants are naturalized plants that produce reproductive offspring, often in very large numbers, at considerable distances from parent plants and thus have the potential to spread over considerable areas. Invasive tree species are species that are able to survive, reproduce and spread, unaided, and sometimes at alarming rates, across the landscape. These species becomes established in natural or semi-natural ecosystems or habitats, is an agent of change, and threatens native biological diversity.

Maintenance

Special attention should be paid to younger trees till they establish, as these trees will provide many ecosystem services and other benefits after maturity. Although number of unhealthy trees is very low in Mira bhaindar city, it is necessary to prune or treat diseased trees to control the spread of the infection.
