

6

Bones and Bone Tissue

SEM osteoclasts in lacunae

Skeletal system

= _____, _____, _____

Bones are main organs:

- osseous tissue
- dense regular and irregular CT, plus bone marrow

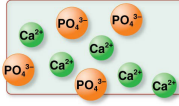

Functions of the Skeletal System

- **Functions:**
 1. **Protection**

Protection:
Skeleton protects vital organs such as the brain.

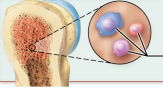

Brain
 2. **Mineral storage and _____**

Mineral storage and acid-base homeostasis:
Bone stores minerals such as Ca^{2+} and PO_4^{3-} , which are necessary for electrolyte and acid-base balance.

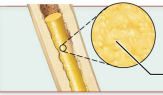

Functions of the Skeletal System

3. **Blood cell formation:** _____ involved in formation of blood cells (hematopoiesis or hemopoiesis)

Blood cell formation:
Red bone marrow is the site of blood cell formation.

Forming blood cells in red bone marrow
4. **Fat storage:** in yellow bone marrow of _____

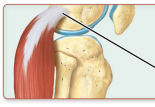

Fat storage:
Yellow bone marrow stores triglycerides.

Fat in yellow bone marrow

Functions of the Skeletal System

5. **Movement:** bones are sites for skeletal muscle attachment

Movement:
Muscles produce body movement via their attachment to bones.

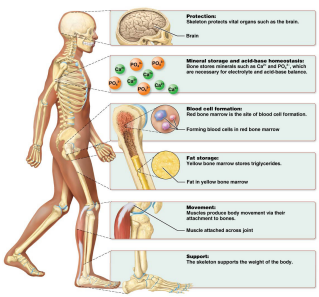

Muscle attached across joint
6. **Support:** supports weight and provides

Support:
The skeleton supports the weight of the body.

Figure 6.1 Functions of the skeletal system.

Functions of the Skeletal System

1. **Protection**
2. **Mineral Storage**
3. **Blood cell formation**
4. **Fat Storage**
5. **Movement**
6. **Support**

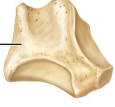

Figure 6.1 Functions of the skeletal system.

Bone Structure Classification (based on shape)

1. **Long bones**
 - longer than they are wide;
 - include most bones in *arms* and *legs*

Humerus
2. **Short bones**
 - roughly *cube-shaped*
 - include **carpals** and _____

Trapezium (carpal bone)

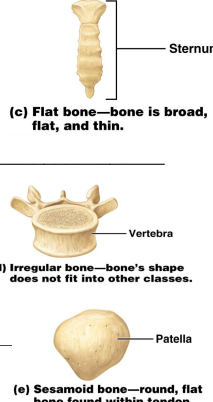

(a) Long bone—bone is longer than it is wide.

(b) Short bone—bone is about as long as it is wide.

Figure 6.2a Classification of bones by shape.

Bone Structure

- Flat bones**
– thin and broad bones
– ribs, pelvis, sternum and _____
- Irregular bones**
– include _____ and certain skull bones
- Sesamoid bones**
– located within _____
– patella (kneecap)

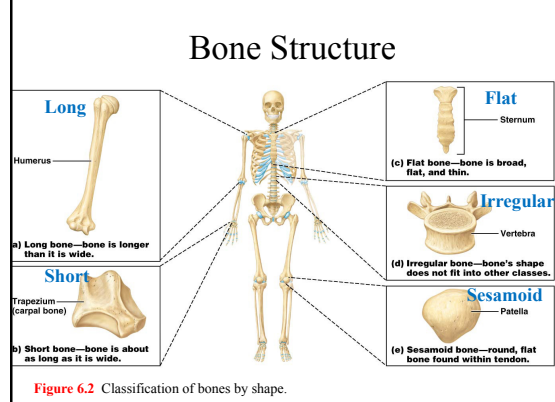

(c) Flat bone—bone is broad, flat, and thin.

(d) Irregular bone—bone's shape does not fit into other classes.

(e) Sesamoid bone—round, flat bone found within tendon.

Figure 6.2c Classification of bones by shape.

Bone Structure

(a) Long bone—bone is longer than it is wide.

(b) Short bone—bone is about as long as it is wide.

(c) Flat bone—bone is broad, flat, and thin.

(d) Irregular bone—bone's shape does not fit into other classes.

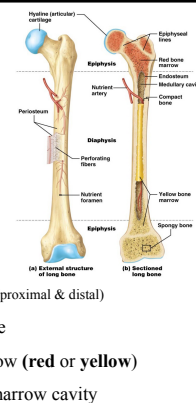

(e) Sesamoid bone—round, flat bone found within tendon.

Figure 6.2 Classification of bones by shape.

Bone Structure

Structure of long bone:

- Periosteum**
– membrane surrounds outer surface
- Perforating fibers (Sharpey's fibers)**
– anchors periosteum firmly to bone surface
- Diaphysis** – _____
- Epiphysis** – _____ of long bone (proximal & distal)
- Articular cartilage** – hyaline cartilage
- Marrow cavity** – contains bone marrow (red or yellow)
- Endosteum** – thin membrane lining marrow cavity

(a) External structure of long bone

(b) Sectioned long bone

Bone Structure

- Compact bone**
– hard, dense outer region
– allows bone to resist stresses (compression & twisting)
- Spongy bone** (_____ bone)
– found inside cortical bone
– honeycomb-like framework of bony struts;
– resist forces from many directions

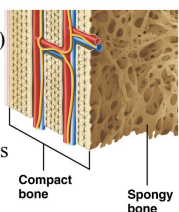

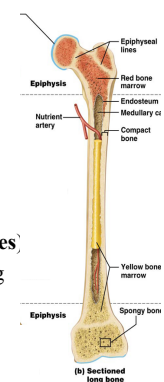

Figure 6.9 Structure of compact bone.

Bone Structure

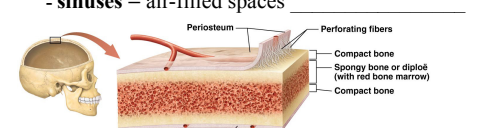

- Epiphyseal lines**
– separates epiphyses from diaphysis
– remnants of epiphyseal plates
- Epiphyseal plates** (_____ plates)
– hyaline cartilage found in developing bones of children

(b) Sectioned long bone

Bone Structure

- Structure of short, flat, irregular, and sesamoid bones**
– covered by periosteum
– **diploë** = two outer layers of thin compact bone with middle layer of spongy bone
– **sinuses** = air-filled spaces

ASP
Real World

Bone Marrow Transplantation (p. 187)

- Diseases of blood
- Needle is inserted into pelvic bone
- Recipient's marrow is *destroyed*
- **Complications** –
- Many recipients can return to a healthy life if transplant “takes”

Microscopic Structure

Extracellular matrix of bone:

- **Inorganic matrix (65%)**
 - consisting of _____ (hydroxyapatite salts of Ca & P)
- **Organic matrix (35%)**
 - osteoid
 - consists of collagen fibers and *usual ECM*

Bone Cells

Bone cells :

- **Osteogenic** – differentiate into osteoblasts
- **Osteoblasts** – _____
- **Osteocytes** – mature bone cells in lacunae
- **Osteoclasts**
 - bone _____
 - secrete acid and enzymes

Figure 6.6 Types of bone cells.

Bone Cells

Osteogenic cell **Osteoblasts** **Osteocytes**

- 1 Osteogenic cells differentiate into osteoblasts.
- 2 Osteoblasts deposit bone until they are trapped and become osteocytes.
- 3 Osteocytes maintain the bone extracellular matrix (ECM).

Figure 6.7 Functions of osteoblasts and osteocytes.

Histology of Bone

Structure of compact bone:

Osteon (Haversian system)

- **Lamellae** = concentric rings of *thin layers of bone*
- **Central canal** = contains blood vessels & nerves
- **Lacunae** = _____ for osteocyte
- **Canaliculi** = _____
- **Perforating canals (Volkmann's canals)** *perpendicular to central canals*

Figure 6.9 Structure of compact bone.

Histology of Bone

Figure 6.9 Structure of compact bone.

Endochondral Ossification

- Endochondral ossification
 - bones begin within hyaline
 - Hyaline cartilage model made of *chondrocytes, collagen, and ECM* surrounded by CT **perichondrium**
 - Cartilage breaks down
 - Collar formation (periosteum)
 - _____ **ossification center** mid-diaphysis
 - **secondary ossification centers** at _____

Most bones of skeleton formed this way.

Endochondral Ossification

Figure 6.12 The process of endochondral ossification.

Endochondral Ossification

Cartilage remains at epiphyseal plate and articular ends.

Figure 6.12 The process of endochondral ossification.

Osteoporosis and Healthy Bones (p. 192)

- Most common bone disease in U.S
- Diagnosed by *bone density measurement*
- **Causes** – *dietary* (calcium and/or vitamin D deficiency)

- **Prevention**
- **Treatment**

Growth in Length

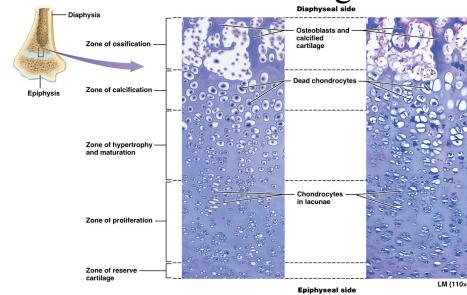

Figure 6.13 Structure of the epiphyseal plate.

Growth in Length

- Long bones lengthen via **longitudinal growth**; involves division of _____ (not osteocytes or osteoblasts) in epiphyseal plate
- Bone growth takes place at epiphysis on side *closest to diaphysis*

Figure 6.14 Growth at the epiphyseal plate.

Growth in Length

- **Epiphyseal plate**
 1. **Zone of reserve cartilage** – (found closest to epiphysis) contains cells that are not directly involved in bone growth but *can be recruited* for cell division if need arises
 2. **Zone of proliferation** - consists of *actively dividing chondrocytes* by endochondral ossification
 3. **Zone of hypertrophy and maturation** (next region closer to diaphysis) contains *mature chondrocytes*
 4. **Zone of calcification** (second to last region) contains dead chondrocytes, some of which have been calcified
Calcified cartilage is replaced with bone.
 5. **Zone of ossification** (last region) consists of *calcified chondrocyte and osteoblasts*

Growth in Length

- Longitudinal growth continues at epiphyseal plate as long as *mitosis continues* in zone of proliferation:
 - Mitotic rate slows around ages of 12-15 years old
 - Between ages of 18-21 epiphyseal plate is **closed**
 - _____ is a *calcified remnant* of epiphyseal plate

Growth in Length

Figure 6.14 Growth at the epiphyseal plate.

Growth in Width

- Appositional growth** = _____
- Osteoblasts, *lay down new bone*
 - Appositional growth does not result in immediate formation of osteons; instead, *new circumferential lamellae* are formed
 - Bones may *continue to increase in width* even after epiphyseal plates have *closed* and bone is no longer *lengthening*

Achondroplasia (p. 199)

- Most common cause of **dwarfism**; gene defect
- Defective gene produces an *abnormal growth factor receptor*
- Bones form and grow abnormally;
- Long-term problems

Role of Hormones in Bone Growth

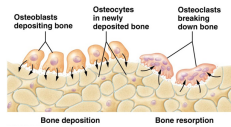

- _____ (GH) – secreted by *anterior pituitary gland*; enhances protein synthesis and cell division in most all tissues, including bone
- _____ - pronounced effect on bone growth:
 - Increases appositional growth in males
 - Increases *rate of mitosis in epiphyseal plate*; leads to “growth spurts” in teenage years
- **Estrogen** also plays a role in bone growth:
 - Increases *rate of longitudinal growth* and inhibits *osteoclasts*
 - Accelerates closure of epiphyseal plate at much faster rate than testosterone → *average height differences* between gender

Real World **Gigantism and Acromegaly** (p. 200)

- *Excess GH* can produce two conditions, depending on when in life it develops; both generally caused by a _____ that secretes hormone
- **Childhood** – condition is _____
- **Adulthood** – condition is _____

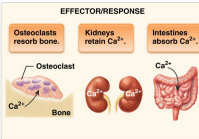

Bone Remodeling

- **Bone remodeling** = new bone is formed by **bone _____** and old bone is removed by **bone _____**
 - Maintenance of *calcium ion homeostasis*
 - *Replacement* of old brittle bone with newer bone
 - *Adaptation* to tension and stress

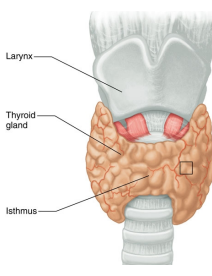

Bone Remodeling

- **PTH** (parathyroid hormone from parathyroid gland) stimulates effects that _____ *blood Ca⁺² levels*
 - Increases osteoclast activity
 - Increases *absorption* of calcium from gut
 - Inhibits calcium *loss* in urine
- **Calcitonin** (from thyroid gland) causes _____ *blood Ca⁺² levels*
 - Inhibits osteoclasts
 - Increases calcium *loss* in urine

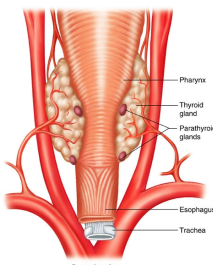

Thyroid Gland

Secretes **CALCITONIN**

Parathyroid Glands

Posterior view
Secretes **PTH**

Bone Remodeling

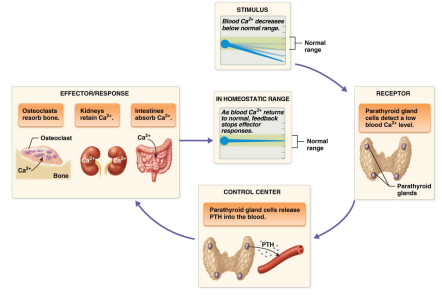

Figure 6.15 Structure of the epiphyseal plate.

Bone Remodeling

- **Factors influencing bone remodeling are summarized:**

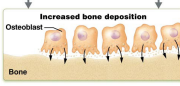

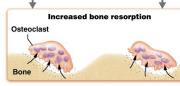

<ul style="list-style-type: none"> • Compressional load or exercise • Tension placed on bone • Testosterone • Adequate dietary intake of calcium and vitamins C, D, and K 	<ul style="list-style-type: none"> • Estrogen • Calcitonin • Increase in blood calcium ion concentration 	<ul style="list-style-type: none"> • Inadequate exercise • Inadequate dietary intake of calcium or vitamins C, D, or K 	<ul style="list-style-type: none"> • Continuous pressure placed on bone • Parathyroid hormone • Decrease in blood calcium ion concentration
Increased osteoblast activity	Decreased osteoclast activity	Decreased osteoblast activity	Increased osteoclast activity
 <p>Increased bone deposition</p>		 <p>Increased bone resorption</p>	

Figure 6.16 Factors that influence bone remodeling.

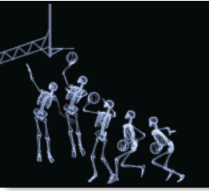

Bone Repair

Fractures:

– Simple fractures vs _____ fractures

- *Spiral*
- *Compression*
- *Comminuted*
- *Avulsion*
- *Greenstick*
- *Epiphyseal plate*

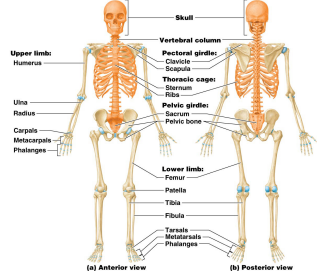

7

The Skeletal System

Skeletal System = _____ bones plus cartilages

- Axial (80 bones)
- Appendicular (126 bones)

Structure of the Skeletal System and Skeletal Cartilages

(a) Anterior view (b) Posterior view

Figure 7.1 Divisions of the skeletal system.

Structure of the Skeletal System and Skeletal Cartilages

- **Axial skeleton**
 - Skull, vertebral column, thoracic cage (ribs, sternum), _____
- **Appendicular skeleton**
 - Bones of pectoral girdle, upper limb, pelvic girdle, and lower limb
 - Pectoral girdle** - _____; anchors upper limb to trunk
 - Pelvic girdle** - _____ bones; anchors lower limb to trunk

Bone Markings

Bone Marking	Description	Example
Depressions: clefts of varying depth in a bone, located where a bone meets another structure, such as another bone or a blood vessel.		
Facet	Shallow convex or concave surface where two bones articulate	Rib: Articular facet for articulation with a transverse process 
Fossa (plural, fossae)	Indentation in a bone into which another structure fits	Humerus: Distal portion with olecranon fossa 
Fovea	Shallow pit	Femur: Fovea capitis 

Table 7.1 Bone Markings.

Bone Markings

Bone Marking	Description	Example
Canal (meatus)	Passage for a blood vessel, nerve, or duct	Temporal bone: Foramen spinosum 
Foramen	Opening in a bone	Vertebral foramen: Foramen transversarium 
Condyle	Projection of a bone that fits into a concave surface of another bone	Radius: Head 
Head	Large, rounded projection of a bone that fits into a concave surface of another bone	Radius: Head 
Process	Projection of a bone	Radius: Head 

Table 7.1 Bone Markings.

Bone Markings

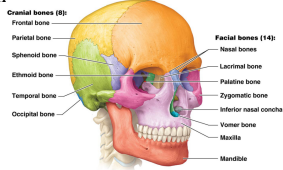

Bone Marking	Description	Example
Protuberance	Outgrowth from a bone	Occipital bone: External occipital protuberance 
Trochanter	Large projection found only on the femur	Femur: Greater trochanter 
Line	Long, narrow ridge	Femur: Linea aspera 

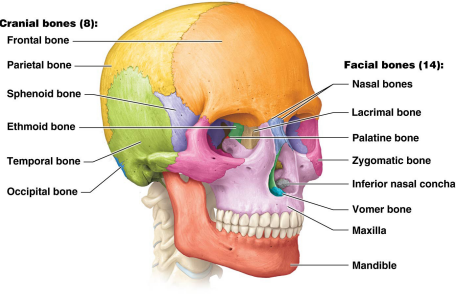

Table 7.1 Bone Markings.

Overview of Skull Structure

- Skull = 22 bones organized in *two groups*:
 - Cranial bones** – collectively known as **cranium**, composed of _____ bones (STEP OFF my skull!)
 - Frontal - 1
 - Occipital - 1
 - Ethmoid - 1
 - Sphenoid - 1
 - Parietal - 2
 - Temporal - 2

Overview of Skull Structure

Cranial bones (8):
Frontal bone
Parietal bone
Sphenoid bone
Ethmoid bone
Temporal bone
Occipital bone

Facial bones (14):
Nasal bones
Lacrimal bone
Palatine bone
Zygomatic bone
Inferior nasal concha
Vomer bone
Maxilla
Mandible

Figure 7.2 Basic structure of the skull: anterolateral view of the cranial and facial bones.

Overview of Skull Structure

- Facial bones** = _____ bones
 - Maxillary - 2
 - Zygomatic - 2
 - Nasal - 2
 - Lacrimal - 2
 - Palatine - 2
 - Inferior nasal concha - 2
 - Mandible - 1
 - Vomer - 1

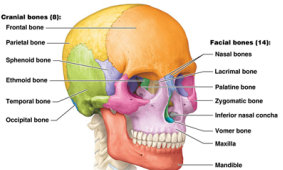

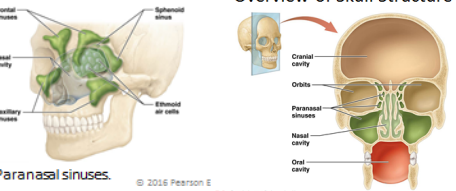

Figure 7.2 Basic structure of the skull: anterolateral view of the cranial and facial bones.

Overview of Skull Structure

- Sinuses** = _____, membrane-lined *spaces*; **paranasal sinuses** = frontal, ethmoid, sphenoid, maxillary

7.13 Paranasal sinuses. © 2016 Pearson Education, Inc.

Understanding How Skull Bones Relate to Each Other

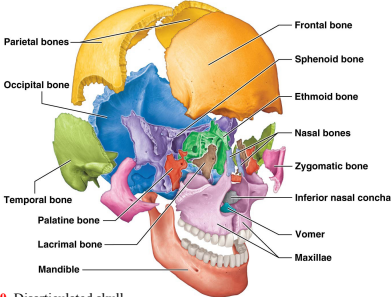

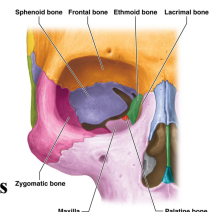

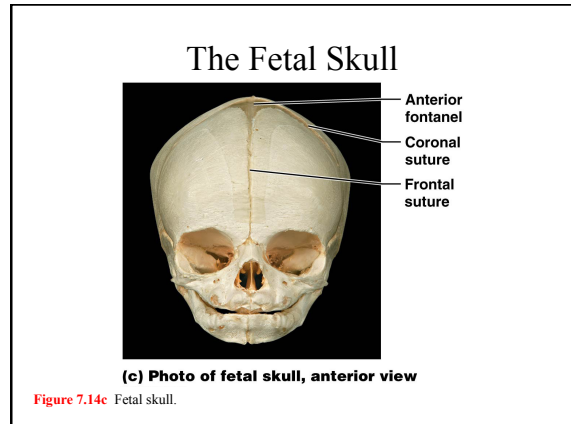

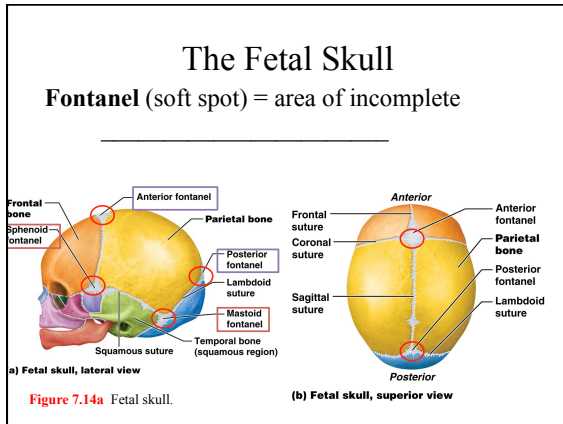

Figure 7.10 Disarticulated skull.

Cavities of the Skull

- Orbit** – FLEZMS 7 fused bones; form walls that encase eyeball, lacrimal gland, and their associated blood vessels, muscles, and nerves (**Figure 7.11**)
 - Frontal bone
 - Lacrimal
 - Ethmoid
 - Zygomatic
 - Maxilla
 - Sphenoid bone
 - and _____ bones

Hyoid Bone

- **Hyoid**
 - doesn't *articulate* with any other bones
 - C-shaped bone
 - Provides numerous muscle attachment points involved in _____

(a) Position of the hyoid bone
(b) Hyoid bone, anterior view

Forensic Skull Anatomy (p. 229)

- Forensic investigators often must identify human remains with little to go on except bones; can provide many clues (particularly skull); one of most basic traits that can be identified from a skull is *gender*
- Four obvious differences:

Forensic Skull Anatomy

© Bone Clones, www.boneclones.com

Male skull **Female skull**

Overview of the Vertebral Column

Vertebral column (spine) – composed of *about* _____ bones (**vertebrae**)

- 7 **cervical** – located in _____
- 12 **thoracic** – articulate with _____
- 5 **lumbar** – in _____
- 5 fused **sacral** (collectively called **sacrum**)
- 3–5 fused **coccygeal** (collectively called **coccyx**)

Overview of the Vertebral Column

- **Spinal curvatures** – C-shaped vertebral column of newborn → S-shaped secondary curvatures as infant grows
 - **Primary curvatures** (_____ and *sacral*) present during fetal dev.
 - **Secondary curvatures** (_____ and *lumbar*) dev. after fetal period

Overview of the Vertebral Column

- **Abnormal spinal curvatures:**
 - **Scoliosis** – abnormal _____ curvatures
 - **Lordosis (swayback)** – exaggerated *cervical* and _____ curvatures
 - **Kyphosis (hunchback)** – exaggeration of _____ curvature

Structure of the Vertebrae

Figure 7.18 Basic structure of vertebrae.

Structure of the Vertebrae

- **Cervical (7)** – smallest vertebrae
 - _____ **foramina** allows passage of vertebral arteries and veins
 - **C₁** (_____)
 - Lacks vertebral body
 - Articulates with *occipital condyles* and **C₂**
 - **C₂** (_____)
 - **Dens (odontoid process)** protrudes from body
 - Allows for *rotational movement* of head at neck; (shaking your head “no”)

Structure of the Vertebrae

- **Thoracic vertebrae (12)**
 - long spinous processes
 - **Superior and inferior costal facets** (articulate with **head of rib**)
 - **Transverse costal facets** on transverse processes (articulate with _____ **on rib**)

Posterior view: Shaped like **giraffe head**

Structure of the Vertebrae

- **Lumbar vertebrae (5)** – *largest and heaviest* of all vertebrae (_____)

Posterior view- shaped like **moose head**

Structure of the Vertebrae

Table 7.3 Comparison of Cervical, Thoracic, and Lumbar Vertebrae

Characteristic	Cervical Vertebrae	Thoracic Vertebrae	Lumbar Vertebrae
Body shape and size	Small and oval; C ₇ lacks a body; C ₁ has the dens on the superior surface of its body	Larger and heart-shaped; contain costal facets	Largest and kidney-shaped
Vertebral foramen shape	Triangular	Circular	Flattened triangular
Transverse processes	Contain transverse foramina	Long; contain articular facets for ribs	Short with no facets or foramina
Spinous processes	Most are fork-shaped; C ₁ lacks a spinous process	Long; point inferiorly	Thick; point posteriorly

Table 7.3 Comparison of Cervical, Thoracic, and Lumbar Vertebrae.

Structure of the Vertebrae

- **Sacrum** – 5 fused sacral vertebrae
 - **Sacral promontory** – bony projection at anterior margin of base (superior aspect)
 - **Sacral foramina** – 4 pairs of holes allows for
- **Coccyx** = 4 fused (3-5) vertebrae

Study Boost: Remembering Skull Bones and Vertebrae

- **PEST OF 6** (six cranial bones): Parietal, Ethmoid, Sphenoid, Temporal, Occipital, Frontal
- **Virgil Is Now Making My Pet Zebra Laugh** (facial bones): Vomer, Inferior nasal conchae, Nasal, Mandible, Maxillae, Palatine, Zygomatic, Lacrimal
- **For Easier Sinus Memorization** (paranasal sinuses): Frontal, Ethmoidal, Sphenoidal, Maxillary
- **Breakfast at 7, lunch at 12, dinner at 5** (number of vertebrae): 7 cervical, 12 thoracic, and 5 lumbar

Study Boost: Remembering Skull Bones and Vertebrae

Intervertebral Discs

• Intervertebral disc

= fibrocartilage pad found between bodies vertebrae

- **Nucleus pulposus** – jelly-like substance; shock absorber
- **Anulus fibrosus** – outer ring of _____

Herniated Disc (p. 238)

- A tear in annulus fibrosus can allow nucleus pulposus to protrude, a condition known as a **herniated disc** (commonly called a **slipped disc**)
- Bulging nucleus pulposus compresses nerve
- Treatments

The Thoracic Cage

- **Thoracic cage**

=

- **sternum**

- **Manubrium** – *superiormost*
- **Body** - middle
- **Xiphoid process** - inferior

The Thoracic Cage

Rib cage= 12 pairs of ribs and their costal cartilages

- Ribs 1–7 (_____ ribs or **vertebrosternal** ribs) attach to sternum via their *costal cartilages*
- Ribs 8–12 (_____ ribs) not directly attached to sternum
 - **Vertebrochondral** ribs 8–10 – attached to *cartilage of 7th rib*
 - _____ or **vertebral** ribs 11 & 12
 - are not attached to sternum

The Thoracic Cage

Figure 7.25 Structure of a typical rib.

The Sternum and CPR (p. 239)

- **Cardiopulmonary resuscitation (CPR)**
- *Correct placement of hands on sternum is critical*

The Pectoral Girdle

- **Pectoral girdle** – clavicle and scapula
- **Clavicle**
 - Sternal end
 - Acromial end

(a) Pectoral girdle, anterior view

Figure 7.26 Overview of the bones of the pectoral girdle and upper limb.

The Pectoral Girdle

- **Scapula**
 - **Acromion**
 - **Coracoid process**
 - **Subscapular fossa** (anterior aspect)
 - **Glenoid cavity** (articulates with head of humerus)
 - **Spine** (_____ ridge)
 - **Supraspinous fossa**
 - **Infraspinous fossa**

(c) Right scapula, posterior view

The Humerus

- **Humerus**
 - **head** articulates with *glenoid cavity* at shoulder joint
 - _____ **neck** is a groove surrounding head
 - _____ **neck** proximal diaphysis
 - **greater & lesser tubercle** lateral and anterior to head

- olecranon fossa
- coronoid fossa
- capitulum
- trochlea

(a) Right humerus, anterior view (b) Right humerus, posterior view

Bones of the Forearm

Bones of forearm (antebrachium)

- **Radius** (_____ bone)
 - head, neck, radial tuberosity, styloid process
- **Ulna** (_____)
 - trochlear notch, olecranon, coronoid process, radial notch, styloid process

Figure 7.30 The bones of the forearm: the radius and ulna.

Bones of the Wrist: Carpals

Wrist (carpus) – _____ (carpals)
(lateral to medial)

- **Scaphoid, Lunate, Triquetrum, Pisiform** (proximal)
- **Trapezium, Trapezoid**

Bones of the Hand and Fingers: Metacarpals and Phalanges

(a) Right wrist and hand, anterior view

Figure 7.31a The hand and wrist.

Bones of the Hand and Fingers: Metacarpals and Phalanges

Metacarpals – 5 each hand

Phalanges – 14 each hand

- **proximal, middle, and distal** _____
- **Thumb** proximal & distal phalanx

Bones of the Hand and Fingers: Metacarpals and Phalanges

(a) Right wrist and hand, anterior view (b) Right wrist and hand, posterior view

Figure 7.31b The hand and wrist.

Wrist Fractures (p. 247)

- Wrist is the most *frequently injured* region of upper limb;
- Fractures

Colles fracture

Bones of the Pelvic Girdle and Lower Limb

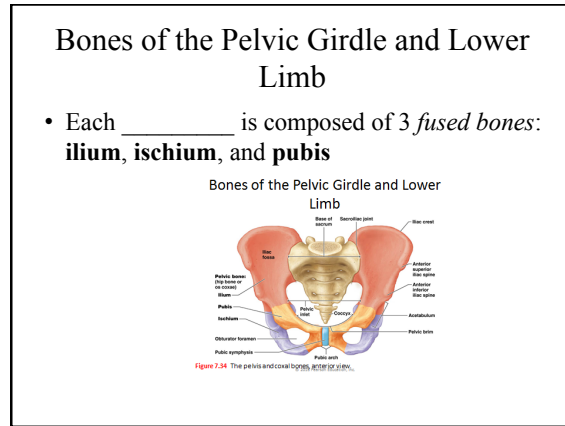

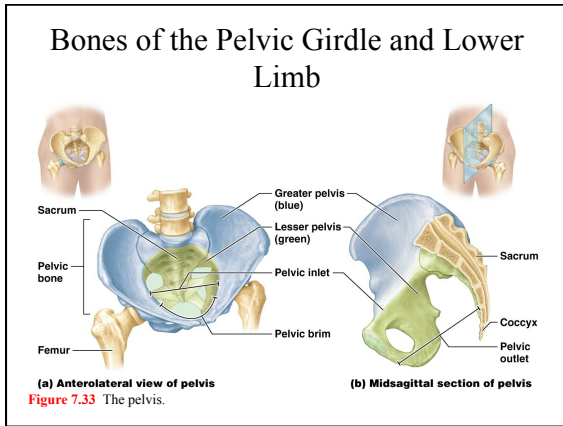

Pelvic girdle =

- **coxal bones** (also known as **os coxae**)
- Articulates with **sacrum** (axial skeleton)

Pelvis – bowl-shaped sacrum and two coxal bones; creates *boundary* for pelvic cavity

Pelvic inlet – oval *opening* formed by sacrum and pelvic girdle

Pelvic brim – bony *ridge* surrounding inlet that defines boundaries between **greater** and **lesser pelvis**

Bones of the Pelvic Girdle and Lower Limb

Female and male pelvis differ between genders:
female pelvis (adapted for *childbirth*) is *wider* and *shallower* than male

- Shape of greater pelvis:**
 - pelvis is *wider* in females with *flared* iliac crests
 - increases distance between ASIS
- Coccyx and sacrum:**
 - female sacrum is *wider* and *shorter* than male sacrum
 - while female coccyx is more *moveable* and more *posterior* than male

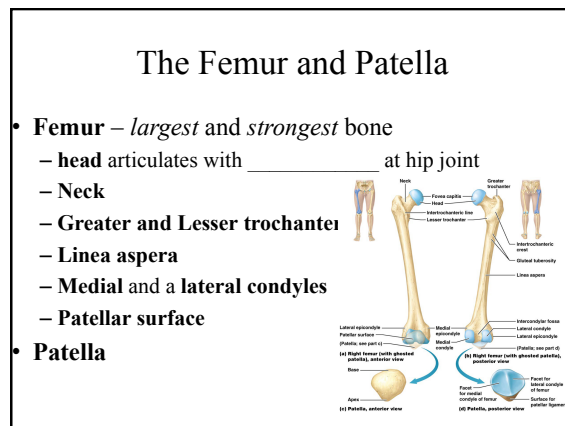

Bones of the Pelvic Girdle and Lower Limb

- Pelvic inlet and outlet:** female inlet is usually *wider* and *oval-shaped* whereas male inlet is *narrow* and *heart-shaped*; female outlet is generally *wider* than male
- Acetabula:** generally *farther apart* in females and pointed more *anteriorly* than in males
- Pubic arch:**
 - angle measured in females = _____
 - male arch measures between _____

Bones of the Pelvic Girdle

FEMALE PELVIS	CHARACTERISTICS	MALE PELVIS
	Wide	
Wider, shorter	Greater pelvis	Narrow
Farther apart	Sacrum	Narrower, longer
Oval shape	Acetabula	Closer together
90°-100° angle	Pelvic inlet	Heart shape
	Pubic arch	60°-70° angle
	Point laterally	
Wide	Ischial tuberosities	Point medially
Wider	Pelvic outlet	Narrow
	Sacrum	Narrower

Figure 7.36 Differences between the female and male pelvises.

Bones of the Leg: Tibia and Fibula

- **Tibia** (_____ bone) larger bone, wt. bearing
 - Tibial tuberosity
 - Medial malleolus
- **Fibula** (_____ bone)
 - Lateral malleolus

Bones of Ankle and Foot: Tarsals, Metatarsals, and Phalanges

- **Tarsals** – 7 *short bones*
 - *Proximal* tarsals: _____, **calcaneus**, and **navicular**
 - *Distal* tarsals medial to lateral: 3 **cuneiforms** (**medial**, **intermediate**, **lateral**) and **cuboid**
- **Metatarsals** – 5 in each foot
- **Phalanges**
 - 14 in each foot

Bones of Ankle and Foot: Tarsals, Metatarsals, and Phalanges

(a) Dorsal view (b) Plantar view

Figure 7.39a, b The ankle and foot.

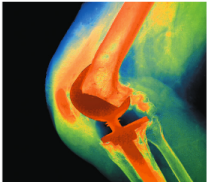

The Study Boost: Remembering Bones of the Arm and Leg

Carpals: **Stop Letting The People Touch The Cadaver's Hand** = Scaphoid, Lunate, Triquetrum, Pisiform, Trapezium, Trapezoid, Capitate, Hamate
(Mentions "hand", so remember that it describes carpals, not tarsals; trapeziUM is by thUMB)

Tarsals: **College Needs Me In Lab Classes**
= Talus, Calcaneus, Navicular; Medial, Intermediate, & Lateral cuneiform, Cuboid

8

Articulations

Articulations (joints) = where bones meet

- allow _____
- provide _____
- allow long bones to _____ (epiphyseal plate)

Functional Classification

Based on _____:

- **Synarthrosis** – no *movement* between articulating bones
- **Amphiarthrosis** – small amount of *movement* between articulating bones
- **Diarthrosis** – freely *moveable*, allowing a wide variety of specific movements

Structural Classification

Based on their _____ *features*:

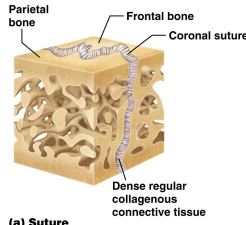

- **Fibrous joints** – *dense regular collagenous CT*; (synarthroses or amphiarthroses)
- **Cartilaginous joints** – *cartilage*; (synarthroses or amphiarthroses)
- **Synovial joints** – fluid-filled joint capsule with hyaline cartilage at articular ends; (diarthrosis)

Fibrous Joints

3 types:

- **Suture**
- **Gomphosis**
- **Syndesmosis**

Suture - fibrous CT
_____ of
cranium; *immoveable*
joint

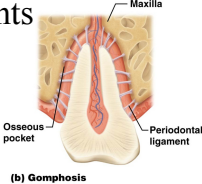

(a) Suture

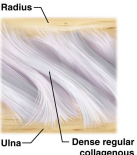

Figure 8.1a The three types of fibrous joints.

Fibrous Joints

- **Gomphosis** – tooth in bony socket (**periodontal ligament**); _____ joint
- **Syndesmosis** – joint between tibia & fibula, ulna & radius (interosseous membrane); _____

(b) Gomphosis

(c) Syndesmosis

Figure 8.1b The three types of fibrous joints.

Cartilaginous Joints

2 types:

- **Symphysis**
- **Synchondrosis**

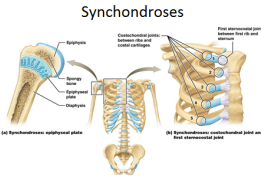

Figure 8.2a, b The two types of cartilaginous joints.

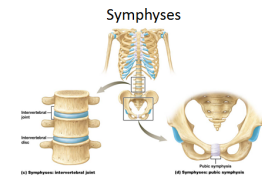

Synchondrosis - *hyaline cartilage*;
Synarthroses (epiphyseal plate, 1st sternocostal and costochondral joints); _____

 Epiphyseal Plate Fractures (p. 260)

- **Epiphyseal plate** in a child's long bone is one of the *weakest parts* of a developing skeleton;
- **Treatment**

Fibrous Joints

- **Symphysis** – *fibrocartilaginous pad; amphiarthrosis*
- _____
- **Pubic symphysis**

Symphyses

00 Symphysis: Intervertebral joint
01 Symphysis: Pubic symphysis

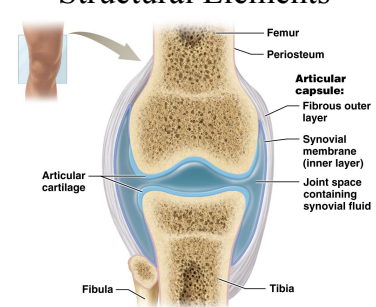

Figure 8.2c. d The two types of cartilaginous joints.

Synovial Joints

Synovial Joints:

- **Joint cavity (synovial cavity)** – space found between articulating bones
- **Articular capsule** – double-layered structure
 - Outer fibrous layer
 - Inner synovial membrane → synovial fluid (lubricates, metabolic fcn., shock absorber)
- _____ **cartilage** – hyaline cartilage; *covers* all _____ exposed articulating bones within a joint
- **Diarthrosis**

Structural Elements

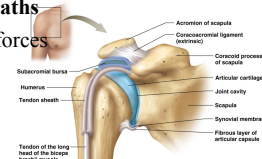

Femur
Perosteum
Articular capsule:
Fibrous outer layer
Synovial membrane (inner layer)
Joint space containing synovial fluid
Tibia
Fibula
Articular cartilage

Figure 8.3 Structure of a typical synovial joint.

Stabilizing and Supporting Factors

- Synovial joints allow more mobility
 - less stable than other joint types
 - structures that provide additional stabilization:
 - Ligament** – dense regular CT connects _____
 - Tendon** - dense regular CT connects _____
 - Bursae and tendon sheaths** provide stabilization forces

Acromion of scapula
Coracoclavicular ligament (trapezoid)
Coracoid process of scapula
Articular cartilage
Joint cavity
Scapula
Fibrous layer of articular capsule
Subacromial bursa
Humerus
Tendon sheath
Tendon of the long head of the biceps brachii muscle

 Bursitis (p. 264)

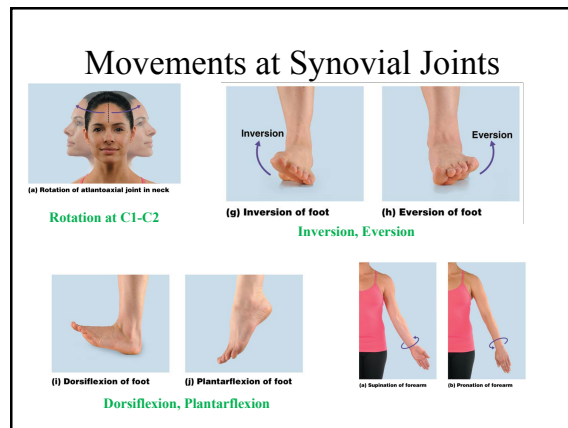

- **Bursitis**
- Most *common sites* of bursitis
- Clinical features

Arthritis

- **Arthritis** – defined as *inflammation* of one or more joints which results in pain and limitations of joint movement:
 - **Osteoarthritis (OA)** – most common; associated with _____, *injuries*, and advanced *age*; characterized by pain, joint stiffness, and lost mobility
 - **Rheumatoid arthritis (RA)** – associated with joint destruction; _____
 - **Gouty arthritis** – joint damage due to inflammatory reaction to _____ deposits

Movements at Synovial Joints

- **Gliding movements** – *sliding motion* between articulating surfaces
- **Flexion, Extension, Hyperextension**
- **Abduction, Adduction**
- **Circumduction, Rotation**
- **Inversion, Eversion**
- **Supination, Pronation**
- **Dorsiflexion, Plantar flexion**

Types of Synovial Joints

- **Plane joint** (gliding joint) – most simple and least mobile articulation between *flat surfaces* of two bones
 - **Hinge joint** – *convex* articular surface of one bone interacts with *concave* depression of second bone
- (a) Plane joint, nonaxial: intercarpal joint
- (b) Hinge joint, uniaxial: elbow joint

Figure 8.11a The six types of synovial joints and motion allowed at each.

Types of Synovial Joints

- **Pivot joint** – one bone pivots or rotates around other
 - **Condylar (ellipsoid) joint** – *convex* surface of one bone fits into *concave* articular surface of a second bone
- (c) Pivot joint, uniaxial: atlantoaxial joint
- (d) Condylar joint, biaxial: metacarpophalangeal joint

Figure 8.11c The six types of synovial joints

Types of Synovial Joints

- **Saddle joint** – each bone's articulating surface has both a *concave* and *convex* region

(e) Saddle joint, biaxial: carpometacarpal joint of thumb

- **Ball-and-socket joint** – spherical surface of one bone fits into *cup-shaped depression* in second bone

(f) Ball-and-socket joint, multiaxial: shoulder joint

Figure 8.11e The six types of synovial joints.

STRUCTURAL CLASSIFICATION AND CHARACTERISTICS	STRUCTURAL CATEGORY	EXAMPLE	FUNCTIONAL CLASSIFICATION (MOBILITY)	STABILITY/MOBILITY CONTINUUM
Plane Two adjacent, flat surfaces articulate together. The bones are held together by dense regular connective tissue in the form of a fibrous capsule and ligaments.	Seven A&B bones articulate together to form the wrist. The carpal bones are connected to the radius.	Carpometacarpal between the trapezoid and trapezium bones	Synovial no movement allowed	MOST STABLE ↑ ↓ LEAST STABLE (MOST MOBILE)
Condylar Two adjacent, rounded surfaces articulate together. The bones are held together by dense regular connective tissue in the form of a fibrous capsule and ligaments.	Condylar teeth articulate with the sockets of the temporomandibular joint.	Tooth in the mandible at the jaw	Synovial no movement allowed	
Synovial Two adjacent, rounded surfaces articulate together. The bones are held together by dense regular connective tissue in the form of a fibrous capsule and ligaments.	Interosseous membrane between radius and ulna and ligament between radius and ulna	Interosseous membrane between radius and ulna and ligament between radius and ulna	Amphiarthrosis some movement allowed	
Cartilaginous Two adjacent, rounded surfaces articulate together. The bones are held together by dense regular connective tissue in the form of a fibrous capsule and ligaments.	Synovial disc: hyaline cartilage plate between bones	Epiphyseal plate: intervertebral disc	Synovial longitudinal plane only amphiarthrosis some movement allowed, respectively	
Synovial Two adjacent, rounded surfaces articulate together. The bones are held together by dense regular connective tissue in the form of a fibrous capsule and ligaments.	Pubis symphysis: fibrocartilage plate between pubic bones	Pubis symphysis: fibrocartilage plate between pubic bones	Amphiarthrosis some movement allowed	
Synovial Two adjacent, rounded surfaces articulate together. The bones are held together by dense regular connective tissue in the form of a fibrous capsule and ligaments.	Ball-and-socket joint: head of humerus and glenoid cavity of scapula	Ball-and-socket joint: head of humerus and glenoid cavity of scapula	Diarthrosis all movement allowed	

Figure 8.12 The Big Picture of Joint Classifications and Stability versus Mobility.

STRUCTURAL CLASSIFICATION AND CHARACTERISTICS	STRUCTURAL CATEGORY	EXAMPLE	FUNCTIONAL CLASSIFICATION (MOBILITY)	STABILITY/MOBILITY CONTINUUM
Plane Two adjacent, flat surfaces articulate together. The bones are held together by dense regular connective tissue in the form of a fibrous capsule and ligaments.	Plane (gliding) Hinge (condylar) Pivot Condyral (Ellipsoidal) Saddle Ball-and-socket	Intercarpal Elbow and knee joints Adiposural joint Second through fifth metacarpophalangeal joints Distal radioulnar joint Shoulder and hip joints	Diarthrosis diary movements Diarthrosis diary movements Diarthrosis diary movements Diarthrosis diary movements Diarthrosis diary movements	MOST STABLE ↑ ↓ LEAST STABLE (MOST MOBILE)
Hinge Two adjacent, rounded surfaces articulate together. The bones are held together by dense regular connective tissue in the form of a fibrous capsule and ligaments.				
Pivot Two adjacent, rounded surfaces articulate together. The bones are held together by dense regular connective tissue in the form of a fibrous capsule and ligaments.				
Condyral (Ellipsoidal) Two adjacent, rounded surfaces articulate together. The bones are held together by dense regular connective tissue in the form of a fibrous capsule and ligaments.				
Saddle Two adjacent, rounded surfaces articulate together. The bones are held together by dense regular connective tissue in the form of a fibrous capsule and ligaments.				
B & S Two adjacent, rounded surfaces articulate together. The bones are held together by dense regular connective tissue in the form of a fibrous capsule and ligaments.				

Figure 8.12 The Big Picture of Joint Classifications and Stability versus Mobility.

Specific Hinge Joints

Elbow – very stable hinge joint (Figure 8.13):

- **Humero-ulnar joint** – articulation between *trochlea* of humerus and *trochlear notch* of ulna
- **Humero-radial joint** – articulation between *capitulum* of humerus and *head* of radius

A&P Flix: Movement at the Elbow

Specific Hinge Joints

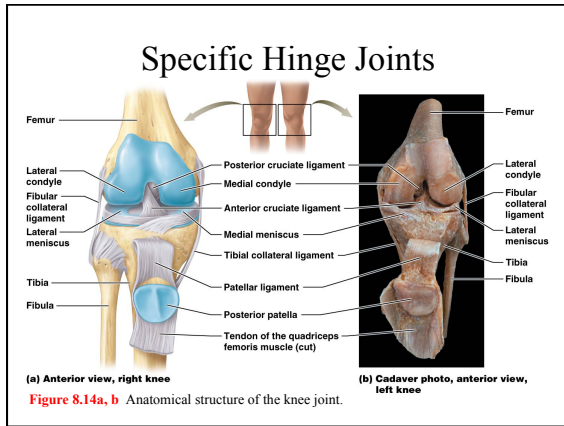

- **Knee:**

- _____ joint – articulation between *femoral* and *tibial condyles*
- **Patellofemoral joint** – articulation between posterior surface of *patella* and anterior patellar surface of *femur*

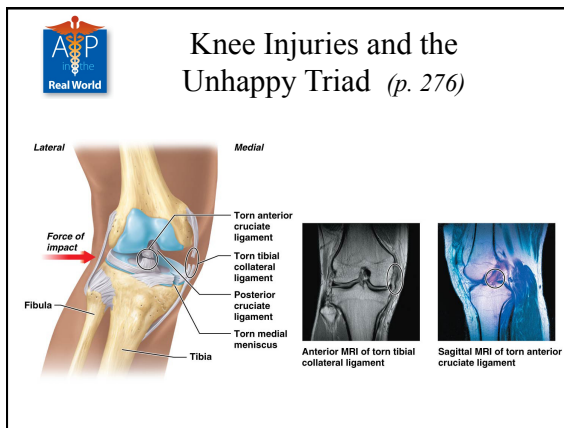

(c) Sagittal section of knee

- **Medial and lateral meniscus** – fibrocartilage *pads* between femoral and tibial condyles
- **Tibial collateral ligament** (medial collateral) – connects femur, medial meniscus, and tibia to one another to provide *medial joint stabilization*

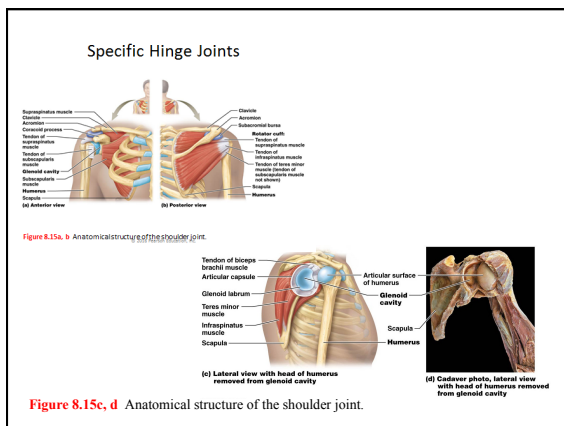

A&P Flix: Movement at the Knee Joint

Specific Hinge Joints

- **Shoulder** (_____) – ball-shaped head of *humerus* and *glenoid cavity*:
 - **Glenoid labrum** – *fibrocartilaginous ring*; increases depth of glenoid cavity to provide more *stability*
 - **Biceps brachii tendon** - helps keep head of humerus within glenoid cavity
 - **Rotator cuff**, providing most of joint's structural stabilization: _____, **infraspinatus**, **subscapularis**, and _____

A&P Flix: Movement at the Glenohumeral Joint

Specific Hinge Joints

- **Hip** (_____) – *acetabulum* and ball-shaped *head of femur*:
 - **Acetabular labrum** – *fibrocartilaginous ring* that helps to stabilize head of femur within acetabulum

Specific Hinge Joints

Figure 8.16c, d Anatomical structure of the hip joint.

A&P Flix: Movement at the Hip Joint

Hip Joint Replacement Surgery (p. 279)

- **Hip replacement** – surgical procedure that replaces a painful damaged joint with an *artificial prosthetic device*
- Severe *arthritis*, *trauma*, *fractures*, and *bone tumors* can all progress to point where hip joint replacement is an option

Hip Joint Replacement Surgery (p. 279)

- **Total replacement**
- **Partial replacement**
