

# Synovial Fluid Workshop

## ● Introduction

- Gross examination
- Save sterile fluid for cultures or research
- Microscopic examination
  - Wet preparations
    - Regular light
    - Polarized light
  - Stained smears. May not be needed
- Leukocyte count. Not always needed.

No disclosures

# REFERENCES

# Normal Synovial Fluid

	Range	Average
Knee joint volume (cc)	0.18 – 3.5	1.1
WBC/mm <sup>3</sup>	13 – 180	63
%PMN	0 – 25	6.5
Albumin g/100cc		1.02
Globulin g/100cc		0.05
Glucose	approximately same as plasma	
Electrolytes	approximately same as plasma	

**Table 3.**

**Number of patients With and Without a Change in the Most Likely Diagnosis Following Synovial Fluid Analysis**

<b>Initial Most Likely Diagnosis</b>	<b>Same Final Most Likely Diagnosis</b>	<b>Different Final Most Likely Diagnosis</b>	<b>Changed %</b>
<b>Osteoarthritis</b>	<b>31</b>	<b>6</b>	<b>16</b>

# Synovial Fluid Workshop

- Introduction
- **Gross examination**
- **Cultures**
- Microscopic examination
  - Wet preparations
    - Regular light
    - Polarized light
  - Stained smears
- Leukocyte count

**Normal**      **Non Inflammatory**      **Inflammatory**      **Purulent**      **Bloody**

## Joint Fluid Characteristics

	<b>Normal</b>	<b>Group I (Non-Inflammatory)</b>	<b>Group II (Inflammatory)</b>	<b>Group III (Septic)</b>
<b>Volume (knee, in rat)</b>	<b>&lt;3.5</b>	<b>&gt;3.5</b>	<b>&gt;3.5</b>	<b>&gt;3.5</b>
<b>Viscosity</b>	<b>Very high</b>	<b>High*</b>	<b>Low</b>	<b>Variable</b>
<b>Color</b>	<b>Colorless</b>	<b>Straw</b>	<b>Straw to opalescent</b>	<b>Variable with organism</b>
<b>Clarity</b>	<b>Transparent</b>	<b>Transparent</b>	<b>Translucent, opaque at times</b>	<b>Opaque</b>
<b>WBC/mm<sup>3</sup></b>	<b>200</b>	<b>300-2000<sup>t</sup></b>	<b>2000 - 100,000</b>	<b>&gt; 50,000<sup>tt</sup> usually &gt; 100,000</b>
<b>%PMN</b>	<b>&lt; 25</b>	<b>&lt; 25</b>	<b>&gt; 50 often</b>	<b>&gt; 75<sup>tt</sup></b>
<b>Culture</b>	<b>negative</b>	<b>negative</b>	<b>negative</b>	<b>usually positive</b>

\*Rapid accumulation of fluid will lower viscosity

<sup>t</sup>2000 is an approximation. Usually less than 500

<sup>tt</sup> may be lower with partially treated or low-virulence organisms

**What do you think of this opaque, creamy fluid?**

**What can cause this “cream of tomato soup” synovial fluid?**

**Fat on the surface after centrifugation of bloody effusion due to intra-articular fracture**

**Opaque synovial fluid not due to cells but due to amyloid**

**“Gold paint” synovial fluid loaded with cholesterol crystals**

## Rice Bodies

**Very viscous knee synovial fluid due to myxedema.  
Can also be seen in ganglia and cysts on Heberden nodes.**

**Clumps of urate crystals in 1<sup>st</sup> MTP joint fluid**

**Anaerobic**

**Gonococcal**

**Fungal**

**Routine Bacterial**

**Tuberculosis**

**If infection is being considered send unadulterated fluid to the laboratory with instructions as to which infections are concerns.**

# Synovial Fluid Workshop

- Introduction
- Gross examination
- Cultures
- **Microscopic examination**
  - **Wet preparations**
    - **Regular light**
    - **Polarized light**
  - Stained smears
- Leukocyte count

**If synovial fluid is not obtained, maintain suction on the syringe as you withdraw.**

Drop of  
joint fluid

Syringe

Glass slide

Drop covered with cover slip

*Fig. 1.* The technique of making a wet preparation of joint fluid.

**Synovial fluid cells examined first under regular light.**

**Synovial fluid leukocytes with cytoplasmic inclusions**

**Synovial fluid neutral fat droplets**

**Fat droplets stained with Sudan black**

**Fragment of synovial villus containing ochronotic shards found floating in synovial fluid.**

**Ochronotic  
Joint Fluid**

**Osteoarthritic  
Joint Fluid**

**What do you think of this joint fluid?  
Regular light microscopy**

**What do you see here?**

**Apatite crystal clumps by regular light microscopy**

**Alazarin red S stain for calcium must be passed through a millipore filter**

**Alazarin red S stained apatite clumps**

**Individual apatite crystals are seen only by electron microscopy**

**Calcific periarthrititis  
due to apatite at 2<sup>nd</sup>  
MCP joint**

**Synovial fluid fibrils often seen in osteoarthritis. Regular light**

**Amorphous clump of synovial fluid amyloid**

**Congo red positive amyloid**

**Apple green birefringence of amyloid with plain polarized light**

**Calcium oxalate crystal**

**Calcium oxalate crystal stained with Alizarin red S**

**Charcot-Leyden crystals in eosinophilic laden synovial fluid**

**Negatively birefringent MSU crystal**

# Polarized Light

- Polarizing discs
- Rotate until dark field
- Crystal will appear white
- First order red plate
- Background red
- Crystal yellow or blue

A

B

C

D

E

- A. Ocular
- B. Analyzer
- C. Compensator
- D. Polarizer
- E. Condenser

**MSU Crystal**

**Plain Polarized  
Light**

**Compensated  
Polarized Light**

# POLARIZED LIGHT MICROSCOPY (Urate crystal)

Orienting Line,  
First Order Red Plate  
COMPENSATOR

**MSU crystals can vary widely in size**

**MSU  
Crystal**

**Lower magnification  
intracellular MSU crystal  
and unidentified dot-like  
fragment**

**Centrifuged synovial fluid pellet to concentrate MSU crystals**

**Weakly  
positively  
birefringent  
CPPD crystal  
in WBC  
vacuole**

**CPPD crystals  
may be more  
brightly  
birefringent**

**CPPD Crystals Can Be Rhomboid or Rod Shaped**

## **Intracellular CPPD**

**CPPD may sometimes  
be seen more easily  
with regular light.**

**Faintly positively  
birefringent CPPD  
can be very small**

**CPPD May Be Non-birefringent**

**CPPD concentrated in  
a cartilage fragment**

**Single cell containing MSU and CPPD crystals**

**Cholesterol and lipid liquid crystals**

# Lipid Liquid Crystals

- **Appear as maltese crosses**
- **Positively birefringent**
- **Associated with some acute otherwise unexplained arthritis**
- **Can be phagocytized**
- **Seen as membranous arrays by EM**
- **Possibly derived from RBC or other cell membranes.**
- **Don't confuse with urate microspherules (negatively birefringent) or talc.**

**Membranous arrays of phospholipid in lipid liquid crystals by EM**

Massive positively birefringent lipid liquid crystals

**Negatively birefringent  
MSU crystal overlying  
positively birefringent  
Maltese cross lipid  
liquid crystal**

**What do you see here?**

**Cryoglobulin and other protein crystals stain with toluidine blue**

**Pyramidal aspect of oxalate crystals are accentuated by polarized light**

# Artefacts that May Be Seen on Polarized Light Examination of Joint Fluid

- **Depot corticosteroids**
- **Anticoagulant crystals**
  - Oxalate
  - EDTA
- **Drying artefact**
- **Glass fragments**
- **Fibrils from lens paper**
- **Corn starch from sterile gloves**
- **Lipids from degenerated cells**
- **Birefringent nail polish used to seal coverslips**

**Depot medrol is very bright and irregular**

**Celestone soluspan can mimic CPPD or cholesterol**

**Glass fragments from  
broken coverslips can  
mimic MSU crystals**

**Lens paper is brightly birefringent**

**What do you see here?**

**These negatively birefringent lipid crystals can form in neutral lipid droplets in specimens left over night**

**Lipid crystals forming in  
neutral fat droplet**

## Corn starch from gloves

Green fragment from tube stopper found in synovial fluid. Nail polish used to seal coverslip can seep into specimen.

# Synovial Fluid Workshop

- Introduction
- Gross examination
- Cultures
- Microscopic examination
  - Wet preparations
    - Regular light
    - Polarized light
  - **Stained smears**
- Leukocyte count

**If leucocyte differential or gram stain may be needed make several thin smears for later staining**

# Cells seen in synovial fluid

- PMN
- Small lymphocytes
- Activated lymphocytes
- Large granular lymphocytes
- Monocytes
- Large mononuclears
- Synovial lining cells (synthetic type)
- Eosinophils
- Plasma cells
- Mast cells
- Others

Wright stain of synovial fluid showing lymphocytes, monocytes and PMN as often seen in RA

**Occasional synovial fluids may have predominantly lymphocytes**

13

**One lymphocyte, two monocytes and the large cell is a synovial lining cell**

**A large cell with a nucleus filling most of the cytoplasm is an activated lymphocyte as may be seen in RA or SLE**

**This large cell is an LE cell**

**Synovial lining cell with phagocytized MSU crystal**

**“Reiter cell” typical of spondyloarthritis**

**World champion “Reiter cell”**

**Metastatic adenocarcinoma cells**

**Bacteria can be suspected on Wright stain**

**Gram stain showing gram positive cocci**

# Synovial Fluid Workshop

- Introduction
- Gross examination
- Cultures
- Microscopic examination
  - Wet preparations
    - Regular light
    - Polarized light
  - Stained smears
- **Leukocyte count**

# Leukocyte Counts on Joint Fluids

- Use heparin or EDTA tubes
- Leukocyte counts fall with time so test best done promptly
- Use 0.3N saline as diluent to lyse red blood cells.
- Automated counters may become clogged and may count material other than cells so should be avoided
- With clear fluids estimated counts can be made.  
0-2 WBC/HPF means that actual counts will virtually always be less than 2000/mm<sup>3</sup>

# Abnormally high leukocyte count reported on an automated counter

## CAUSES OF NON-INFLAMMATORY JOINT FLUIDS

Osteoarthritis  
Traumatic arthritis  
Acromegaly  
Gaucher's disease  
Hemochromatosis  
Hyperparathyroidism  
Ochronosis  
Paget's disease  
Jaccoud's arthritis  
Hemarthrosis, hemophilia  
Mechanical derangement  
Fractures  
Osteochondritis dessecans  
Epiphyseal dysplasias

Primary tumors  
Metastatic tumors  
Pigmented villonodular  
synovitis  
Aseptic necrosis  
Ehlers-Danlos syndrome  
Sickle cell disease  
Amyloidosis  
Hypertrophic pulmonary  
osteoarthropathy  
Pancreatitis  
Charcot joints  
Wilson's disease

# Other Tests are Rarely Useful

- Rheumatoid factor is not needed and can mislead
- Cytokines, cell surface markers, enzymes, etc. are still mostly for research
- PCR may be an important test in the near future for difficult to identify infections
- Consider synovial biopsies if synovial fluid is not diagnostic. Decide if your question can be better answered by examining tissue.

**PCR demonstration of  
chlamydial nucleic acid in  
reactive arthritis synovial  
fluid**

*Chlamydia trachomatis* (16s rRNA g

466 bp →

466 bp →

# Chlamydia Identification by PCR is More Often Positive in Synovium than Synovial Fluid

- Total of Patients: 37

● (+) Synovium	24	(64.8%)
● (+) Synovial fluid	13	(35.1%)
● (+) On both	14	(37.9%)
● (-) On both	11	(29.7%)
● (+) Syn (-) Sf	10	(27.0%)
● (-) Sf (+) Syn	2	( 5.4%)

**TB granuloma detected in synovium despite negative synovial fluid culture**

**Other less common diseases like multicentric reticulohistiocytosis may also be detected by synovial biopsy**

RHEUMATOLOGY

# Conclusions

- Examining synovial fluid may be the only way to determine the process involving a given joint
- Gross appearance and wet drop examination are most helpful
- Your examination is important and worth documenting on a SF report form
