**Abstract** An annotated checklist of marine and freshwater fishes of five islands of Mishima (including Take-shima, Iwo-jima, Kuro-shima, Showaiwo-jima, and Den-shima islands) in the Osumi Islands, Kagoshima, southern Japan, was compiled from specimen and literature surveys. All registered specimens previously recorded from Mishima in published papers were reexamined. A total of 541 species (267 genera and 111 families), including 109 species that represent the first reliable records from Mishima (120 species new to Kuro-shima, 45 new to Take-shima, 25 new to Iwo-jima, and 1 new to Den-shima islands) on the basis of collected specimens and/or underwater photographs, are listed with citation of literature, registration numbers, sizes, localities (island names), and some remarks. Twenty-five and five species recorded from the islands represent the specimen-based northernmost and southernmost records in Japanese waters.

## Introduction

The Osumi Islands (Fig. 1) is an island group located in the northern extremities of the Nansei Islands (Osumi Islands south to Yaeyama Islands) and the Satsunan Islands (Osumi Islands to Amami Islands) and just south of southern Kyushu. It consists of six inhabited islands, i.e., Tanegashima, Yaku-shima, Kuchi-noerabu-jima, Take-shima, Iwo-jima, and Kuro-shima islands, and three uninhabited islands, i.e., Mage-jima, Showaiwo-jima, and Den-shima islands. Among these islands, Take-shima, Iwo-jima, Kuro-shima, Showaiwo-jima, and Den-shima islands are called as Mishima or Kami-mishima, which are administratively included in Mishima Village.

Take-shima and Iwo-jima islands of Mishima are a part of northern edge of the Kikai Caldera, which spread 21 km west to east, and 18 km north to south, with 400–500 m depth. Mt. Iwodake (703 m height above the sea level) in Iwo-jima island is an active volcano, constantly fuming. In the Iwo-jima Fishing Port, hot springs containing a large amount of iron gush out from the bottom, turning reddish brown as they react with the seawater. Showaiwo-jima island off east side of Iwo-jima island was created by the 1934 eruption. Kuro-shima island, the largest island in Mishima, belongs to the Paleo-Ryukyu Volcanic Belt along with the Uji Islands and Kusagaki Islands. Kuro-shima, meaning black island, is named because there are many trees growing throughout the island and looks black.

No comprehensive ichthyofaunal surveys and studies have been carried out in Mishima until Motomura et al. (2013a) published “Fishes of Iwo-jima and Take-shima islands”, reporting 414 marine species. Subsequently, Fukui et al. (2015) reported 23 deepwater fishes from off Kuro-shima island. To complete comprehensive ichthyofaunal survey of Mishima, Major expeditions were made in Kuro-shima island in November 2016 and in Take-shima island in March 2021, both involving 13 personnel from the Kagoshima University Museum, with several small scale expeditions in both islands. About 2000 specimens of marine fishes were collected during the expeditions.

Examination of the above-mentioned specimens, published literature, and unpublished underwater photographs taken at Mishima, confirmed 541 species of fishes from the islands. All species are listed below. Characteristics of the ichthyofauna of the five islands of Mishima are provided.

## Material and methods

Sampling methods were described and illustrated in Motomura et al. (2013a). Curatorial procedures for collected specimens followed Motomura and Ishikawa (2013). Standard and total lengths are abbreviated as SL and TL respectively. The systematic arrangement of families generally follows Motomura (2021). Within families, species are arranged in alphabetical order of the scientific name. Scientific and standard Japanese names follow Motomura (2021), the latter having been transliterated using the Hepburn system. Each species record was compiled from voucher specimens, underwater photographs, and/or published literature. Registration number, number of specimens registered (if more than one), mm in SL or TL, and locality as Take-shima, Iwo-jima, Kuro-shima, Showaiwo-jima, and Den-shima (expressed as without “island”) are listed in each species record. Color photographs of all of the newly recorded species in this study, except for those of the 14 species already published under mis-identifications and 3 species without photographs when fresh, are shown in plates 1–10.

Institutional codes used in this paper are as follows: KAUM (Kagoshima University Museum, Kagoshima, Japan), and NSMT (National Museum of Nature and Science, Tsukuba, Japan).

## Remarks

Examination of the above-mentioned newly collected specimens, published literature, and unpublished underwater photographs taken at Mishima and re-examination of museum specimens from Mishima showed that 338 species (169 genera and 61 families) were recorded from Iwo-jima, 247 species (140 genera and 57 families) from Take-shima, 146 species (108 genera and 70 families) from Kuro-shima, 14 species (14 genera and 8 families) from Showaiwo-jima, and one species *Opistognathus hopkinsi* (Jordan and Snyder,

1902) from Den-shima. A total of 541 species (269 genera and 111 families) of fishes were recorded from Mishima, 109 of which are the first records from Mishima. In each island, 120 species are the first records from Kuro-shima, 45 species from Take-shima, 25 species from Iwo-jima, and one species from Den-shima. In addition, 25 and 5 species represent the northernmost and southernmost specimen-based records, respectively, in Japanese waters (Table 1).

The number of species in the top 10 most speciose families occurring at Mishima are shown in Tables 2–5. Comparable data for 16 localities in southern Japan, including the Sagami Sea, Osezaki (Suruga Bay), Kushimoto (Kii Peninsula), Kashiwa-jima island (Shikoku), Yaku-shima island (Osumi Islands), Amami-oshima island (Amami Islands), Kikai-jima island (Amami Islands), Tokunoshima island (Amami Islands), Okinoerabu-jima island (Amami Islands), Yoron-jima island (Amami Islands), Okinawa-jima island (Okinawa Islands), Ie-jima island (Okinawa Islands), the Miyako Islands, Ishigaki-jima island (Yaeyama Islands), Iriomote-jima island (Yaeyama Islands), and the Ogasawara Islands, were presented in Motomura (2016: tables 1, 2), Nakae et al. (2018: table 2), Mochida and Motomura (2018: table 1), Motomura and Uehara (2020: table 1), and Fujiwara and Motomura (2020: table 1). Although Mishima is geographically located near Yaku-shima island, the top 10 most speciose families, and their percentages of number of species in each family to total number of species in Mishima (Table 5) were not the same with Yaku-shima island (Motomura, 2016: table 2), but Mishima's ichthyofauna was rather similar to those of locations along the Pa-

cific coast of southern Japan (Motomura, 2016: table 2). The families Syngnathidae and Carangidae listed as the 9th and 10th speciose families, respectively, in the Sagami Sea and Osezaki were not listed in Mishima. The lack of Syngnathidae from the list in Mishima is probably due to a lack of estuarine and seagrass beds in Mishima. Because no commercial fisheries in Mishima, it is less opportunities to obtain carangids during the surveys. On the other hand, the family Holocentridae listed as the 10th speciose family in Mishima is not listed in any locations of southern Japan which is probably because Mishima has well developed coral and rocky reefs where holocentrids prefer to inhabit. Recently, Motomura (2015) proposed the “Osumi Line” a major biogeographical boundary for marine fishes in southern Japan that is located in the Osumi Islands between Yaku-shima, and “Tanegashima, Iwo-jima and Take-shima islands” (Motomura, 2017; Motomura and Harazaki, 2017; Motomura and Suzuki, 2019; Motomura and Matsunuma, 2022). Therefore, Mishima and Tanegashima island are located in southern edge of ichthyofauna of the Japanese mainland. Detailed description of the Osumi Line was given in Motomura (2015), Motomura and Suzuki (2019), and Motomura and Matsunuma (2022).

This study: KAUM-I. 95890, 46.9 mm SL, Kuro-shima; KAUM-I. 95937, 40.4 mm SL, Kuro-shima.

#### ***Pseudoplesiops annae* (Weber, 1913)**

[Jpn name: Kamereontanabatamegisu]

Yoshida et al. (2013a): KAUM-I. 30617, 25.7 mm SL, Iwo-jima; KAUM-I. 31411, 27.1 mm SL, Iwo-jima; KAUM-I. 31412, 22.0 mm SL, Iwo-jima. Yoshida et al. (2013b): KAUM-I. 30617, 23.4 mm SL, Iwo-jima; KAUM-I. 31411, 26.3 mm SL, Iwo-jima; KAUM-I. 31412, 21.5 mm SL, Iwo-jima.

Remarks: The Iwo-jima specimens represent the northernmost records for the species.

#### **FAMILY PLESIOPIDAE**

##### ***Plesiops coeruleolineatus* Rüppell, 1835**

[Jpn name: Tanabatauo] (Pl. 4G)

This study: KAUM-I. 156543, 35.9 mm SL, Take-shima; KAUM-I. 156544, 40.3 mm SL, Take-shima; KAUM-I. 156545, 40.9 mm SL, Take-shima; KAUM-I. 156546, 37.8 mm SL, Take-shima.

#### **FAMILY OPISTOGNATHIDAE**

##### ***Opistognathus hopkinsi* (Jordan and Snyder, 1902)**

[Jpn name: Agoamadai] (Pl. 4H)

This study: KAUM-I. 107728, 105.7 mm SL, Den-shima.

Remarks: The Den-shima specimen represents the southernmost record for the species.

##### ***Opistognathus solorensis* Bleeker, 1853**

[Jpn name: Hoshikageagoamadai]

Tashiro et al. (2018b): KAUM-I. 95905, 59.2 mm SL, Kuro-shima; KAUM-I. 95906, 59.6 mm SL, Kuro-shima; KAUM-I. 95907, 60.7 mm SL, Kuro-shima.

#### **FAMILY PRIACANTHIDAE**

##### ***Heteropriacanthus carolinus* (Cuvier, 1829)**

[Jpn name: Gomahirekintoki]

Yoshida (2013h, as *Heteropriacanthus cruentatus*): KAUM-I. 29667, 206.7 mm SL, Take-shima. This study: KAUM-I. 95962, 193.4 mm SL, Kuro-shima; KAUM-I. 96515, 232.4 mm SL, Kuro-shima; KAUM-I. 96524, 219.4 mm SL, Kuro-shima; KAUM-I. 96525, 188.6 mm SL, Kuro-shima; KAUM-I. 96535, 194.0 mm SL, Kuro-shima.

##### ***Priacanthus hamrur* (Forsskål, 1775)**

[Jpn name: Hosekikintoki]

Yoshida (2013i): KAUM-I. 37836, 289.9 mm SL, Iwo-jima.

#### **FAMILY APOGONIDAE**

##### ***Amioides polyacanthus* (Vaillant, 1877)**

[Jpn name: Oniishimochi]

Yoshida (2013f, as *Coranthus polyacanthus*): KAUM-I. 37923, 170.3 mm SL, Iwo-jima; KAUM-I. 37924, 118.4 mm SL, Iwo-jima; underwater photograph, Iwo-jima.

Remarks: The Iwo-jima specimens represent the northernmost record for the species.

***Apogon caudicinctus* Randall and Smith, 1988**

[Jpn name: Togenagaishimochi]

Yoshida (2013m): KAUM-I. 29534, 50.5 mm SL, Iwo-jima; KAUM-I. 29536, 20.8 mm SL, Iwo-jima; KAUM-I. 29537, 15.3 mm SL, Iwo-jima; KAUM-I. 29538, 13.4 mm SL, Iwo-jima; KAUM-I. 29560, 11.1 mm SL, Iwo-jima; KAUM-I. 31372, 13.9 mm SL, Take-shima; KAUM-I. 31680, 26.4 mm SL, Iwo-jima.

Remarks: The Take-shima specimen represents the northernmost record for the species.
