ABSTRACT — As a result of lichenological exploration in the Iğdır province (Turkey), a total of 292 lichenized fungi belonging to 96 genera in the *Ascomycota*, including 2 subspecies and 6 varieties, were determined from 174 different localities. *Caloplaca glomerata*, *Caloplaca kansuensis*, *Dermatocarpon miniatum* var. *cirsodes*, *Lecanora bicincta* var. *sorediata*, *Lecanora prophetae-eliae*, *Phaeophyscia hispidula*, *Physcia scopulorum*, *Placopyrenium iranicum* and *Pyrenopsis subareolata* are new to Turkey, and also Asia except *Pyrenopsis subareolata* and *Lecanora prophetae-eliae*.

Introduction

Especially in last three years the knowledge about lichen flora of Turkey has significantly increased and substantial new lichen records have also been added to it (Aptroot & Yazıcı 2012, Arslan et al. 2011, Karagöz & Aslan 2012, Karagöz et al. 2011, Kinalioğlu & Aptroot 2011, Oran & Öztürk 2010, 2012, Osyczka et al. 2011, Vondrák et al. 2012, Yazıcı et al. 2010a,b,c, 2011a,b) However, there are still many lichenologically unexplored parts of Turkey (e.g. Muş, Hakkari, Şırnak, Kilis, Elazığ etc.)

Iğdır is such a part: it has never been the subject of a detailed lichenological study, and only fourteen lichenized fungi have thus far been reported from this area where Turkey borders with Nakhchivan and Armenia (Aptroot & Yazıcı 2012, Vondrák et al. 2012, Yazıcı 2012, Yazıcı et al. 2011b, 2012). This is in contrast with nearby areas such as the provinces Ardahan, Kars, Ağrı and Van, which have already received already much more attention (Aslan 2000, Karagöz & Aslan 2012, Steiner 1899, Vondrák et al. 2012, Yazıcı et al. 2011a).

This paper presents the results of dedicated lichenological fieldwork in Iğdır province done in spring and summer 2010 and summer 2011.

Material and methods

Lichen specimens were collected from 174 different localities between 28 March 2010 and 29 July 2011 in the region Iğdır (Table 1). The investigated area includes the districts Iğdır (Center), Tuzluca, Aralık, Karakoyunlu and the localities are marked on the map of Figure 1. Air dried samples were studied with a Nikon SMZ1500 stereomicroscope and a Nikon Eclipse 80i light microscope and for the identification the major identification guides were used (e.g. Brodo et al. 2001, Dobson 2005, Esslinger 1997, Giralt 2001, Poelt 1974, Poelt & Věžda 1981, Smith et al. 2009, Wirth 1995). Vouchers are deposited in the herbarium of the Biology Department, Faculty of Science, Karadeniz Technical University, Turkey (KTUB).

Study area

İğdir province in the eastern part of Turkey is situated along the border with Armenia, Nakhchivan and Iran. Kars in the northwest and Ağrı in the west and south are the adjacent provinces. It occupies an area of 3.587 km² (Figure 1).

İğdir is one of the least forested areas in Turkey. It is a strongly sun-exposed, highly elevated and gently sloped, windswept, treeless area dominated by steppe vegetation, alternating with streams and rocks. Several mountains emerge, such as Zor, Tekaltı, Ziyaret and Oyuklu.

Prunus, *Pyrus*, *Populus*, *Salix*, and *Elaeagnus* trees occasionally grow along the streams (Baytop & Denizci 1963), and both calcareous and siliceous rock outcrops can be found predominantly around the villages and on the mountains in the south.

İğdir has an extreme climate. The summers are hot and dry while the winters are cold and snowy. The mean annual temperature is 11.6°C, the average humidity 63%, and the mean annual rainfall about 257.6 mm. Most precipitation falls during the winters as snow (Akman 1999).

The lichen flora of Turkey is similar to that of Europe (Yazici & Aslan 2003), and many species can be identified using the available floras for that area (e.g. Smith et al. 2009, Dobson 2005, Wirth 1995). However, the internal eastern region, including İğdir, has more pronounced affinities with continental Asia.

Results; list of taxa

The lichenological survey of İğdir province yielded a total of 292 lichenized fungi. This includes 2 subspecies and 6 varieties, representing 96 genera in the *Ascomycota*.

We found nine taxa are new to Turkey. Of these 8 are also new to the whole of Asia.

The taxa are listed alphabetically. "#" indicates new records for Turkey and "*" for Asia while "+" indicates parasitic lichens. All taxa are new to İğdir region except *Caloplaca pellorella*, *Caloplaca teicholyta* and *Pyrenodesmia variabilis*.

Acarospora bullata Anzi – Loc. 59, 60: on calcareous rock.

Acarospora cervina (Ach.) A. Massal. – Loc. 1, 2, 4, 5, 6, 8, 9, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 25, 26, 30, 48, 57, 59, 60, 61, 62, 75, 76, 78, 79, 80, 81, 82, 83, 84, 94, 98, 99, 100, 102, 103, 104, 105, 107, 109, 110, 111, 112, 115, 116, 120, 121, 122, 124, 125, 126, 127, 128, 129, 130, 131, 132, 133, 134, 136, 137, 138, 139, 140, 141, 142, 143, 145, 147, 148, 149, 150, 153, 154, 155, 156, 157, 158, 161, 162, 163, 164, 165, 167, 169, 170, 171, 172, 173, 174: on calcareous rock.

Acarospora fuscata (Nyl.) Th. Fr. – Loc. 1, 2, 3, 4, 5, 6, 9, 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 30, 48, 54, 57, 59, 60, 61, 62, 79, 80, 81, 82, 84, 98, 99, 102, 103, 104, 105, 107, 108, 110, 111, 112, 113, 115, 122, 124, 125, 126, 127, 128, 129, 130, 132, 133, 134, 136, 137, 138, 139, 140, 141, 142, 143, 145, 146, 147, 152, 154, 155, 156, 157, 158, 161, 163, 167, 169, 170, 171, 172, 173: on siliceous rock.

Acarospora glaucocarpa (Ach.) Körb. – Loc. 16: on calcareous rock.

Acarospora impressula Th. Fr. var. *impressula* – Loc. 6, 20, 22: on siliceous rock.

+*Acarospora impressula* Th. Fr. var. *hospitans* (H. Magn.) Clauzade & Cl. Roux – Loc. 22: on *Aspicilia cinerea*; 48, 62, 75, 76, 78, 79, 100, 124, 127, 136: on *Aspicilia desertorum*.

Acarospora macrospora (Hepp) A. Massal. ex Bagl. – Loc. 5, 6, 48, 61, 107, 126, 133: on calcareous rock.

Acarospora oligospora (Nyl.) Arnold – Loc. 125: on calcareous rock .

Acarospora umbilicata Bagl. – 169: on siliceous rock.

Acarospora veronensis A. Massal. – Loc. 1, 4, 5, 6, 9, 14, 17, 19, 21, 24, 25, 30, 48, 59, 61, 62, 79, 82, 84, 98, 103, 104, 106, 108, 109, 112, 113, 121, 124, 125, 127, 130, 131, 133, 134, 136, 138, 140, 142, 155, 156, 167, 172: on siliceous rock.

Discussion

Saxicolous lichens appear to predominate in the dry mountain climate of İğdir. As to substrate preference, 95 lichen taxa are epiphytic, 10 of which grow equally on mosses; 202 taxa are saxicolous, of which 180 taxa are exclusively saxicolous; 19 taxa are terricolous; 68 taxa are exclusively epiphytic. Of the epiphytic species, 30 taxa were found on deciduous trees and 25 on coniferous trees (Table 2).

Four species were reported only once before from Turkey: *Acarospora oligospora*, *Agonimia allobata*, *Agonimia tristicula* and *Xanthoria aphrodites*.

The following taxa are rarely reported in Turkey so far and possibly of limited distribution in the country: *Acarospora oligospora*, *Agonimia allobata*, *Agonimia tristicula*, *Anaptychia kaspica*, *Bilimbia lobulata*, *Bilimbia sabuletorum*, *Buellia sequax*, *Caloplaca inconnexa*, *Caloplaca lecideina*, *Dermatocarpon vellereum*, *Fuscopannaria mediterranea*, *Lecanora ochroidea*, *Lecidella patavina*, *Lichenella stipatula*, *Peltigera ponojensis*, *Peltigera scabrosa*, *Pertusaria lactescens*, *Pleopsidium flavum*, *Psora vallesiaca*, *Rhizoplaca subdiscrepans*, *Umbilicaria aprina*, *Xanthoparmelia pokornyi*, *Xanthoparmelia convoluta*, *Xanthoria aphrodites* and *Xanthoria fulva*.

The following crustose, foliose and fruticose (rarely) lichen taxa appeared widespread on siliceous and calcareous rocks on the mountains in mostly the south of İğdir region.

Acarospora cervina, *Acarospora fuscata*, *Acarospora veronensis*, *Aspicilia cinerea*, *A. caesiocinerea*, *Aspicilia desertorum*, *Candelariella vitellina*, *Dimelaena oreina*, *Immersaria athroocarpa*, *Lecanora argopholis*, *Lecanora rupicola*, *Lecidella carpathica*, *Physcia caesia*, *Proparmeliopsis muralis*, *Ramalina polymorpha*, *Rhizocarpon disporum*, *Rhizocarpon geographicum*, *Rhizoplaca chrysoleuca*, *Rhizoplaca melanophthalma*, *Rhizoplaca peltata*, *Rinodina milvina*, *Verrucaria fuscella*, *Xanthoparmelia stenophylla*, *Xanthoparmelia verruculifera* and *Xanthoria elegans*.

Crustose lichen taxa were widely determined to grow directly on siliceous and calcareous rocks in the south areas of İğdır plateau while lichens such as *Cetraria*, *Cladonia*, *Leptogium* and *Peltigera* grow on mosses in the same areas. On the other hand *Endocarpon*, *Toninia*, *Xanthoparmelia* and some other members of *Cladonia* predominantly grow on poor soil. Some epiphytic species such as *Peltigera*, *Physconia* (especially *Physconia muscigena*, *Physcia*, *Caloplaca*, *Cladonia* (occasionally) were occasionally observed on mosses in mountainous districts in the southern areas of İğdır region (e.g. between Uğurca-Yukarı Civanlı villages, Yukarı and Aşağı Civanlı village, Tekaltı Mountain, Zor Mountain and Valley, Ağrı Mountain, and other valleys etc.).

Nearly no lichen species have been observed in the large area of northern and south-eastern İğdır, and also in the north and east of Tuzluca and the surroundings of Karakoyunlu and Aralık with grassy plains and without trees. For example some *Caloplaca*, *Physcia* taxa were poorly observed only on *Salix*, *Elaeagnus* and *Populus* in Tuzluca: Köprübaşı, Sürmeli, Aralık: Saraklı, Aşağı Çamurlu, Hasanhan, Babacan, Aşağı topraklı, Karakoyunlu: Gökçeli, Cennetabat, Bayatdoğanşalı villages.
