

# CHROMOSOME NUMBERS OF COLEOPTERA \*

STANLEY G. SMITH  
Forest Insect Laboratory, Sault Ste. Marie, Ontario

Received 7.vi.52

THE present is a complete list of the chromosome numbers of Coleoptera. That in Makino's (1951) *An Atlas of the Chromosome Numbers in Animals* is replete with errors : not in the numbers themselves—almost without exception, these have been faithfully recorded from the originals—but in the spelling of the specific, generic, and family names, as well as in the nomenclature and systematic disposition of many of the species.† Considering the difficulties with which Makino was faced, the coverage of the literature is good, perhaps no more than 14 determinations by nine authors being omitted.

I had earlier intended to compile a list of some 160 chromosome determinations, which I have made as time permitted during the course of the past eight years, together with others that have appeared in print, and to publish them as a supplement bringing those given by Harvey (1916 and 1920) up to date, but it now appears that a complete revision of Makino's list is warranted. It is perhaps noteworthy that 11 families find themselves represented for the first time and that the total of cytologically known Coleoptera now reaches 340. According to Makino's tabulation, this number is surpassed among Insecta only in the Orthoptera and Heteroptera but in no other animal group, and constitutes approximately 10 per cent. of the species of animals whose chromosome numbers have been recorded. The distribution of species, genera, subfamilies, and families by haploid number of autosomes and by sex-chromosome type is given graphically in fig. 1.

In the accompanying tabulation it has been considered advisable to arrange the species not in alphabetical sequence under families (a procedure followed by Makino and by Harvey) but so far as is possible in phylogenetic sequence, since it is only through a logical grouping based on current concepts of taxonomic relationships that the full import of the cytological findings becomes evident. The systematic arrangement adopted herein is that devised by Leng (1920) on the basis of adult morphology, and his catalogue is also taken as

\* Contribution No. 48, Division of Forest Biology, Science Service, Department of Agriculture, Ottawa, Canada.

† Thirty-three spelling mistakes occur among the total of 180 determinations tabulated ; 45 species are retained in genera from which they are now, or were even at the time of first publication, removed ; and a few, for example *Silpha perforata*, are listed under the incorrect family. The majority of these errors and all the obsolete names have been carried over from the original authors. It is regrettable that cytologists in general have been, and many still are, remarkably lax in their dealing with taxonomic nomenclature. But unfortunately many purely typographical errors have arisen *de novo* during the printing of both the original Tokyo and the first American editions.

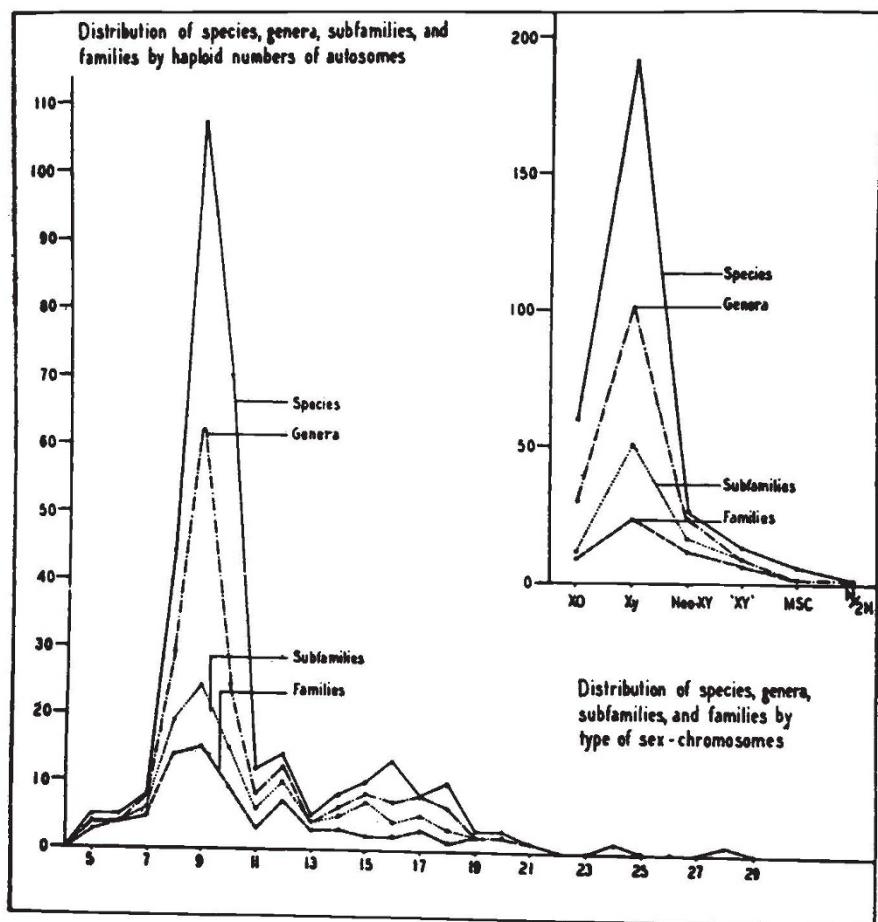

FIG. 1.

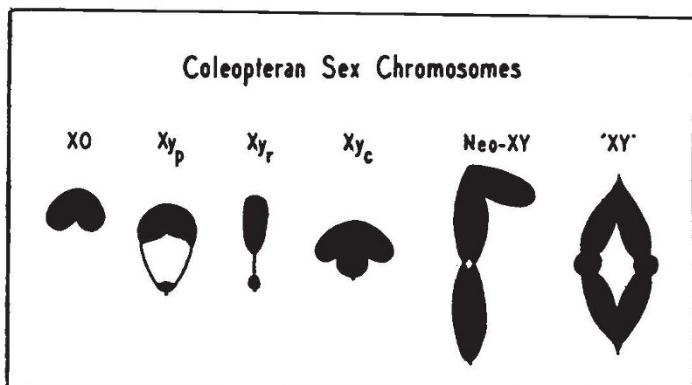

FIG. 2.

the authority for questions of nomenclature. Whereas Leng and his co-workers were concerned only with Coleoptera of America, north of Mexico, many of the species listed here occur only outside North America; the disposition and nomenclature of such exotic species are those given in the *Coleopterorum Catalogus*.

With but few exceptions all taxonomic determinations of my material were made by W. J. Brown, Systematic Entomology, Science Service; it is a distinct pleasure to record my debt of gratitude to him for these and for guidance in questions of synonymy.

#### GENERAL NOTES CONCERNING THE LIST

Papers preceding Stevens (1905) are largely in error or open to doubt; they have therefore, with the exception of a determination by Prowazek (see footnote 41), been omitted but are fully listed by Harvey (1916) and Makino (1951). It has not been possible to secure a few of the papers cited by Makino; references to these are placed in parentheses. Unless otherwise stated, undetermined species I have examined originated from the Lake Kipewa region in the Province of Quebec. Components marked with an asterisk are considered as parts of new families by Böving and Craighead (1931).

The first number column gives the somatic chromosomes according to sex, the second gives the number of autosomal pairs and the sex chromosomes.

The following symbols are used: "XY", indistinguishable or unidentified sex chromosomes; x and y, relatively small sex chromosomes; p, r, and c, parachute-, rod-, and centric-associations respectively; neo-XY, derivative, or complex, sex-determining mechanism (see text fig. 2); s, supernumerary chromosome; Parth., Parthenogenetic.

The list has been compiled up to April 1952.

## SUMMARY AND ABSTRACT

Approximately 340 species and subspecies of Coleoptera are listed of which about one-half are determinations made by the author. The number of component genera totals 179, the number of families 33. The commonest sex-determining mechanisms are Xy, neo-XY, and XO as follows :—

Xy :	193	species	in	112	genera	in	24	families
neo-XY :	29	"	24	"	12	"		
XO :	60	"	30	"	9	"		

The distribution of species, genera, subfamilies, and families by haploid number of autosomes and by sex-chromosome type is given graphically. Parthenogenesis occurs in two families ; compound sex chromosomes are found in a third and possibly a fourth.

### ADDENDUM

Since this list was compiled, reprints of three papers have been received: Virkki (*Ann. Zool. Soc. Zool. Bot. Fenn. "Vanamo"*, 14, 1-104, 1951) provides information on 30 additional species in the Scarabaeidae and new determinations for *Trichius fasciatus* L. ( $2n=19$ , *contra* Yosida herein) and *Oryctes nasicornis* L. ( $2n=18$  *contra* Prowazek, *v. footnote 42* herein); Guénin (*Rev. suisse Zool.*, 59, 277-282, 1952) reports that four European species of *Cicindela* have XXXY : XXX/XXX sex-determining mechanisms; and Yosida (*Papers Co-ord. Comm. Res. Genet.*, 3, 41-49, 1952) gives determinations for another carabid and another chrysomelid, besides giving *Silpha perforata* Gebler as  $2n=20$  and 21 (*contra* Yosida, 1951, *v. Makino*, 1951).
