Introduction

This list is intended to contain all vascular plant species known or postulated to occur in Glacier Bay National Park and Preserve, including Gustavus, Alaska. Its purpose is to provide both layperson and scientist with a reliable catalog of species likely to be encountered in the area. Particular attention has been given to common names and to disposition of herbarium specimens in order to facilitate further inquiry into the flora.

Nomenclature follows that employed in the Glacier Bay Herbarium, which is generally that of Eric Hultén's *Flora of Alaska and Neighboring Territories* except some family names and a few annotations by specialists. (Exceptions are given in parenthesis).

(Continued from page 1)

No attempt has been made to provide synonymies; these can be found in Hultén, which is also recommended for range maps and illustrations of species. The most authoritative keys and species descriptions are to be found in Stanley Welsh's *Anderson's Flora of Alaska*.

These genera are in particular need of further examination by specialists: *Potamogeton*, *Agrostis*, *Calamagrostis*, *Poa*, *Puccinellia*, *Carex*, *Cypripedium*, *Atriplex*, *Stellaria*, *Epilobium*, *Arctostaphylos*, *Castilleja*.

Each species represented by a herbarium specimen is annotated with a subscript in this fashion:

H - Any species represented in the Glacier Bay Herbarium.

M - Additional species represented in the University of Minnesota Herbarium.

F - Additional species represented in the Tongass National Forest Service Herbarium.

L - A specimen which was in Glacier Bay Herbarium, but now is lost.

The list is divided into two parts:

Neither Part A nor Part B lists plants that have escaped from cultivation unless they have become established.

Part A

The main body of the list contains all species of known or probable occurrence.

Species on this list are annotated as follows:

1 - Present in Glacier Bay National Park & Preserve / Gustavus:

Species represented in the Glacier Bay or another Herbarium for which the taxonomy is straightforward or has been checked by a specialist.

2 - Probably present in Glacier Bay National Park & Preserve / Gustavus:

Species represented in the Glacier Bay or another Herbarium for which the taxonomy is difficult and uncheckable by a specialist, or species which have been confidently identified in the field, but not verified by a specimen.

Part B

Other species postulated to occur are listed in an Appendix. This list includes species:

- whose range in Hultén includes Glacier Bay / Gustavus, or
- which is on some plant list for Glacier Bay / Gustavus, or
- which has been tentatively identified in the field, or
- which may be a synonym of a species listed in Part A, or
- which is in a Herbarium, but is still questionable.

Part A

Division LYCOPHYTA:

Plants resembling mosses or miniature conifers; reproduction by spores; cones and flowers lacking; stems not jointed.
