

Flora Protection Order - bryophytes

Radula holtii

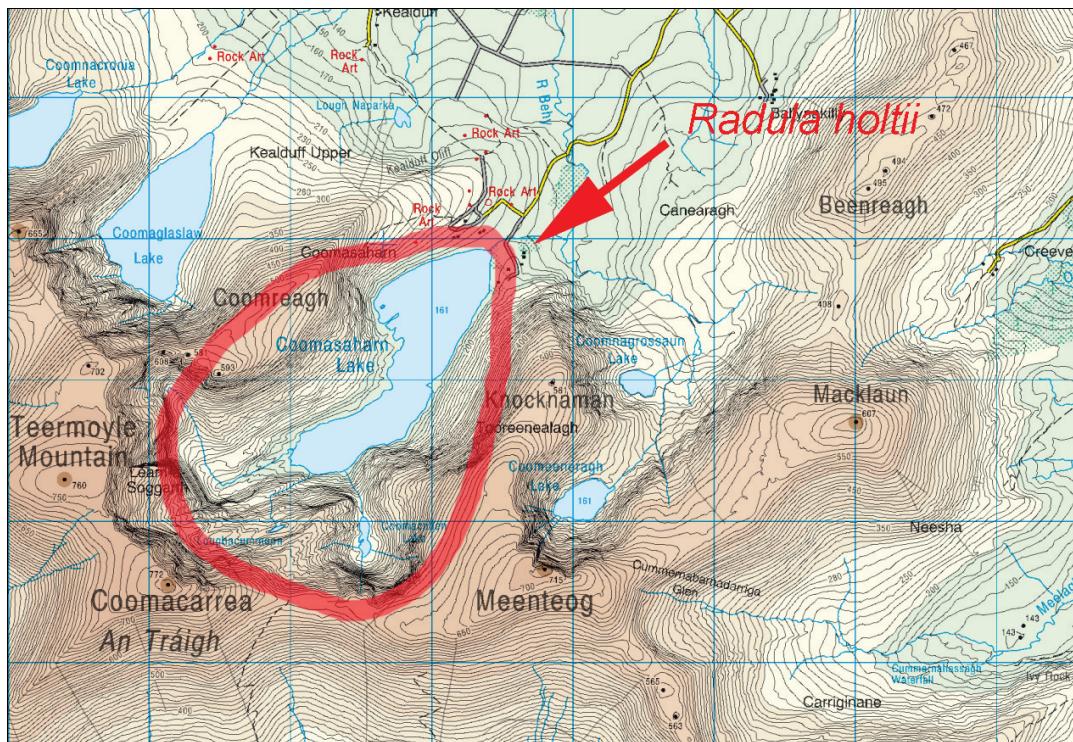

Status: Near Threatened; listed on the Flora Protection Order

Location: Coomasaharn, Co. Kerry

Species Records

| Taxon | Vice County number | Taxon Site | Locality / habitat | Grid Reference | Date | Recorder | Protected site |

|--|--|--|----------------------------|--|--|
| Species <i>Radula holtii</i> | County Kerry | 6" Map Kerry Sheet 71 | Discovery Map 78 | | |
| Locality/ Site name Coomasaharn, below L. Coomacullen | Vice-county (No.) South Kerry (H1) | SAC/NHA 000365 Killarney National Park, Macgillycuddy's Reeks and Caragh River Catchment | | | |
| Grid ref (GPS, National Grid) V6249183200(±6) | 2005 Aerial Photo O6168-D | Recorder(s) R.L. Hodd | | | |
| Elevation (m) 265 | Solid geology Sandstone | Survey date 07/10/2014 | | | |
| Site description | <i>R. holtii</i> grows under the deep shade of a large erratic adjacent to the flow of the outflow stream from L. Coomacullen, which cuts through a steep, rocky slope. | | | | |
| Population description | A number of large patches of <i>R. holtii</i> , with occasional perianths, grow on rocks in deep shade, at the edge of the flow of a small side channel of a wide waterfall. | | | | |
| Associated species | <i>R. holtii</i> is associated at this location with <i>Lejeuena eckloniana</i> , <i>Thamnobryum alopecurum</i> and <i>Hymenophyllum wilsonii</i> . | | | | |
| Vegetation (Fossitt, 2000) | ER3 Siliceous Loose rock | | | | |
| Current management | The surrounding slopes are heavily grazed, but this does not impact this population. | | | | |
| Threats | This population may be threatened by erosion on a small scale, particularly when the river is in spate. | | | | |
| Conservation measures | Monitor to ensure population remains in good condition. | | | | |
| Ownership | Ownership is unknown, likely commonage. | | | | |
| Access | Access to this site is from the end of the minor road leading south from Glenbeigh to close to Coomasaharn Lough, from where a rough path leads alongside the lake, from where a short climb leads to this population. | | | | |
| Other remarks | | | | | |

Management & Conservation

General

- Water abstraction for hydroelectric schemes could endanger this species at some sites
- New survey needed at many older sites, as this species was not targeted specifically during recent fieldwork

Potential site-specific threats/issues

- This population may be threatened by erosion on a small scale, particularly when the river is in spate.

Radula holtii

Identification

Like all species of *Radula*, *R. holtii* is a rather fleshy leafy liverwort with a rounded leaf lobe much larger than the almost square lobule beneath, and no underleaves. It is yellowish-green in colour and the shoots grow up to c. 2 cm long and 1.8 mm wide. Although superficially similar to the much more common *R. complanata* and *R. lindbergiana*, the antical leaf margin of *R. holtii* does not cross the stem, and gemmae are very rare, whereas they are very common in the other two species. Furthermore, the perianths are characteristically trumpet-shaped, with a narrow base and a wide mouth; the other two species have oblong perianths. Finally, the cell walls of the stem medulla are thin-walled rather than collenchymatous.

Distribution in Ireland

R. holtii is confined to the extreme west and south-west, with recent records from 11 localities in four vice-counties: S. Kerry (Brandon Mountain, 1961–2008; Lough Anascaul, 2006; Loch an Duin, 2006; An Loch Dubh, Ballysitteragh, 2006; Mount Eagle, 2006; Ballaghbeama Gap, 1967–1983); N. Kerry (Muckross-Ross Island, 1905–1983; Torc Cascade, 1885–2005); W. Cork (Glenbeg Lough and Lackawee, 1955–1979) and W. Mayo (Ben Gorm, 1901–1987; Devil's Mother, 1901–1987). There are older records from a further 11 localities in: S. Kerry (Lough Currane, 1967; Lough Coomeathcun, 1951; Coomasaharn, 1961; Inchiquin

Lough, 1967; Uragh Wood, 1967; Cummeenduff Glen, 1967; O'Sullivan's Cascade, 1912–1935); N. Kerry (Eagle's Nest, 1911–1925; Derrycunihy Wood, 1967); W. Cork (Pass of Keimaneigh, 1967) and W. Mayo (Old Head Wood, 1901–1909). It is not clear whether there has actually been a decline in the species, since *R. holtii* was not on the original list of target species for recent fieldwork and little effort has therefore been made to refind it at old localities. This plant is described as Southern Atlantic by Ratcliffe (1968).

Ecology and biology

R. holtii is a hyperoceanic species that grows in shade, usually deep shade, on wet rocks in ravines, woodland, by lakes, in small caves or under overhangs, usually by streams and waterfalls, especially where permanently wet from spray. It is a lowland plant, recorded in Ireland from near sea level to c. 330 m. Associates include *Jubula butchinsiae*, *Lejeunea* spp., *Plagiochila exigua*, *Porella pinnata*, other *Radula* spp., *Trichostomum hibernicum* and *Trichomanes speciosum*.

Paroicous and often fertile, sporophytes are frequent in this species. Gemmae are very rare.

World distribution

This plant is recorded from the Azores, Madeira and the Canary Islands, where it is not on any list of rare or threatened species, and also from Spain and Portugal, in

Hornworts and Liverworts

both of which it is listed as *Vulnerable*. It is absent from Britain. It is classified as a Hyperoceanic Southern-temperate floristic element and is apparently endemic to Europe and Macaronesia.

Threats

There are probably few real threats to *R. holtii*, but water abstraction for hydroelectric schemes could endanger this species at some sites.

Conservation

This species has a very restricted distribution and the

Irish populations are of global importance for conservation. Efforts should be made to target this species for resurvey, in particular the many localities described from the 1960s. Populations at the more important sites should be monitored.

Protected sites with recent records: Glanmore Bog SAC; Killarney National Park; Killarney National Park, Macgillycuddy's Reeks and Caragh River Catchment SAC; Maumtrasna Mountain Complex pNHA; Mount Brandon SAC; Mweelrea/Sheeffry/Erriff Complex SAC; **Unprotected sites with recent records:** Mount Eagle.
