Dear Ms. Adensam:

In the Matter of the Application of) Docket Nos. 50-390
Tennessee Valley Authority) 50-391

As committed by TVA during a meeting with the U.S. Nuclear Regulatory Commission's (NRC) Mechanical Engineering Branch representatives on May 27 and 28, 1981, we are submitting the enclosed copy of a report containing documentation of the TPIPE computer program. This documentation includes solutions to seven piping analysis benchmark problems provided by the NRC.

Very truly yours,

NRC REQUESTED TPIPE VERIFICATION

A set of benchmark problems has been run on TPIPE as requested in reference 1 using the suggested benchmark problems of reference 2. TPIPE is a piping analysis program used for all nuclear piping analysis by TVA. All required benchmarks have been run successfully. The results of the seven benchmarks are attached and include computer run listings containing the following information:

1. The input data.
2. The natural frequencies.
3. The mode shapes.
4. The participation factors.
5. The combined displacements, the rotations, and the elemental internal forces and moments for all seismic directional excitations of NRC calculated modes.

TPIPE calculates a total response to dynamic excitation by combining interspatial responses, i.e., directional responses to the support motion for each calculated mode, then by combining intermodal responses, i.e., resultant responses to support motion for each calculated mode. Interspatial combination was performed using the square root of the sum of the squares (SRSS) of corresponding representative maximum values of the spectral responses in an orthogonal coordinate system to a three-dimensional design earthquake (two horizontal components and a vertical component). Intermodal combination was accomplished using either the SRSS method, the NRC 10% method, or the NRC Grouping method. The particular combination method for a given problem was chosen in order to match as closely as possible the method used by the NRC in the benchmark printout.

The SRSS of individual resultant modal responses to support motion over the range of all calculated modes was used when no modes were closely spaced. Calculated modes included at least all of the NRC calculated modes. SRSS was used on problem 5 and on problem 6 for a secondary check (problem 6 contained the results using two combination methods, SRSS and Grouping method).

The NRC 10% method was used in Benchmark problem No. 2 as a secondary verification that the solution was independent of combination techniques as stated in reference 2.

The NRC Grouping method, used for problems 1, 3, 4, 6, and 7, accounts for groups of closely spaced modes. A group includes all modes having frequencies less than 10% above that of the first mode of the group (the mode with the lowest frequency in the group). For the exact equations of any of the methods described herein, please refer to reference 3.

Program dependent differences between the NRC Benchmark input to EPIPE and TVA Benchmark input to TPIPE exist and should be noted. The differences include:

1. Lumped weight/mass, particular weight assigned to individual nodes, was input to EPIPE in LB SEC²/IN and was input to TPIPE in LB's. The masses were converted by multiplying by 386.4 IN/SEC² as TPIPE was executed in a "consistent units" mode with that gravitational constant.
2. Spectral curves input to EPIPE in IN/SEC² were converted to G's for TPIPE by dividing by 386.4 IN/SEC²/G.
3. Coefficient's of thermal expansion and design temperatures input to EPIPE were left out of the input to TPIPE since no thermal load cases were requested.
4. "Third points" of curved members input to EPIPE as center of curvature, CC, were changed to tangent intersection, TI, for input to TPIPE.
5. False members with specified "spring rates" input to EPIPE to simulate support types were changed to "flexible supports" with specified "spring rates" and restraint directions for input to TPIPE.

All of these differences have no effect upon the analyses.

Discrepancies were found in the benchmark documentation, reference 2. The member labels on the isometric of problem 2 are incorrect. Problem 3 contains output of two different computer runs. The listing of the computer output up to the participation factor table is from a run containing two skewed supports changed to vertical supports in a second run, except for the evidence of a "pen and ink" change to the input data table. The output from the first run contains the generated nodal data table, the mode shape printout, the boundary element table, the material property table, the pipe cross-section table, and the listing of frequencies for the system with misdirected supports. These specific results were duplicated by TPIPE. The remaining printout contained the participation factor table and the resultant dynamic response table. The specific results contained in this portion, along with the frequencies listed in the erratum attached to reference 1, were also duplicated by TPIPE. As the final results were deemed most necessary, the TPIPE run which matched the participation factors and the resultant dynamic response was chosen to be attached. Problem 4 had four instances of a node having two false members with identical spring rates acting in the same direction. The two restraints were modeled with a single flexible support with twice the spring rate acting in the appropriate direction for each instance of the duplication. TPIPE would not allow a node to be connected to eight other nodes as did EPIPE. The TPIPE model replaced the single node with two very close connecting nodes, then connected half of the eight nodes to each. Problems 3, 5, and 6 had restraint members in misdirected lines of action according to the respective isometrics. The misdirections were duplicated for the TPIPE runs. Problem 6 also contained straight pipe elements next to curved elements which were not tangent at the connecting nodes. This arrangement normally would not have caused problems, but the points of the curved member do not lie on the circle described for the

element by the given radius, the tangent intersection point, and the end points' locations. The problem created in the TPIPE run was nonmatching curved member endpoint coordinates though the differences were small.

The seven piping analysis benchmark problems provided by the NRC have been run successfully on the computer program, TPIPE. The EPIPE program used by the NRC and the TPIPE program used by TVA are both modified versions of the general purpose program, SAP IV. TPIPE has several improvements incorporated; the most significant improvement has provided a shifting capability in the frequency analysis routine that reduces the error associated with obtaining the frequency of modes in the later portion of iterations. TVA's results compare to the NRC's published results (see reference 2) as follows:

1. TPIPE frequencies matched EPIPE frequencies to three significant digits.
2. TPIPE normalized mode shapes matched EPIPE normalized mode shapes to three significant digits.
3. TPIPE participation factors matched EPIPE participation factors to three significant digits.
4. TPIPE reponse spectrum analysis results matched to three significant digits the EPIPE response spectrum analysis results. The results have been presented in this report.

PROGRAM CONTROL INFORMATION

PIPING SYSTEM GEOMETRY DEFINITION

NUMBER OF CONTROL POINTS.....	18
NUMBER OF NODAL POINTS.....	78
NUMBER OF NONGLOBAL COORDINATE SYSTEMS.....	4
NUMBER OF ADDITIONAL SUPPORT TYPES.....	0
NUMBER OF MATERIAL PROPERTY TYPES.....	1
NUMBER OF PIPE CROSS SECTION TYPES.....	7
NUMBER OF SPECIAL COMPONENT CROSS SECTIONS..	0
NUMBER OF PIPE MEMBERS.....	81
NUMBER OF SPECIAL CONNECTIONS.....	0
NUMBER OF SPECIAL COMPONENTS.....	0
NUMBER OF DYNAMIC SPRINGS.....	0
NUMBER OF MULTIPLE EXCITATION ZONES.....	0
UNITS OF LENGTH AND WEIGHT.....	CONSISTENT
GRAVITY.....	386.40
NODAL POINT COORDINATE CHECK OPTION.....	NO

PROBLEM DEFINITION

EXECUTION MODE= 101000
1= STRUCTURAL DEFINITION IS FROM DATA CARDS
0= NORMAL DATA CHECKING RUN
1= ANALYSIS REQUESTED
0= NO STRUCTURAL PLOTTING REQUESTED
0= NO POSTPROCESSING REQUESTED
0= NO THERMAL TRANSIENT RESPONSE EXECUTION REQUESTED

ANALYSIS TYPES(01100) REQUESTED

FREQUENCY ANALYSIS	
MAXIMUM NUMBER OF MODES REQUESTED.....	30
NUMBER OF SPRING SUPPORTS IN DYNAM MODEL	0
MINIMUM PERIOD OF HIGHEST MODE(SEC).....	.0100
MAXIMUM FREQUENCY FOR MODE PRINTOUT(HZ)..	6.7
RESPONSE SPECTRUM ANALYSIS	
NUMBER OF SPECTRAL CURVES TO BE INPUT...	1
NUMBER OF RESPONSE SPECTRUM LOAD CASES..	1

PROGRAM STORAGE..... 15000

RESTART TAPE GENERATION OPTION.. NONE REQUESTED
