Safety instructions for using ultra hard cutting tools

1. Instructions for using ultra hard cutting tools

As required by the laws concerning Product Liability enforced on July 1, 1996, we place warning or caution labels on the packages of applicable NTK products. However, each tool body itself bears no detailed safety instructions. Therefore, you are requested to read and understand fully the "Safety instructions for the use of carbide cutting tools" before putting any ultra hard tool materials into use. In addition, we request all relevant staff and operators fully understand these safety instructions prior to use.

2. Basic characteristics of ultra hard tool materials

2−1. Meaning and classifications of terms used in this leaflet

Ultra hard tool materials: The collective name for materials used as cutting tools, including carbides, ceramics, CBN and diamond (PCD) sintered materials.

Carbide: Tool materials where the main component is WC (Tungsten Carbide)

Ultra hard materials: The collective name for materials used as ultra hard tools. Also used as a convenient way of referring to carbides under a narrower definition.

Ultra hard tools: The collective name for tools using ultra hard tool materials.

2−2. Physical properties

Appearance: Varies depending on the material. Example: gray, black or gold

Odour: No odour

Hardness: Cemented carbide: HV500 up to 3,000 kg/mm^2

Specific gravity: Carbide: 9 up to 19

2−3. Constituents

Carbide, nitride, carbo-nitride, or oxidized materials of W, Ti, Al, Ta, B or the like; some contain metallic components such as Co, Ni, Cr and/or Mo.

3. Precautions for handling ultra hard tool materials

- One of the properties specific to these materials is high hardness, another is brittleness. Therefore, shock loads or impacts, or excessive clamping of these materials may result in breakage or other damage.
- As the specific gravity (density) of these materials is very high, a large component made up of these materials or such products in large quantity should be handled with care.
- Ultra hard materials are different in their thermal expansion ratio from metals. These products are prone to thermal shock and subsequent breakage when subjected to sudden increase or decrease in temperature.
- As cutting oil, lubricant and general moisture may corrode ultra hard materials and affect their strength, pay extra attention to storing them in good conditions.

4. Precautions for processing ultra hard tools

- The strength of ultra hard tools may be significantly lowered depending on the surface condition. Always use diamond grinding wheels for finish machining.
- Dust is produced when ultra hard tools are ground. Install appropriate ventilation/disposal equipment and wear protective gear such as masks, as inhalation of such dust may be hazardous to health. If such dust contacts your skin or comes into contact with your eyes, flush well with flowing water.
- After the grinding of ultra hard tools or brazed tools, the waste coolant contains components of heavy metals. Be sure to dispose of such waste liquid properly.
- After re-grinding ultra hard tools, check that they are free of cracks or damage before use.
- When ultra hard material or products made of ultra hard material is marked with lasers or an electric pen, cracking may occur to the marked area. Do not mark in areas where stress is applied during use.
- Processing ultra hard material by electric discharge may cause residual cracks on the surface, resulting in lower strength. Thus, remove any cracks completely by grinding as required.
- Be careful when brazing ultra hard material. If the temperature is lower or higher than the melting point of the brazing material, the insert may not be permanently fixed.

Precautions for Safe Use of Cutting Tools

Applicable Products	Possible Risks	Safety Measures
General Cutting Tools	◎Contact with a sharp cutting edge with bare hands may result in injury.	＊Use protective gear such as protective gloves when taking the tool out of packaging and installing into the machine.
	◎Misuse or using under inappropriate conditions may cause the cutting tool to break and/or shatter into pieces, resulting in personal injury.	＊Use protective equipment, machine guarding and/or protective glasses. ＊Use within the range of recommended conditions. Please refer to the instruction manual and catalogue.
	◎Sudden increase in cutting resistance due to sudden impact load or excessive wear may cause the cutting tool to break and/or shatter into pieces, resulting in personal injury.	＊Use protective gear such as protective gloves when taking the tool out of packaging and installing into the machine.
	◎High-temperature chips may be produced and long chips may be ejected, resulting in injury and/or burns.	＊Use protective equipment, machine guarding and/or protective glasses. ＊Before removing chips, always stop the machine. Wear protective gloves and use proper equipment for chip removal.
	◎The tool and material/work being cut can become very hot. Touching them immediately after use may cause burns.	＊Use protective gear such as protective gloves.
	◎Sparks, heat generation due to breakage and/or chips during cutting may cause fire.	＊Do not use the machine and tools in locations where there are risks of ignition or explosion. ＊When using water-insoluble cutting oil, fire prevention measures must be implemented.
	◎Out of balance machine set ups when used at a high-speed, may cause insert breakage due to excess vibration or chatter, resulting in injury.	＊Use protective equipment, machine guarding and/or protective glasses. ＊Perform a trial-run beforehand to make sure the setup is stable, free of chatter, vibration and abnormal noise.
	◎Touching burrs and flashes on machined work may result in personal injury.	＊Use adequate hand protection.
Throw-Away Type Tools (With indexable insert)	◎Inappropriately clamped inserts and/or components may become detached from the machine during cutting, resulting in injury.	＊Before installing the insert, clean the seating surface and clamping components so that they are free of debris. ＊Use the wrench supplied to install the insert and check that the insert and components are securely clamped. Do not use any inserts or components other than the items specified.
	◎Excessively tightening with a device such as a pipe extension may cause the insert and/or components to break or detach due to over clamping.	＊Do not use tightening devices such as pipe extensions to obtain further torque. Always use the supplied wrench.
	◎At a high speeds inserts and/or components may lose clamping pressure due to the loosening effect of centrifugal force. This is very dangerous. Always ensure secure clamping systems and check regularly.	＊Use within the range the recommended conditions. Please refer to the instruction manual and catalogue.
Cutters and Rotational Tools	◎As cutters have sharp cutting edges, contact with bare hands may result in injury.	＊Use protective equipment such as protective gloves.
	◎Imbalance or eccentric rotation may cause the tool to break due to vibration or chatter, resulting in potential injury.	＊Use at a rotational speed within the recommended conditions. ＊To prevent eccentric rotation and vibration due to worn bearings, regularly check the machine rotor/ rotating parts for the accuracy and balance and adjust as required.
Drills	◎Extra care should be taken when through hole drilling as chips may be ejected at high speed as the drill breaks through the workpiece.	＊Use protective equipment such as machine guards and/or protective glasses. Additional guarding around the chuck and drill may be advisable.
	◎Drill tips of a very small diameter are usually pointed and extremely sharp. Extra care and safety precautions should be taken when handling to avoid puncture wounds.	＊Always use precautions and secure safe handling methods. ＊Wear protective gloves and glasses.
Brazed Inserts / Tools	◎Inserts may break or become, detached due to incorrect brazing.	＊Use protective equipment such as machine guards and/or protective glasses. Additional guarding around the chuck and drill may be advisable.
Others	◎It is not advisable to use repeatedly brazed inserts as the braze may progressively weaken.	＊Do not use repeatedly brazed inserts as the strength of such inserts is lowered.
	◎Use only for the original and intended purpose. Using outside recommended parameters is very dangerous, causing damages to machines and/or tools.	＊Always use and operate as specified, observing the required safety rules and conditions.

Guidelines for Catalog

- This catalog lists products as of August 2019.
- Please note that specifications of the products listed in this catalog may be changed without notice due to continuous research & development and product improvements.
- This catalog contains the major features and relevant information on all of our products. Please contact our sales representatives or dealers if more detailed information is needed.
- Stock Status Symbols

  ● : Standard stock available for Right-Hand, Left-Hand and neutral products
  R : Stock available only in Right-Hand
  L : Stock available only in Left-Hand
  ★ : 1 weeks delivery
  ◉ : 3 weeks delivery
  ■ : While stock lasts
  No symbol : Not stocked

■ Standard

1) Holder Type	Package quantity	Notes
Turning holder	1 pc/case	
Milling cutter	1 pc/case	
2) Spare parts	**Package quantity**	**Notes**
Screw	10 pcs/case	Clamp screw, Clamp bolt, Double screw, Button screw
Seat	10 pcs/case	Shim seat
Clamp	10 pcs/case	Clamp
Wrench and cutter parts (such as cartridges)	5 pcs/case	Wrench, bit, cutter product
Blade	1 pc/case	
Handle, Hose	1 pc/case	Handle with magnet, handle and bit
3) Insert Type	**Package quantity**	**Notes**
BIDEMICS (Brazed)	1 pc/case	JP2
Endmill	1 pc/case	CERAMATIC (Ceramic), S-MILL (Carbide)
CBN	1 pc/case	B16, B22, B23, B30, B36, B40, B52, B5K, B6K
PCD, Diamond coating	1 pc/case	PD1, PD2, UC1
CTPW insert for cut-off	5 pcs/case	CTPW series
STICK DUO Solid carbide bar	1 pc/case	SHFS, SHFB, SBFS, SBFB, SBB, SBG, SBT, SSP
All others	10 pcs/case	

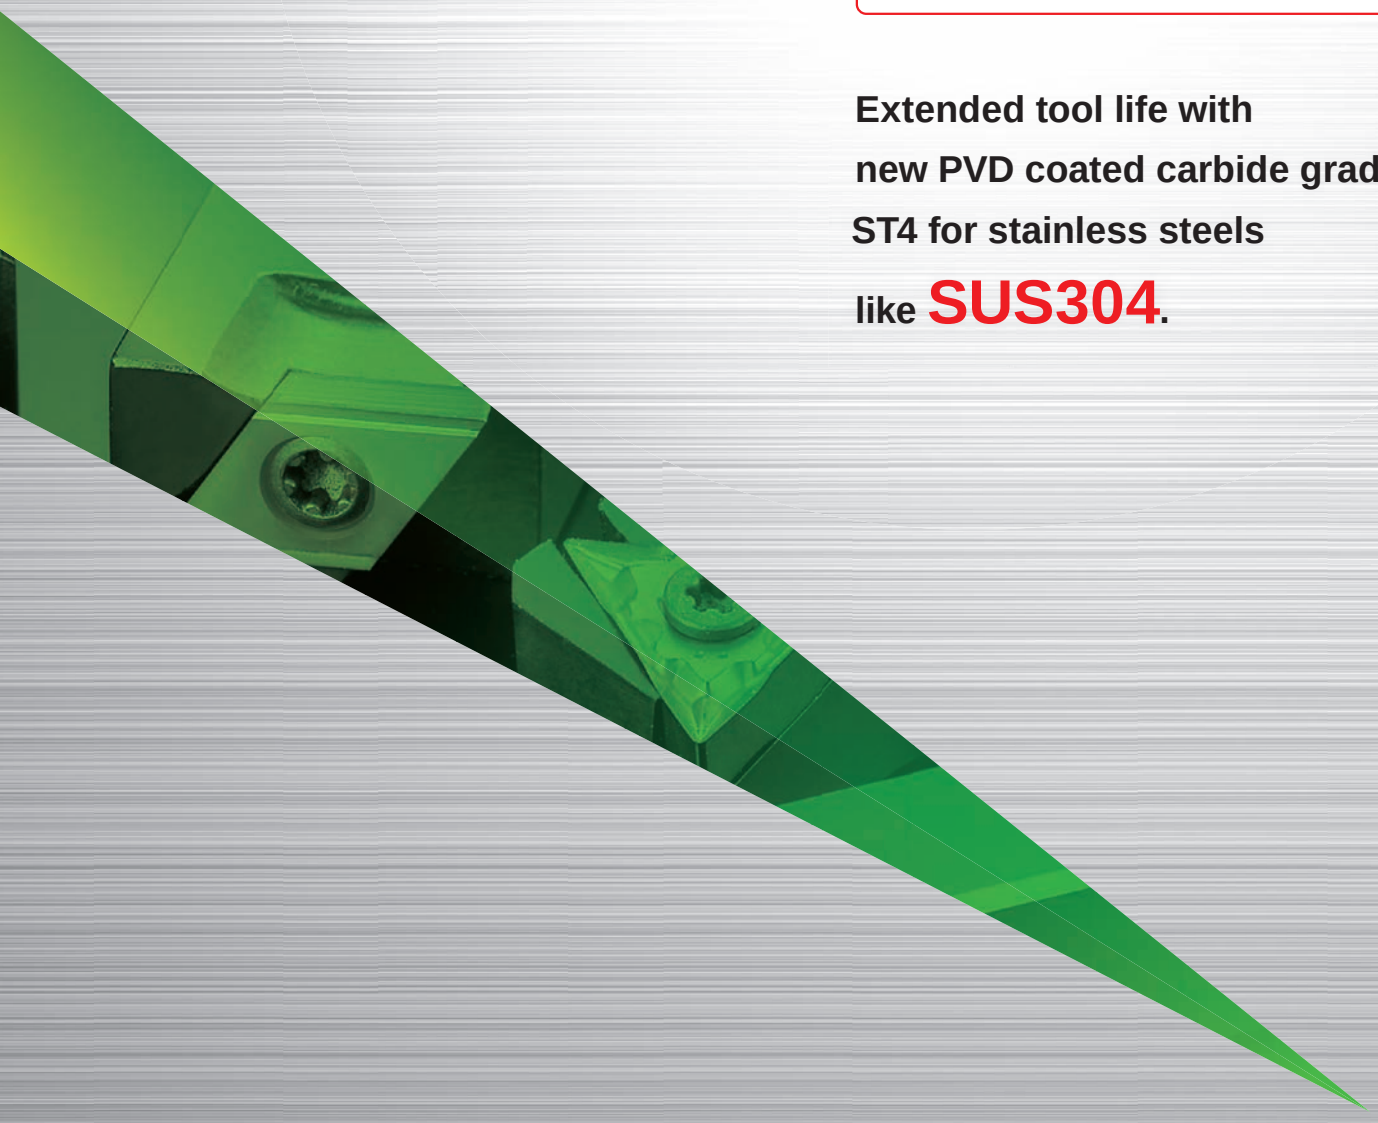
＊Packaging may vary depending on the product size.
For more information, please contact your nearest distributor or our sales office.

ST4

SUPER TOUGH COAT

For Stainless Steel

Extended tool life with new PVD coated carbide grade. ST4 for stainless steels like SUS304.



WATCH ON YouTube

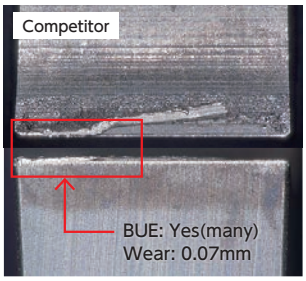
Stable and consistent performance when machining stainless steel

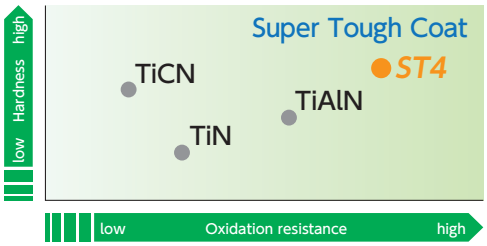
Low tool life , and unstable chip evacuation are factors preventing stable machining of stainless steel.
The New PVD coated carbide grade ST4 solves the issues related to machining stainless steel.

Higher hardness and oxidation resistance

NTK's unique coating technology creates a high-aluminum composition.
Extends tool life and allows high-speed machining of stainless steel.

NTK vs. competitor(cut off)
Workmaterial : SUS304(ϕ11) Vc=80m/min f=0.03mm after 200pcs cut-off

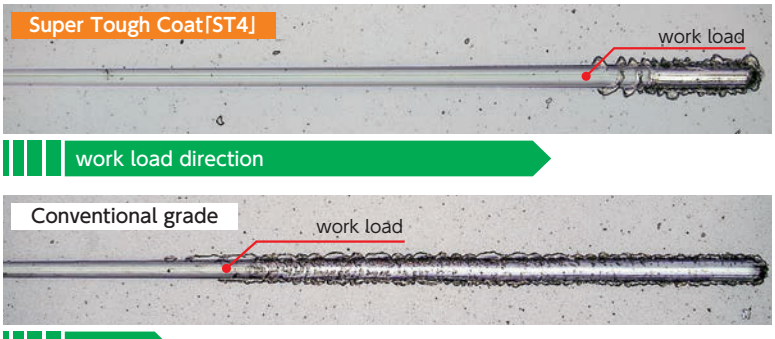


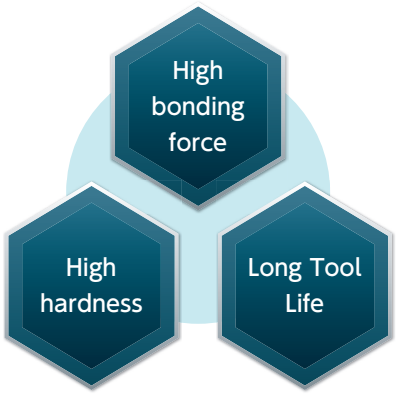


Stable machining, excellent surface finish ⇒ Extended tool life

NTK new PVD coated carbide grade ST4 improved bonding force and surface smoothness .
It prevents BUE trouble from stainless steel machining, and achived stable cutting.

Measurement (Scratch test on coating layer)





Super Tough Coat ST4 × Chipbreaker for stainless steel

NTK's ST4 grade combined with unique chipbreakers meet the demands of your machining.

Features

Features

- *F type chipbreaker allow chips to evacuate backward.*
- *Combination of the F-chipbreakers and Mogul Bar delivers the best performance.*

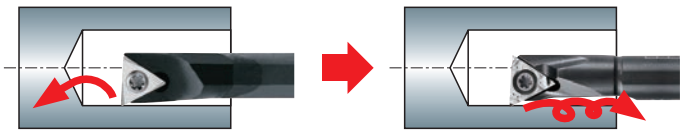
	DOC (mm)	Feed(mm/rev) 0.05	Feed(mm/rev) 0.1
FG chipbreaker  ● Best for finishing ● Works for small DOC (ap-0.5mm) ● High rake angle	0.1		
	0.3		
F1 • F05 chipbreaker  ● Covers wide range of conditions ● Ground chipbreaker	0.5		

Note: Right-hand inserts with FG and F1 chipbreakers should be used with right-hand holders

Material : SCM435 Holder : S10K-STUPR11D12-OH
Insert : TPGH110304 Series Cutting condition : V_c=80m/min
Bore diameter : ϕ12 External coolant **Depth of cut : 20mm**

Typical inserts

F05, F1, FG chipbreakers



Direct flow chips forward. Then packed chips damage and break cutting edge.

Direct chips backwards and eliminate chipping on inserts.

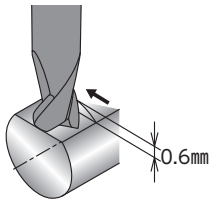
Field result

SUS416F(D-cut) ϕ6mm-2 flutes

Work material	: SUS416F
rev/min	: 3,200
Feed(mm /rev)	: 140
DOC (mm)	: 0.6
Coolant	: WET

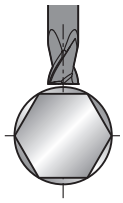


NTK : S-MILL	12,000 pcs/corner+α
Competitor's solid endmill	10,000 pcs/corner

As the competitor's endmill reached the end of its tool life with bad surface finish.
NTK's S-MILL maintained quality surface finish through out its longer tool life.

S45C(Hexagon machining ϕ10⇒ϕ8mm AF) ϕ6mm-2 flutes

Work material	: S45C
rev/min	: 2,600
Feed(mm /rev)	: 480
DOC(mm)	: 1.0
Coolant	: WET



NTK : S-MILL	70 pcs/corner+α
Competitor's solid endmill	50 pcs/corner

The S-Mill's sharpness reduced the occurance of burrs and increased tool life; clear improvments over the competitor's tool. The sharp cutting edge also produces noticeably less sound than the current tooling.

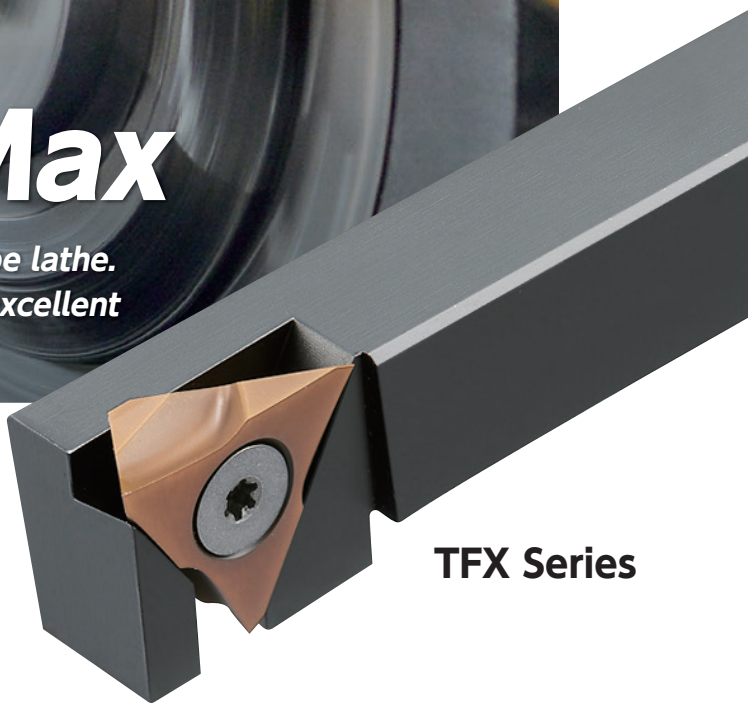
・Cutting conditions (machine, work material...) affect surface finish and burr generation.
If cutting performance is not good with above cutting conditions, please adjust speed and feed by same %.

The Front Max

The Front Max

NEW style front turning insert for swiss type lathe. Specially designed chipbreaker provides excellent chip control and sharpness.



TFX Series

MAX DOC 5.0mm available

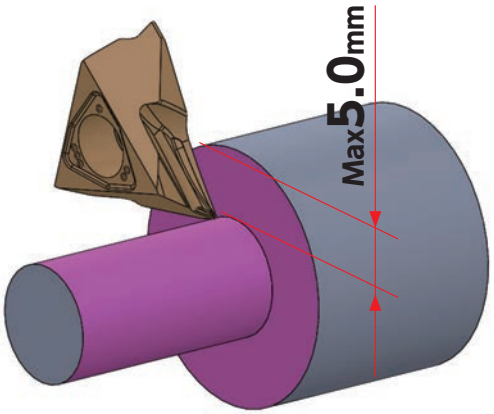
WATCH ON YouTube

Are these common issues in your machining operation?

- It is hard to machine a large depth of cut on Swiss type lathes.
- It is difficult to control chips and dimensions.

The Front Max is the solution.

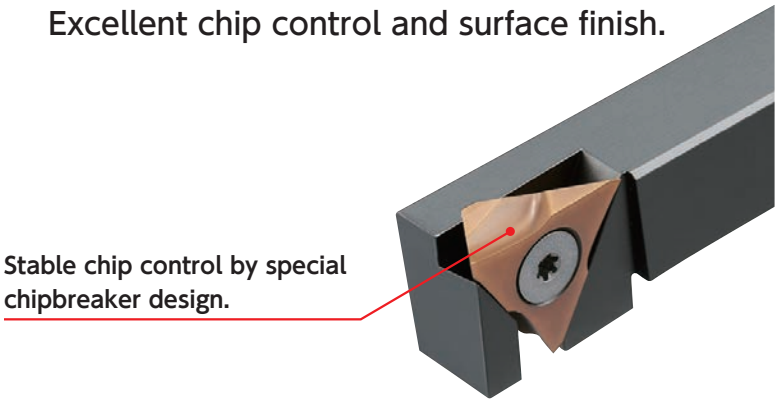
Features



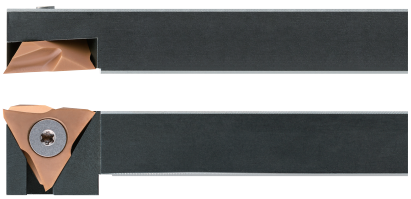
1 Up to 5.0mm DOC capability

Specially designed chipbreaker reduces cutting resistance, achieves excellent chip control and surface finish.

Excellent chip control and surface finish.



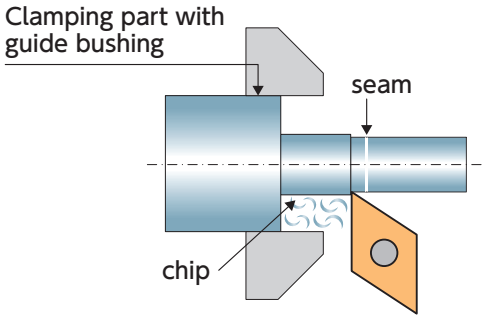
2 Rigid side clamp system



Strong clamping prevents moving insert .
This provides stable turning process.

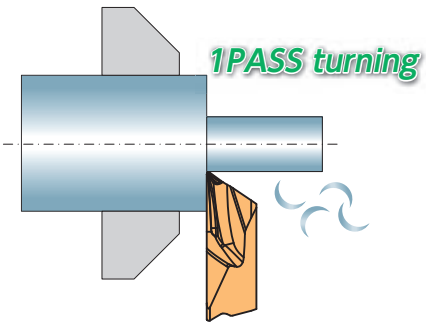
Tooling for Large DOC

Conventional tooling



- Longer cycle time with roughing and finish turning.
- Seam on surfece occurs with separate turning.
- Tool wear increase by 2 passes
- Chip may go into guide-bushing.
- Need to run multi times due to guide-bushing limitation

The Front Max



- Reduce cycle time
- Extend insert tool life
- Improve part quality
- Simplify machining program

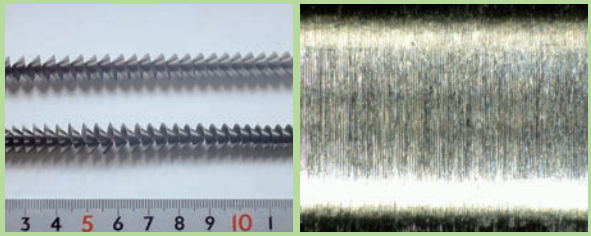
Cutting performance

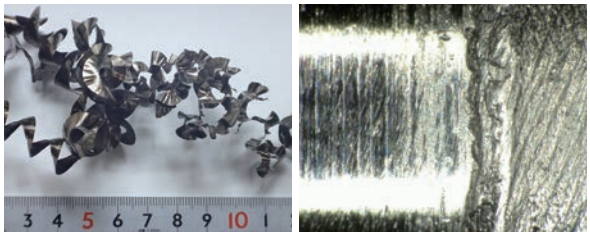
DOC 5.0mm Work material : SUS304 Cutting condition : Vc=80m/min f=0.03mm/rev WET

NTK The Front Max



Good chip control and excellent machined surface finish

Competitor's chipbreaker designed for high DOC turning

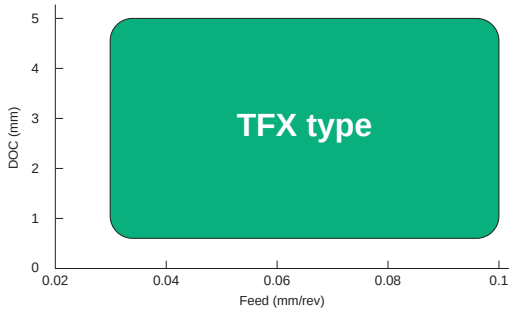


Rough surface finish

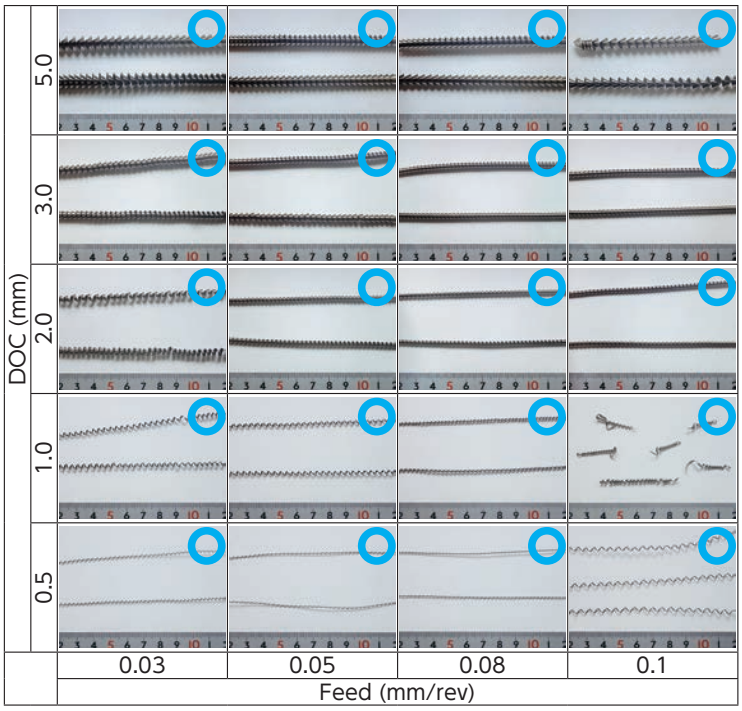
Excellent chip control in variety of cutting conditions

Covers a wide range of Doc's and feeds.

〈Chip control〉

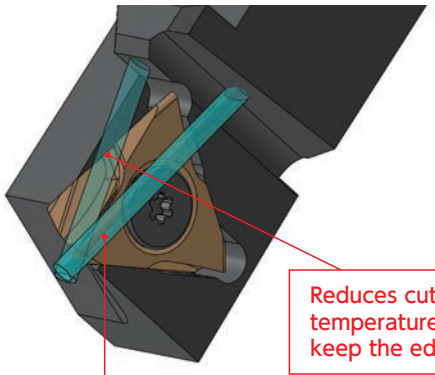


Workmaterial : SUS304 Cutting condition : Vc=80m/min WET



Available in coolant through toolholder

- Can take 30° taper.
- Use with TFX type insert enables stable turning.

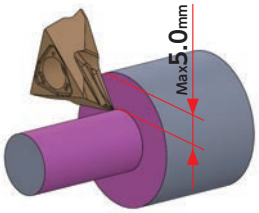


Reduces cutting tool temperature and helps keep the edge sharp

Improves part tolerance by steady coolant supply to the edge

Work material : SUS304

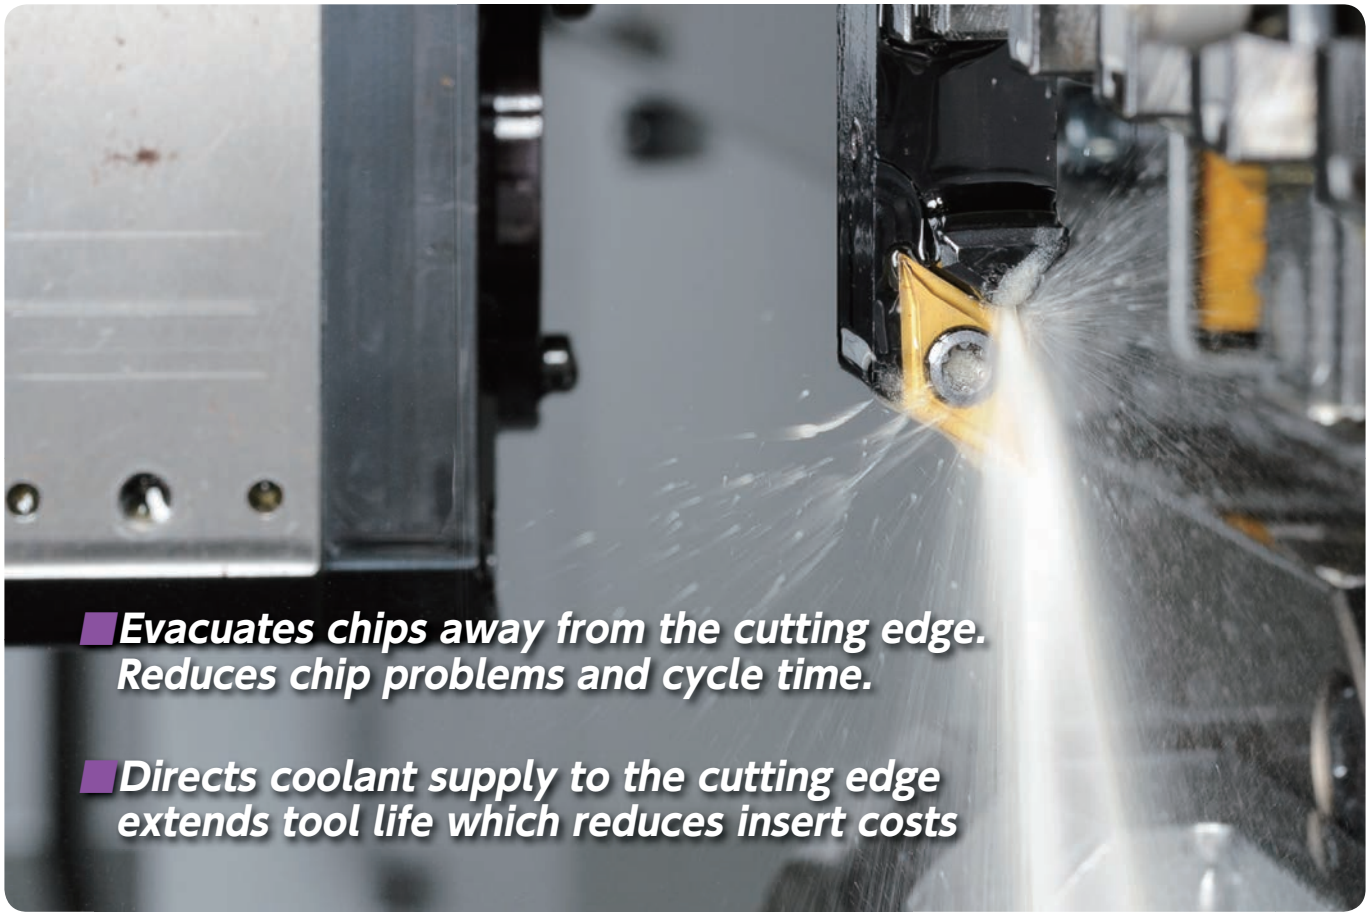
	The Front Max	Competitor
Cutting speed(m/min)	80	110
Feed(mm/rev)	0.03	0.01
DOC(mm/rev)	5.0	←
Coolant	Wet	←



Insert item number:
DM4 TFX3302MR

The Front Max	180pcs./corner
Competitor	50pcs./corner

・NTK Front Max provided 5.0mm DOC with higher feed and got 3 times longer tool life.

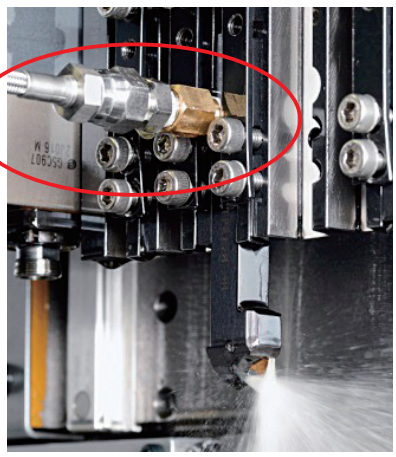


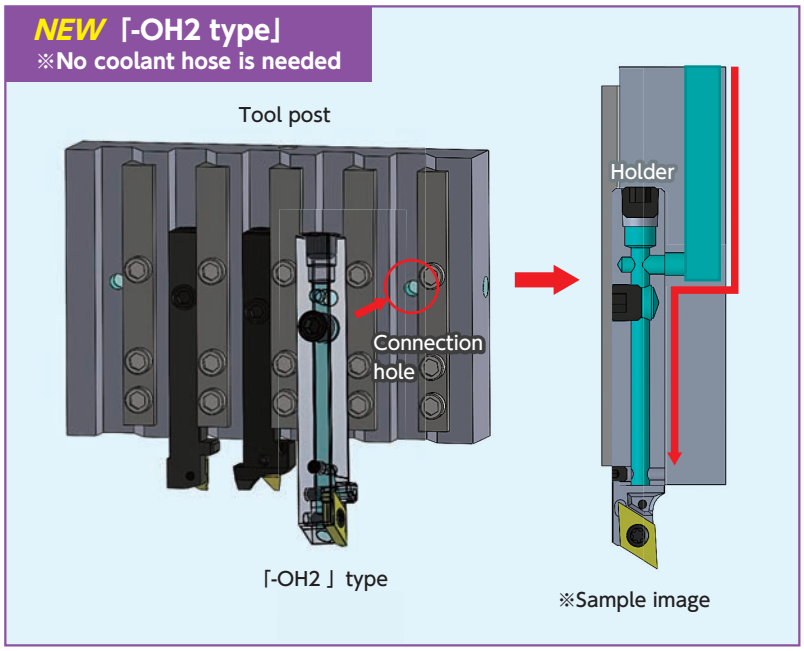
Hose free capability - OH2 - new feature added

Coolant is supplied from the tool post directly to the tools

※ No coolant hose is needed

※Conventional type「-OH」type (hose is needed)





- Eliminates chip entanglement on hoses
- Use the tool post space effectively

➡ Can install more SPLASH toolholders, for higher productivity

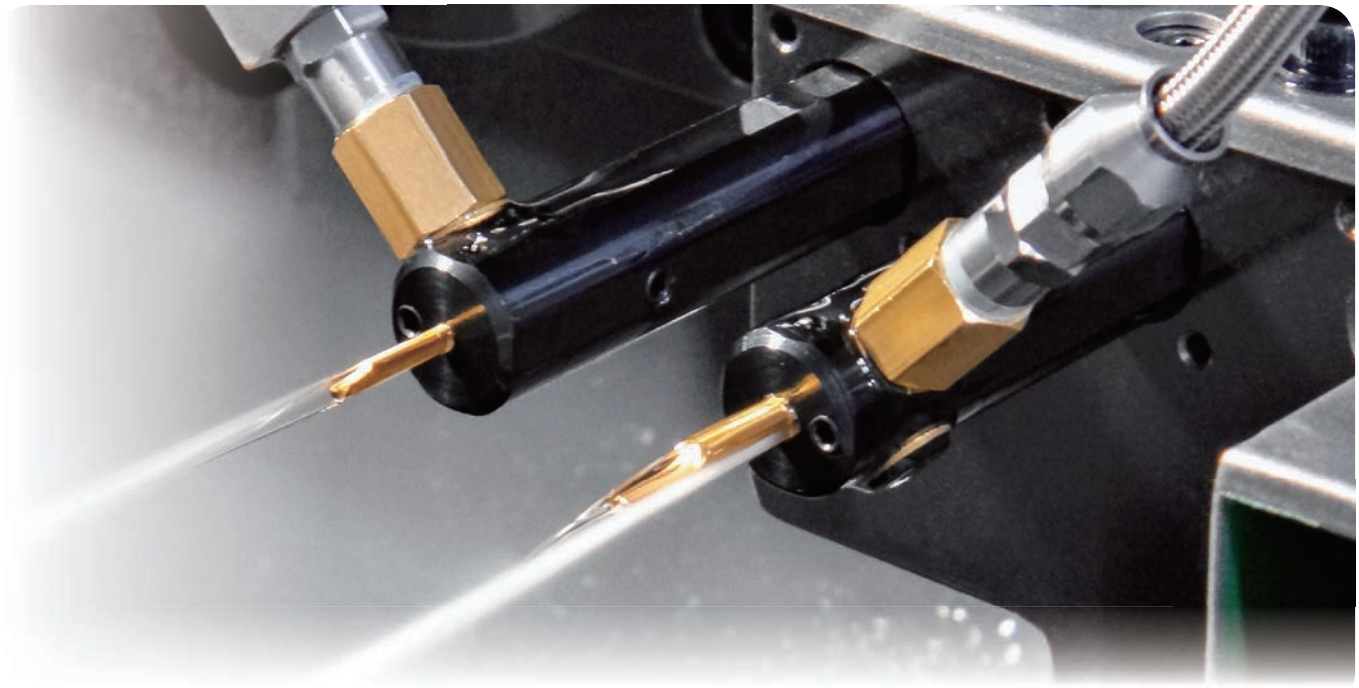
STICK DUO SPLASH

Coolant through sleeves for ID Boring with Adjustable Overhang Mechanism

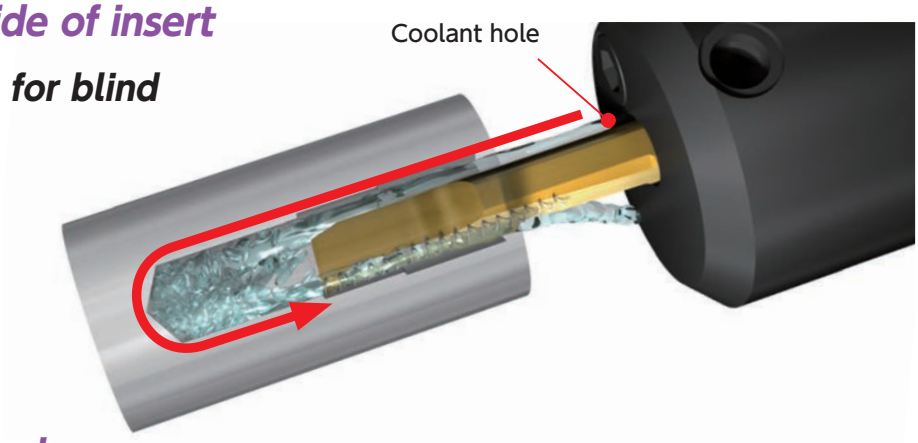


Features

Can choose from 2 coolant directions

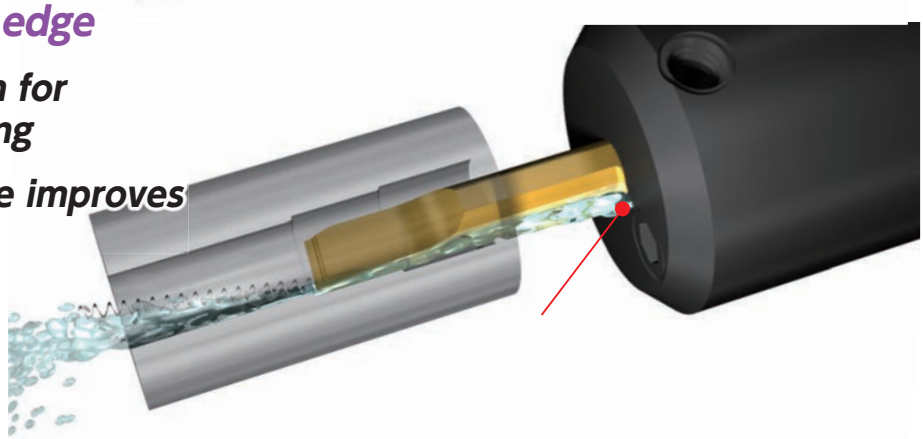
Coolant towards backside of insert

- Good chip evacuation for blind hole machining



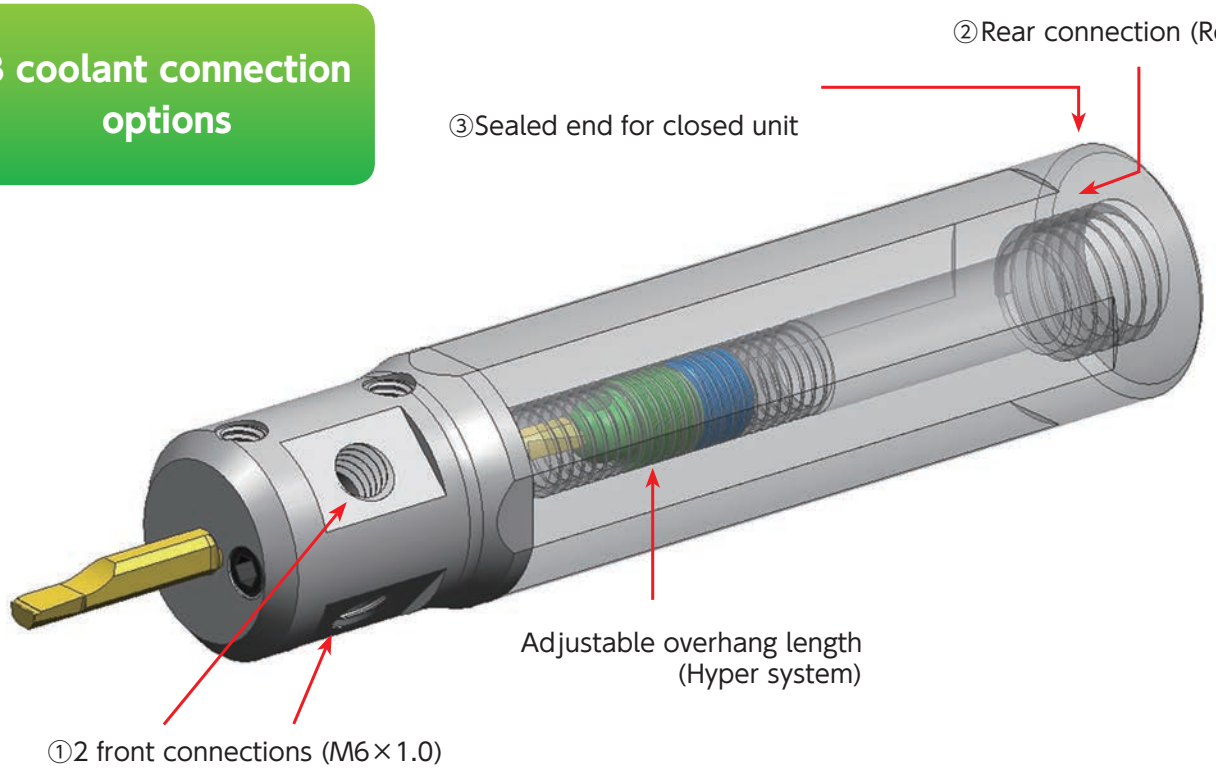
Coolant towards insert edge

- Good chip evacuation for through-hole machining
- Coolant to insert edge improves wear resistance

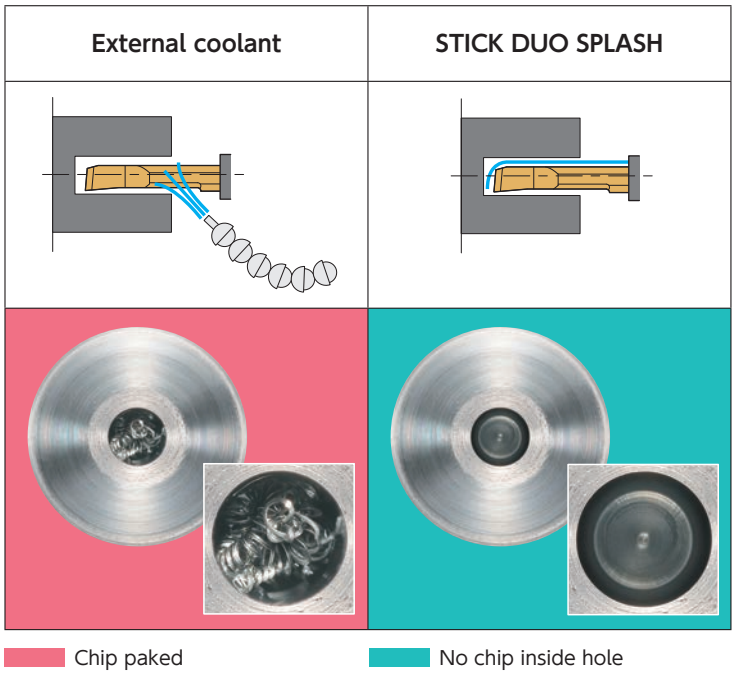


Structure

3 coolant connection options



Machined work piece comparison



Work material : SCM435
Insert : SHFS040R005S
Cutting speed : v_c=50m/min
DOC : a_p=0.2
Feed : f =0.02mm /rev
Hole depth : 15mm
Pilot hole : ϕ5.1×28L
Coolant pressure : 5MPa

Picture for jointing coolant hose

CUTTING TOOLS

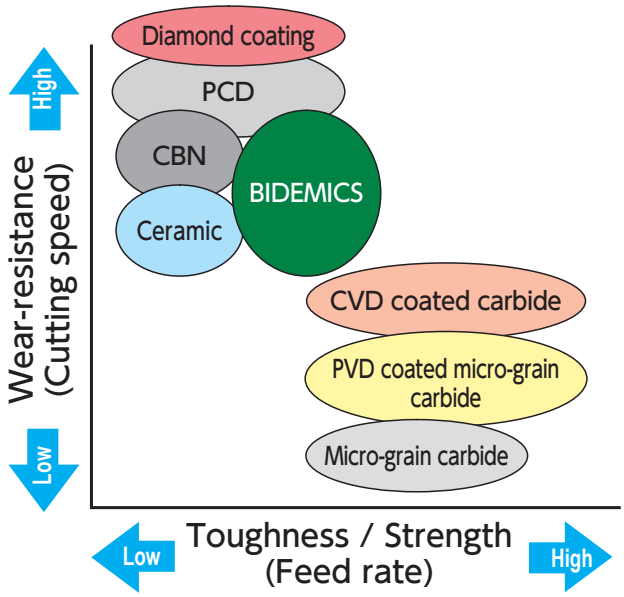
Tool Materials / Selection Guide

Tool Materials / Selection Guide

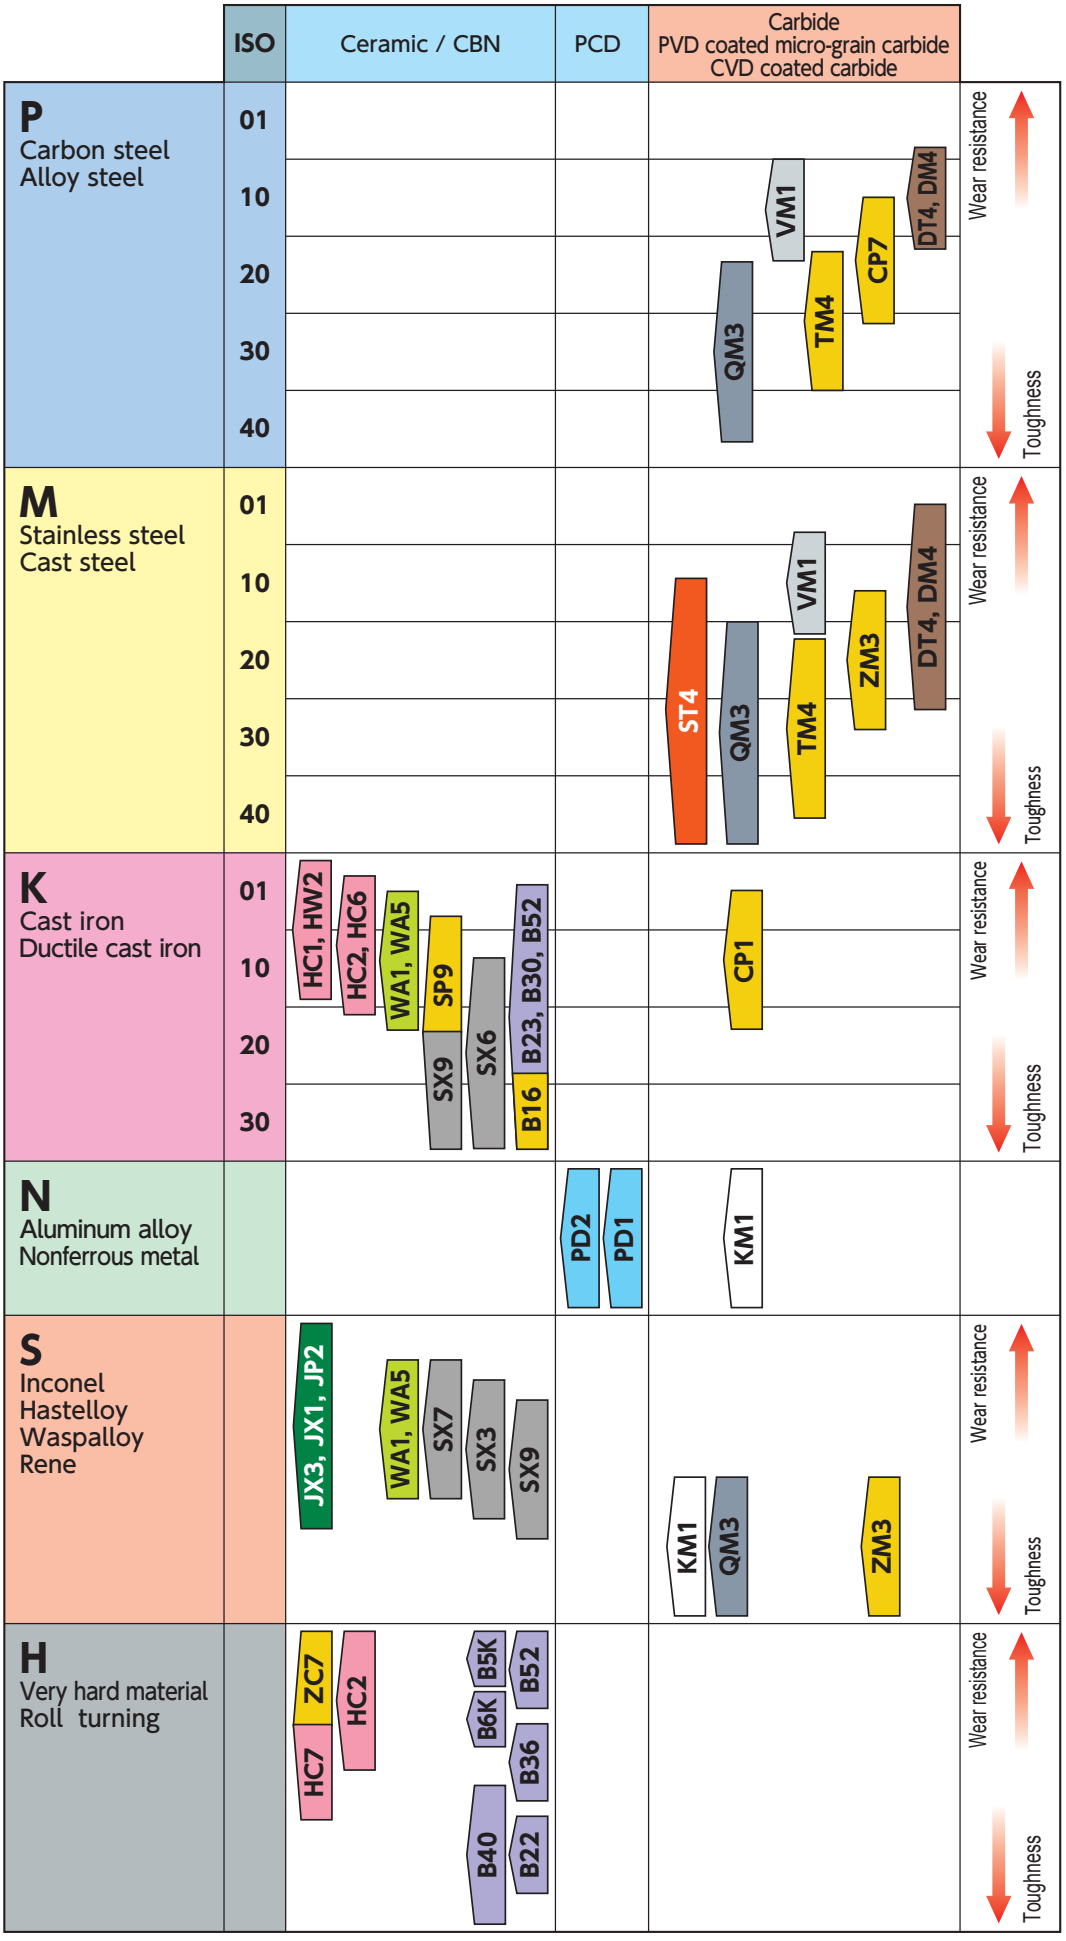
NTK Cutting Tools offer a wide range of tool materials, including PCD, CBN, ceramics and coated carbides, to accommodate various cutting applications.
In the SS Tool series, PCD and micro-grain ultra-hard carbides are set as the standard materials to meet the requirements of automatic and sliding head machines.
They are especially suited to micro-machining, offering excellent cutting performance and high quality surface finish.

● Material map



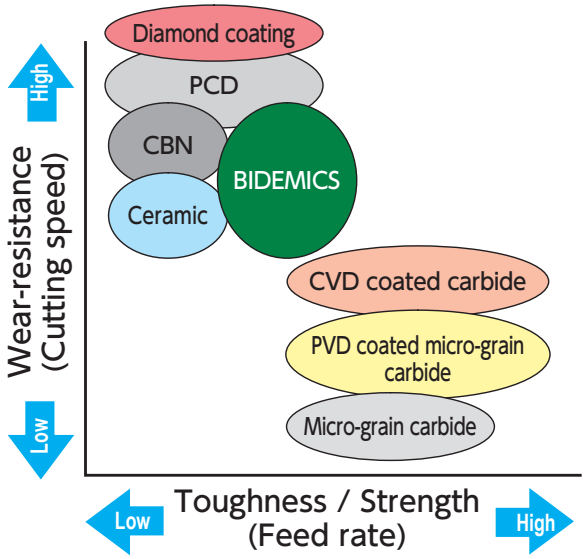
BIDEMICS	Highly efficient machinig for Heat resistance alloy	BIDEMICS **JX3, JX1, JP2**
PCD	High-speed cutting of non ferrous metals	Polycrystalline diamond PCD **PD1, PD2**
CBN	High-speed cutting of high hardness materials and cast irons	CBN **B22, B23, B30, B36, B40, B52** PVD coated **B5K, B6K** Solid CBN **B16**
Ceramic	Highly efficient cutting of high hardness materials and cast irons	Whisker grade **WA5 WA1,** Alumina/Titanium carbide grade **HC2, HC7, ZC7, HC6** Alumina grade **HC1, HW2,** Silicon nitride grade **SX3, SX6, SX7, SX9, SP9**
CVD coated carbide	General and multi-purpose machining of steels and cast irons	CVD coated carbide **CP1**···Cast iron **CP7**···Steel
PVD coated micro-grain carbide	Precision cutting, Cutting of stainless steel and hard-to-cut materials	PVD coated micro-grain carbide **ST4, TM4, ZM3, QM3, VM1, DT4, DM4**
Micro-grain carbide	Cutting of nonferrous metals and non-metal materials	Micro-grain carbide **KM1**

■Insert grade recommendation by work material type

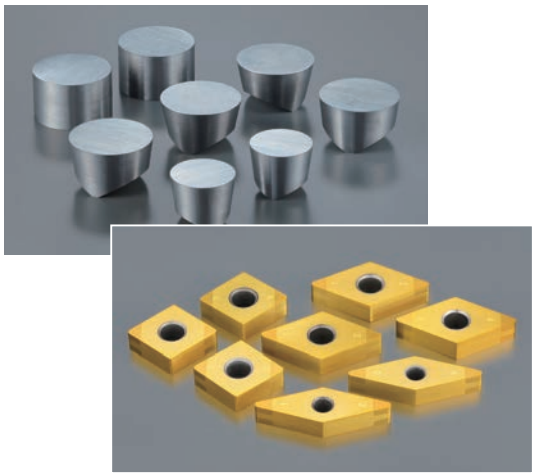


Tool Materials / Selection Guide

NTK cutting tools offer a wide range of tool materials, including PCD, CBN, ceramics and coated carbides, to accommodate various cutting conditions.
For the SS tool series, PCD, micro-grain carbides are set as the standard materials to meet the requirements of automatic lathes specifically micro-machining, with excellent cutting performance and high quality surface finish.



BIDEMICS

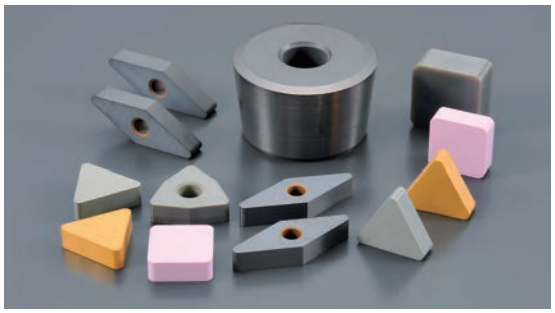


Highly efficient machinig for Heat resistance alloy

NTK's BIDEMICS is the latest revolutionary insert grade to hit the HRSA material machining industry since the release of Whisker ceramics.
BIDEMICS is a patented material with unique physical characteristics that are above and beyond current whisker grades used on HRSA material applications.
The word is spreading through the HRSA industry and around the world about the results achieved when using BIDEMICS.

For more information, please go to ···

Ceramic

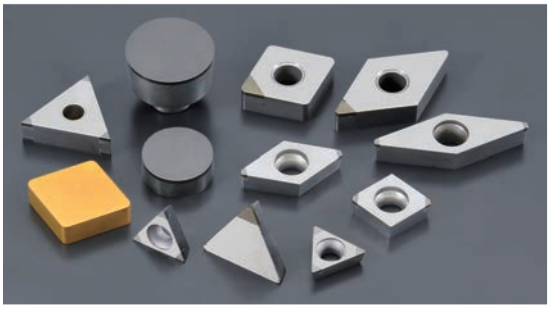


For high-efficiency cutting of hardened materials and cast irons

Ceramic tools offer high cutting speed and highly efficient machining thanks to their outstanding heat resistance and chemical stability.
A wide range of tools in various shapes, made of different types of ceramic including silicon nitride, alumina and whisker series, enables you to achieve high cutting speeds and higher productivity than carbide tools in many applications.

For more information, please go to ···

CBN



For high-speed cutting of hardened materials and cast irons

This material is made of CBN (Cubic Boron Nitride) as the base component and a special ceramic binder, giving a high level of hardness at both room and high temperature ranges. One of its superior features is that it causes very little chemical reaction with work piece materials.
It is mainly used for machining of materials with high hardness and high-speed cutting of cast iron.

For more information, please go to ···

PVD coated micro-grain carbide

For precision cutting and general machining of hard-to-cut materials including stainless steel

The carbides in this grade has been developed by reducing the size of the WC hard grains, which are the main component of cemented carbide, to approximately 1 μ.
By coating such carbide by the PVD method with TiN, TiCN, or TiAlN, these materials are the most suitable for precision cutting and cutting of difficult-to-cut materials.
PVD coating on such micro grain carbide offers much improved wear resistance and thermal shock resistance.
These carbides are tougher and harder than conventional carbides, with much sharper cutting edges.

For more information, please go to ··· D2

Micro-grain carbide

For cutting of non-ferrous metals and non-metal materials

Using non-coated micro-grain ultra-hard carbide, which provides ultra sharp cutting edges, this type of carbide usually, has a mirror-like polished surface.
This type is the most appropriate tool material for machining of non-ferrous metals and resins, where especially sharp cutting edges are required.

For more information, please go to ··· D2

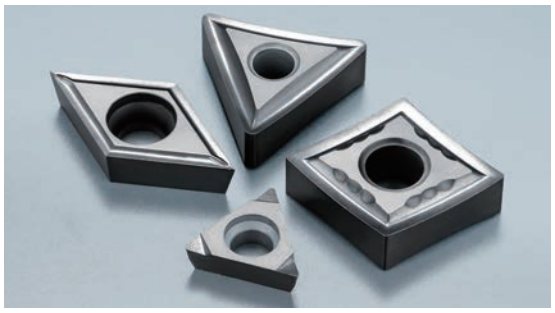
CVD coated carbide

For general cutting of steels and cast irons

This type of carbides, suitable for cutting steel and cast iron, use carbide as the base material with coating applied by the CVD method for extra wear and heat resistance.

For more information, please go to ··· D6

New diamond coating

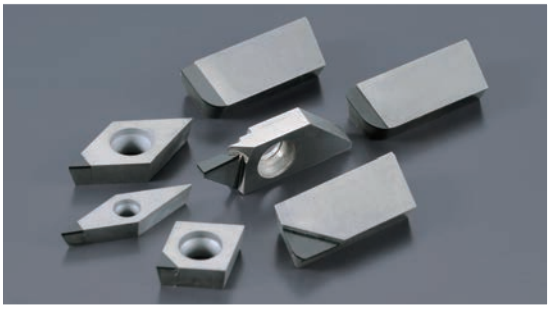


For Carbon and Ceramic

High purity and high hardness diamond coating are filmed minutely, so it has better wear resistance comparing to the past PCD tools.

For more information, please go to ···

PCD



For high-speed cutting of non-ferrous metals

As diamond is the hardest and lowest in affinity with nonferrous metals cutting material , its deposition resistance as well as wear resistance is excellent. However, as a tool material, its low toughness and characteristically low chipping resistance posed problems.
PCD is the material that solved these problems by sintering micro-grain diamond to make a polycrystalline structure without affecting the diamond-specific characteristics.
This material allows you to cut non ferrous metals at a higher speed than carbide cutting tools.

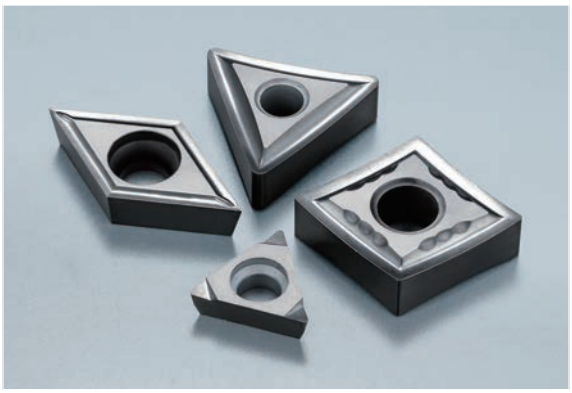
C

PCD CBN

New diamond coating



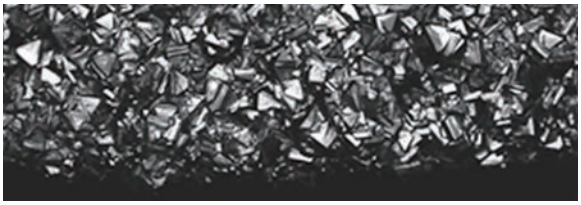
High purity and high hardness diamond coating are filmed minutely, so it has better wear resistance comparing to the past PCD tools.

For more information, please go to ···

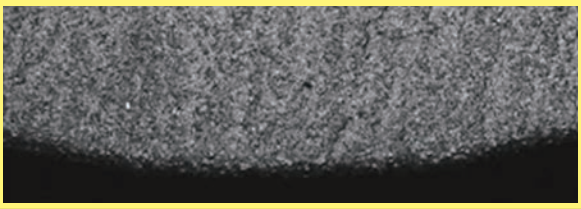
UC1 For Carbon and Ceramic

Comparing to the past diamond coating, particle diameter is less than 1/10

Past diamond coating "UC2"



New diamond coating "UC1"



Features

- ***Improve wear resistance***

  High purity and high hardness diamond coating are filmed minutely, so it has better wear resistance comparing to the past PCD tools.

- ***High adherence efficiency***

  NTK's original carbide base material and technical surface treatment development, acquires high adherence efficiency and can reduce the cause of unusual damage by coating exfoliate and able to cut more stable and long term.

- ***Improve chip control • More shape variations***

  Excellent chip-control of molded chipbreakers will be able to reduce the manufacturing lines stopping time.
  ・I t is able to deal with NTK standard chip-breaker coated by UC1 as special manufactures!

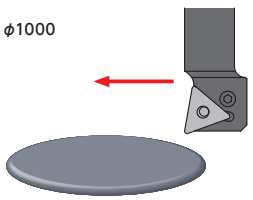
- ***High cost performance***

  Increasing the number of corners, it contributes to the improvement of machining cost.

【Case study 】

Application of carbon machining Carbon

Work material	: Carbon
Cutting speed (m/min)	: 300
Feed (mm/rev)	: 0.1 ～ 0.4
Depth of cut (mm)	: 1.0
Coolant	: DRY

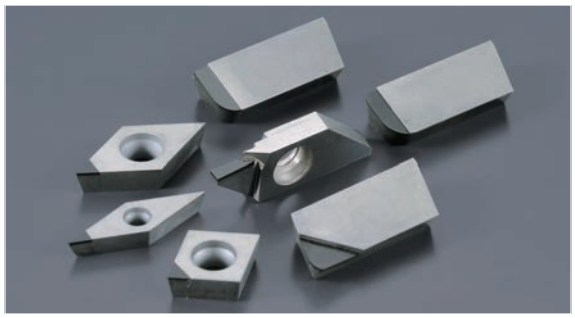


NTK : **UC1**	4 pcs/corner
Competitor's diamond coating	3 pcs/corner

【Carbon Ceramic 】

- ***Improve wear resistance due to the adoption of sharp standard chipbreaker,and long expectancy***
- ***Maximum 6 corner negative inserts are lined-up as well.***
  Contributed to cost reduction!

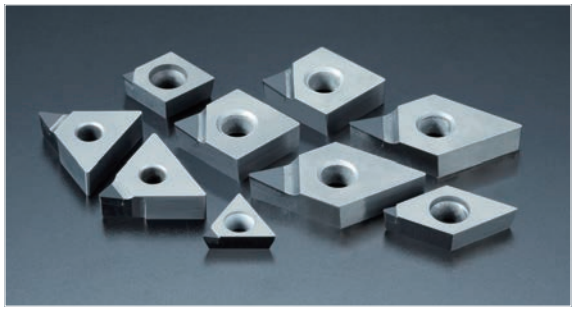
Diamond sintered body, PCD



Diamond excels in deposition resistance with its low affinity and has excellent wear resistance with high hardness. But it also has a problem with fracture resistance due to lack of toughness. PCD is the material solving that problem without losing original characteristics of diamond by sintering fine grain diamond and generating polycrystallization. It enables much higher speed machining of nonferrous metals compared to carbide.

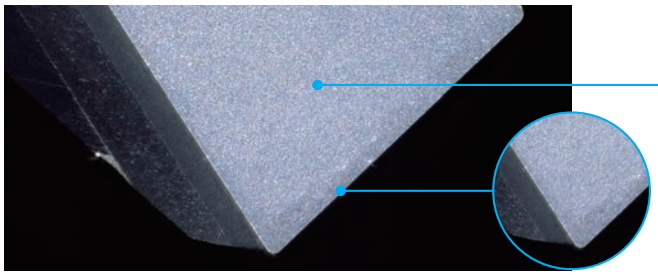
For more information, please go to ···

PD1 / PD2 For high speed machining of nonferrous metals!



Features

- *Elevated cutting speed when compared to carbide*
- *Recommended for cutting of aluminum and copper alloys with excellent deposition resistance*
- *Incorporates a very sharp cutting edge condition*
- *Pre-grinding and cutting-off types added in addition to the current milling cutter types*



- Uses strictly selected diamond grains , the hardest of all material types
- Further improved strength by poly-crystallizing dense diamond micro grains
- Excellent deposition resistance thanks to a lower affinity to nonferrous materials
- Sharp cutting edge attained
- Enables high precision and stable machining by control of potential built-up edge

Main applications for cutting: aluminum alloys, brass, copper alloys, graphite, ceramic compact, plastics

【Recommended cutting conditions】

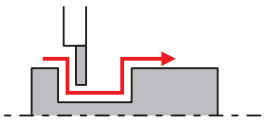
Work material	Cutting speed (m/min)	Feed rate (mm /rev)	Cutting oil
aluminum alloy	Turning : ~ 350 Milling : ~ 4000	Turning : ~ 0.12mm /rev Milling : ~ 0.20mm /t	WET
Copper alloy	Turning : ~ 200 Milling : ~ 1000		

【Actual machining examples】

Machining of spool ●Work material : A6063

	Conventional cutting tool	NTK
Material grade	Competitor's brazed carbide grade cutting tool	PD1
Cutting speed (m/min)	100	200
Feed rate (mm/rev)	0.02	0.06
Cutting oil	WET	←
Machining method	Grooving (5) followed by profiling of the grooves	Single stroke
Life (pcs./corner)	1,000	10,000

PD1

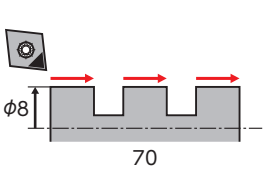


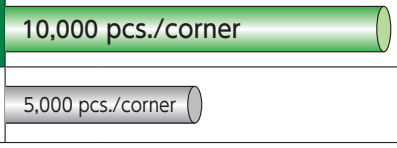
Shorter cycle time due to single pass machining.
PD1 produces an excellent surface finish without deposition, higher efficiency and prolonged life resulted.

Machining of spool

Material grade	: A6061
Cutting speed (m/min)	: 170
Feed rate (mm/rev)	: 0.06
Depth of cut (mm)	: 0.15
Cutting oil	: WET

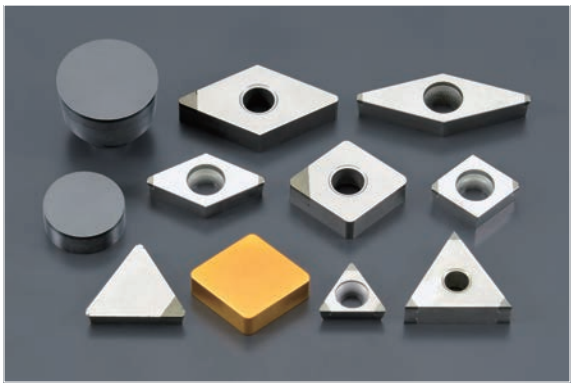
PD2





PD2, excellent in wear resistance, achieved twice the life of competitor's product.

High-pressure sintered compact



CBN grade inserts are composed mainly of CBN (Cubic Boron Nitride) particles with a special ceramic binder. The material has excellent cutting material properties including high hardness at normal and highly elevated temperatures, little chemical reactions with work materials, making it a material suitable for cutting tools

CBN inserts can be used for machining of cemented materials and high speed machining of cast iron

For more information, please go to ···

B16 Best for high efficiency machining of cast iron !

Features

- ***Solid CBN with multiple corners available***
- ***The coating allows easy checking of used cutting edges***

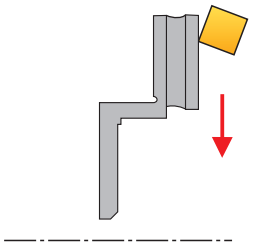
Material grade	Main binder	CBN content	Major application
B16	TiN coating + special ceramic	82%	Roughing and finishing of normal cast iron at high speed/rolling rolls

【Actual machining examples】

Rough cutting of disc brake

Work material : FC250
Cutting speed (m/min) = 1,000
Feed rate (mm/rev) = 0.7
Depth of cut (mm) = 1.0
Cutting oil : WET

B16



NTK : **B16**	800 pcs./corner
Competitor's CBN product	650 pcs./corner

B16 produced tool life of 1. 2 times the competitor's product.

B22 Best for machining of rolls of high hardness !

Features

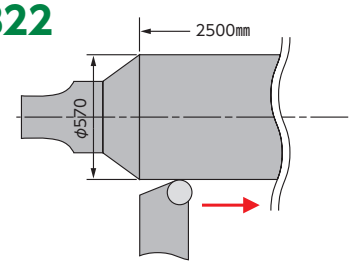
- ***Top layer of CBN with a carbide base offereing multiple cutting edges***
- ***High hardness due to the use of the special binder***

Material grade	Main binder	CBN content	Major application
B22	TiN-base	80%	Turning of very hard rolls

Machining of roll

Work material : High chrome cast iron
Cutting speed (m/min) = 60
Feed rate (mm /rev) = 0.2
Depth of cut (mm) = 2.0
Cutting oil : WET

B22

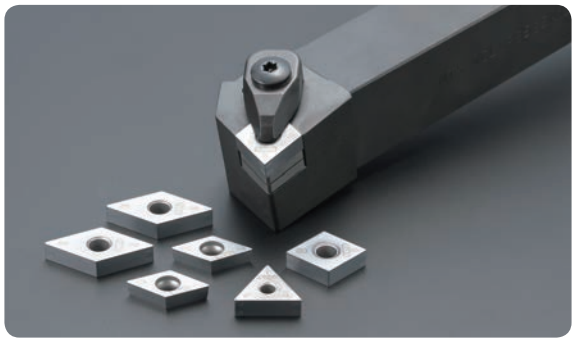


NTK : **B22**	2 passes
Competitor's CBN product	1 pass

B22 produces twice the life of the competitor product.

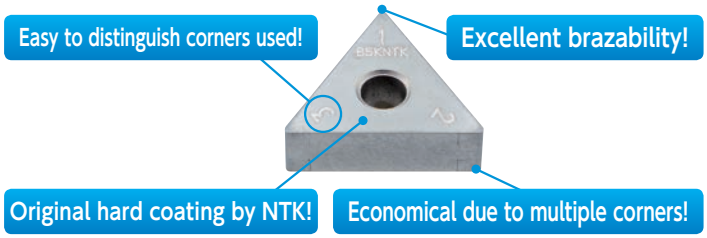
EZCUBE

CBN inserts offer high performance, low price and versatility !



Features

- *Seven grades available for different component materials*
- *Large range for various applications*
- *Multiple corners on both insert sides contributes to cost reduction*



NEW CBN (Cubic Boron Nitride)

●NTK *EZCUBE* / EZ CUBE

Material grade	Main binder	CBN content	Major application
B5K※	TiC-base	50%	Continuous to semi-interrupted machining of hardened steels Finishing of ductile cast iron
B6K※	TiCN-base	65%	Semi-interrupted to interrupted machining of hadened steels
B23	Ti-base	90%	High-speed semi roughing of cast iron/sintered alloys
B30	Ti-base	95%	High-speed finishing of cast iron
B36	TiCN-base	65%	semi-interrupted to interrupted machining of hardened materials
B40	TiN-base	65%	Interrupted machining of highly hardened materials
B52	TiC-base	50%	Finishing of ductile cast iron and continuous machining of highly hardened materials

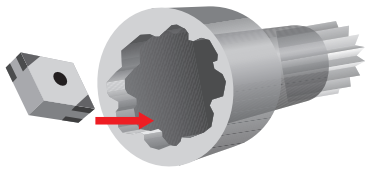
※PVD coating CBN

【Actual machining examples】

Interrupted boring of continuous-velocity universal joint

Work material:S55C(HRC62)
Cutting speed(m/min)=110
Feed rate(mm/rev)=0.14
Depth of cut(mm)=0.15
Cutting oil : DRY

B40



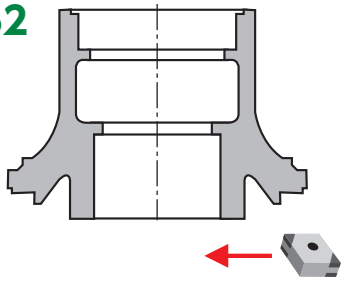
NTK : **B40**	2,300 pcs./corner
Competitor's CBN product	1,500 pcs./corner

B40 grade inserts showed a prolonged life without chipping in the interrupted boring operation.

Arial Narrow Bolg

Work material : FCD600
Cutting speed(m/min)=350~400
Feed rate(mm/rev)=0.08
Depth of cut(mm)=0.2
Cutting oil : WET

B52



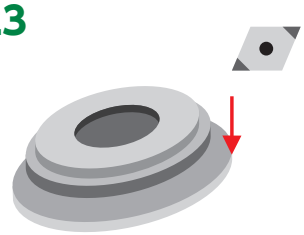
NTK : **B52**	60 pcs./corner
Competitor's CBN product	30 pcs./corner

The life of B52 grade inserts was twice that of the competitor product.

Cutting of outer side of oil pump housing

Work material : FC250
Cutting speed(m/min)=250
Feed rate(mm/rev)=0.2
Depth of cut(mm)=2.0
Cutting oil : WET

B23



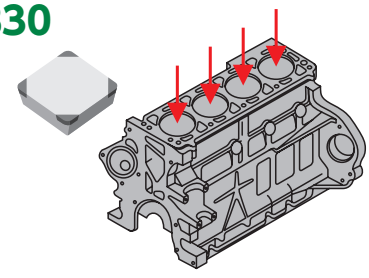
NTK : **B23**	210 pcs./corner
Competitor's CBN product	70 pcs./corner

The life of B23 grade inserts was 3 times as long as the competitor's product.

Continuous boring on cylinder block

Work material : FC material
Cutting speed(m/min)=800
Feed rate(mm/rev)=0.3
Depth of cut(mm)=0.1
Cutting oil : WET

B30



NTK : **B30**	800 pcs./corner
Competitor's CBN product	500 pcs./corner

The life of B30 grade inserts was 1.6 times as long as the competitor's product.

MEMO

D

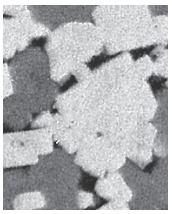
Micro-grain Carbide, PVD / CVD-coated Carbide

Micro-grain Carbide and PVD/CVD-coated Carbide

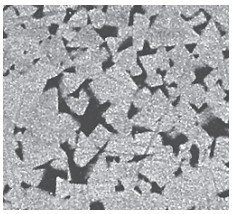
Excellence in precision machining and machining of hard-to-cut materials

These material grades use WC micro-grain carbide, the hard layer of which is granulated to a micro size 1 μm as the substrate. Furthermore, the substrate is coated by the PVD method with TiN, TiCN, and/or TiAlN. The end results are materials that are suitable for precision machining and machining of difficult-to-cut materials. Inserts in these grades are tougher and harder than carbide and come with precision sharp cutting edges. They even have superior toughness and sharper cutting edges than ultra micro-grain carbide grades, with excellent wear resistance and thermal crack resistance.

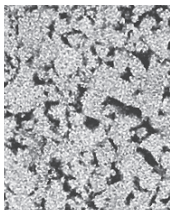
Carbide grade



General carbide structure



Micro-grain carbide structure

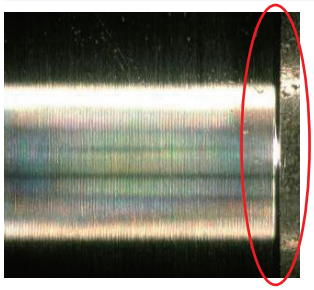


Super micro-grain carbide structure

The result of intensive research and development for improving carbide grades

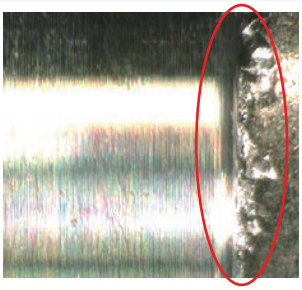
The NTK carbide grade series shows very stable performance under a wide range of conditions. NTK uses micro-grain carbide substrate with a balance of wear resistance and toughness.

Features Superior cutting performance



No burrs

Machined with NTK insert with a sharp cutting edge



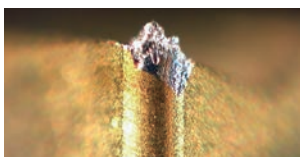
Burrs

Machined with a competitor's product with a honed cutting edge

Relentless pursuit of better cutting performance

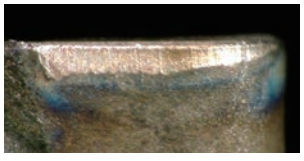
NTK takes pride in its carbide grade series.
Their outstanding cutting performance is due to the grinding of ultra sharp cutting edges. Sharper cutting edges provide for better burr control, lower tool pressure, holding tighter tolerances and reducing work hardening.

Features Precise analysis on insert wear patterns



Build-up edge

Chipping / fracture



Flank wear

Wear on rake

Continuous research on insert tool life

Damage to insert cutting edges varies depending on the machining process and the work material. There are various types of coatings that reduce such damage to prolong the tool life. NTK carbide series offer various coatings developed to improve their resistance characteristics including wear, fracture, adhesion and oxidation, by utilizing state of the art technology.

※For products with coating, the values of the base material are indicated.

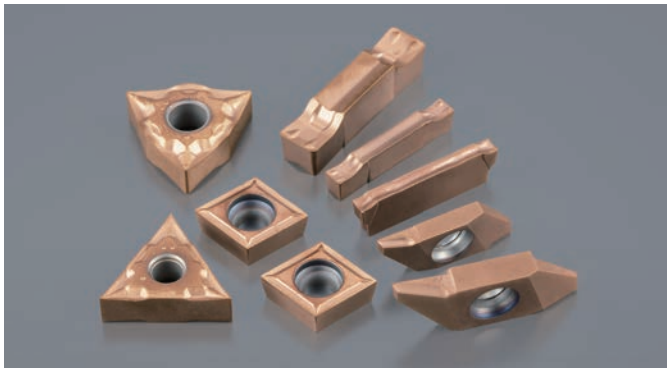
NEW ST4 — Best grade for stainless steel

Features

- ***Best grade for SUS304 thanks to New ST coating***
- ***Excellent adhesion and wear resistance***

Best for	Optimized for	Excellent in
● Stainless steels	Conventional lathes Swiss-type lathes	Adhesion resistance

DM4 — Excellent oxidation resistance

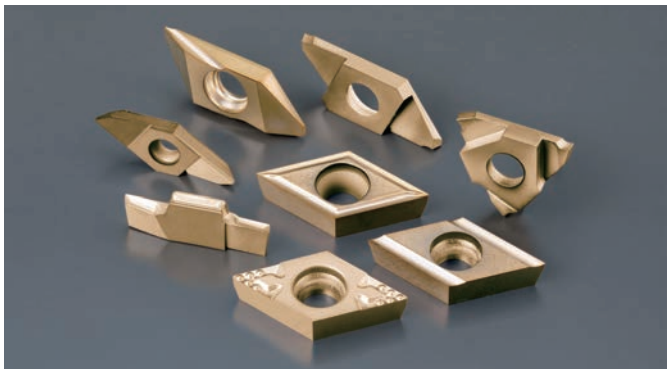


Features

- ***Best oxidation resistance for high temperature machining***
- ***Optimized for Conventional / Swiss-type lathes***

Best for	Optimized for	Excellent in
● Titanium alloys ● Stainless steels ● Alloy steels ● Carbon steels ● Heat resistant alloys	Conventional lathes Swiss-type lathes	Oxidation Heat resistance

DT4 — Excellent heat resistance for Swiss-type lathes

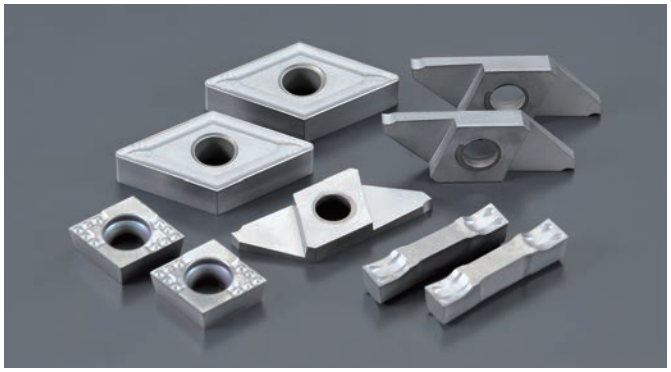


Features

- ***Excellent oxidation resistance for Swiss-type lathes***

Best for	Optimized for	Excellent in
● Titanium alloys ● Stainless steels ● Alloy steels ● Carbon steels ● Heat resistant alloys	Swiss-type lathes	Oxidation Heat resistance

QM3 — Superb wear resistance and fracture resistance in interrupted cutting



Features

- ***Excellent toughness and wear resistance for wide speed range***
- ***Stable interrupted machining of steel***

Best for	Optimized for	Excellent in
● Carbon steels ● Stainless steels ● Alloy steels ● Heat resistant alloys	Swiss-type lathes Conventional lathes	Wear resistance

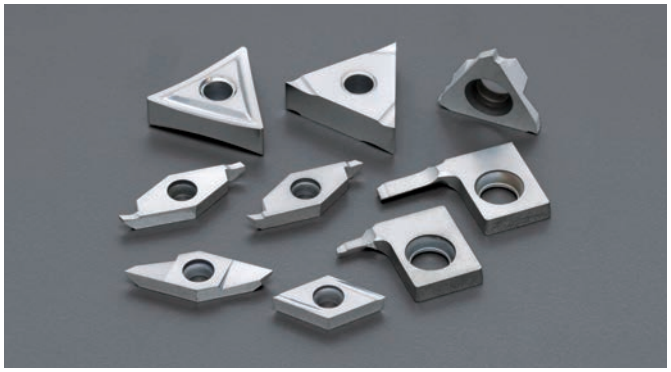
TM4 Next generation standard insert grade for Swiss-type lathes

Features

- ***Excellent dimensional stability and tool life thanks to triple titanium layers with excellent adherence to insert substrate***

Best for	Optimized for	Excellent in
● Carbon steels ● Stainless steels ● Alloy steels	Swiss-type lathes	Balance

VM1 High precision machining of small diameter parts

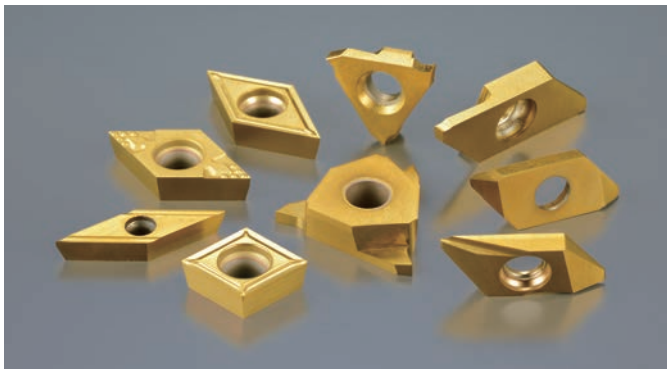


Features

- ***Especially for machining free cutting steels (SUM materials)***
- ***For high-precision machining with longer tool life even in the high-speed machining range***

Best for	Optimized for	Excellent in
● Carbon steels ● Stainless steels ● Alloy steels	Swiss-type lathes	Edge sharpness

ZM3 The best selling grade for Swiss-type lathes



Features

- ***Stabilizes machining dimensions thanks to the coating being firmly adhered to the substrate***
- ***A wide range of cutting tools in various sizes available for Swiss-type lathes***

Best for	Optimized for	Excellent in
● Carbon steels ● Stainless steels ● Alloy steels ● Non-ferrous materials	Swiss-type lathes Conventional lathes	Adhesion resistance

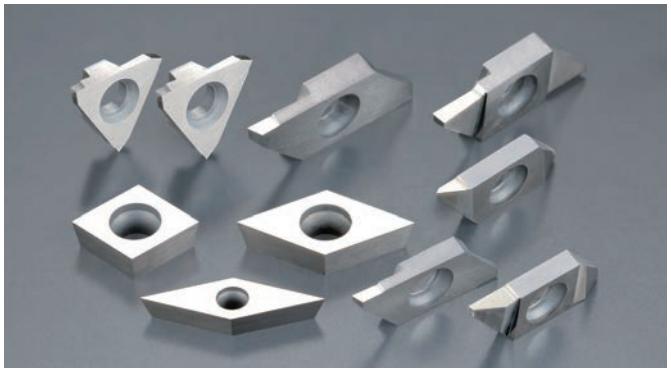
NEW AC3 Developed for soilid carbide endmill

Features

- ***Newly developed for Carbide endmill***
- ***Excellent sharpness and great wear resistance***

KM1

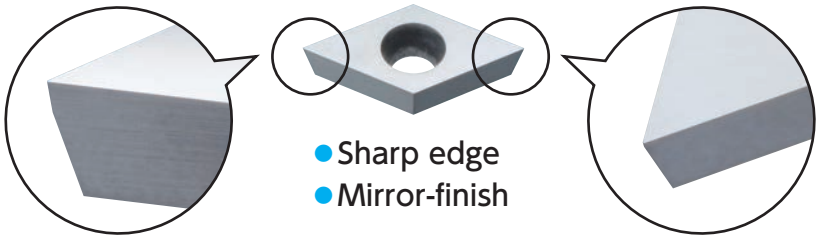
Good for non-ferrous materials like PEEK, Brass, Aluminum and Copper



Features

- ***Very sharp cutting edges with uncoated Micro-grain carbide***
- ***Excellent adhesion resistance because of mirror-finish***
- ***A wide range of cutting tools in various types available for Swiss-type lathes***

Best for	Optimized for	Excellent in
● Aluminium ● Plastic (PEEK) ● Non-ferrous materials	Swiss-type lathes	Edge sharpness



● Sharp edge
● Mirror-finish

CP1

For roughing cast iron and ductile cast iron

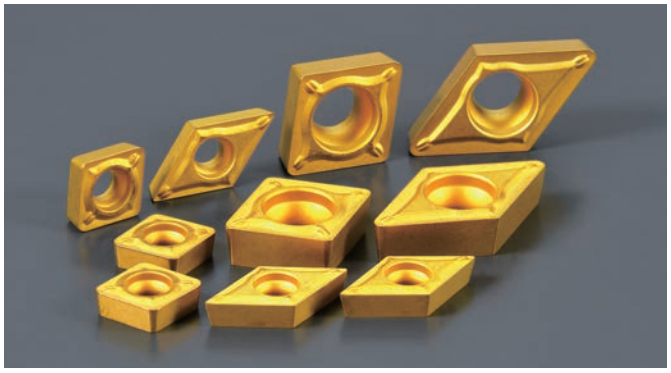
Features

- ***High wear resistance achieved by laminating thick film TiCN layer and Al_2O_3 layer as the coating; Great for cast iron cutting even in high-speed range***
- ***Excellent deposition resistance due to our original surface treatment***
- ***Can also be used for machining ductile cast iron***

Best for	Optimized for	Excellent in
● Ductile cast iron ● Gray cast iron	Conventional lathes	Wear resistance

CP7

For roughing at high speed in steel machining !



Features

- ***High wear resistance and fracture resistance achieved by multi-layer coating of the base material by CVD method; used for a wide range of cutting conditions***
- ***Recommended for high-speed machining of alloy steel and general steels***
- ***Best for machining of automotive components on automatic lathes***

Best for	Optimized for	Excellent in
● High-speed machining of alloy steels	Conventional lathes	Wear resistance

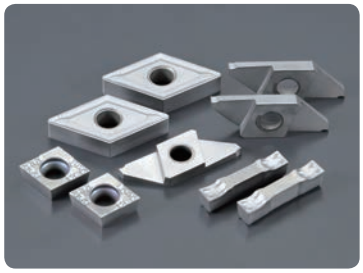
PVD Coatings for Turning

NEW ST4 — ST-Coat

Best grade for Stainless Steel

- *Stainless steel*

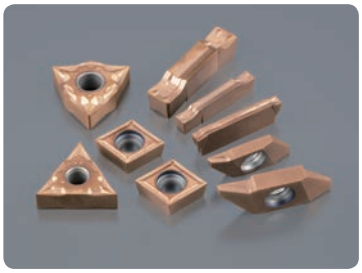
QM3 — Q-Coat



Best wear resistance

- *Stainless steel*
- *Carbon steel*
- *Alloy steel*

DM4 — DM-Coat



Best heat resistance

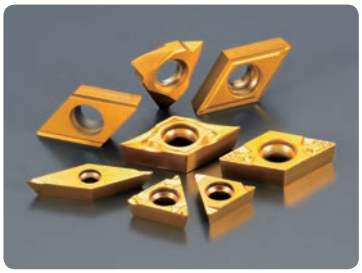
- *Heat resistant alloy*
- *Stainless steel*
- *Hardened material*

DT4 — DT-Coat

Best balance of heat resistance and sharp edges

- *Titanium alloy*
- *Heat resistant alloy*
- *Stainless steel*
- *Hardened material*

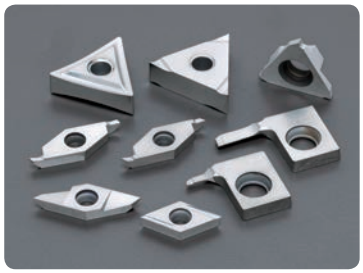
TM4 — TM-Coat



Best balance of wear resistance and adhesion resistance

- *For small part machining in general*

VM1 — V-Coat



Best edge sharpness

- *Titanium alloy*
- *Non-ferrous material*
- *Stainless steel*
- *Plastic*

ZM3 — Z-Coat

Best adhesion resistance

- *General purpose machining*

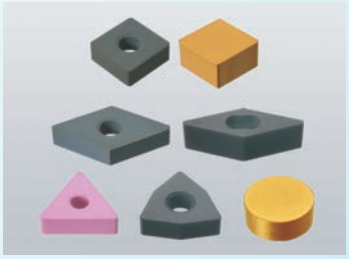
MEMO

E



Insert Item List

ISO / INCH Insert Nomenclature

①Code for shape

Classification	Code	Shape	Apex angle (degree)	Symbol
Regular polygons	H	Regular hexagon	120	⬡
	O	Regular octagon	135	⯃
	P	Regular pentagon	108	⬠
	S	Square	90	□
	T	Equilateral triangle	60	△
Rhomboids and equilateral unequal-angles	C	Rhomboids	80	◇
	D		55	
	E		75	
	F		50	
	M		86	
	V		35	
	W	Hexagon	80	⬡
Rectangles	L	Rectangle	90	□
Parallelograms	A	Parallelograms	85	▱
	B		82	
	K		55	
Circles	R	Circle	–	○

Note : The smaller of the apex angles is used.

③Codes for accuracy

Code	Diameter of inscribed circle d (mm)	Thickness s (mm)	Corner height m (mm)
A*	± 0.025	± 0.025	± 0.005
F*	± 0.013		± 0.013
C*	± 0.025		
H	± 0.013		
E	± 0.025	± 0.13	± 0.025
G			
J*	± 0.05 ~ ± 0.13**	± 0.025	± 0.005
K*			± 0.013
L*			± 0.025
M	± 0.05 ~ ± 0.13**	± 0.13	± 0.08 ~ ± 0.18**
N		± 0.025	
U	± 0.08 ~ ± 0.25**	± 0.13	± 0.13 ~ ± 0.38**

Notes : The asterisk (*) indicates that the accuracy range is, basically, applied to inserts equipped with a flat drag. The double asterisk (**) indicates that the accuracy range is determined by the size of the insert.

Tolerances for each insert size

Except for inserts with 55, 50 or 35 degrees in apex angle

Diameter. of inscribed circle d (mm)	Inscribed circle diameter tolerance d		Corner height tolerance m	
	Class J, L, K, M, N	Class U	Class M or N	Class U
6.35 9.525	± 0.05	± 0.08	± 0.08	± 0.13
12.70	± 0.08	± 0.13	± 0.13	± 0.20
15.875 19.05	± 0.10	± 0.18	± 0.15	± 0.27
25.40	± 0.13	± 0.25	± 0.18	± 0.38

The tolerances for class M inserts with 55 degrees in apex angle are as follows

Diameter. of inscribed circle d (mm)	Inscribed circle diameter tolerance (mm) d	Corner height tolerance (mm) m
6.35 9.525	± 0.05	± 0.11
12.70	± 0.08	± 0.15
15.875 19.05	± 0.10	± 0.18

Note : The accuracy range of "m" can be spread for inserts with apex angles smaller than 55 degrees.

Type of insert material	①	②	③	④	⑤	⑥	⑦	⑧	⑨
Metric	QM3	D	N	M	G	12	04	T	N
Inch	QM3	D	N	M	G	4	3	1	T	N

②Codes for relief angles

Relief angle (degree)	Code
3	A
5	B
7	C
15	D
20	E
25	F
30	G
0	N
11	P
Other relief angles	O

Note : The relief angle must be that of the major cutting edge.

④Codes for grooved holes

For normal series				
Code	Provision of holes	Shape of hole	Chipbreaker	Pattern
N	No	——	None	
R			Single-sided	
F			Double-sided	
A	Yes	Cylindrical	None	
M			Single-sided	
G			Double-sided	
W		Partially cylindrical Single-sided: 40 - 60 deg	None	
T			Single-sided	
Q		Partially cylindrical Double-sided: 40 - 60 deg.	None	
U			Double-sided	
B		Partially cylindrical Single-sided: 70 - 90 deg.	None	
H			Single-sided	
C		Partially cylindrical Double-sided: 70 - 90 deg.	None	
J			Double-sided	
X		——	——	——

Note : Only the normal series is to be used for the metric system. Always use code X for scalene inserts. However, X must not be used for inserts of shapes not defined in the table (1) above.

For small-size series		
Code	Provision of holes	Chipbreaker
E	No	None
S		Single-sided
L		Double-sided
D	Yes	None
P		Single-sided
K		Double-sided
X	——	——

Note : Use the smaller size series for the inch system when inscribed circle diameter is 7.94 mm or less. However, use normal series only when the diameter is 6.35 mm giving priority to the small-size series.

⑦Codes for corner radii

For corner R		
Corner-R nominal value (mm)	Inch system	Metric system
Sharp corner		
r_ε : 0.2	Y	02
0.4	1	04
0.8	2	08
1.2	3	12
1.6	4	16
2.0	5	20
2.4	6	24
3.2	8	32
Other radii		X
For circular inserts	0	00*
		M0*

Notes : "00" (double zero) is used for insert circle diameter indicated in inches. "M0" is used for insert circle diameter indicated in millimeters.

⑤Codes for cutting edge lengths or for inscribed circle diameters

Diameter of inscribed circle d (mm)	Inch system		Metric system												
	Normal series	Small-size series	Shapes												
			H	O	P	S	T	C	D	E	F	M	V	W	R
3.97	—	5					06			T3					
4.76	—	6					08			04					
5.56	—	7				05	09	05	06	05	07	05	09	03	
6.35	2	(8)	03	02	04	06	11	06	07	06	08	06	11	04	06
7.94	—	0	04	03	05	07	13	08	09	08	10	07	13	05	07
9.525	3	—	05	04	07	09	16	09	11	09	12	09	16	06	09
12.70	4	—	07	05	09	12	22	12	15	13	16	12	22	08	12
15.875	5	—	09	06	11	15	27	16	19	16	20	15	27	10	15
19.05	6	—	11	07	13	19	33	19	23	19	24	19	33	13	19
25.40	8	—	14	10	18	25	44	25	31	26	33	25	44	17	25
31.75	0	—	18	13	23	31	54	32	38	32	41	31	54	21	31

⑥Codes for thickness

Thickness S (mm)	Inch system		Metric system
	Inscribed circle series		
	Normal series	Small-size series	
1.59	—	2	01
2.38	—	3	02
3.18	2	4	03
3.97	—	5	T3
4.76	3	6	04
5.56	—	—	05
6.35	4	—	06
7.94	5	—	07
9.52	6	—	09
12.70	8	—	12

⑩	⑪
•	G
•	G

⑧Codes for major cutting edges

Without honing (Tool nose processing)	F
Angular honing	T
Round honing	E
Angular honing + round honing	S
Special honing	K
Special honing + round honing	P

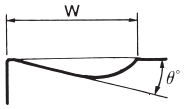
⑨Codes for left/right handed inserts

Type	Code
Right-handed	R
Left-handed	L
Not specified	N

⑪Codes for chipbreaker shapes

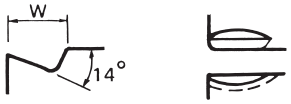
Parallel-honing type (mm)

Code	W	θ°
A	1.0	14
B	1.5	14
C	2.2	14
D	2.8	10
E	3.5	10



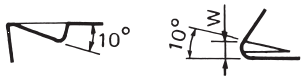
Type N (Double-positive type) (mm)

Code	W
N1	1.5
N2	2.2



Type P (Angle type) (mm)

Code	W
P1	0.9
P2	1.25



Full-arc embossed type (mm)

Code	W
F	1.5
G	2.2
H	2.8

*Note: NTK WP style inserts have a wiper facet design.
The insert has a 0.3mm flat on the cutting edge when the insert is set into the toolholder.
The flat on the cutting edge ensures a superior surface when feed rates are increased.
WP style inserts can be used in toolholders: SDJC, Y-SDJC, CH-SDUCL and DS-SDUL.

*Note: NTK WP style inserts have a wiper facet design.
The insert has a 0.3mm flat on the cutting edge when the insert is set into the toolholder.
The flat on the cutting edge ensures a superior surface when feed rates are increased.
WP style inserts can be used in toolholders: STAC

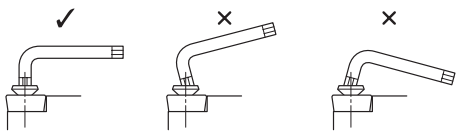
Attention: When tightening screws

- Make sure the wrench tip and wrench hole are neither deformed nor stripped
- Engage the wrench straight to screw hole



- Do not apply more torque than the recommended amount (as shown to the right)

Note: Wrenches and bits come in a pack of five
Clamp screws come in a pack of ten

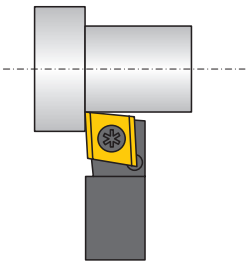
General Turning Inserts Explained

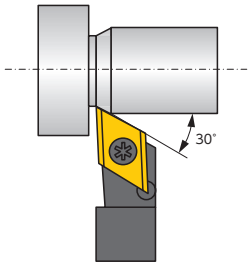
Advantage for each geometry

CC.. Style (80°)



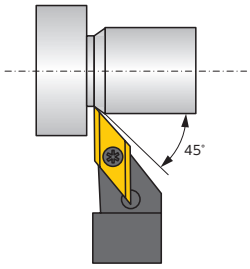
- Increased toughness. Cutting edge is close to insert pocket.
- Not applicable to undercut

DC.. Style (55°)



- Versatile geometry. Toughness of CC.. with flexibility of VC..
- Up to 30 deg. undercuts

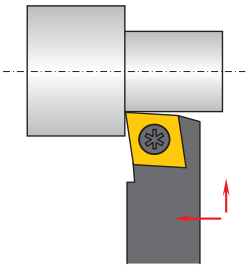
VB / VC / VP Style (35°)



- Wide coverage in work geometry.
- Up to 45 deg. undercuts

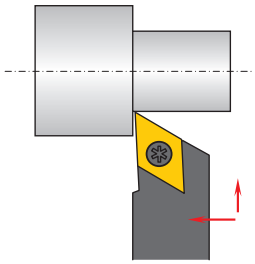
Chip Control and Finish

SCLCR ➡G22



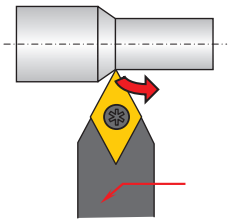
Rigid clamping
High dimensional repeatability

SDJCR ➡G24



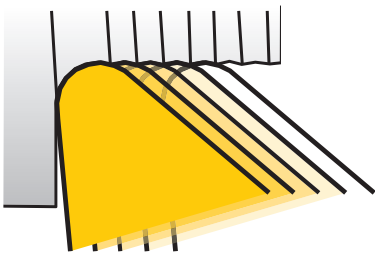
Increased room for chip evacuation creates better surface finish

SDNCN ➡G24

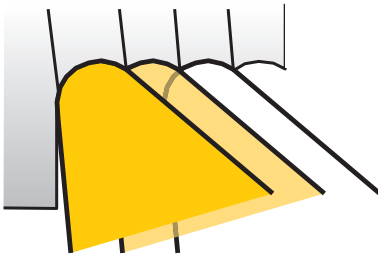


Chips flow away from the work

Surface Finish in General Turning Using Inserts with Wiper Flat

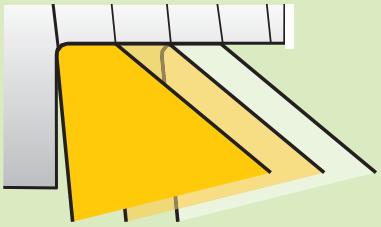


Slower feed rates create better finishes but sacrifices cycle time, chip control, and tool life.



Fast feed rates improve chip control but produce a bad surface finish.

Inserts with wiper



Inserts with a wiper flat create good chip control and surface finish when feed rates are increased.

Wiper Flat Insert - WP series

DCGT.. -WP (TFD) ➡G24

for SDJC toolholders

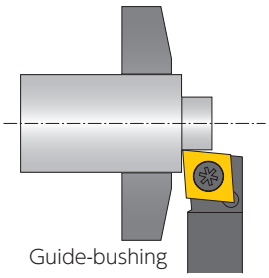
TCGT.. -WP (TFT) ➡G36

for STAC toolholders

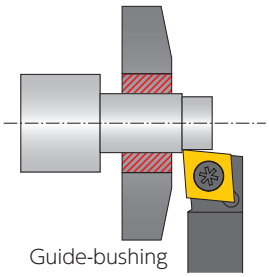
VCGT.. -WP (TFV) ➡G29

for SVJC toolholders

Roughing and Finishing Long Work on Swiss Lathes

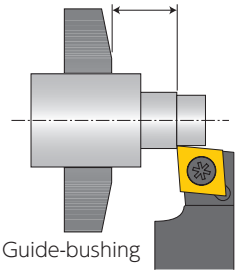


Single pass machining is common in Swiss front turning operations.



Conventional toolholders are not suitable for roughing or finishing of long parts. The guide-bushing cannot hold machined bar stock.

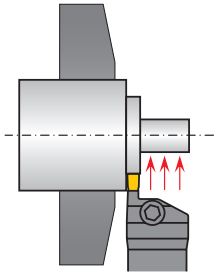
Shifted Holders



Shifted Holders make a finishing process possible without worrying about the bar stock coming out of the guide-bushing.
Coolant flows effectively which improves chip control thanks to the increased room between the tools and guide-bushing.

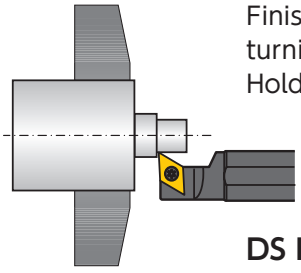
SCLC-N-F ➡G22
SDJC-N-F ➡G24

Combination of Grooving Tool and DS Holders



Rough with grooving tool for good chip control

GTWP Holders ➡H28



Finish by using general turning inserts with DS Holders

DS Holders

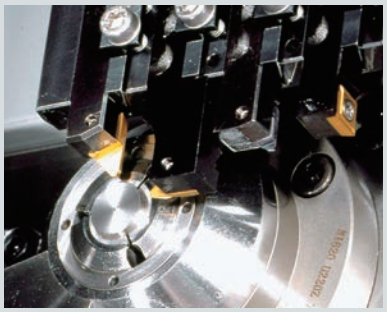
Y-axis Toolholders

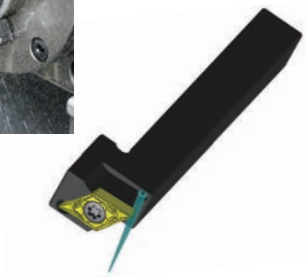
Chip control by gravity

WATCH ON YouTube

Features

- Chip drops down to the bed of the machine due to gravity, and chip control problem is solved
- Available in coolant through style
- Front turning, grooving, and back turning operations can be performed by utilizing Y-axis control





- Perfect solution for chip problems
- Less wear, more stable dimensions

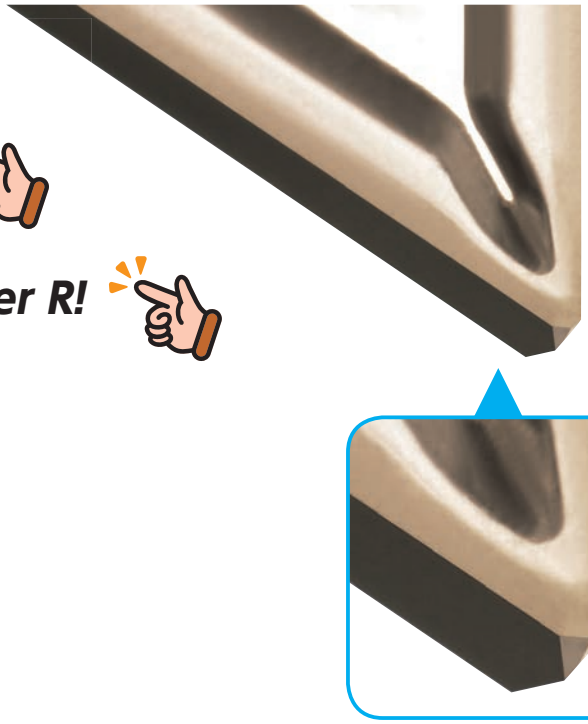
TFD-AM3 breaker

Lined up Front turning

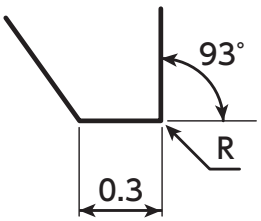
Good surface!

Good chip control!

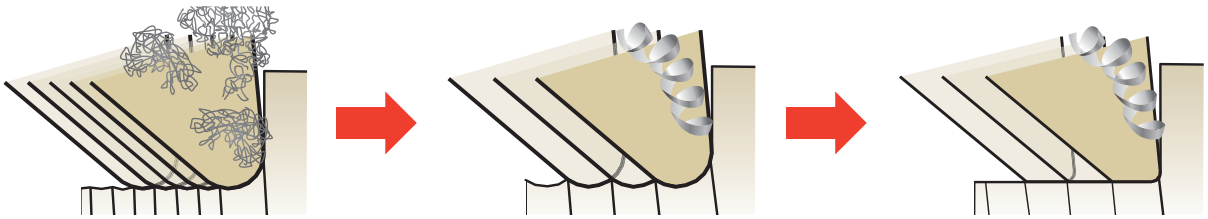
Good inside corner R!



Edge design



Surface finish in front turning

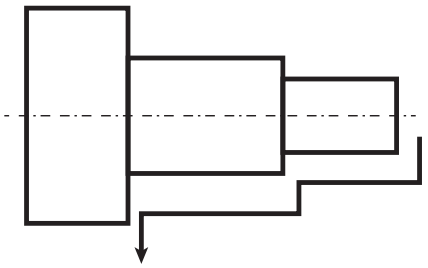


Unstable chip control at low feed rate to keep surface finish

Bad surface finish at high feed rate to improve chip control

TFD wiper insert offers good chip control and surface finish

Cutting condition	
Work material	SUS304
Cutting speed	V_c=30 ~ 80m/min
Feed speed	f =0.015mm /rev
Depth of cut	a_p=0.15mm
DT4 TFD11FR05AM3	1500pcs /corner
Conventional tool	700pcs/corner



Surface finish of conventional tool after 500pcs machined was Ry10.2μm, and dimensional change 0.1mm occurred at start of machining.
TFD-AM3 chipbreaker(DT4 grade) achieved stable machining with no dimensional change after 1,000pcs machined. Surface roughness was Ry2.3μm.

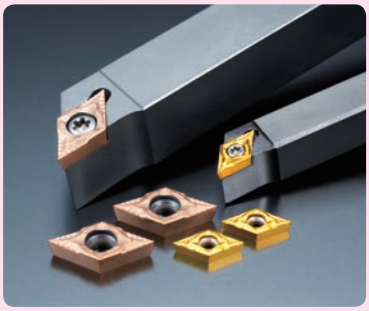
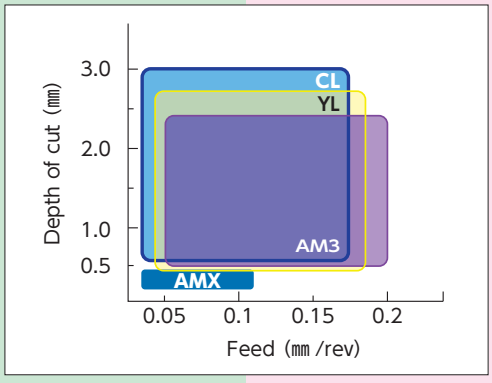
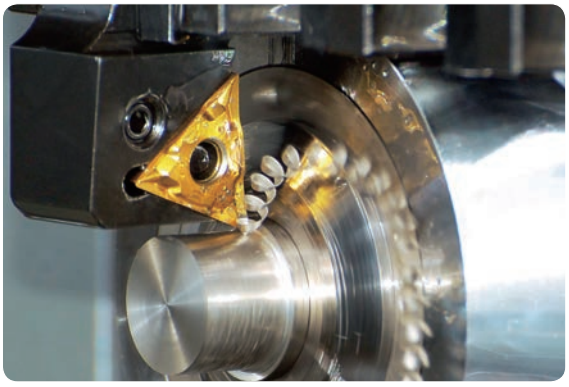
- Designed for very light depth of cut
- Exceptional sharpness





UL Chipbreaker

6 corner insert for Swiss machines

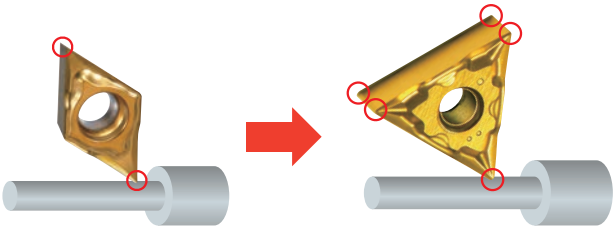


WATCH ON YouTube

Features

- First negative style insert designed for Swiss machines
- Less tool pressure and good chip control

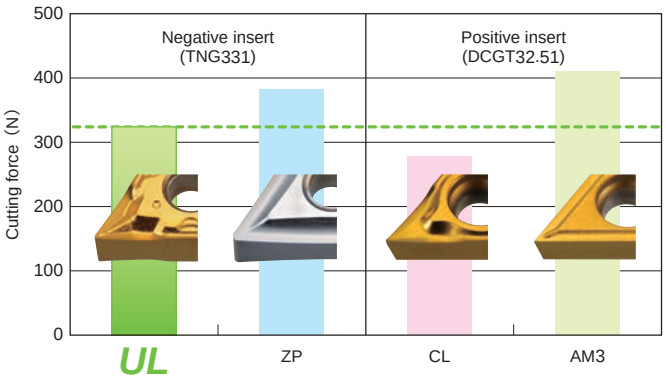
Reduce Cost in Swiss Machining



Positive insert with sharp cutting edge is required for Swiss machining.

With UL chipbreaker, negative insert provides sharp cutting edge AND more corners.

Cuts Like Positive Inserts



Covers a Wide Range of Cutting Conditions with Good Chip Control

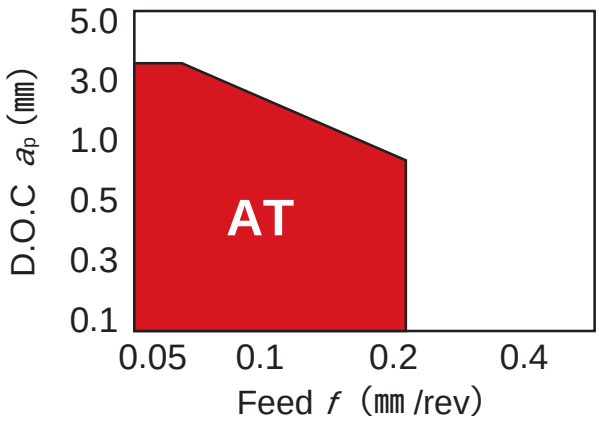
AT breaker

Features

- ***Almighty breaker which combines sharp edge and cutting edge strength!***
- ***By mirror finish breaker, it is able to suppress built up edge in slow speed region and sticky work material (such as S10C e.t.c.)***
- ***Able to machine high precision due to E class precision inserts.***

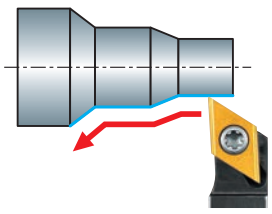


〈Cutting edge shape〉

Case study

Shaft machining

Work material	: S15C
Cutting speed (m/min)	: 20 ~ 150
Feed (mm/rev)	: 0.02
Depth of cut (mm)	: 0.10
Coolant	: WET

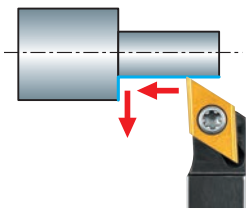


TM4 AT breaker	1,600 pcs/corner
Competitor's polished breaker (PVD coated carbide)	500 pcs/corner

Due to the strict dimensional tolerance, tool life was not stable using conventional product.
Thanks to AT breaker, deposition has been restrain and tool life became longer.

Shaft machining

Work material	: S45CL
Cutting speed (m/min)	: 200
Feed (mm/rev)	: 0.07
Depth of cut (mm)	: 0.5
Coolant	: WET



TM4 AT breaker	1,500 pcs/corner
Competitor's polished breaker (PVD coated carbide)	900 pcs/corner

Stable machining and longer tool life can realize due to the sharp edge and cutting edge toughness of AT breaker.

➡E42

DS-ACH Toolholders

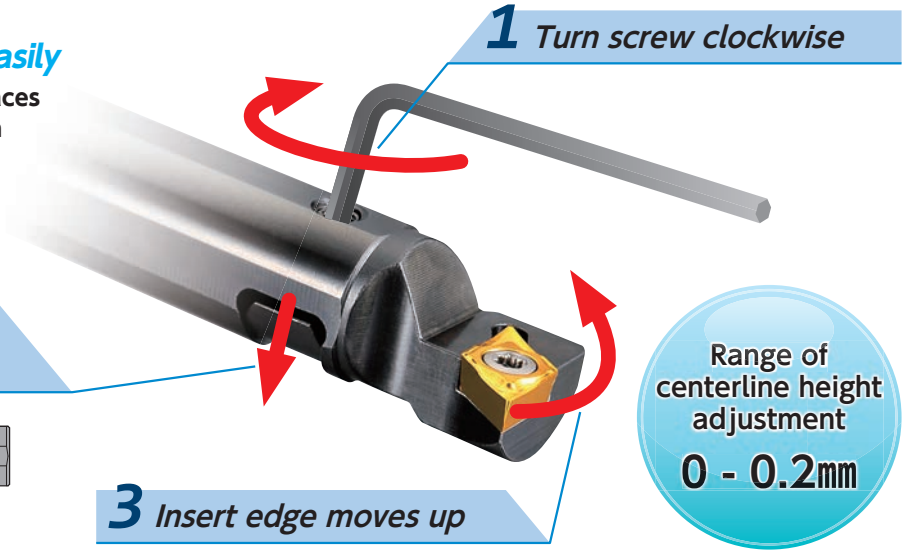
Features

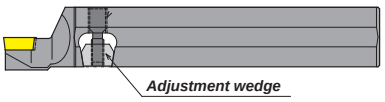
WATCH ON YouTube

- Adjust centerline height simply with a wrench

1 Adjust centerline height easily

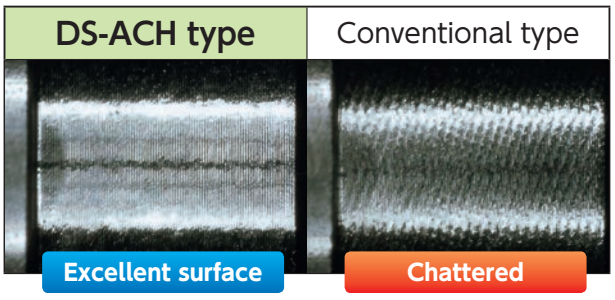
- Eliminate center boss on end faces
- Provide constant OD dimension
- Adjust easily in machine





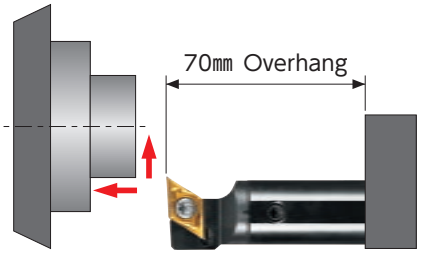
2 Optimized design reduces vibration

Improved chatter resistance.



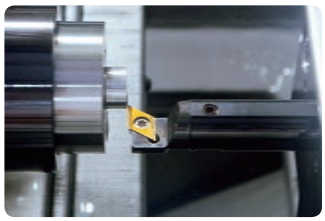
Tested cutting conditions (SUS304)

Work material : SUS304
Holder : DS-SDUL19-11-ACH
Insert : DCGT11T302MCL TM4
Cutting condition : v_c=75 m/min、 f =0.05 mm/rev、 a_p=2.0 WET

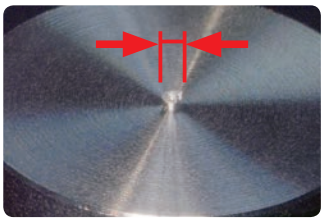


How to use

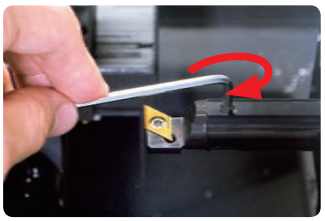
Insert moves in an upward direction only. (Loosen wedge screw before making any adjustment)



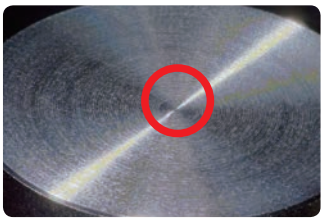
①Install the holder slightly below centerline. Then take a facing test cut.



②Measure the diameter of the centerboss.



③Raise the center height by one half of the diameter of the boss. Adjustment references are available in the tool case.



④Re-machine the end face.

*Adjustment instructions are supplied in the tool case

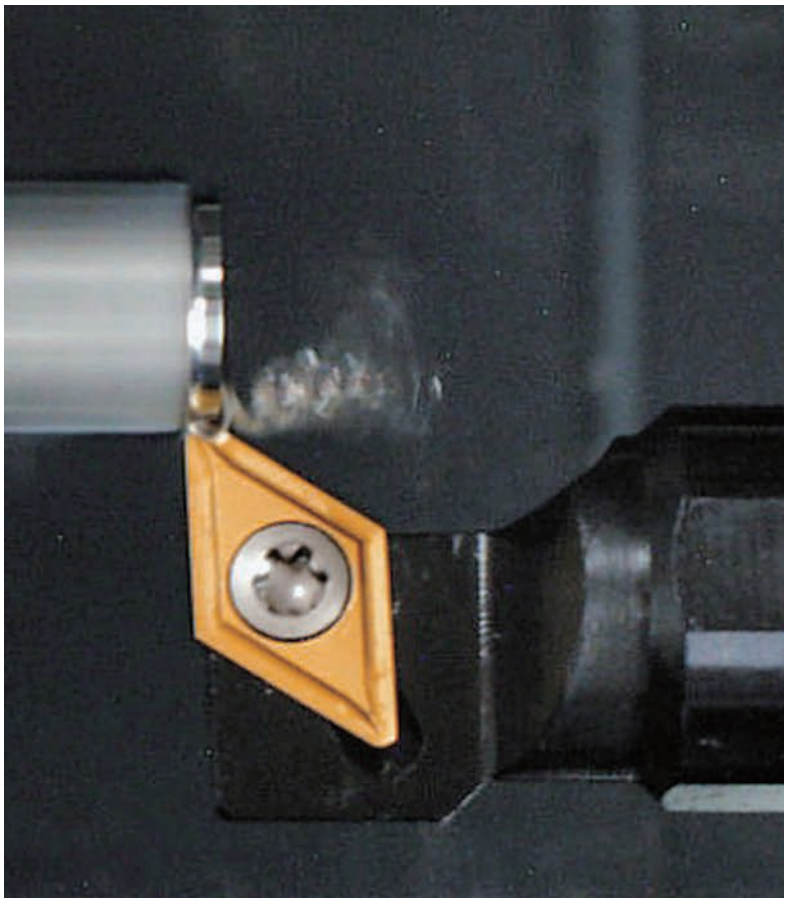
DS Toolholders

Make the most of vacant drill sleeves

DS / DS-ACH Toolholders

Industry Proven Concept



Are you satisfied with the number of tool positions in your machine?

NTK DS type toolholders are useful when additional tool positions are required

Front turning, Back turning, Grooving, Threading, and Small boring which fit into the machines' vacant drill sleeves

DS Series toolholders can be used with both Swiss or non-Swiss type CNC lathes

Features

- More turning tools without any hassle
- Available for Front turning, Back turning, Grooving, Threading, Micro-boring, and interchangeable tooling
- Available shank size range: from 14 mm to 32 mm

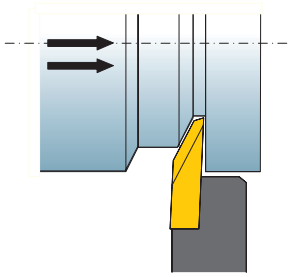
Recommended max. depth of cut for each pass

(Multiply this ratio by the length of blade (a) to obtain the max. depth of cut for each pass)

Work material \ Grade	PVD Coated Carbide ST4·QM3·DT4·DM4·TM4·VM1·ZM3
Steel	a x 0.7
Stainless Steel	a x 0.6
Non-ferrous material	a x 0.9
Plastic	a x 0.9

a : Length of Blade b : Max. Depth of Cut

When the length of blade (a) is not long enough

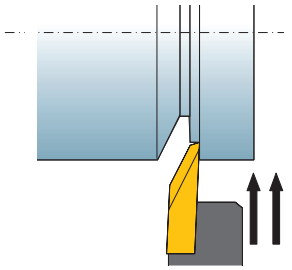


Back turning can be performed multiple times until the total depth of cut reaches (b).

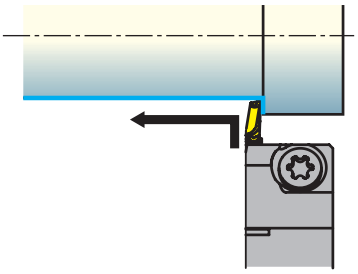
End face

NTK BM-chipbreaker	Competitor
	Excellent surface	Rough surface

When experiencing rough finish on shoulder



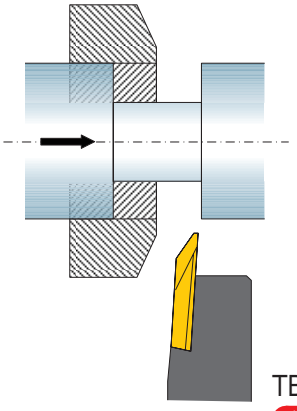
Turning the shoulder twice can improve the finish.
This problem can be solved by using TBP-BM, TBPA-BM, TBDP inserts without increasing the number of passes



TBP-BM, TBPA-BM, TBDP come with NTK's uniquely designed molded chipbreaker providing single pass machining. These inserts can provide excellent surface finish.

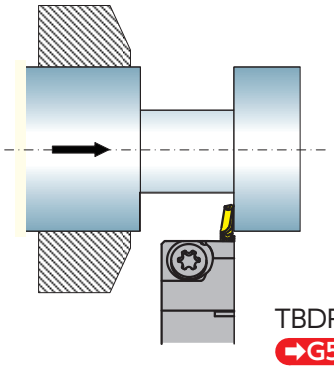
TBP-BM ➡G53
TBPA-BM ➡G55
TBDP ➡G57

Finishing cut



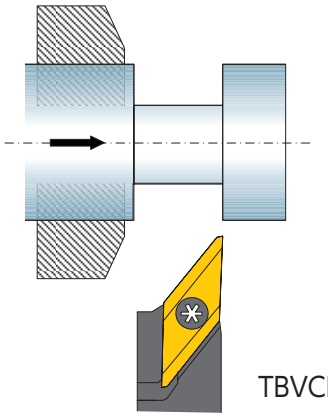
Roughed section goes into the guide bushing when performing finish cuts. (Deburring may be needed upon roughing)

TBP
➡G52



TBDP-L
➡G57

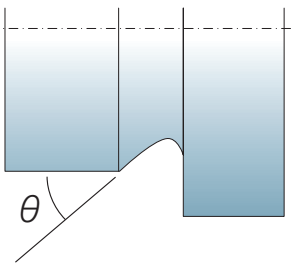
TBDP Left-hand toolholder will eliminate the risky process of pulling back the turned bar stock into the guide-bushing for finishing process, because its cutting point is away from the guide-bushing.



TBVCR··F10
➡G56

Cutting edge is located away from the guide-bushing. Roughing can be performed without retracting roughed part from guide-bushing.

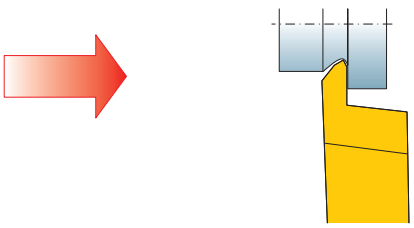
Undercut



Assume undercut exists on back turning section

$\theta = 22^\circ$ type

$\theta = 45^\circ$ type



TBMH style inserts should be used to cut the undercut

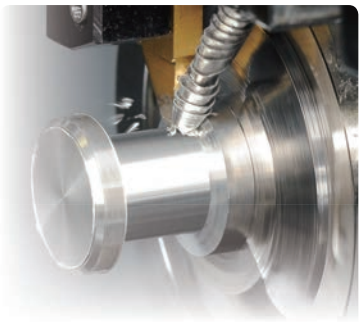
Inserts ➡G61

Holders ➡G60

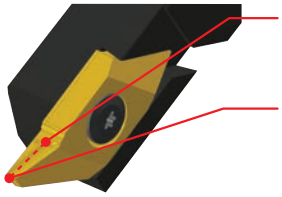
TBP-BM / TBPA-BM for Back Turning

Features

- "Single Pass Back Turning" offers excellent surface finishes
- Up-right style insert and screw clamping provides high rigidity
- Wiper flat on cutting edge offers excellent surface finishes even under high feed cutting conditions



New BM chipbreaker



- Prevents the rough end face from hitting the chip
- Wiper flat on cutting edge creates excellent surface finishes

Best Solution for Chip Control

Coolant through toolholders now available

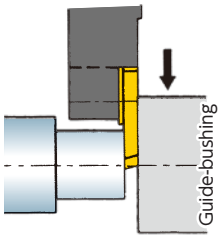
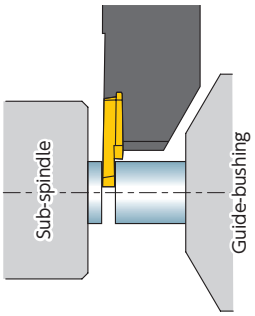
CTP/CTPA/CTPS/CTPW selection guide : Right hand? Or Left hand?

Right-hand recommended



R-hand Toolholder using a R-hand insert with lead angle

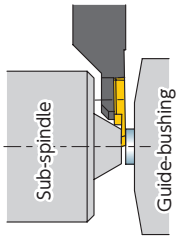
Left-hand recommended



L-hand Toolholder with a non-lead angle insert when the bar stock is held by sub-spindle

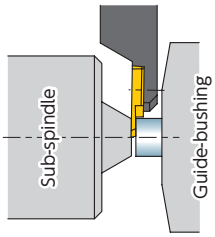
CTP/CTPA-SUB selection guide Right hand? Or Left hand?

Right-hand recommended



R-hand Toolholder with R-hand insert with lead angle for longer parts or small diameter part. When part length is too short for sub-spindle to hold, use L-hand with slower speed.

Left-hand recommended

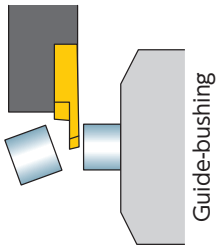


L-hand with L-hand insert with lead angle for short part

Cut-off Tool Selection Guide

Right-hand combination

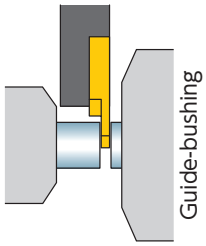
FR, FRFT, FRV Style



FRFT: Flat top
FRV : Flat top with mirror finish

- Common geometry in cut-off
- Lead angle minimizes center-boss
- End face is likely to get scratched from chip control because of lead angle and chip-breaker configuration
- Good for small diameter machining as it cuts near guide-bushing

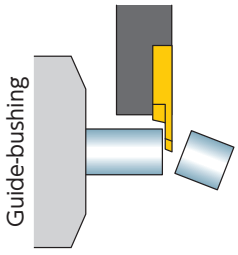
FRN, FRS,FRNV Style



FRS : Flat top
FRNV: Flat top with mirror finish

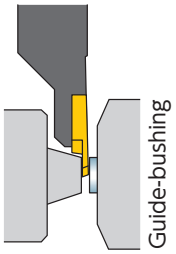
- Good for small diameter machining as it cuts near guide-bushing
- 1st recommendation when sub-spindle holds the part
- No lead angle helps to prevent scratches on both faces

FRK Style



- Used with inverse spindle rotation
- Short part length and using sub-spindle
- Less burrs with hollow work

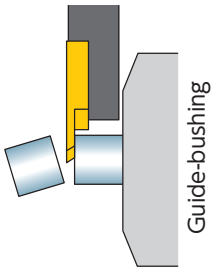
CTP. R-SUB



- Recommended when cut-off point is close to guide-bushing for small and thin parts
- When the part length is short, extended sub-spindle guide-bushing is generally used

Left-hand combination

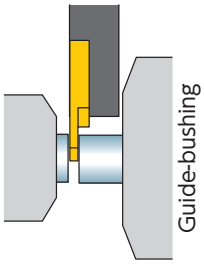
FLK, FLKFT, FLKV Style



FLKFT: Flat top
FLKV : Flat top with mirror finish

- Can cut-off closer to the sub-spindle
- Less burrs with hollow work
- Sub-spindle should hold the work

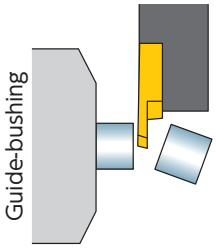
FLN, FLS Style



FLS: Flat top

- Recommended when required to cut-off close to the sub-spindle due to short part length
- Good for big diameter part
- No lead angle helps to prevent scratches on both faces
- Sub-spindle should hold the work

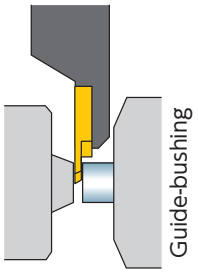
FL, FLV Style



FLV: Flat top with mirror finish

- Used with inverse spindle rotation
- Without sub-spindle
- Less burrs with hollow work

CTP. L-SUB



- Recommended when required to cut-off close to the sub-spindle especially with small diameters
- Can cut much closer to the sub-spindle than the other left-handed tool holders
- Sub-spindle should hold the work

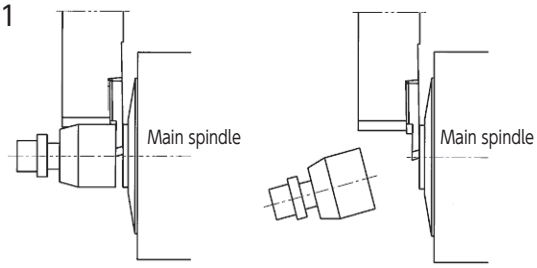
Notification about max cut-off diameter

※Max cut-off diameter in the catalog shows when X end point is 0.0.

①When cut-off

When X end point became over X0.0, the work material will fall off so that interference will not occur. (Fig 1)

Fig 1



②When cut-off while grabbing (When using neutral type)

Max cut-off diameter will depend on X end point, so please check the max cut-off diameter based on X end point.

※Please used the formula below.

【Calculation formula】

Possible machining diameter = Max cut-off diameter - X end point

(Value notice on the catalog) (Optional)

《Example》

When machining until X-1.0 using CTP15FRN

12.0 - 1.0 = 11.0 (Max workable diameter)

③When cut-off while grabbing (When using lead angle type)

Max cut-off diameter will depend on X end point, so please check the max cut-off diameter based on "dimension A" below (Fig.2) and X end point.

※Please used the formula below.

【Calculation formula】

Possible machining diameter = Max cut-off diameter - X end point

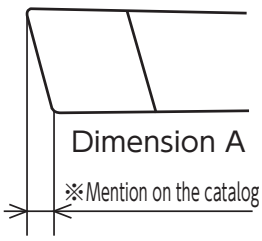
(Value notice on the catalog)

【How to decide X end point】

X end point ≧ dimension A × 2

(Fig.2)

Fig 2



《Example》

When using CTP15FR

X end point : 0.460 × 2 = 0.920

(dimension A)

12.0 - 0.920 = 11.08 (Max workable diameter)

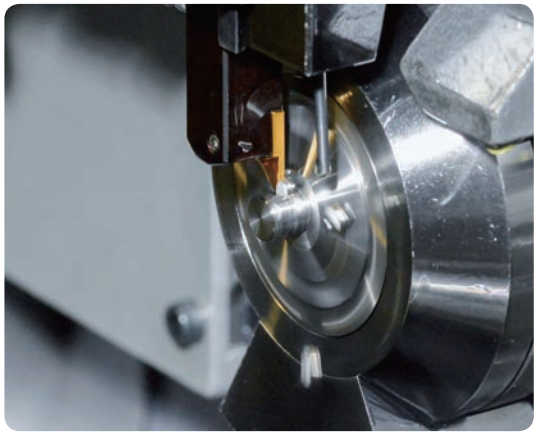
CTP-CX / CTPA-CX for Cut-off



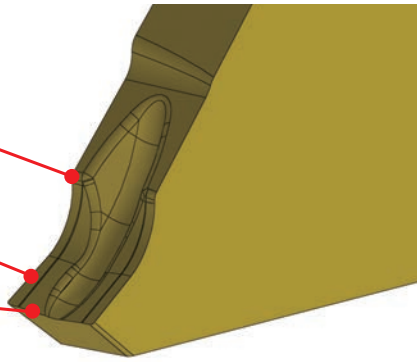
Features

- New 3D molded chipbreaker on CTP style inserts
- Excellent chip control and straight-line stability with proprietary designed CX chipbreaker.
- Fold chips strongly from both ends result superior machined surface finish

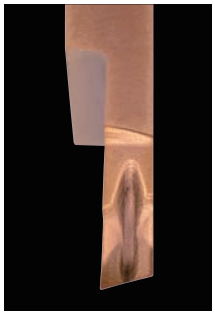
1 Fold chips from both ends strongly.

2 Up-sharp edge like ground inserts (15°)

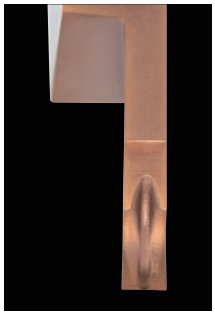
3 2 step V shape to keep nose-R shape and fold chips.



With lead angle



Neutral



Best Solution for Chip Control

Coolant through toolholders now available

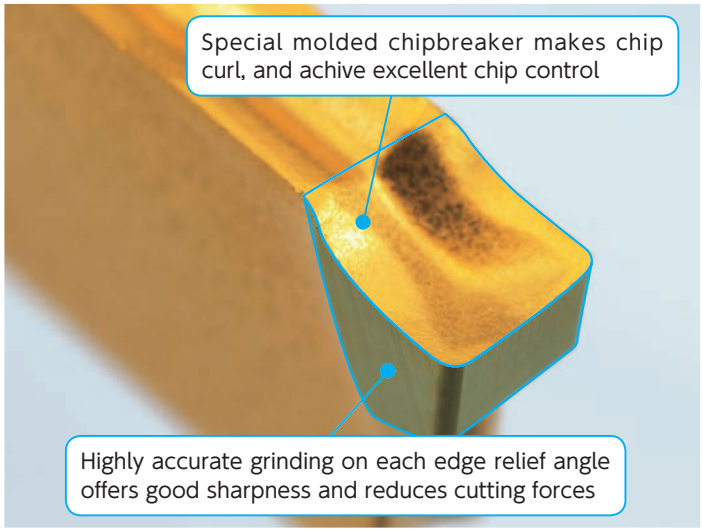
CUT DUO

Features

- Offers excellent chip control and superior surface finishes due to a special molded chipbreaker and precision grinding
- Achieves rigid clamping because of a 3-V point clamping design
- Wide toolholder selection for various diameters



Chip control (Vc=80m/min)

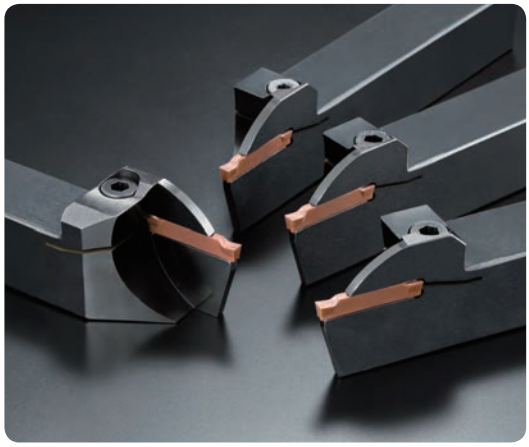
CUT DUO EXTRA

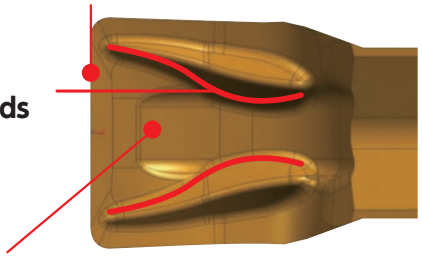


Features

- New double-edge cut-off tools with 3mm width for max. cut-off diameter of 42mm
- Original 'S' shape chipbreaker provides controlled chip evacuation

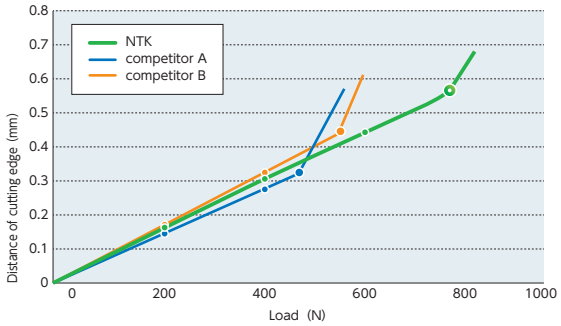
1 Chip control

- Straight design improves toughness of cutting edge
- Folds chips from both ends strongly



- High rake angle for up-sharp edge

2 High rigidity



- Improved reliability and productivity on high-load cut-off application

CTPS Series

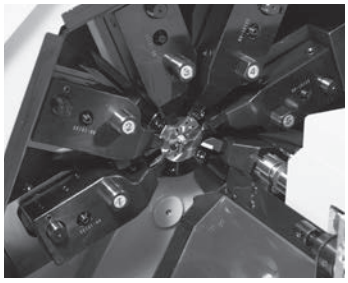
Best tool for Cam-style machine !!



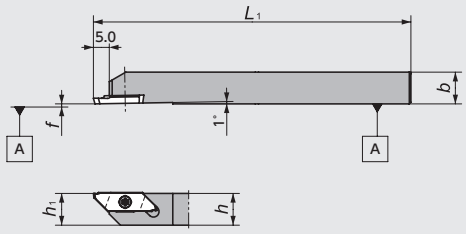
Features

- All the inserts can use the same toolholder
- Designed to be used for back turning, cut-off, grooving and threading
- The dedicated SVAC-N type is offered for front turning

CTPS

Best for up to 10mm diameter material

Figure-1



●Right-Hand style shown

CTPSR-SUB

Best for up to 4mm diameter material

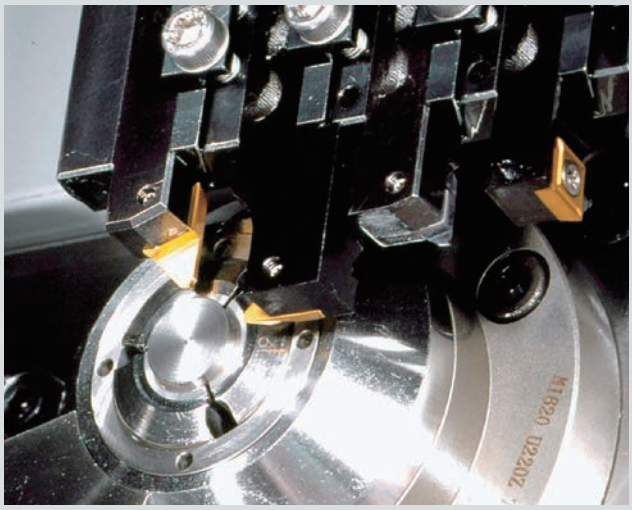
Y-axis Toolholders

Chip control by gravity

Features

- Chip drops down to the bed of the machine due to gravity, and chip control problem is solved
- Available in coolant through style
- Front turning, grooving, and back turning operations can be performed by utilizing Y-axis control



- Perfect solution for chip problems
- Less wear, more stable dimensions

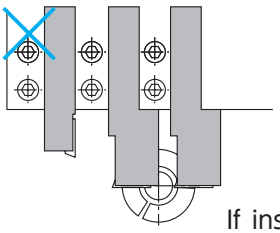
◆Important notes for using Y-axis holders

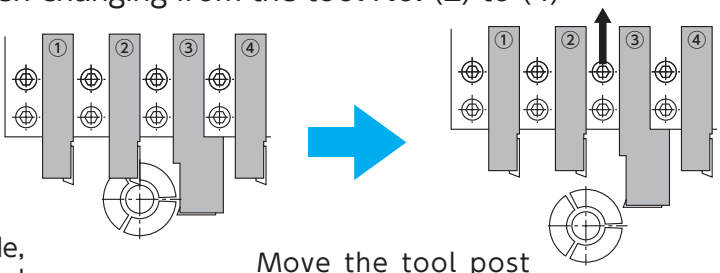
Up to 2 Y-axis holders can be installed on a tool post. Do not install side by side in order to prevent interference.



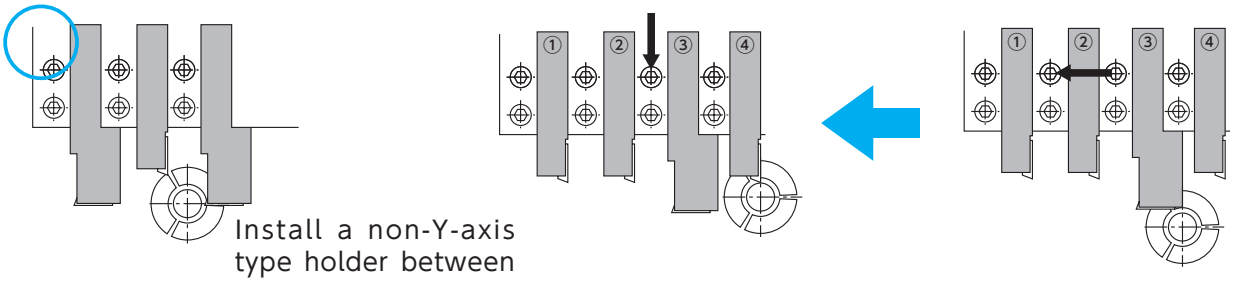
If installed side by side, the work piece and the Y-axis holders may interfere with each other.

When changing tools, set the backward position of the tool post with the overhang of the Y-axis holder(s) as per the reference.

When changing from the tool No. (2) to (4)



Move the tool post back based on the position of the cutting edge of the Y-axis holder (3).



Install a non-Y-axis type holder between the two Y-axis holders.

OD machining table

The OD that can be machined are indicated by the grooving holder "Y-GTTR type" as an example (The dimensions of other Y-axis holders are the same.)

Overhang of the Y-axis holder	Figures	Item \ L	20	22	25

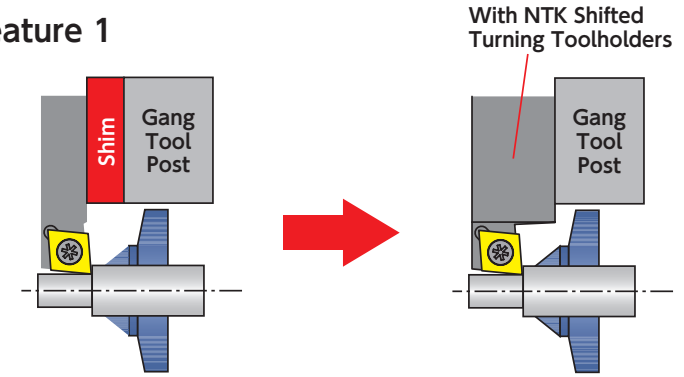
Shifted Toolholders Toolholders for extended guide-bushing

Two Major Features

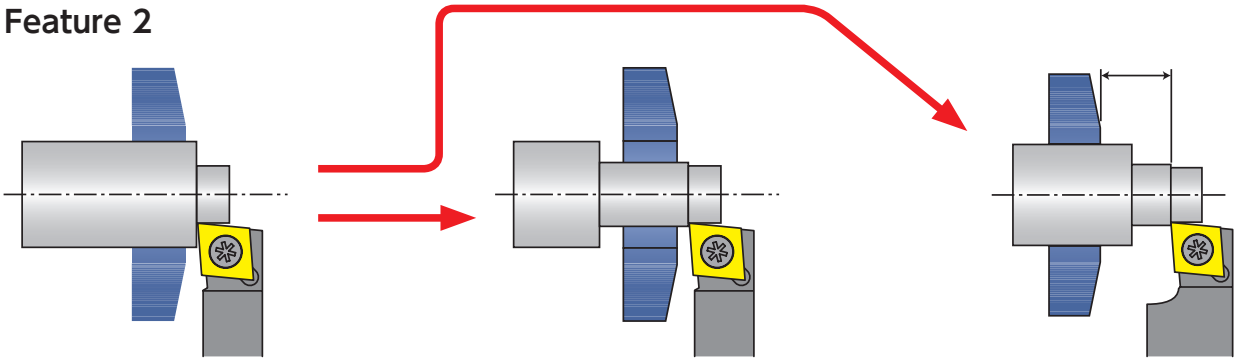
1. Eliminate shims for turning holders when extended guide bushing is used (especially in thread whirling)
2. Performs finish cut without retracting roughed section (bar) from guide bushing

●Feature 1



No shims required during thread whirling operation with an extended guide bushing

●Feature 2



Typical turning

With Conventional Holders:
Roughed bar comes out when retracted for finish turn

With Shifted Holders:
Finish turn can be done without retracting the roughed bar

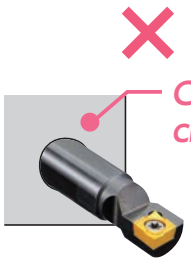
➡G22・G24

DS Sleeve

Features

- Prevents coolant and chips from damaging live tool stations
- Accepts DS Series holders to perform various back working
- Designed exclusively for 22mm and 34mm round shank stations
- Compatible with 16mm / 22mm round shank DS Series holders

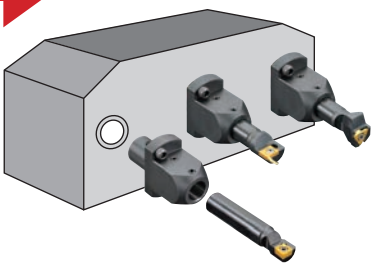
First Recommendation for Turning



Coolant and chips sneak in.

When DS holders are used directly in live tool stations, coolant and chips sneak in from the flat of holders to damage the live stations

How it works



Stop coolant and chips from damaging live tool stations.

By using the DS Sleeve, you can use the DS Series holders without any worry about damaging live stations

For Back 4-spindle unit

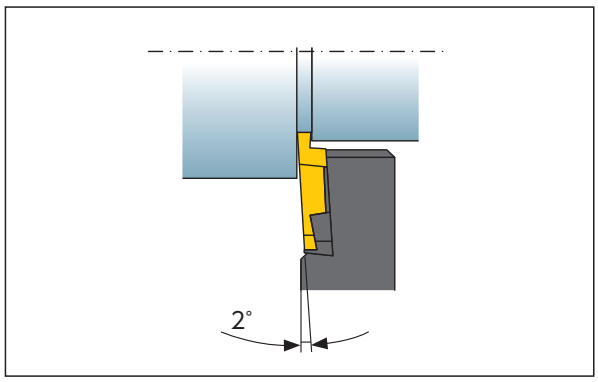
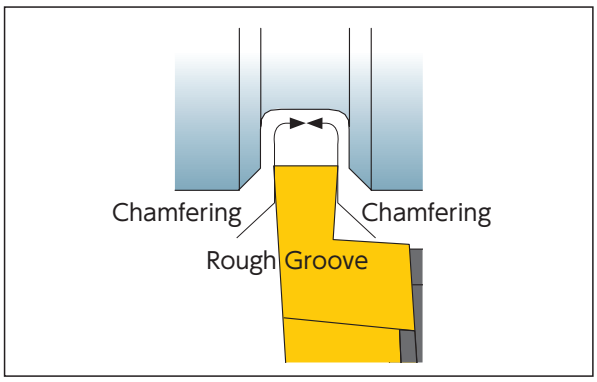
General Information

OD Grooving

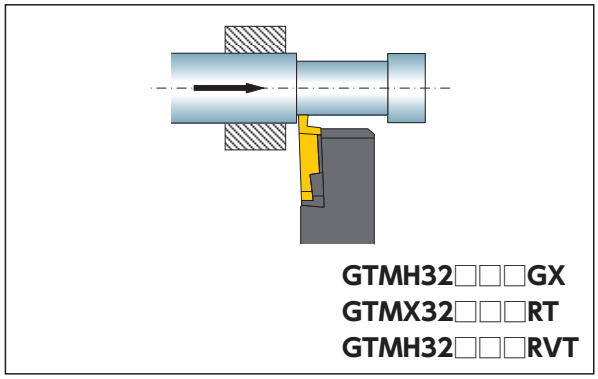
NTK GTMT / GTMH series can be used for uneven diameter grooving thanks to the 2 degree slanted insert mounting on the toolholder



Chamfering and radius machining can be done after the rough grooving process at the center of the groove

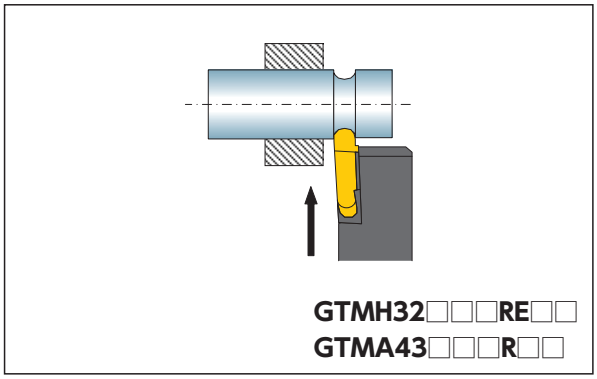


Side Turning



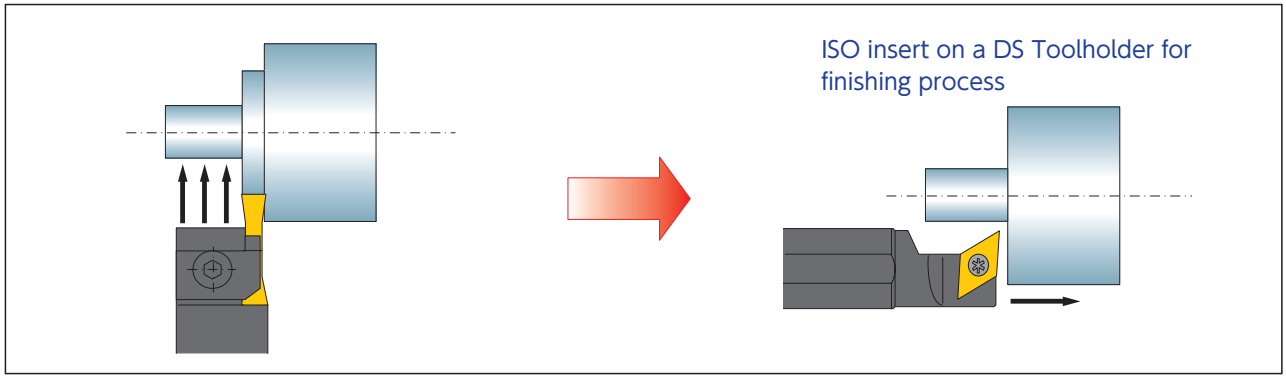
GTMH32□□□GX
GTMX32□□□RT
GTMH32□□□RVT

Full Radius

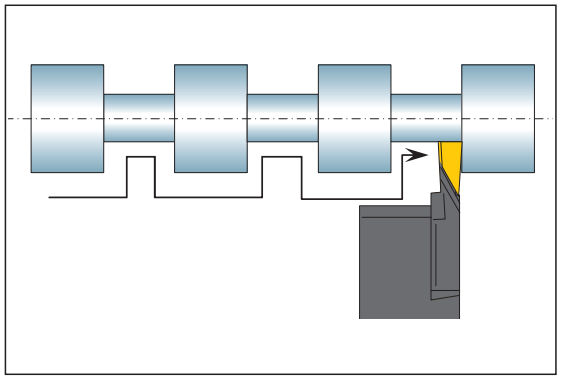


GTMH32□□□RE□□
GTMA43□□□R□□

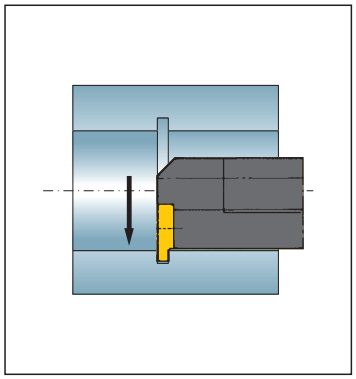
Rough Plunging for OD Turning



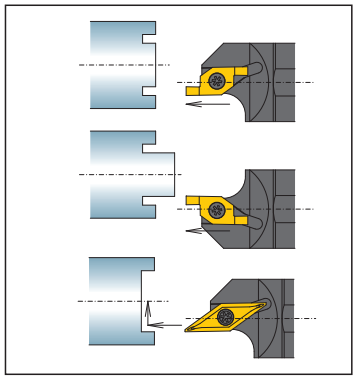
Spool Grooving



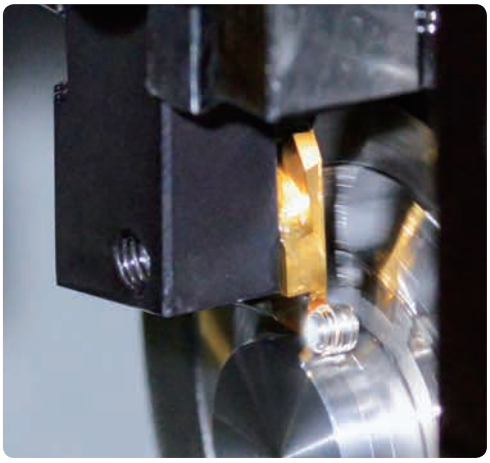
ID Grooving



Face Grooving



GTMH-GX for Grooving / Side Turning

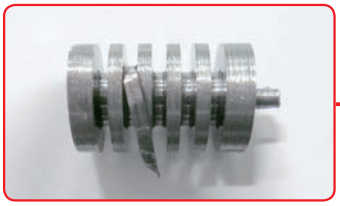


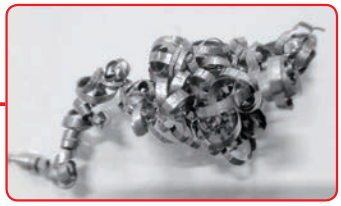
Features

- Can solve the problem of chips remaining in the grooves and bird's nest of chips
- Good surface finishes on groove side faces
- Up to 2.0mm DOC side turning capability

Typical Grooving Problems

- Chips remain at the bottom of groove
- Bird's nest of chips

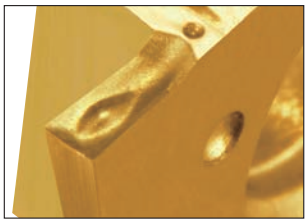




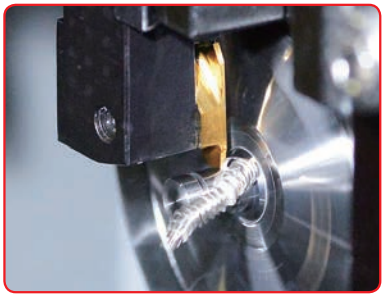
Excellent Chip Control

- Chipbreakers

Groove width 1.5mm～

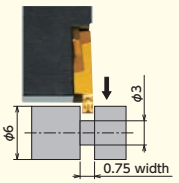


Groove width ～ 1.0mm



GX chipbreaker can solve these problems

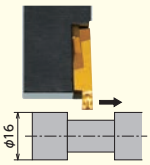
- Grooving



Feed rate (mm/rev)	0.01	0.03	0.05
GX chipbreaker			
Competiton's chipbreaker			

Material : SUS304 (Φ 6 →Φ 3) v_c =80m/min a_r =1.5mm

- Side Turning



DOC \ Feed rate (mm/rev)	0.01	0.03	0.05	0.08
0.25				
0.5				0.75				
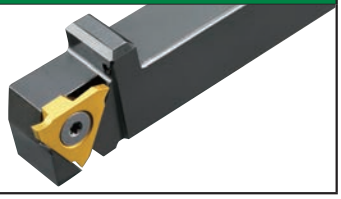
Material : SUS304 v_c =80m/min 0.75mm width insert

Best Solution for Chip Control

Coolant through toolholders now available

GTT-OH2 / OH



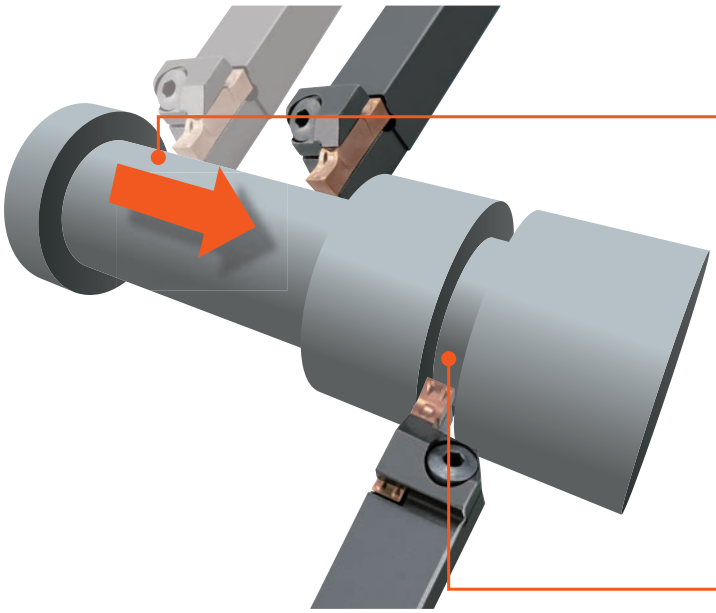
Y-GTT-OH

➡H22

SCRUM DUO

Features

- Grooving and side turning tools with highly rigid design
- 3D design chipbreakers result in less tool pressure and excellent chip control



Side-turning

	NTK:GW chipbreaker	Competitor
Chip		
Surface finish		
Material : SCM415 V_c=150m/min f =0.1mm/rev a_p=1.0mm

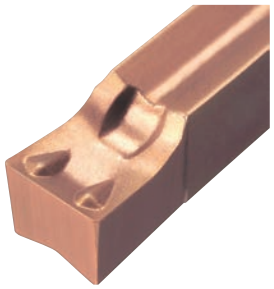
Grooving

	NTK:GW chipbreaker	Competitor
Chip		
Surface finish		
Material : SCM415 V_c=150m/min f =0.1mm/rev a_p=7.0mm

Chipbreaker

For Grooving / Side-turning

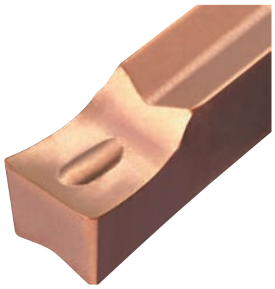
GW



- *Excellent chip control*
- *Good sharpness*
- *Side turning capability*

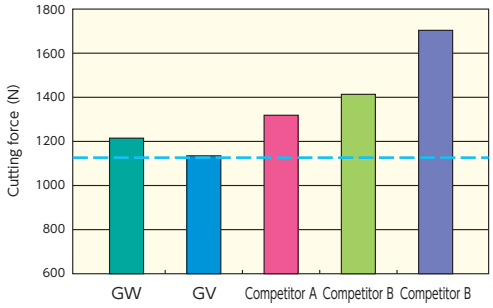
Less tool pressure

GV



- *Superior sharp edge*

Tool pressure comparison when grooving



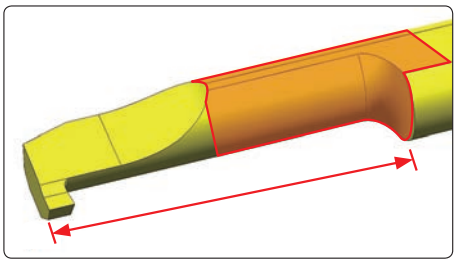
➡H28 • H29

STICK DUO Short type for ID Grooving

Features

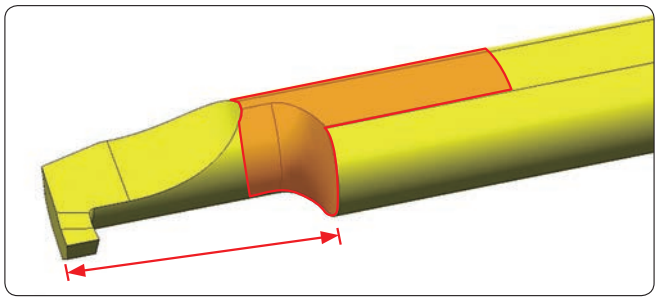
- *Added "short type" STICK DUO series for grooving*
- *Offers high precision!*
- *Best for internal grooving in work material's mouth.*
- *2 corners=Economical!*

Former



For multiple work shape

Short type



Focused on rigidity

➡H34

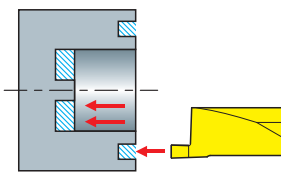
STICK DUO ID Face Grooving type

Features

- *Added "face grooving type"STICK DUO series for grooving*
- *Best for back end surface grooving for small shank.*
- *2 corners=Economical!*

Application Example

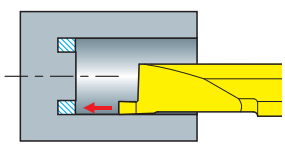
Body machining	
Work material	: SUS303
Cutting speed (m/min)	: 110
Feed (mm/min)	: 0.04
Inserts width (mm)	: 2.0
Coolant	: WET



TM4	1000pcs/corner
Competitor	500pcs/corner

Able to machine twice as long as competitors due to TM4 coating which has wear resistance ability. Also, due to the excellence in sharpness, surface is good as well.

Machine parts machining	
Work material	: SUS304
Cutting speed (m/min)	: 70
Feed (mm/min)	: 0.04
Inserts width (mm)	: 1.5
Coolant	: WET



TM4	500pcs/corner
Competitor	300pcs/corner

Excellent chip control by best breaker design. Also, about two times longer tool life due to the coating of TM4 which is superior to wear resistance.

➡H37

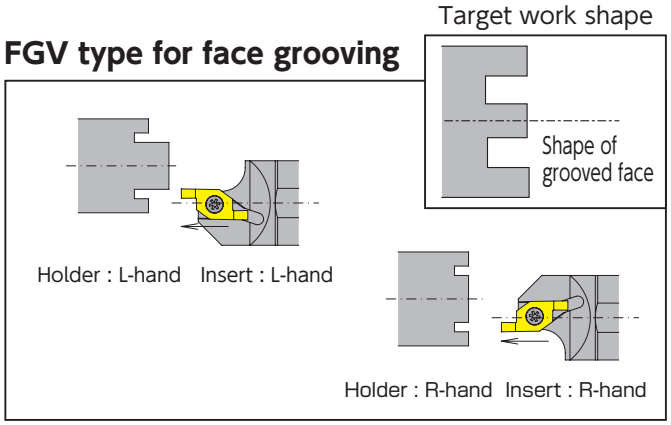
SATURN DUO

Face grooving tool

Features

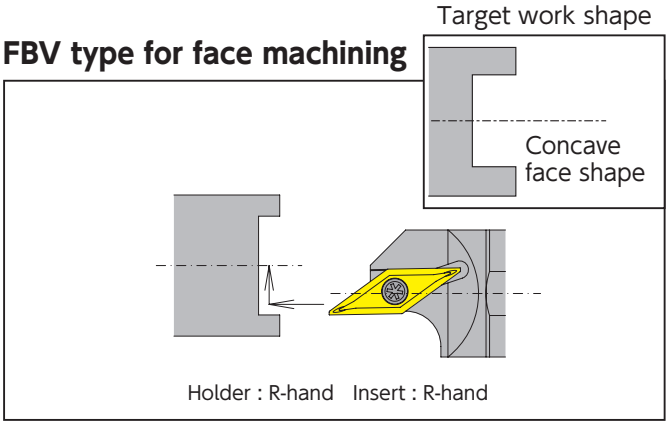
- FGV type for face grooving and FBV type for face machining
- Economical double-corner specification
- Improved tool rigidity by optimizing the overhang and holder shape
- Gang-type, front-gang-type and sleeve holder types available

FGV type for face grooving



- Grooving is possible under a wide range of cutting conditions due to strengthened rigidity of both insert and holder
- Minimum machining diameter of ϕ6.0, and groove width of 1.0mm
- Left-hand types available for machining work with a boss

FBV type for face machining



- Further improved face machining efficiency
- Minimum machining diameter of ϕ8.0

■Recommended Cutting Condition for FGV Style Tooling (for Face Grooving)

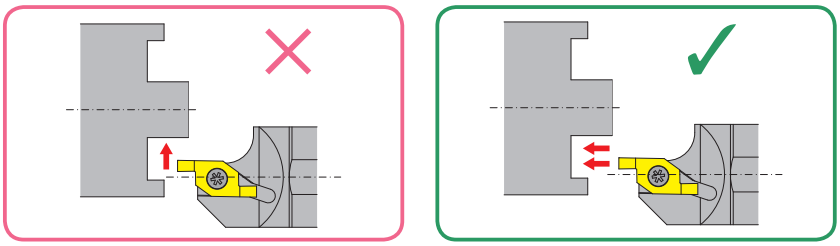
			Steel (Carbon Steel, Alloy Steel)	Stainless Steel (Excluding SUS303)	Free Cutting Steel (Including SUS303)	Non-ferrous Metals (Brass, Aluminum, Copper)
Speed (m/min)			50 (30 ~ 100)	40 (30 ~ 100)	60 (30 ~ 100)	80 (50 ~ 120)
Feed Rate (mm/rev)	Groove Depth (mm)	1.0	0.03 (0.01 ~ 0.05)	0.02 (0.01 ~ 0.04)	0.04 (0.01 ~ 0.06)	0.04 (0.01 ~ 0.06)
		1.5	0.02 (0.01 ~ 0.04)	0.01 (0.005 ~ 0.03)	0.03 (0.01 ~ 0.05)	0.03 (0.01 ~ 0.05)
		2.0	0.01 (0.005 ~ 0.03)	0.01 (0.005 ~ 0.03)	0.02 (0.01 ~ 0.04)	0.02 (0.01 ~ 0.04)

☆Tips for Successful Face Grooving

①Run multiple passes if turning wider grooves.
Make sure to groove from outer diameter to inner diameter to avoid any interference.
②If lines appear on the boss section, slow down feed rate when retracting the tool.
③If scratch appears at the end of the boss, slow down the feed rate.
④If groove surface looks torn, either slow down feed rate or increase speed.
⑤If groove bottom looks torn with a speed and feed condition, increase the speed.

☆Note

Side turning cannot be performed with FGV style tooling



■Recommended Cutting Conditions for FBV Style Tooling (for Face Grooving)

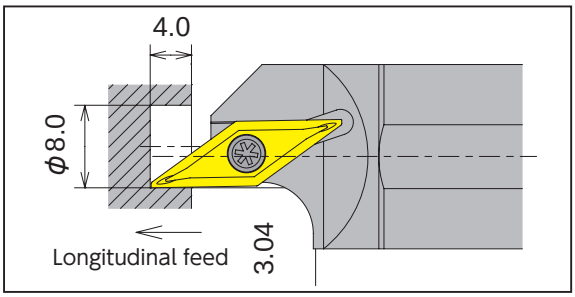
Minimum machining diameter: ϕ8.0　WET

			Steel (Carbon Steel, Alloy Steel)	Stainless Steel (Excluding SUS303)	Free Cutting Steel (Including SUS303)	Non-ferrous Metals (Brass, Aluminum, Copper)
Speed (m/min)			50 (30 ~ 70)	40 (30 ~ 60)	60 (30 ~ 80)	80 (50 ~ 100)
Feed Rate (mm/rev)	Groove Depth (mm)	1.0	0.025 (0.01 ~ 0.05)	0.02 (0.01 ~ 0.05)	0.05 (0.01 ~ 0.06)	0.05 (0.01 ~ 0.06)
		1.5	0.02 (0.01 ~ 0.05)	0.01 (0.005 ~ 0.025)	0.025 (0.01 ~ 0.05)	0.025 (0.01 ~ 0.05)
		2.0	0.01 (0.005 ~ 0.025)	0.01 (0.005 ~ 0.025)	0.02 (0.01 ~ 0.05)	0.02 (0.01 ~ 0.05)

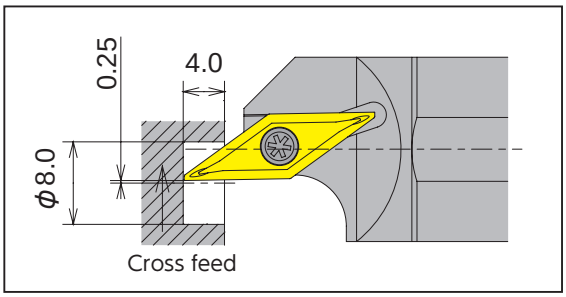
* When machining difficult materials where chip control is problematic (such as SUS303), it is recommended that the machining be carried out in several stages.

☆Machining process

- For materials with good machinability, it is possible to machine up to 4.0mm deep at a low feed rate in a single pass for both longitudinal feed and cross feed.



Cutting in Z direction : Longitudinal feed



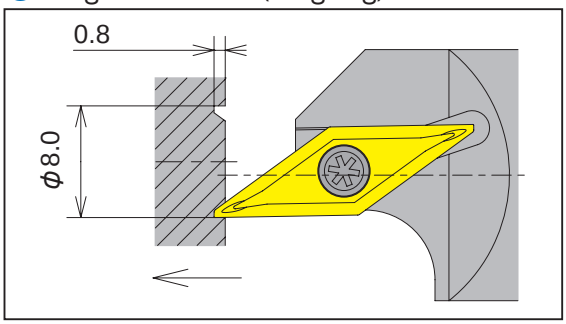
Cutting in X direction : Cross feed

☆Useful tips for machining

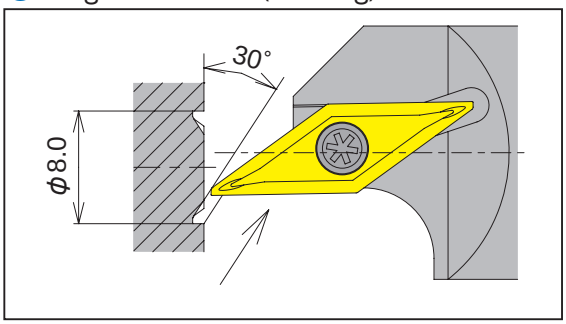
When burrs occur on ID surface, it is recommended to perform the cut in 2 passes, one for roughing and one for finishing as shown in the following procedure:

☆Example of 2-pass machining: Leave 0.2mm on roughing then run a finish cut

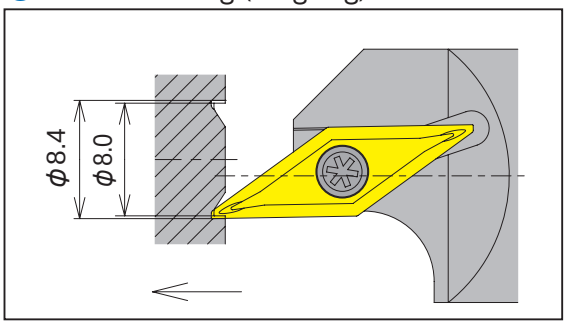
❶ Longitudinal feed (roughing)



❷ Longitudinal feed (finishing)



❸ Slant machining (roughing)



❹ Cross feed (finishing)

■Side turning instruction for GTMH-GX / GTMX-T / GTMH-VT

①To perform side turning with an insert whose groove width is greater than 0.43 set side turning feed rate to 0.03mm/rev or smaller.

②When performing side turning with an insert whose groove width is greater than 0.43 and the feed rate is over 0.03mm/rev (0.1mm/rev max), it is likely that chips will damage grooved sides. In this case, please perform grooving in two or more passes to make room for chips before performing side turning.

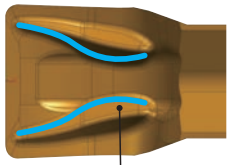
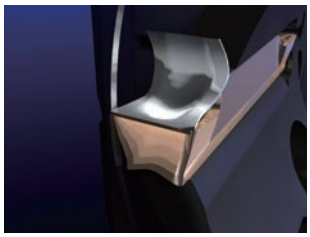
SCRUM DUO BLADE - Carbide Face Grooving Tool



Unique S-shape design



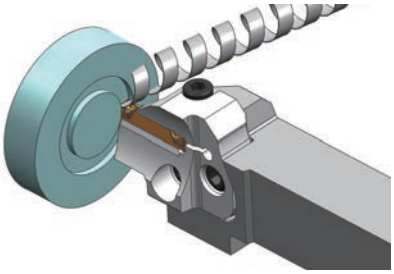
Features

- ***New GT Chipbreaker designed for face-grooving***
- ***The best rigidity in a Modular system***
- ***Excellent chip-control and great finish***

Excellent Chip Control

For more information, please go to ···

● Grooving

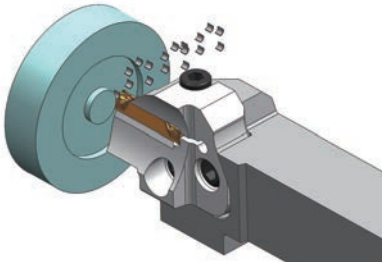


- **Excellent chip control and superior surface finish**
- **Good chip control without a peck cycle**

	NTK:GT chipbreaker	Competitor	
Chip			Tangled chips during deep grooving
Surface finish			Scratches inside bottom

Material : SCM415, V_c=150m/min, f =0.1mm/rev ,Φ50diameter ,1.0mm depth,No step feed,WET
Insert : GWPFM500N04-GT DM4 Holder : GBWPFR-5T15-050120

● Side-turning



- **Excellent chip control for side-turning process**
- **Shiny surface finish**

Depth of cut (mm)	feed (mm/rev) 0.05	0.1	0.2

Threading

Work Material		High Temperature Alloys	Titanium Alloys	Cobalt Chrome Alloys	Stainless Steels		Alloy Steels	Carbon Steels
					Hard to cut	Free cutting		
Common Name		Inconel Hastelloy MP35N	Ti-6Al-4V	ASTM F-75	SUS304 SUS440C	SUS303 SUS430F	SCr / SCM	S10C ~ S55C
Grade	1st choice	VM1			VM1 / ZM3		QM3	
	2nd choice	ZM3			QM3		VM1 / ZM3	
Cutting Speed (m/min)		20 40 70	30 60 80		40 70 100	50 90 180	50 90 150	

*Unless your machine is equipped with high speed threading program, please set the feed rate to 2000 mm/min or lower to prevent making incomplete threads

Infeed Threading Method

	Features	
	Advantage	Disadvantage
 Radial Infeed	●Most popular and easiest method ●Easy to change parameter ●Uniform wear on both sides of insert	●Chip evacuation ●Vibration due to higher cutting force ●Ineffective for large pitch threading
 Flank Infeed	●2nd most popular and easy method ●Effective for larger pitch and gummy material thanks to lower cutting force ●Excellent chip evacuation	●Larger flank wear on right side of the insert ●Difficult to change cutting depth per cut
 Modified Flank Infeed	●Reduce flank wear on right side ●Effective for larger pitch and gummy material thanks to lower cutting force ●Excellent chip evacuation	●Difficult to program ●Difficult to change cutting depth per cut
 Incremental Infeed	●Uniform flank wear ●Effective for larger pitch and gummy material thanks to lower cutting force	●Difficult to program ●Difficult to change cutting depth per cut ●Chip evacuation

Thread Whirling

Features

New Double-lead video is on WATCH ON YouTube

- NTK's unique patented design technology makes precise and correct inserts possible the first time, *without any redesign or remanufacturing even if it is a multiple-lead thread*
- The sharper cutting edges produce a better surface finish and longer tool life than competitor's inserts

Form Double-lead or Multiple-lead with Single Pass

	Double-lead threads	Triple-lead threads
Work	Bone screw	Worm gear
Work material	Ti-6Al-4V ELI	brass
Work appearance		
Insert appearance		Major Dia.	ϕ4.0mm	ϕ7.0mm
Minor Dia.	ϕ2.4mm	ϕ4.7mm
Lead [Pitch×No. of Lead]	3.42mm (1.71mm×2)	4.9mm (1.63mm×3)

- Can reduce cycle time by more than half
- NTK can achieve what other competitors cannot

Double-lead Bone Screw Process Example

1. 1st thread whirl at taper part
2. Rotate the bar 180° and whirl the 2nd thread on same part as 1
3. Thread whirl whole straight part
4. Thread whirl at very last part to get two-exits, after back of bar has been backed up a half lead (one pitch) and rotated 180°

Special Item Capability

- Even though almost all bone screw shapes are special, NTK thread whirling inserts can make the correct shape of thread the first time, without any redesign or remanufacturing
- Basically NTK thread whirling inserts are ground with topping and coated

Conditions \ No. of teeth		9	6	4	
Main spindle	RPM	**10 - 40**	10 - 25	7 - 15	Faster RPM reduces machining time
Whirling cutter	RPM	**1500 - 4000**			
Feed Rate		**Same as thread-lead**			
Bar stock	ϕ	**~ϕ10.0 ***		~ϕ5.0	* For cutter with ϕ12㎜ ID
Work Material		**Ti-6Al-4V ELI / SUS316 / Titanium**			

- Formula for calculating thread whirling process time

$$T\ (\text{Seconds}) = \frac{60 \times \text{Thread length}}{\text{Main spindle rpm} \times \text{Feed rate (Thread lead)}}$$

Ex.) Double lead / 50㎜ length / 2.54 lead (2×1.27 pitch) / 30 rpm

$$T\ (\text{Seconds}) = \frac{60 \times 50}{30 \times 2.54} = 40\ \text{Seconds}$$

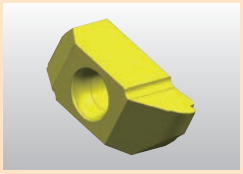
NTK's Unique Attachment System

NTK's whirling insert holder can be attached and detached without removing mounting screws

① Loosen the Mounting Screws
② Rotate the Insert Holder 10 degrees
③ Detach the Insert Holder without removing the Mounting Screws

Basic Insert Grade

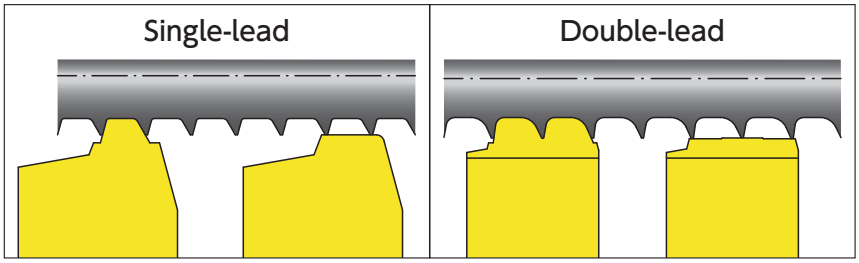
ZM3



- ZM3 is our basic grade for NTK thread whirling
- ZM3 offers excellent surface finish
- NTK can make inserts with other coatings to meet customers demands

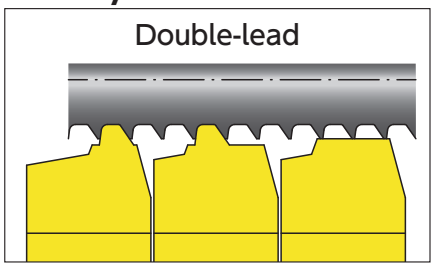
NTK Experiences and Solutions Example

For absolute flat on OD



- Two insert combination brings absolute flat on OD to meet the drawing

For tiny thread



- NTK's Thread Whirling system can machine small diameter multi-lead screws to spec, with lower tool pressure, by using several types of specially designed and accurately ground inserts on the cutter.

Standard Thread Whirling Inserts (two-sided) for Medical ISO Style Threads

4mm thickness insert

(Note: Must use Thread whirling cutters with 12㎜ ϕDm dimension. See page U18-19 to find ϕDm for each cutter.)

Application Examples

Double-lead Bone Screw			
Work Material : Ti-6Al-4v ELI			
Bar Stock Dia.	ϕ9.5	Number of start	2
Major Dia.	ϕ4.0	Helix Angle	28.5°
Minor Dia.	ϕ2.5	Hand of thread	Right
Cutting condition			
Main Spindle Speed (rpm)	15	Speed of whirling cutter (rpm)	3,500
Lead = Feed (mm/rev)	5.5	Result	OK
NTK Thread Whirling	Dramatically improved productivity		
Competitor's Thread Whirling	*Cannot complete with single pass. Requires feeding stock multiple times and two passes for threading each time.*		
NTK thread whirling succeeded in double lead screw machining when one of the major thread whirling suppliers has failed many times.			

Double-lead Bone Screw			
Work Material : Ti-6Al-4v ELI			
Bar Stock Dia.	ϕ8.9	Number of start	2
Major Dia.	ϕ4.57	Helix Angle	23.0°
Minor Dia.	ϕ3.05	Hand of thread	Right
Cutting condition			
Main Spindle Speed (rpm)	12	Speed of whirling cutter (rpm)	2,500
Lead = Feed (mm/rev)	5.08	Result	OK
NTK Thread Whirling	Dramatically improved productivity		
Competitor's Thread Whirling	*Cannot complete with single pass. Requires feeding stock multiple times and two passes for threading each time.*		
The customer could not get perfect double lead thread form in single pass from other manufacturers. NTK got perfect thread form with a single pass on first trial saving cycle time.			

Double-lead Bone Screw			
Work Material : Ti-6Al-4v ELI			
Bar Stock Dia.	ϕ6.35	Number of start	2
Major Dia.	ϕ3.0	Helix Angle	15.4°
Minor Dia.	ϕ2.1	Hand of thread	Right
Cutting condition			
Main Spindle Speed (rpm)	11	Speed of whirling cutter (rpm)	2,200
Lead = Feed (mm/rev)	2.2	Result	OK
NTK Thread Whirling	Dramatically improved productivity		
Competitor's Thread Whirling	*Cannot complete with single pass. Requires feeding stock multiple times and two passes for threading each time.*		
Customer was concerned with stock rigidity and long cycle time. NTK applied three geometry inserts to achieve single pass machining, in dramatically short time. The up-sharp cutting edges and low cutting pressure produced "excellent" surface finish.			

Single-lead Bone Screw			
Work Material : 316SS			
Bar Stock Dia.	ϕ8.0	Number of start	1
Major Dia.	ϕ3.45	Helix Angle	7.5°
Minor Dia.	ϕ2.67	Hand of thread	Right
Cutting condition			
Main Spindle Speed (rpm)	23	Speed of whirling cutter (rpm)	2,000
Pitch = Feed (mm/rev)	1.24	Result	OK
NTK Thread Whirling	2600 pcs		
Competitor's Thread Whirling	1000 pcs		
Some thread whirling manufacturers offer 6-teeth or 12-teeth systems, too many teeth cause chip packing issues and more tool pressure. Fewer teeth means greater cycle time. NTK concluded that 9-teeth is the best configuration. Our customers can run 1.5 times faster and get longer tool life.			

Single-lead Bone Screw			
Work Material : Ti-6Al-4v ELI			
Bar Stock Dia.	ϕ5.0	Number of start	1
Major Dia.	ϕ2.3	Helix Angle	5.3°
Minor Dia.	ϕ1.7	Hand of thread	Right
Cutting condition			
Main Spindle Speed (rpm)	30	Speed of whirling cutter (rpm)	3,100
Pitch = Feed (mm/rev)	0.58	Result	OK
NTK Thread Whirling	2200 pcs		
This thread is up to 32 mm length with a small pitch. Cycle time could be increased with a single-point threading tool. NTK's inserts, designed for lower tool pressure, ran 2,200 pcs/corner at 30 rpm of bar stock (F10,800). It only took 110 seconds to finish a 32 mm length thread.			

Triple-lead Worm Gear			
Work Material : Brass			
Bar Stock Dia.	ϕ8.0	Number of start	3
Major Dia.	ϕ7.0	Helix Angle	14.6°
Minor Dia.	ϕ4.7	Hand of thread	Left
Cutting condition			
Main Spindle Speed (rpm)	20	Speed of whirling cutter (rpm)	3,500
Lead = Feed (mm/rev)	4.8	Result	OK
Multi-lead threads, common in the Worm Gear industry are made by a forming or cutting process. The large helix angle is difficult to machine with single-point threading. NTK now makes thread whilring inserts for multi-lead threads. Cycle time is reduced with a one pass process and thread form dimensions are stable with the low tool pressure.			

MEMO

J

Shaper

SHAPER DUO

■Hexalobular Socket

■Hexagon Socket

■Square Socket

- Now available for Hexalobular(6-lobe) Socket
- Perfect fit for back spindle of Swiss machine
- Achieves good corner edge sharpness
- Less tool pressure than Rotary-Broaching
- Easy to adjust for correct dimension
- Economical double-ended insert bar (Except for Hexalobular)

Comparison Chart of Hexalobular Socket Machining

	Tool Pressure	Cycle Time	Tool Cost	High speed spindle	Program	
Shaper Duo 	◎	◎	◎	Not necessary	Simple	●No high speed spindle needed ●A lot less cycle time
End milling	○	×	△	Necessary	Complicated	●Need high speed spindle ●Time consuming process

- Small diameter endmill driven by high-speed spindle is popular way to create Hexalobular(6-lobe) socket. It has some flexibility but needs high speed spindle unit and it is a time consuming process.
- SHAPER DUO can make Hexalobular(6-lobe) socket faster and simpler.

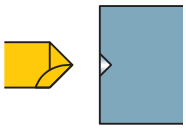
Comparison Chart of HEX Socket Machining

	Tool Pressure	Cycle Time	Flexibility	Tool Cost	
Shaper Duo 	◎	△ ＊Can be off-set by over-wrapping operation	○	◎	●Less tool pressure-especially on small diameter parts ●One size can cover several socket sizes
Broach Tool	△	○	×	△	●Need to have tools for each socket size

- Rotary-broach is an efficient way for Hexagon socket. But tool pressure is high and often it pushes part too hard.
- SHAPER DUO system enables less tool pressure and provides better tolerance with less cost.

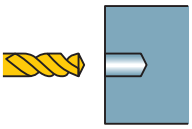
Process Chart

① Center drilling



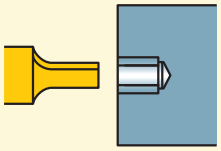
Make a center hole which is smaller than pilot hole drill.

② Drilling (Pilot hole)



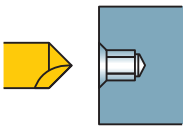
Select a drill with same or smaller (0 ~ -0.1mm) dia. as AF and machine a bit deeper because burrs may cause chipping on shaper insert

③ Shaper tool



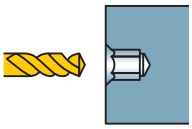
Machine socket rotating 60 degrees 6 times

④ Chamfering



Chamfer with the same pilot hole drill as ①

⑤ Deburring



Finish and deburr with the same drill as in process②
☆Reduce cutting conditions due to heavy interruption

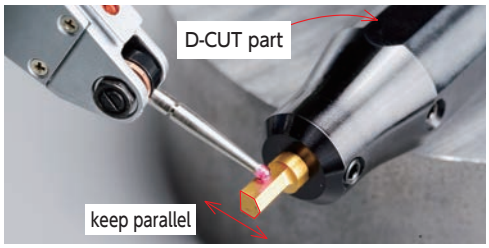
SHAPER DUO Set-up Instructions -Hexagonal

■Outside machine

①



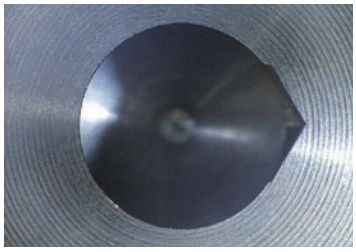
- Set the insert bar in the sleeve and check the parallelism of the flat portion of the sleeve and the insert bar.
- Minimize the overhang of the insert.

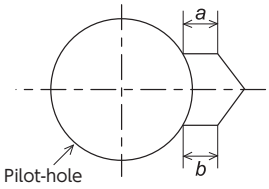
■Inside machine

②

- Set the sleeve into the tool post and make sure the sleeve is set parallel.
- Minimize sleeve overhang.

③

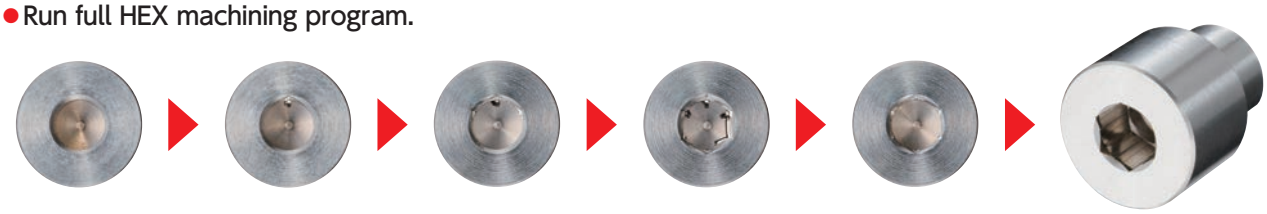




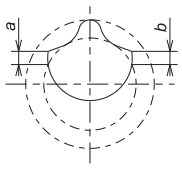
- Increase the number of machining passes with smaller depth of cut if the insert chips with large depth of cut. (0.025mm×5pass is recommended)
  No chamfering process is required for measuring purpose.
- Measure the length of both [a] and [b] with comparator or magnifier.
- Adjust centerline height by rotating the sleeve until you get the same length for [a] and [b].(The difference should be less than 0.02mm)
  *If the straight is not seen with increased passes, please reset the insert and the sleeve.
  Please make sure both the insert and the sleeve are set up correctly.

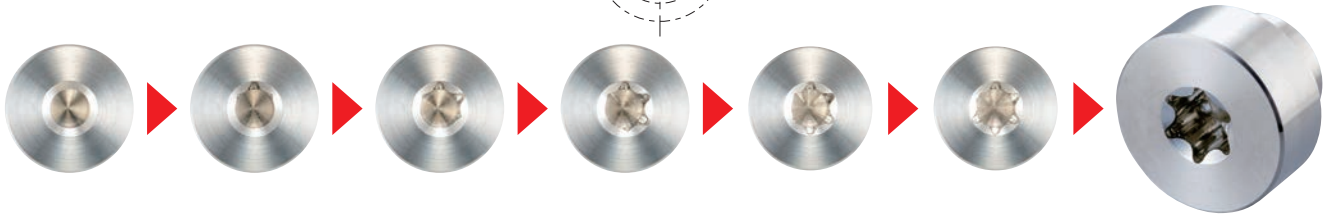
④ **Machine Hexagonal shape**

- Run full HEX machining program.



■For Hexalobular machining
Basically same as Hexagonal socket





Hexagon Socket Programming Code Examples from Machine Builders in Metric

Hex socket size : Hex 3.0mm, AF(Final "X" position) 3.46mm, Depth 3.5mm
Pilot drill diameter : 3.0mm **Starting "X" position : 2.95mm (see chart on J3)**
Insert : SSP030N1940N TM4
Parameters : Feed 3000mm/min, DOC(Roughing) 0.025mm, (Finishing) 0.005mm

Programming tips

● **Make a program considering final " X "position.**

#1 Final "X"position : 3.46mm (AF)
#2 Finishing position of roughing : 3.46−0.01 (Finishing) =3.45mm
#3 Calculate total DOC for roughing : 3.45−3.0 (Pilot hole) =0.45mm
#4 Determine number of cuts : 0.45÷0.05 (DOC for Dia.)= 9.0 + **2** (round down to whole number and add "**2**" for program adjustment)
→ Roughing sequence runs 11 times
#5 Set starting point : 3.45−(0.05×(11−**1**)) = 2.95mm : must subtract by "**1**" for program adjustment

I. Index the sub-spindle 6 times in 60 degree increments.
II. Specify the coordinate system shift command (in X axis direction) for the tool. [2 x f, where f is tool dimension located in catalog].
  • A positive direction shift is recommended for easier programming.
III. Execute the positioning of the tool.
  • X position should be smaller than pilot drill diameter.
  • Z position should be offset 2.0 mm from material to achieve program feed rate.
IV. Go to the Sub-Program #1.
  • Sequence runs 11 times. First cutting point X2.95 and final cutting point X3.45, with 0.05 DOC (for diameter) each time.
A. Specify dwell time. This allows the program and machine to stay synchronized.
B. Cut into part 3.5mm. F3000 is recommended feed to be used for most materials; including Titanium Alloy and Stainless Steel.
C. This code backs off the tool with an angle greater than 6 degrees (10 degrees used in example). See page J3.
D. Return to the X position + 0.05mm (the DOC for diameter).
V. Go to the Sub-Program #2, for finishing sequence.
E. Finishing operation with 0.005mm DOC (X 3.46) is recommended for better surface finish.

Hexalobular Socket Programming Code Examples from Machine Builders in Metric

Hexalobular socket size : Hexalobular T15 (depth : 3.81mm)
Pilot drill diameter : 2.3mm
Insert : SSP050N43T15 TM4
Parameters : Feed 3000mm/min, DOC(Roughing) 0.025mm, (Finishing) 0.005mm

Programming tips

- **Make a program considering final " X "position.**

#1 Final " X "position : 3.35mm(A)
#2 Finishing position of roughing : 3.35−0.01 (Finishing) =3.34mm
#3 Calculate total DOC for roughing : 3.34−2.3 (Pilot hole) =1.04mm
#4 Determine number of cuts : 1.04÷0.05 (DOC for Dia)=20.8 + **2** (round down to whole number and add "**2**" for program adjustment)
→ Roughing sequence runs 22 times
#5 Set starting point : 3.34−(0.05×(22−**1**)) = 2.29mm : must subtract by "**1**" for program adjustment

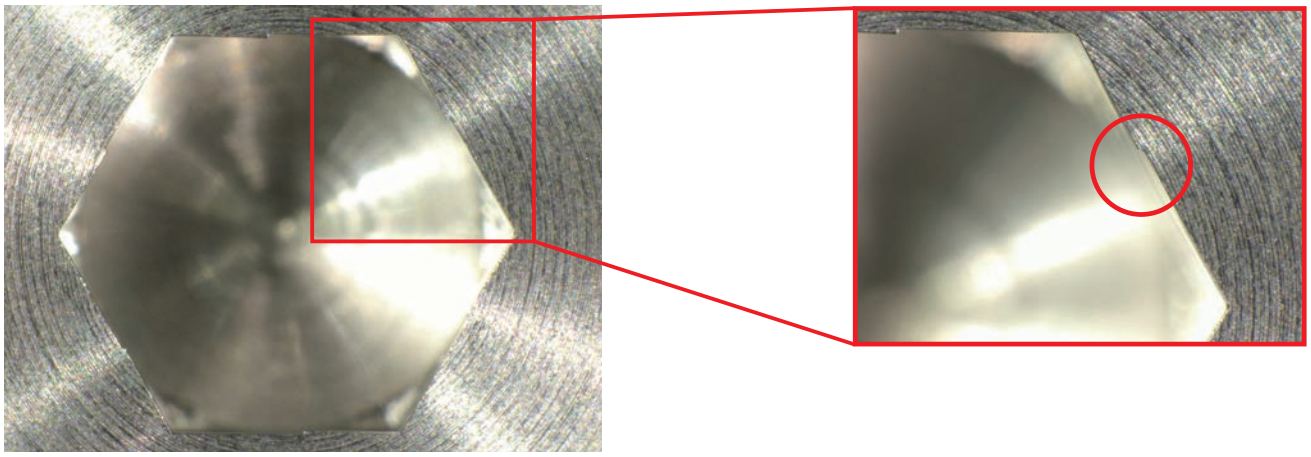
I. Index the sub-spindle 6 times in 60 degree increments.
II. Specify the coordinate system shift command (in X axis direction) for the tool. [2 x f, where f is tool dimension located in catalog].
  • A positive direction shift is recommended for easier programming.
III. Execute the positioning of the tool.
  • X position should be smaller than pilot drill diameter.
  • Z position should be offset 2.0 mm from material to achieve program feed rate.
IV. Go to the Sub-Program #1.
  • Sequence runs 22 times. First cutting point X2.29 and final cutting point X3.34, with 0.05 DOC (for diameter) each time.
A. Specify dwell time. This allows the program and machine to stay synchronized.
B. Cut into part 3.81mm. F3000 is recommended feed to be used for most materials; including Titanium Alloy and Stainless Steel.
C. This code backs off the tool with an angle greater than 6 degrees (10 degrees used in example). See page J3.
D. Return to the X position + 0.05mm (the DOC for diameter).
V. Go to the Sub-Program #2, for finishing sequence.
E. Finishing operation with 0.005mm DOC (X 3.35) is recommended for better surface finish.

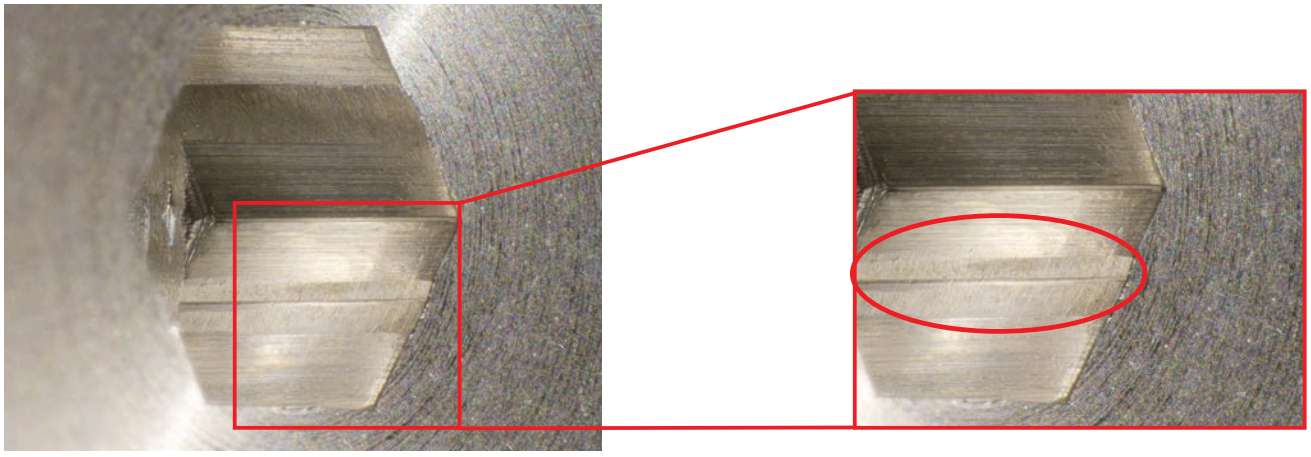
SHAPER DUO Troubleshooting

■Problem: Step on sides



Cause: Incorrect tool set-up
(Center-line shift)
Solution: Machine one angle and make sure both [a] and [b] lengths are identical, rotating the sleeve if necessary

■Problem: Wall dented



Cause: Pilot hole remaining
Solution: Need pilot hole tool's offset

■Problem: Wall tapered

Solution: ● Smaller depth of cut
● Less tool overhang

■Problem: Chuck is slipping / Insert chipped

Solution: ● Run at 3000 mm/min feed rate
● Smaller depth of cut

- 3000 mm/min feed rate can cover most materials including Titanium alloy and Stainless steel.
- Too slow or too fast of a feed rate may cause excessive tool pressure for the workpiece and tool.

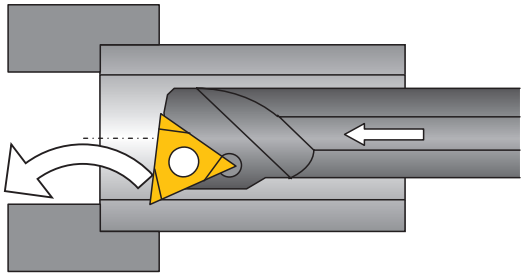
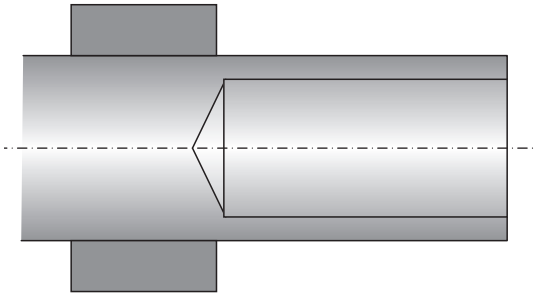
Through hole

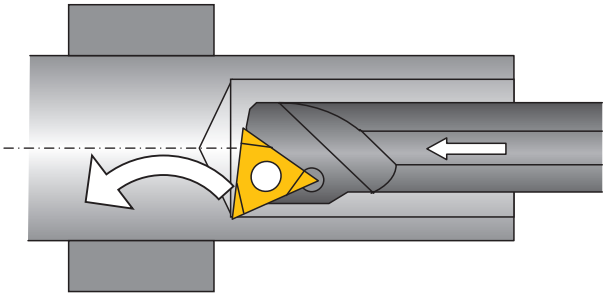


For chip control : chips can be evacuated forward

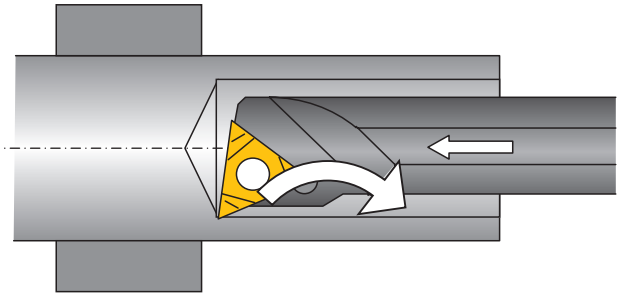
Blind hole



Blind hole due to bar stock



Typical inserts direct flow chips forward. Then packed chips damage and break cutting edge



F05, F1, and FG chipbreakers will direct chips backwards and eliminate chipping on inserts

*Note: Use right-hand inserts with F05, F1 and FG chipbreaker for right-hand boring bars

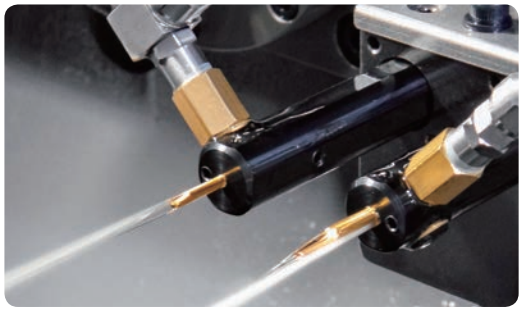
※Caution: Due to the tolerance, it might not fit into the holder which is made by other company.

STICK DUO SPLASH

- Coolant through sleeves for ID Boring with Adjustable Overhang Mechanism -

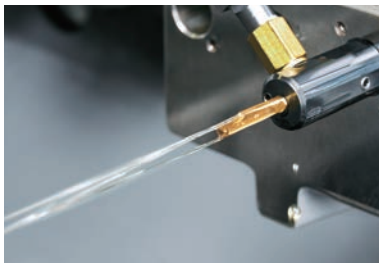


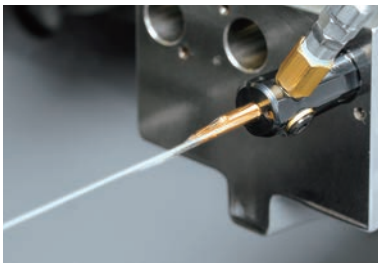
■No chip problems

STICK DUO SPLASH	External coolant
	No chip inside hole	*Chip packed*

Material : SCM435
Insert bar : SHFS040R005S
Hole depth : 15㎜
Pilot hole : φ5.1×28.0㎜L
Coolant Pressure : 5MPa

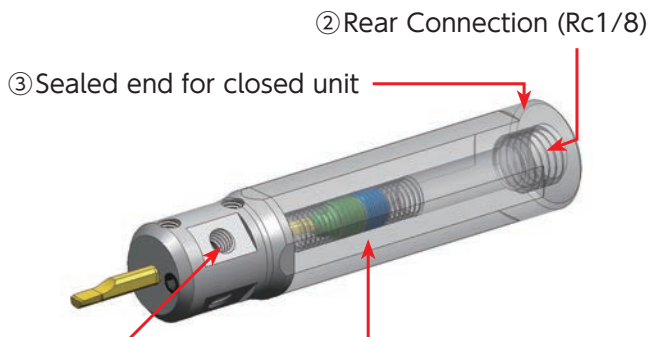
■Choose from 2 coolant directions

Ⅰ) For Blind hole	Ⅱ) For Through hole
	 Coolant hole	Coolant hole 
	


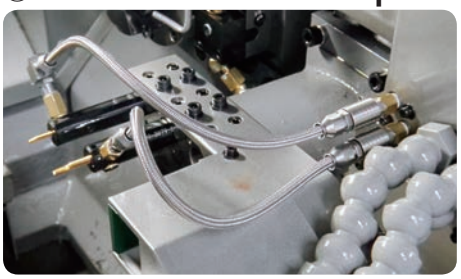


Just rotated 180 degrees

■3 coolant connection options



①Front Connection example



②Rear Connection example

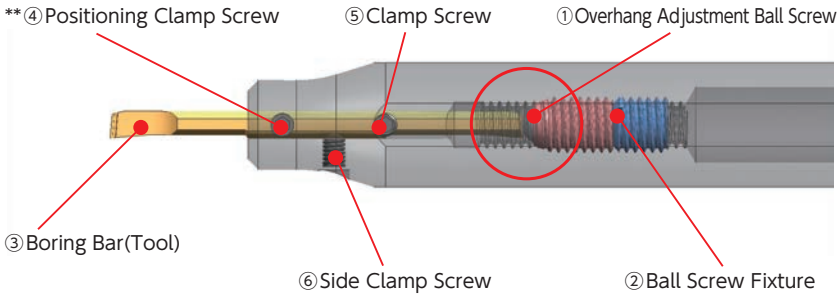
MEMO

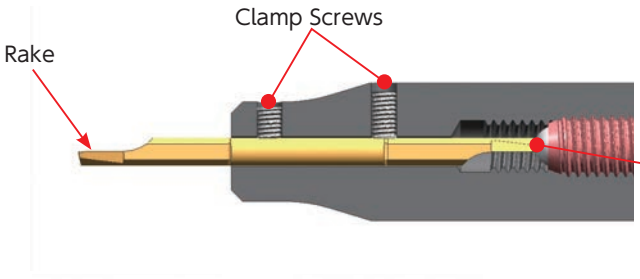
STICK DUO HYPER

- Sleeves for ID Boring with Adjustable Overhang Mechanism -

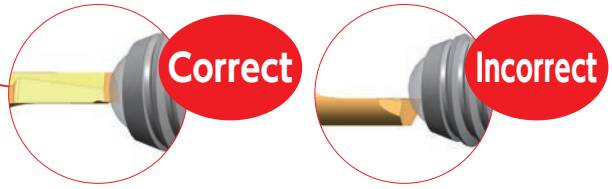
■Can Index boring bars like inserts

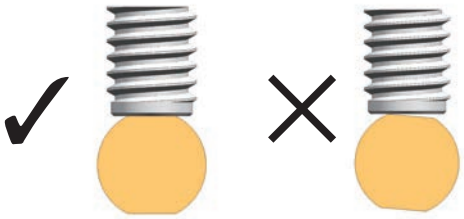


■Installation Procedure for STICK DUO Hyper



Caution: Improper installation dramatically increases the chance of chipping cutting edge

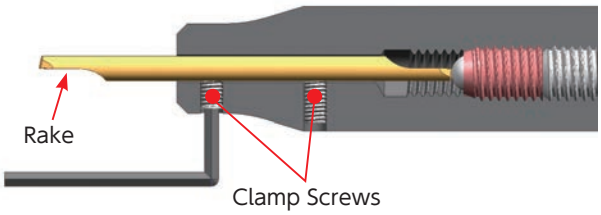




Improper clamping of boring bar causes unstable centerline height and offset

①Position the overhang adjustment ball screw to determine overhang amount
②Slide the ball screw fixture to secure the ball screw location
③Insert a boring bar (tool)
Note: Make sure to insert the boring bar correctly so that the rake face is toward the side where the clamp screws are located
④Secure the boring bar by tightening the positioning clamp screw ▶Recommended Clamping Torque: 2.0N·m
** Make sure to clamp the boring bar so that the flat surface of the bar makes proper contact with clamp screws
⑤Secure the boring bar by tightening the remaining clamp screws ▶Recommended Clamping Torque: 2.0N·m
⑥Even if 4 and 5 cannot be performed due to tool clearance and layout, the tool can be used by only securing the side clamp screw
Once the initial setup is complete, repeat the above procedures 3 thru 5 for each index

■When the tool is installed upside down



Toolholder must be installed so that clamp screws and rake of the tool face toward the same side

STICK DUO HYPER - Sleeves for ID machining -

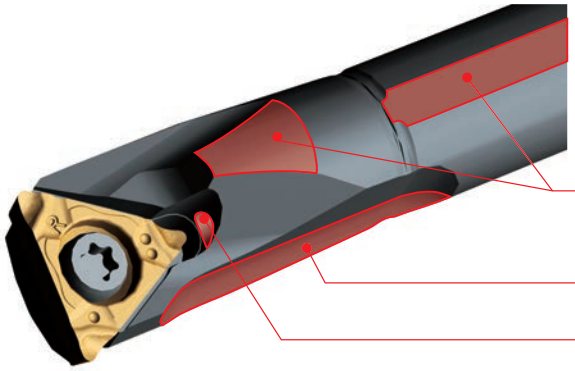
※Caution: Due to the tolerance, it might not fit into the holder which is made by other company.

Mogul Bar

High rigidity boring bars



Features

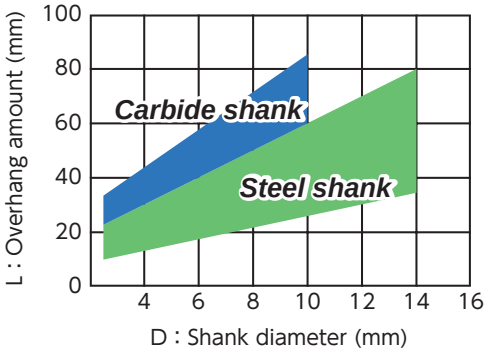
- ***High rigidity + Minimal flat widths Reduce vibration***
- ***Large clearance for improved chip evacuation***
- ***All Mogul Bar boring bars are coolant through***

Recommended amount of overhang

Steel Shank L/D≦5

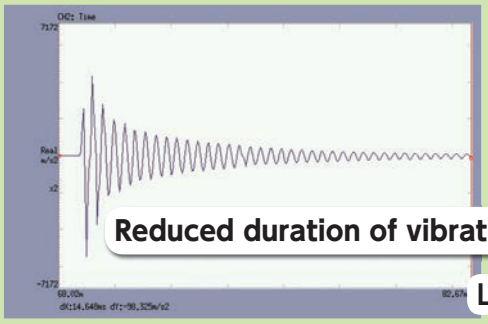
Carbide Shank L/D≦7

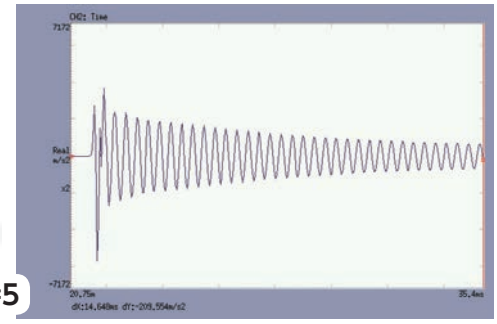
L : Overhang
D: Shank diameter



[Cutting condition example]
Work materials: Alloy steel, stainless
V_c=80m/min f =0.05 ~ 0.1mm/rev a_p=0.1 ~ 0.5mm(DOC) WET

Vibration analysis

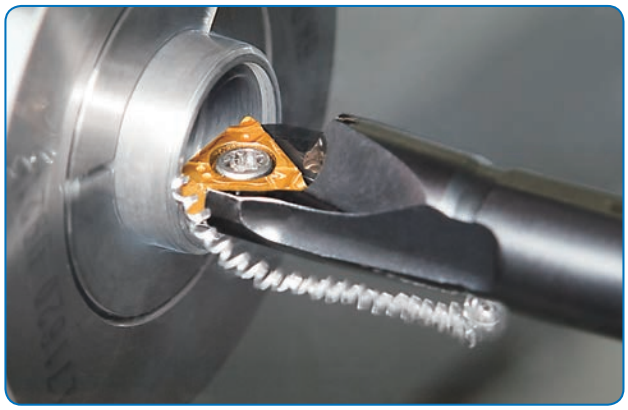
MogulBar	Other boring bars
	




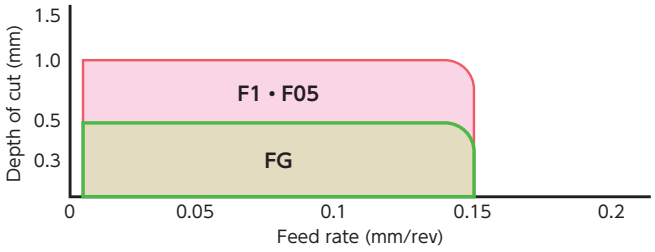
Note: Assuming a 100N load is applied. An equal amount of force was applied to both bars for vibration analysis.
Boring bar used in above analysis: S08H-STUPR09D10-OH

F Chipbreakers - Evacuate chips BACKWARD

- F chipbreakers allow chips to evacuate backward
- Combination of the F-chipbreakers and Mogul Bar delivers the best performance



Recommended Cutting Condition Range



F Chipbreakers - Features

	DOC (mm)	Feed(mm/rev) 0.05	Feed(mm/rev) 0.1
FG Chipbreaker ● Best for finishing ● Works for small DOC (0.5mm or less) ● High rake angle 	0.1			0.3		F1/F05 Chipbreakers ● Cover wide condition range ● Ground chipbreaker 	0.5		Note: Right-hand inserts with FG and F1 chipbreakers should be used with right-hand holders		[Cutting condition example] SCM435 Diameter : ϕ12.0 V_c=80m/min Depth of Bore : 20mm Wet Holder : S10K-STUPR11D12-OH Insert : TPGH110304

MEMO

M

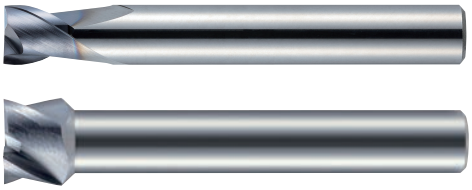
Endmills

S-MILL / Solid Carbide Endmill

Features

- The tools sharpness creates a remarkable finish on machined surface.
- 2, 3, and 4 flute designs with a selection of diameters to cover a variety of applications. (2 flute available in 2mmϕ)
- 40, 45, and 50mm lengths ideal for automatic lathes.

Two style



Three flute options

Surface finish

	NTK (S-MILL)	Competitor A	Competitor B
Magnified work material (side face)			Magnified work material			
	Excellent surface finish	Bad surface finish	

Material: SUS304 (ϕ16mm) ϕ6mm −2 flute 3,000 rpm, F=300mm/min, a_p=3.0mm, a_e=1.2mm

Field Result

SUS416F (D-cut)
ϕ6mm-2 flute

3,200 rpm	Feed : 140 mm/min	
DOC : 0.6 mm	
WET	
NTK : **S-MILL**	12,000 pcs/corner+α
Competitor's solid endmill	10,000 pcs/corner

The competitor's end mill showed an obvious decrease in surface finish quality as it reached the end of its tool life. NTK's S-MILL maintained a quality surface finish throughout the extent of its longer tool life.

S45C (AF 8mm HEX)
ϕ6mm-2 flute

2,600 rpm	Feed : 480 mm/min	
DOC : 1.0 mm	
WET	
NTK : **S-MILL**	70 pcs/corner+α
Competitor's solid endmill	50 pcs/corner

The S-MILL sharpness reduces the occurance of burrs and tool life is increased; clear improvements over the competitor's tool. The sharp cutting edge also produces noticeably less sound than the current tooling.

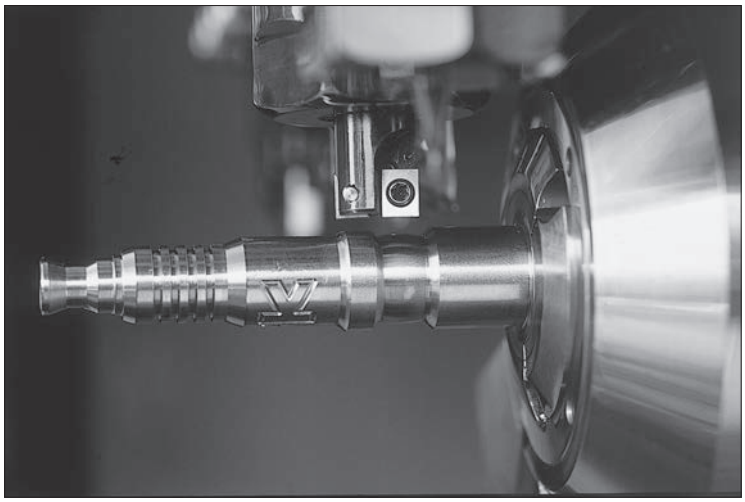
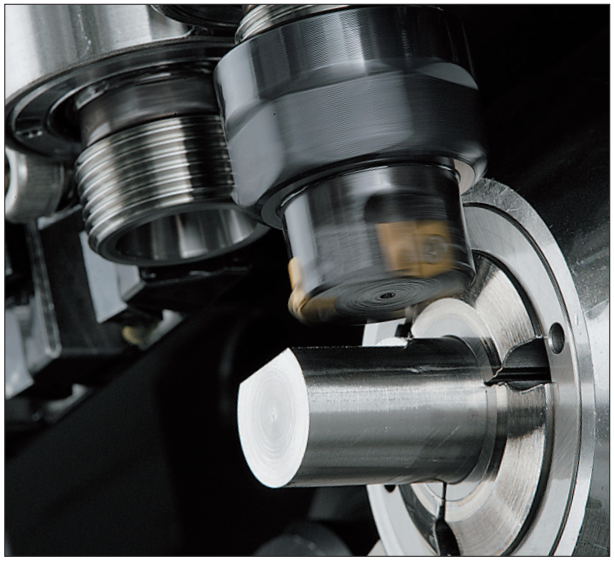
・Cutting conditions (machine, work material...) affects surface finish and burr generation.
If cutting performance is not good with above cutting conditions, please adjust speed and feed by same ratio.

Small Diameter Indexable Endmills





Features

- **Attach 20mm end mills in ER16 collet**
- Just change inserts to index. No need to make any adjustments
- High quality surface finish, as low as 1um (Rz) when wiper inserts are used
- Corner radius as small as 0.05mm
- In addition to D cut, ramp machining can be performed*

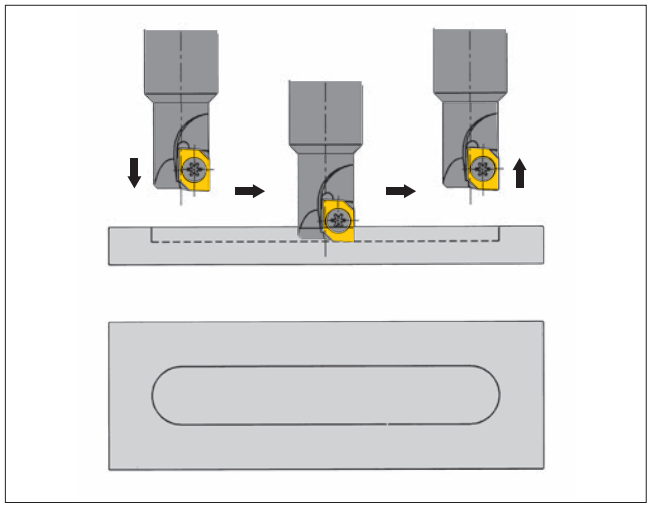
*A combination of single-blade type endmills and inserts with center blade is required

【Recommended Cutting Conditions】

Work Material	Speed (m/min)	Axial feed (mm/t)	Traverse feed (mm/t)	Depth of cut (mm)	Width of cut
Steel	80 - 120	~0.03	~0.05	~3.0	~50% of cutter diameter
Stainless Steel	40 - 60	~0.02	~0.04	~2.0	~50% of cutter diameter

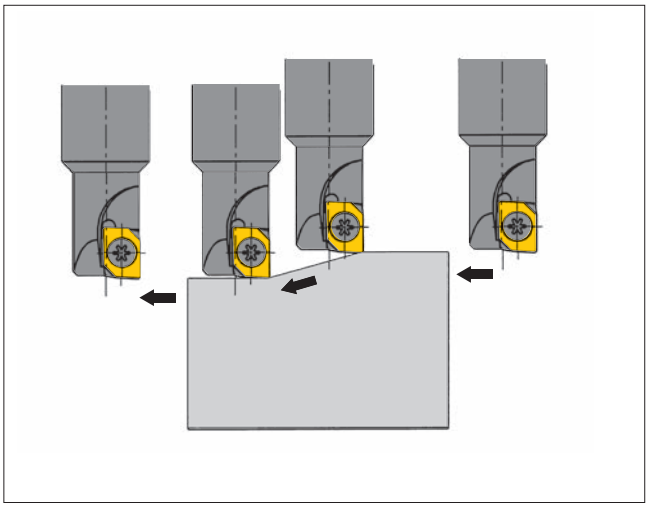
Application Example

Application Example-1



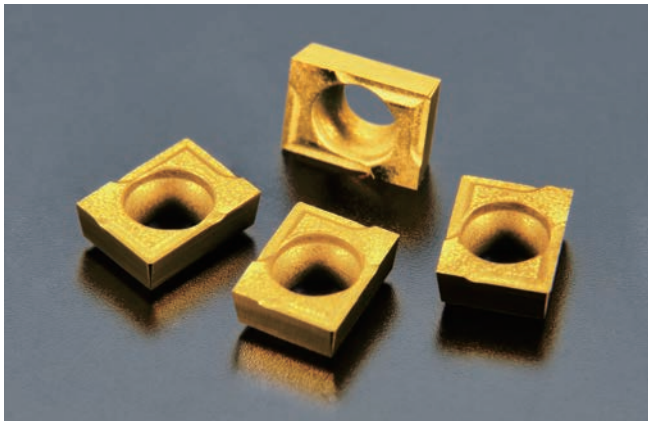
- A single tooth endmill equipped with a center cutting edge insert can be used for both plunge and side cut operations.

Application Example-2



- A single tooth endmill equipped with a center cutting edge insert can be used for slope milling operations.

Insert



Wiper

- Excellent surface finish obtained with new wiper insert

Chipbreaker

- Less tool pressure with chipbreaker

45°

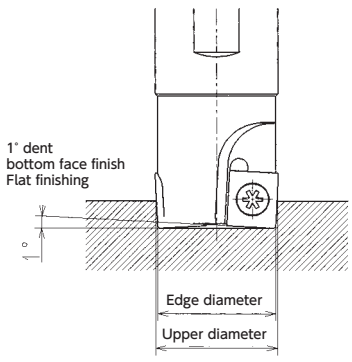
0402CFN-045					0.2	5066535	●

Precaution for using REL type

When using the REL type end milling tool, tapering will occur on the side machined area of the work piece by the following amount:

Depth of cut (mm)	Top face machining dia – Bottom face machining dia (mm)
2	0.05
3	0.08
4	0.12
5	0.15



RCL type rectangular tooth chamfering type

Features

- Cycle time can be reduced by using micro-grain carbide grade inserts. (Compared with the high-speed steel (HSS) end milling tools).
- Improved surface finish

① Cutter diameter and machining conditions

Cutter diameter	Recommended module	Recommended feed rate
ϕ 14	2.25 or less	0.3㎜ /rev or less
ϕ 12	2.15 or less	0.3㎜ /rev or less

If the recommended module or the recommended feed rate is exceeded, the clamping screw should be re-tightened at least once or twice a day to prevent loss of secure clamping.

Precautions

① When mounting the end milling tool, ensure a minimum amount of overhang from the chuck to the tool nose in order to prevent run out during machining (Target value: approx. 20 mm)

② As is probably known, gear tooth chamfering applies shock loading due to interrupted cutting. For this reason, the holder and clamping screw may deteriorate quicker than normal. Therefore, we request that you replace the holder and clamping screw periodically with new ones for safer and more stable operation.

③ In addition, please re-tighten the clamping screw regularly to avoid loss of clamping force during machining.

【Actual examples】

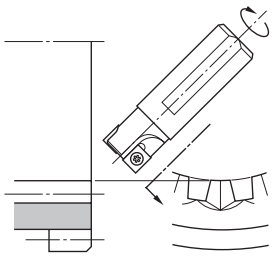
Gear tooth chamfering on sleeve

Work material : SCM415

Cutting speed (m/㎜) = 154

No. of revolutions ($㎜^{-1}$) = 3,500

Cutting oil : WET



NTK : **ZM3** 2-insert	2,000 pcs
Competitor's PVD-coated carbide Single insert	200 pcs

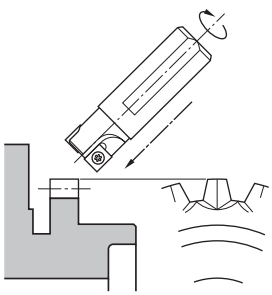
Gear chamfering on speed gear

Work material : SCr420 (HB140 ～ 230)

Cutting speed (m/㎜) = 42

No. of revolutions ($㎜^{-1}$) = 955

Cutting oil : WET



NTK : **ZM3** 2-insert	1,500 pcs
SKH55 Solid	100 pcs

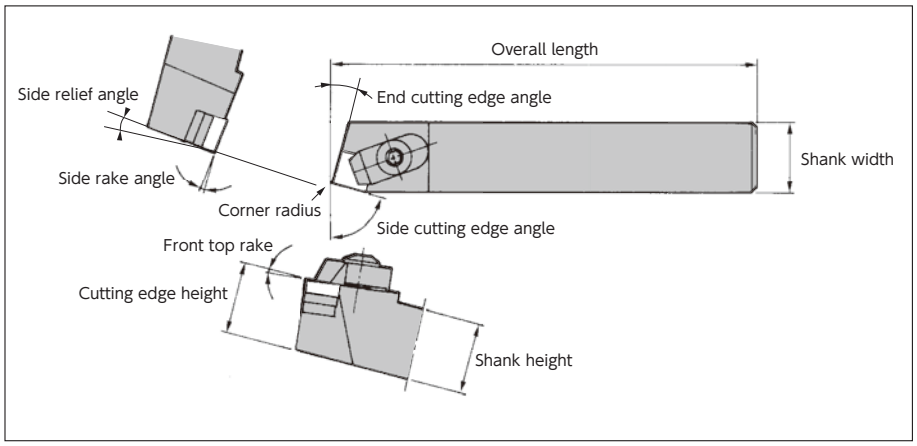
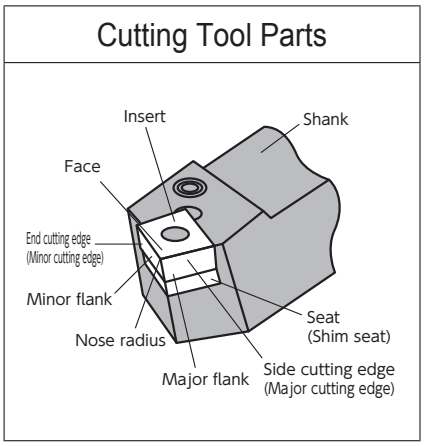
Turning Tool Terminology

Toolholder part names

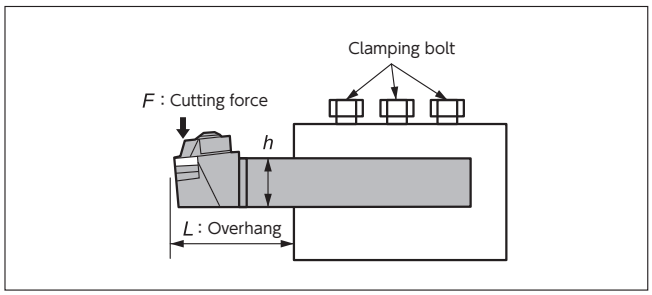




Holder rigidity

Toolholder deflection

$$\delta = \frac{4 \times F \times L^3}{E \times b \times h^3} = \frac{4 \times k_c \times f \times L^3}{E \times b \times h^3}$$

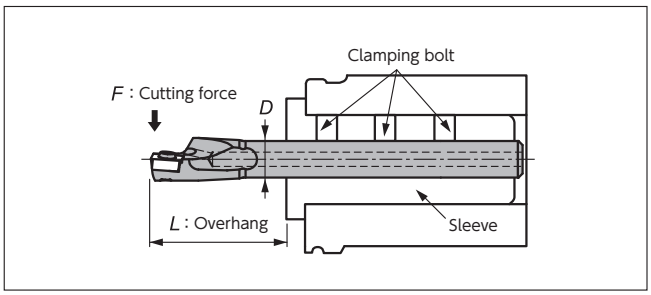


Symbol	Term	Unit
δ	Deflection amount	mm
b	Shank width	mm
h	Shank height	mm
E	Young's modulus	N/mm²
a_p	Depth of cut	mm
f	Feed amount	mm/rev
k_c	Specific cutting force	N/mm²
L	Overhang	mm
F	Cutting force	N

($F = k_c \times a_p \times f$)

Boring bar deflection

$$\delta = \frac{64 \times F \times L^3}{3 \times E \times \pi \times D^4} = \frac{64 \times k_c \times a_p \times f \times L^3}{3 \times E \times \pi \times D^4}$$



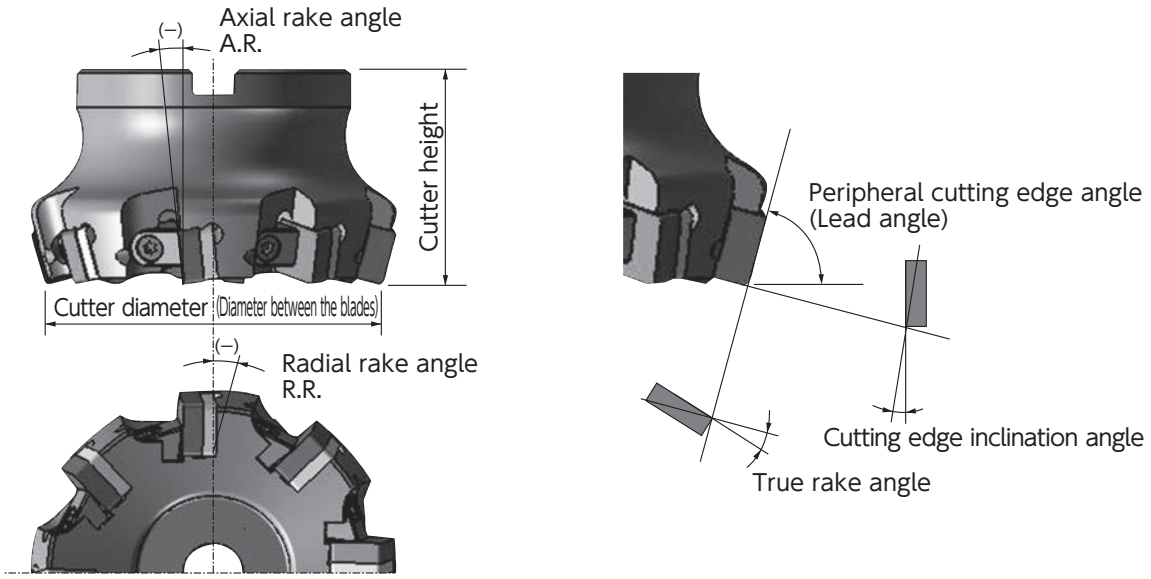
Symbol	Term	Unit
δ	Deflection amount	mm
D	Shank width	mm
E	Young's modulus	N/mm²
a_p	Depth of cut	mm
f	Feed amount	mm/rev
k_c	Specific cutting force	N/mm²
L	Overhang	mm
F	Cutting force	N

($F = k_c \times a_p \times f$)

An important factor in improving the rigidity of a toolholder is to ensure the overhang of the tool shank is as short as possible.

Milling Cutter Terminology

Milling cutter terminology



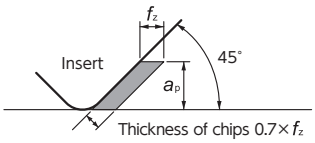
Functions of each cutting edge angle

Name	Function	Effects
Radial rake angle: R.R.	Controls the direction of chip evacuation and cutting force	Negative (−): Excels in chip control performance
Axial rake angle: A.R.	Controls the direction of chip evacuation and cutting force	Positive (+): Excels in cutting performance and BUE resistance
Lead angle	Controls the thickness and evacuation direction of chips	Larger lead angles decrease the thickness of chips and relieves cutting load
True rake angle	Actual rake angle	Larger angles excel in cutting performance and BUE resistance, but lower the cutting edge strength Smaller angles increase the cutting edge strength but lower the BUE resistance
Cutting edge tilt angle	Controls the direction of chip evacuation	Larger angles excel in chip control performance and relieve cutting load, but lower the strength of the insert corner

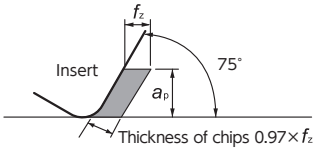
Functions of each angle

《Lead angle》: Relationship of this angle and chip thickness

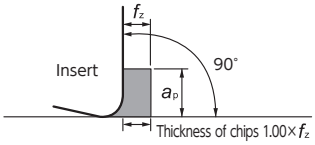
Lead angle : 45 degrees



Lead angle : 75 degrees



Lead angle : 90 degrees



《Rake angle》: Combinations and characteristics

Combinations of the angles for basic cutting edge shapes		 Double-positive cutting edge shape(DP edge shape)	 Double-negative cutting edge shape(DN edge shape)	 Negative-positive cutting edge shape(NP edge shape)
Radial rake angle(R.R.)		Positive (+)	Negative (−)	Negative (−)

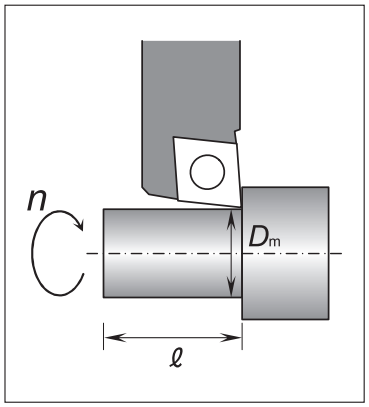
Calculation Formula for Turning

Calculating the cutting speed



Calculating the cutting speed from the rotation speed

$$v_c = \frac{\pi \times D_m \times n}{1000} \quad (\text{m/min})$$

Calculating the revolution speed from the cutting speed

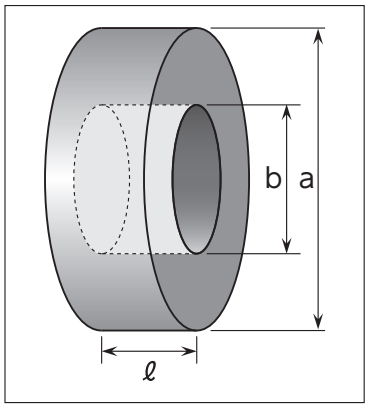
$$n = \frac{1000 \times v_c}{\pi \times D_m} \quad (\text{min}^{-1})$$

v_c : Cutting speed (m/min)
D_m : Machining diameter (mm)
n : Spindle speed (min^{-1})
π : Pi (3.14)

Example : Obtaining a cutting speed for machining a work piece of 200 mm diameter at the spindle speed of 1,000 min^{-1}:

$$v_c = \frac{\pi \times 200 \times 1000}{1000} = \underline{628\ (\text{m/min})}$$

Calculating the cutting time



Calculating the cutting time for OD (ID) machining

$$T = \frac{\ell}{f \times n} \quad (\text{min})$$

T : Cutting time (min)
ℓ : Cutting length (mm)
f : Feed rate (mm/rev)
n : Spindle speed (min^{-1})

Calculating the cutting time for facing

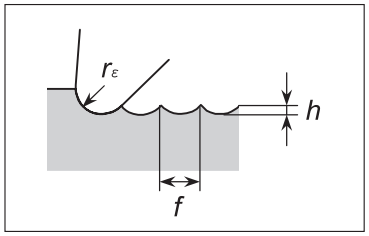
$$T = \frac{\pi \times (a^2 - b^2)}{4000 \times v_c \times f} \quad (\text{min})$$

T : Cutting time (min)
v_c : Cutting speed (m/min)
f : Feed amount (mm/rev)
π : Pi (3.14)

Example : Obtaining a cutting time for machining of work to be cut 100 mm long at the spindle speed of 1,000 min^{-1} and at a feed rate of 0.1 mm/rev:

$$T = \frac{100}{0.1 \times 1000} = \underline{1\ (\text{min})}$$

Calculating the theoretical surface roughness



$$h = \frac{f^2}{8\, r_\varepsilon} \times 1000 \quad (\mu\text{m})$$

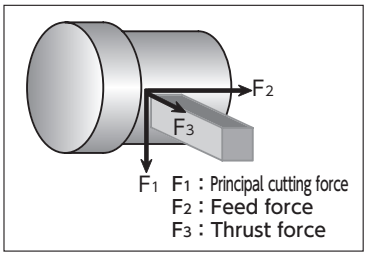
h : Theoretical surface roughness (μm)
f : Feed amount (mm/rev)
r_ε : Corner radius (mm)

Example : Obtaining the theoretical surface roughness when machining with an insert having 0.8 corner radius at a feed rate of 0.1 mm/rev:

$$h = \frac{0.1^2}{8 \times 0.8} \times 1000 = \underline{1.56\ (\mu\text{m})}$$

【Guidelines for actually finished surface roughness】
Steel type work: Theoretical surface roughness × 1.5 to 3
Cast iron type work: Theoretical surface roughness × 3 to 5

Calculating the cutting force



$$F_{(N)} = k_c \times a_p \times f$$

F : Cutting force (N)
k_c : Specific cutting force (N/mm²) *See the table below.
a_p : Depth of cut (mm)
f : Feed amount (mm/rev)

Example : Calculating the cutting force for grey cast iron cut at the feed rate of 0.2 mm/rev and with a depth of cut of 3 mm:

$$F = 1800 \times 3 \times 0.2 = \underline{1080\,(N)}$$

Calculating the power required

$$P_{c\,(kW)} = \frac{v_c \times f \times a_p \times k_c}{60 \times 10^3 \times \eta}$$

P_c : Required power (kW)
v_c : Cutting speed (m/min)
f : Feed amount (mm/rev)
a_p : Depth of cut (mm)
k_c : Specific cutting force (N/mm²) *See the table below.
η : Mechanical efficiency (0.7~0.8)

Example : Calculating the cutting power for the machining of grey cast iron at a cutting speed of 700 m/min, feed rate of 0.4 mm/rev, and with a depth of cut of 2 mm (with 0.8 set as the mechanical efficiency):

$$P_c = \frac{700 \times 0.4 \times 2 \times 1400}{60 \times 10^3 \times 0.8} = \underline{16.33\,(kW)}$$

Specific cutting force

Work material		Tensile strength or hardness	Specific cutting force (N/mm²) "k_c" to cutting feed rate (mm/rev)				
			0.1mm/rev	0.2mm/rev	0.3mm/rev	0.4mm/rev	0.6mm/rev
Soft steel		520	3,610	3,100	2,720	2,500	2,280
Medium steel		620	3,080	2,700	2,570	2,450	2,300
Hard steel		720	4,500	3,600	6,250	2,950	2,640
Tool steel	SKD	670	3,040	2,800	2,630	2,500	2,400
		770	3,150	2,850	2,620	2,450	2,340
Cr-Mo steel	SCM	600	3,610	3,200	2,880	2,700	2,500
		730	4,500	3,900	3,400	3,150	2,850
Alloy steel	SNCM	900	3,070	2,650	2,350	2,200	1,980
		HB350	3,310	2,900	2,580	2,400	2,200
Gray cast iron	FC	HB200	2,110	1,800	1,600	1,400	1,330

Calculating the volume of chips produced

$$Q_{(cm^3/min)} = v_c \times f \times a_p$$

Q : Volume of evacuated chips (cm³/min)
v_c : Cutting speed (m/min)
a_p : Depth of cut (mm)
f : Feed amount (mm/rev)

Example : Obtaining the volume of chips evacuated per minute for machining at a cutting speed of 700 m/min, feed of 0.4 mm/rev, and a depth of cut of 2mm

$$Q = 700 \times 0.4 \times 2 = \underline{560\,(cm^3/min)}$$

Troubleshooting for Turning

Troubleshooting Case Studies: Turning

	Case/Symptom		Possible causes	Corrective measures
Insert	VB wear		●The material / grade is too soft ●Cutting speed is too high ●Relief angle is too small	●Use a coated grade ●Choose a material/grade highly resistant to wear ●Decrease the cutting speed
	Wear on face		●High temperature causes chemical reactions between the insert material and chips	●Use a coated grade ●Decrease both of the cutting speed and feed rate ●Widen the rake angle
	Notching wear		●The work surface is too hard ●Boundary area has been oxidized ●Burrs, caused by chips in the sheared form, have been cut	●Widen the side cutting edge angle ●Make the nose radius larger so that cutting is performed within the radius ●Use a round insert
	Chipping/ fracture		●Feed rate is too high ●Chips have become trapped ●Chatter resulting in vibration	●Enlarge the honed edge ●Make the nose radius larger ●Narrow the rake angle to secure the cutting edge strength
	Flaking		●This is due to compressive forces being applied to the cutting edge from elastic deformation in the area being cut ●This occurs when deposited/adhered material is peeled off	●Change the cutting conditions by checking the cutting edge ●Choose a material/grade highly resistant to fracture ●Increase the coolant rate and pressure ●Improve the run-out of the main spindle of the machine
	Plastic deformation		●High cutting force and excessive heat is applied to the cutting edge	●Choose a material/grade highly resistant to wear ●Decrease both of the cutting speed and feed rate ●Make the nose radius larger ●Use coolant
	Built-up edge		●This occurs because the cutting temperature is lower than the recrystallization temperature of the work material	●Increase the cutting speed ●Use coolant with excellent lubrication performance ●Change to a grade with less affinity to the work material
	Deposition		●The deposition is caused to the face by a chemical reactions of the work material due to heat generation	●Increase the cutting speed ●Widen the relief angle ●Hone the face with a mirror-like-surface finish ●Change to a grade with less affinity to the work material
	Clamping crack		●The insert was clamped under improper seating conditions	●Clean the clamping areas and install the insert in the recommended way ●Tighten to the specified torque
Work piece	Chipping		●The feed rate is too high ●An unsuitable insert was selected	●Decrease the feed rate ●Use a smaller edge preparation ●Change to a grade highly resistant to boundary wear ●Change the cutting edge angle of the holder
	Burring		●The feed rate is incorrect ●The shape of insert is not suitable	●Decrease the feed rate ●Use a smaller edge preparation
	Chatter mark		●The cutting force is too great ●The rigidity of the work piece and cutting tool is insufficient	●Decrease the feed rate ●Use a smaller edge preparation ●Ensure tool overhang is minimised ●Change the cutting edge angle of the holder
	Gouging		●Vibration of the cutting edge due to deposition/built-up edge	●Increase the cutting speed ●Use cutting oil excellent in lubrication performance ●Change to a grade with less affinity to the work material

Surface Roughness Standards

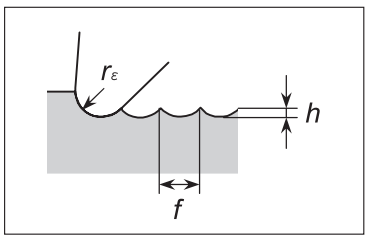
Theoretical surface roughness

The theoretical surface roughness for lathe machining is the minimum value which can be obtained under the set machining conditions, and can be expressed by the following formula.

$$h_{(\mu m)} = \frac{f^2}{8\,r_\varepsilon} \times 1000$$



h : Theoretical surface roughness (μm)
f : Feed amount (mm/rev)
r_ε : Nose radius (mm)

Actual surface roughness

- When machining steel: Theoretical surface roughness x 1.5-3
- When machining cast iron: Theoretical surface roughness x 3-5

Surface finish improvement measures

- Increase the nose radius.
- Adjust the cutting speed and/or feed amount.
- Use a wiper insert.
- Change the material and/or shape of the insert

Relationship with triangle symbols

Arithmetic average roughness Ra (μm)	Maximum height Rz (μm)	10-point average roughness Rz_{JIS} (μm)	※ (Triangle symbol)
0.025	0.1	0.1	▽▽▽▽
0.05	0.2	0.2	
0.1	0.4	0.4	
0.2	0.8	0.8

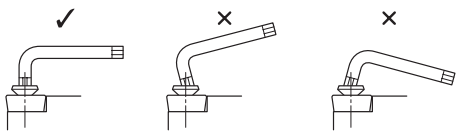
Attention: When tightening screws

- Make sure the wrench tip and wrench hole are neither deformed nor stripped
- Engage the wrench straight to screw hole



- Do not apply more torque than the recommended amount (as shown to the right)

Note: Wrenches and bits come in a pack of five
Clamp screws come in a pack of ten
