

**AN UPDATED LIST OF PTERIDOPHYTA AND LYCOPHYTA TYPE MATERIAL
DEPOSITED AT THE
NATIONAL HERBARIUM OF COSTA RICA (CR)**

SILVIA LOBO C.

Herbario Nacional (CR)
Av. Central and 2, 17th Street
San José, Costa Rica
slobo@museocostarica.go.cr

ABSTRACT

This study presents information about the type specimens of Pteridophyta and Lycophyta housed at the National Herbarium of Costa Rica (including ex INB). In total, Pteridophyta and Lycophyta type material encompasses 422 species and infraspecific taxa. This represents 257 species and 960 specimens more than the last assessment. 137 holotypes, 239 isotypes (s.l.), 22 syntypes, and 766 paratypes (s.l.) are present. Foreign type material comprises 10% of the collection.

The National Herbarium of Costa Rica (CR) is one of the oldest and largest plant collection in Central America and Mesoamerica, with a history of over 130 years in the documentation and study of the country's flora. These activities have resulted in the herbarium containing 90% of known plant species nationwide. The National Institute of Biodiversity (INBio) transferred its herbarium to CR in 2015, nearly doubling the number of bryophyta, lichens, fungi, and plant specimens. The CR type collection also was greatly enlarged by this addition.

In Costa Rica, two other institutions house plant type specimens. The Herbarium of the Costa Rican University (USJ) houses Pteridophyta and Lycophyta types of approximately 8 species. The emphasis of the Lankester Botanical Garden (JBL) is on the orchid family.

The only previous attempt to list cryptogamic type specimens at CR was by Ruiz-Boyer and González-Ball (2002), who documented 283 type specimens of 165 species and infraspecific taxa. The present report presents an updated list of the type specimens of Pteridophyta and Lycophyta presently housed at CR.

This study is based on the author's specimen-by-specimen examination of the CR and ex INB collection from 2015 to 2018. Each type specimen was examined after checking their labels against original descriptions and/or additional bibliographical material and online databases (specially Tropicos (www.tropicos.org) and JSTOR (www.jstor.org)). An active search for specimens stored as non-type material was also undertaken. After screening and comparison, the status of the type specimen was confirmed, registered in the CR database, and scanned and stored in the type collection. The original CR type specimens information and image can be seen in <http://ecobiosis.museocostarica.go.cr>, and ex INB type specimens can be consulted in <http://www.specify7.museocostarica.go.cr:8080/specify-solr/>. For this paper, nomenclature of genera follows PPG 1 (2016).

RESULTS

The fern and lycophyte type collection at CR contains 1239 type specimens, representing 422 species and infraspecific taxa (Table 1). Six main categories of types are represented (Fig. 1). No lectotypes or neotypes exist. The vast majority of the CR type material is from Costa Rica (90%); the rest is mainly from Latin American countries (Fig. 2).

The transfer of the former INB collection added 254 type specimens to CR: 58 holotypes, 27 isotypes, 167 paratypes and 3 fototypes, and 12 new species of cryptogams to the type collection. But it also increased the different type categories for a single species: 20 species are now represented by both a holotype and an isotype and 37 species by a holotype, an isotype, and paratypes. Previously there were just 16 cases in CR.

Principal authors of the type species represented in CR are Konrad H. Christ and A. Rojas, who together have described the 48% of the species. Christ was a Swiss botanist who specialized in pteridology (Gómez 1977) — he is the main author of the fern species of Costa Rica of the late and early Twentieth Century. Alexander Rojas (A. Rojas) is a Costa Rican pteridologist who has published many taxonomic studies of the country's ferns and lycophytes since the 1990s.

An interesting finding is that in the description of 24 new taxa, 13 specimens were used repeatedly (Table 2).

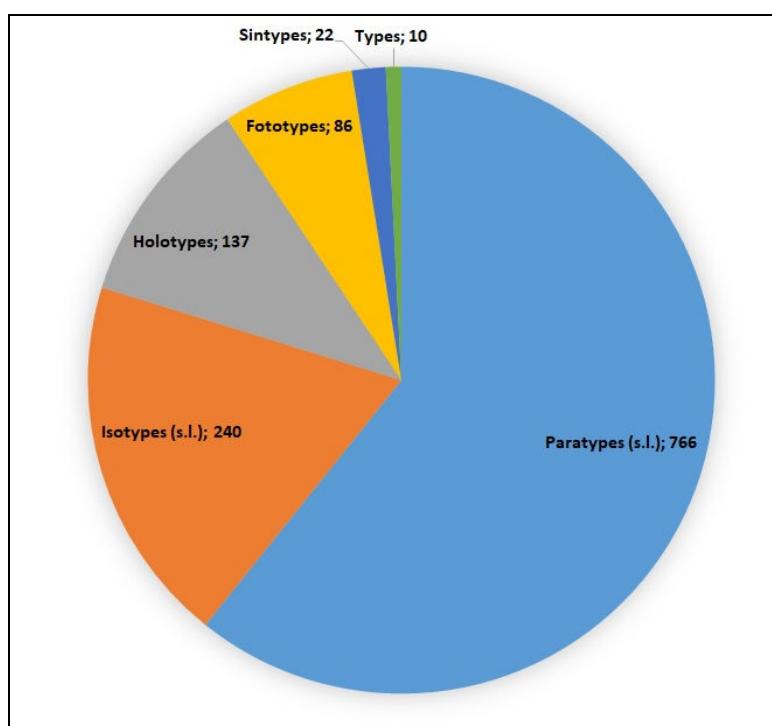

Figure 1. Number of specimens in each type category.

Table 1. List of fern and lycophyte type specimens deposited at the National Herbarium of Costa Rica (CR). Abbreviations are: H= Holotype, I= Isotype, L= Lectotype, IL= Isolectotype, LP= Lectoparatype, S= Syntype, IS= Isosyntype, P= Paratype, T= Type, F= Phototype. Species included in Ruiz-Boyer and González-Ball (2002) are marked with *.

Table 2. List of the 13 specimens used in the descriptions of different taxa.

Specimen	Taxa 1	Taxa 2
H. Pittier 10981	<i>Alsophila leucolepis</i> var. <i>pubescens</i>	<i>Alsophila acutidens</i>
A. Tonduz 11784	<i>Dennstaedtia obtusifolia</i> var. <i>protrusa</i>	<i>Dicksonia obtusifolia</i> var. <i>protrusa</i>
W. Burger 5421	<i>Megalastrum longiglandulosum</i>	<i>Megalastrum longipilosum</i> var. <i>glandulosum</i>
H. Pittier 10993	<i>Ctenitis skutchii</i>	<i>Megalastrum intermedium</i>
L. Gómez-Pignataro 3347	<i>Elaphoglossum alvaradoanum</i>	<i>Elaphoglossum auripulum</i> var. <i>longipilosum</i>
I. Chacón 1162	<i>Elaphoglossum brenesii</i>	<i>Elaphoglossum</i> <i>heterochroum</i>
I. Chacón 2291	<i>Elaphoglossum lenticulatum</i>	<i>Elaphoglossum mitorrhizum</i>
W. Burger 8853 E. Scamman 7962	<i>Megalastrum costipubens</i>	<i>Megalastrum longipilosum</i> var. <i>glabrescens</i>
H. Pittier 13257	<i>Polypodium montigenum</i>	<i>Polypodium plebeium</i> var. <i>palmense</i>
P. Biolley 10688	<i>Polybotrya acuminata</i> var. <i>villosa</i>	<i>Polybotrya villosula</i>
S. Knapp 2109	<i>Elaphoglossum lanceiforme</i>	<i>Elaphoglossum</i> <i>pseudoerinaceum</i>
M. Valerio 168	<i>Elaphoglossum talamancaicum</i>	<i>Elaphoglossum terrestre</i>

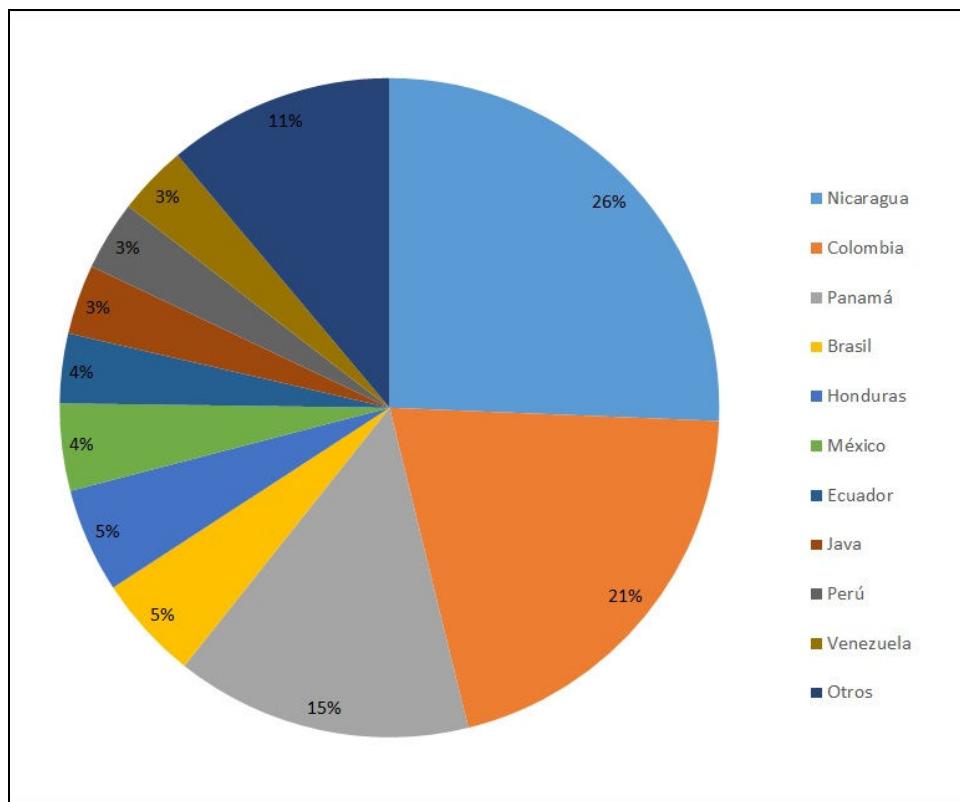

Figure 2. Distribution (%) of the foreign type species of Pteridophyta and Lycophyta in CR.

ACKNOWLEDGEMENTS

I would like to thank María Teresa Vizoso (GDA) for her valuable collaboration in the search, registration, and scanning of a significant number of specimens. I also would like to extend my sincere gratitude to Dr. Robbin Moran (NY) for his critical review of the first draft of the paper.
