

TAXONOMIC SUMMARY OF HETEROTHECA (ASTERACEAE: ASTEREAE): SECT. CHRYSANTHE

GUY L. NESOM

Research Associate

Academy of Natural Sciences of Drexel University

Philadelphia, Pennsylvania

guynesom@sbcglobal.net

ABSTRACT

A taxonomic overview of *Heterotheca* sect *Chrysanthē* includes 49 species. Fourteen new species are described: ***Heterotheca excelsior* Nesom, sp. nov.**, ***Heterotheca fulcians* Nesom, sp. nov.**, ***Heterotheca hartmanii* Nesom, sp. nov.**, ***Heterotheca incensa* Nesom, sp. nov.**, ***Heterotheca inflata* Nesom, sp. nov.**, ***Heterotheca joshuana* Nesom, sp. nov.**, ***Heterotheca komarekiae* Nesom, sp. nov.**, ***Heterotheca marc bakeri* Nesom, sp. nov.**, ***Heterotheca orovillosa* Nesom, sp. nov.**, ***Heterotheca postpetrinis* Nesom, sp. nov.**, ***Heterotheca scelionis* Nesom, sp. nov.**, ***Heterotheca schneideri* Nesom, sp. nov.**, ***Heterotheca utahensis* Nesom, sp. nov.**, and ***Heterotheca vespertina* Nesom, sp. nov.** Two new combinations validate earlier names for currently recognized species: ***Heterotheca hirsuta* (Greene) Nesom, comb. nov.** (replacing *H. barbata* and modifying its definition) and ***Heterotheca hirsutissima* (Greene) Nesom, comb. nov.** (replacing *H. horrida*). One replacement name is required: ***Heterotheca paniculata* Nesom, nom. nov.** (= *Chrysopsis floribunda* Greene, not *Heterotheca floribunda* Benth.). Nine new combinations validate names at specific rank in *Heterotheca*, drawn from species previously described in *Chrysopsis* and from taxa previously treated at varietal rank within *Heterotheca*: ***Heterotheca angustifolia* (Rydb.) Nesom, comb. nov.**, ***Heterotheca ballardii* (Rydb.) Nesom, comb. nov.**, ***Heterotheca cinerascens* (Blake) Nesom, comb. et stat. nov.**, ***Heterotheca cryptocephala* (Woot. & Standl.) Nesom, comb. nov.**, ***Heterotheca harmsiana* (Semple) Nesom, comb. et stat. nov.**, ***Heterotheca hispida* (Hook.) Nesom, comb. nov.**, ***Heterotheca pedunculata* (Greene) Nesom, comb. nov.**, ***Heterotheca resinolens* (A. Nels.) Nesom, comb. nov.**, and ***Heterotheca scabrifolia* (A. Nels.) Nesom, comb. nov.** A lectotype is designated for *Chrysopsis floribunda* Greene. Details of typification, a county-level distribution map, and at least a diagnostic description are provided for each species.

This study follows the treatment of sects. *Heterotheca* and *Ammodia* (Nesom, Phytoneuron 2019-64: 1–22. 2019), which gives an introduction, Acknowledgements, and Literature Cited for the whole series. A treatment of sect. *Phyllothecea* is in preparation.

Hopes of resolving several taxonomic problems in goldenasters by field and herbarium study in 2020 were nixed by the pandemic — the study is published in its present form to substantiate usage of names in floristic accounts. Modifications and additions probably will be made in the near future.

INDEX and MAPS — HETEROTHECA sect. CHRYSANTHE

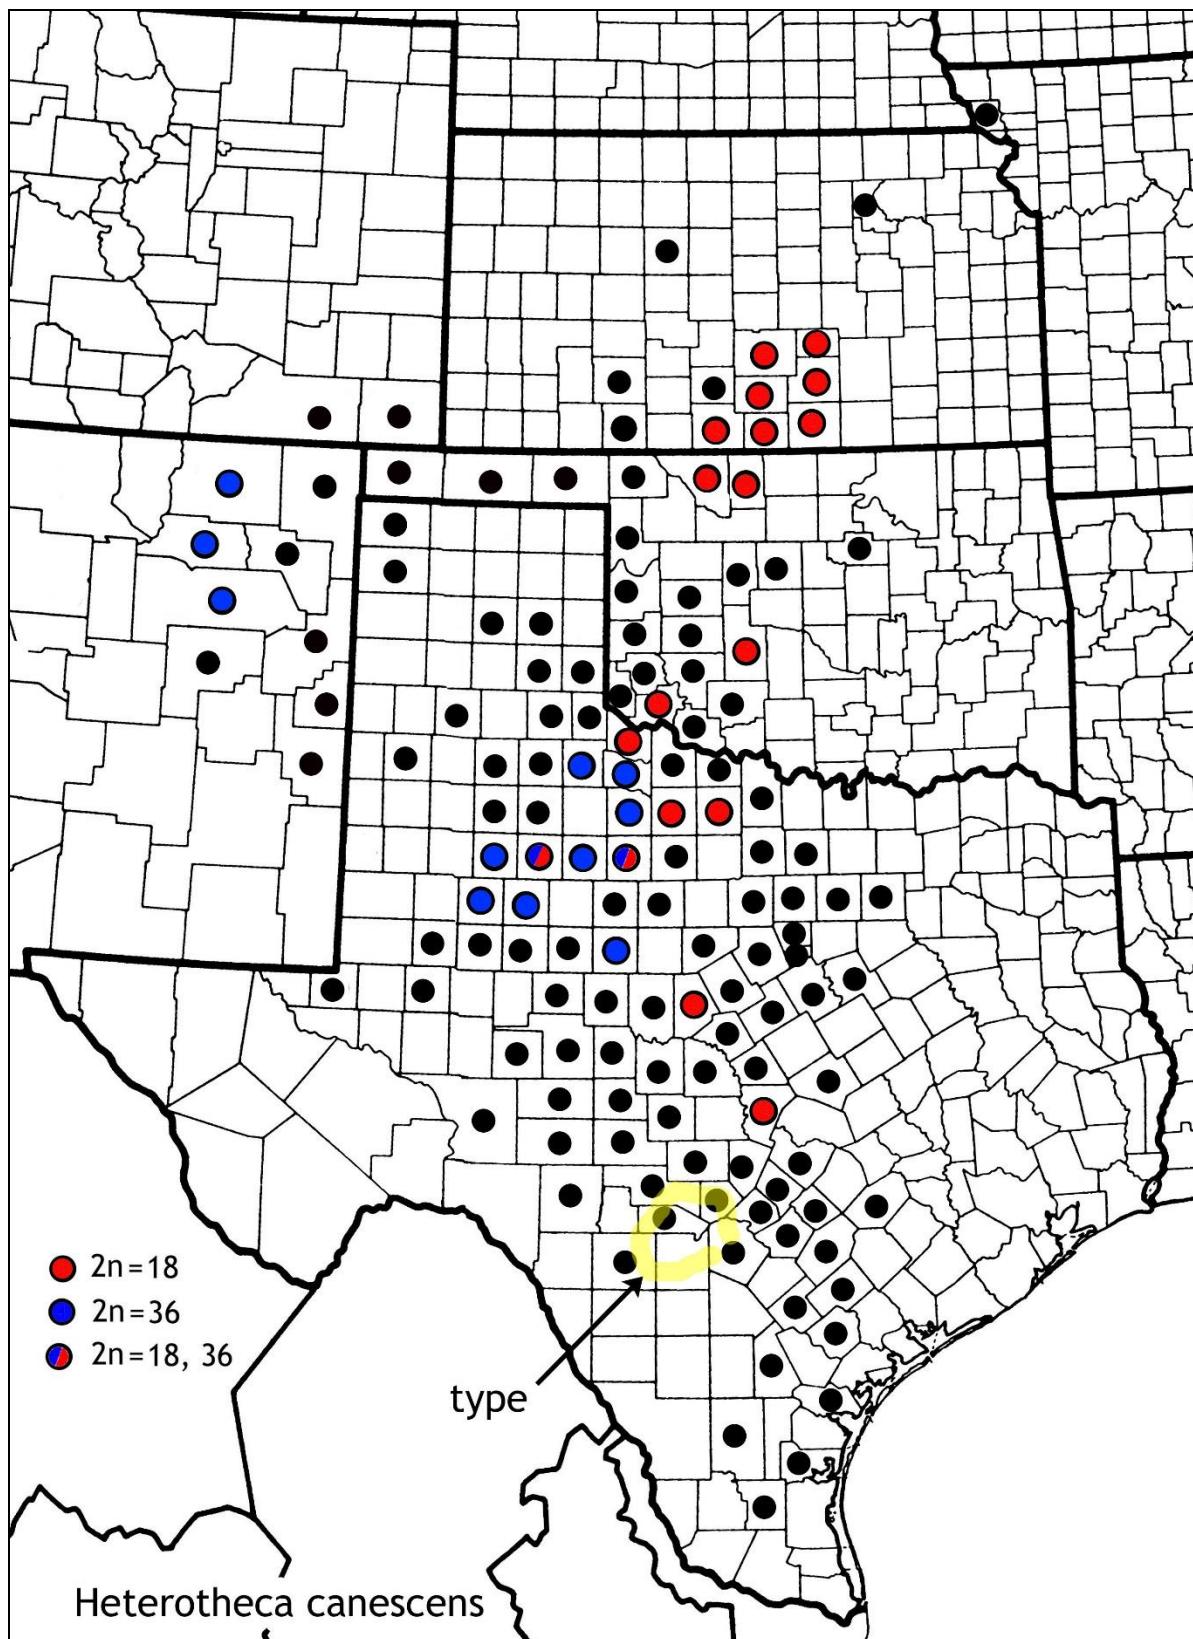

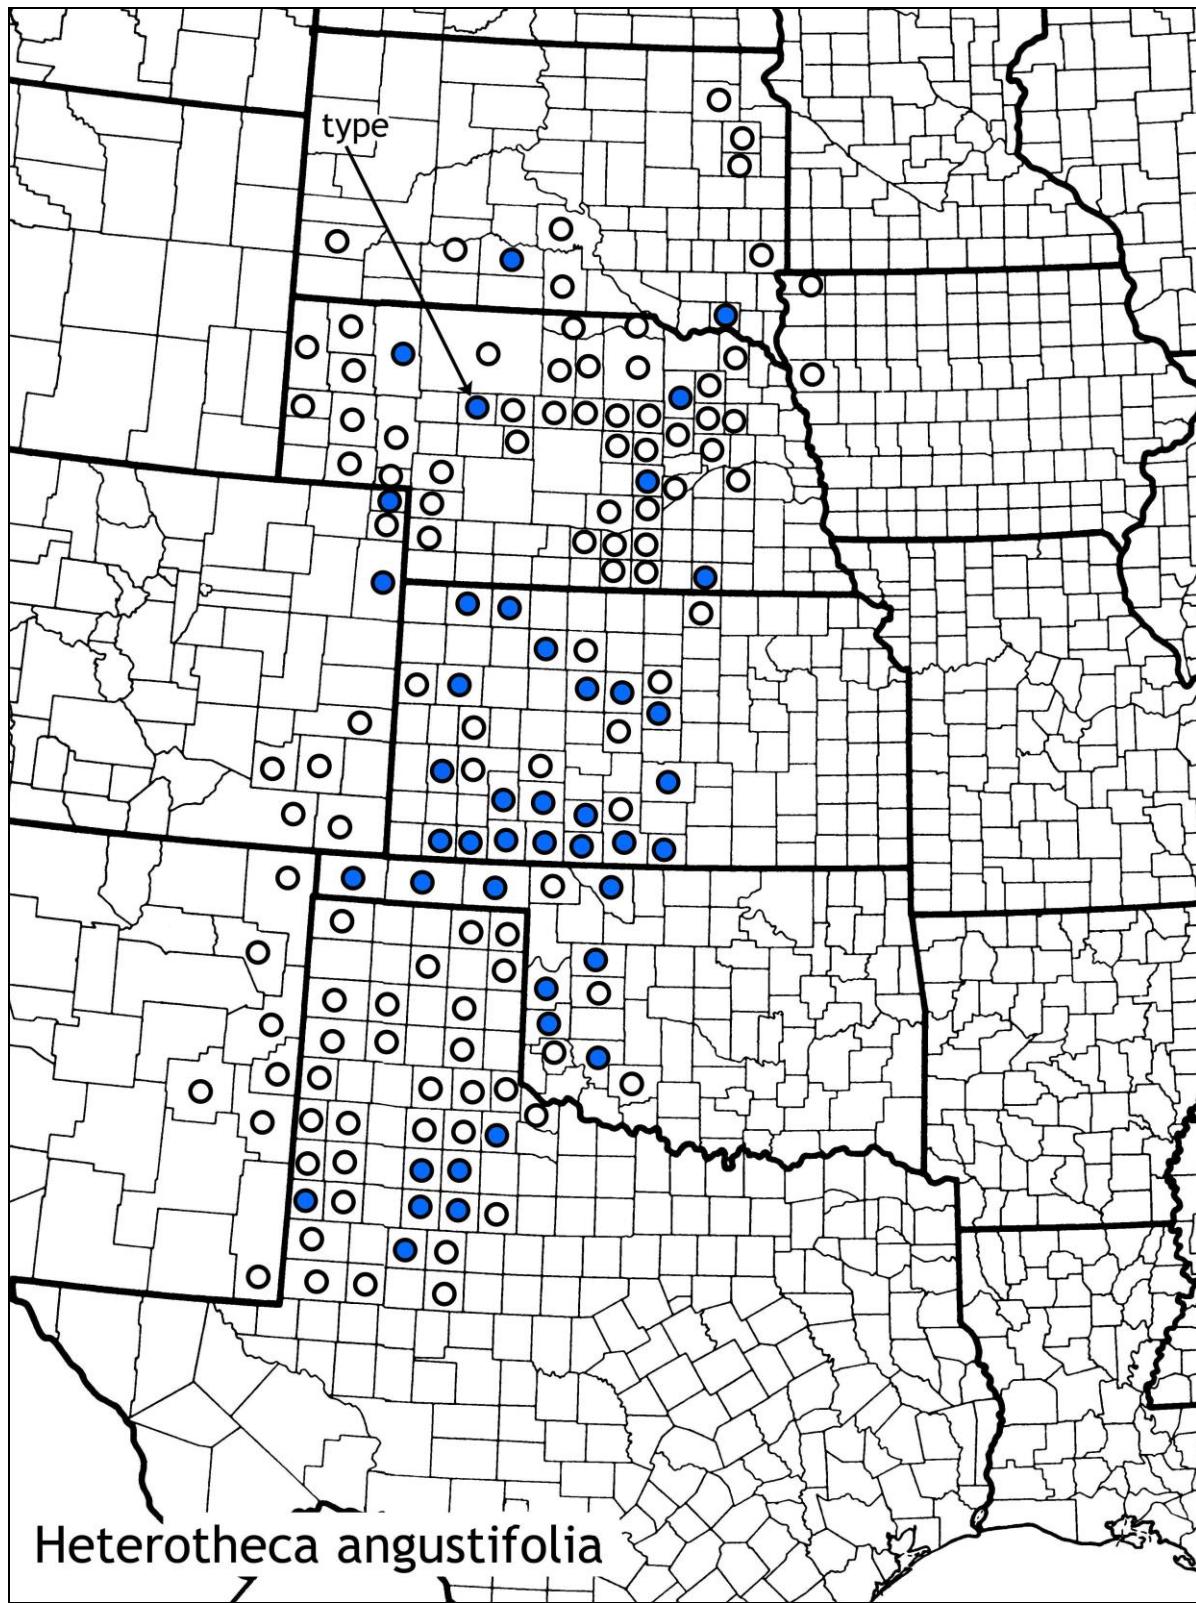

Map 4. Distribution of *Heterotheca orovillosa*.

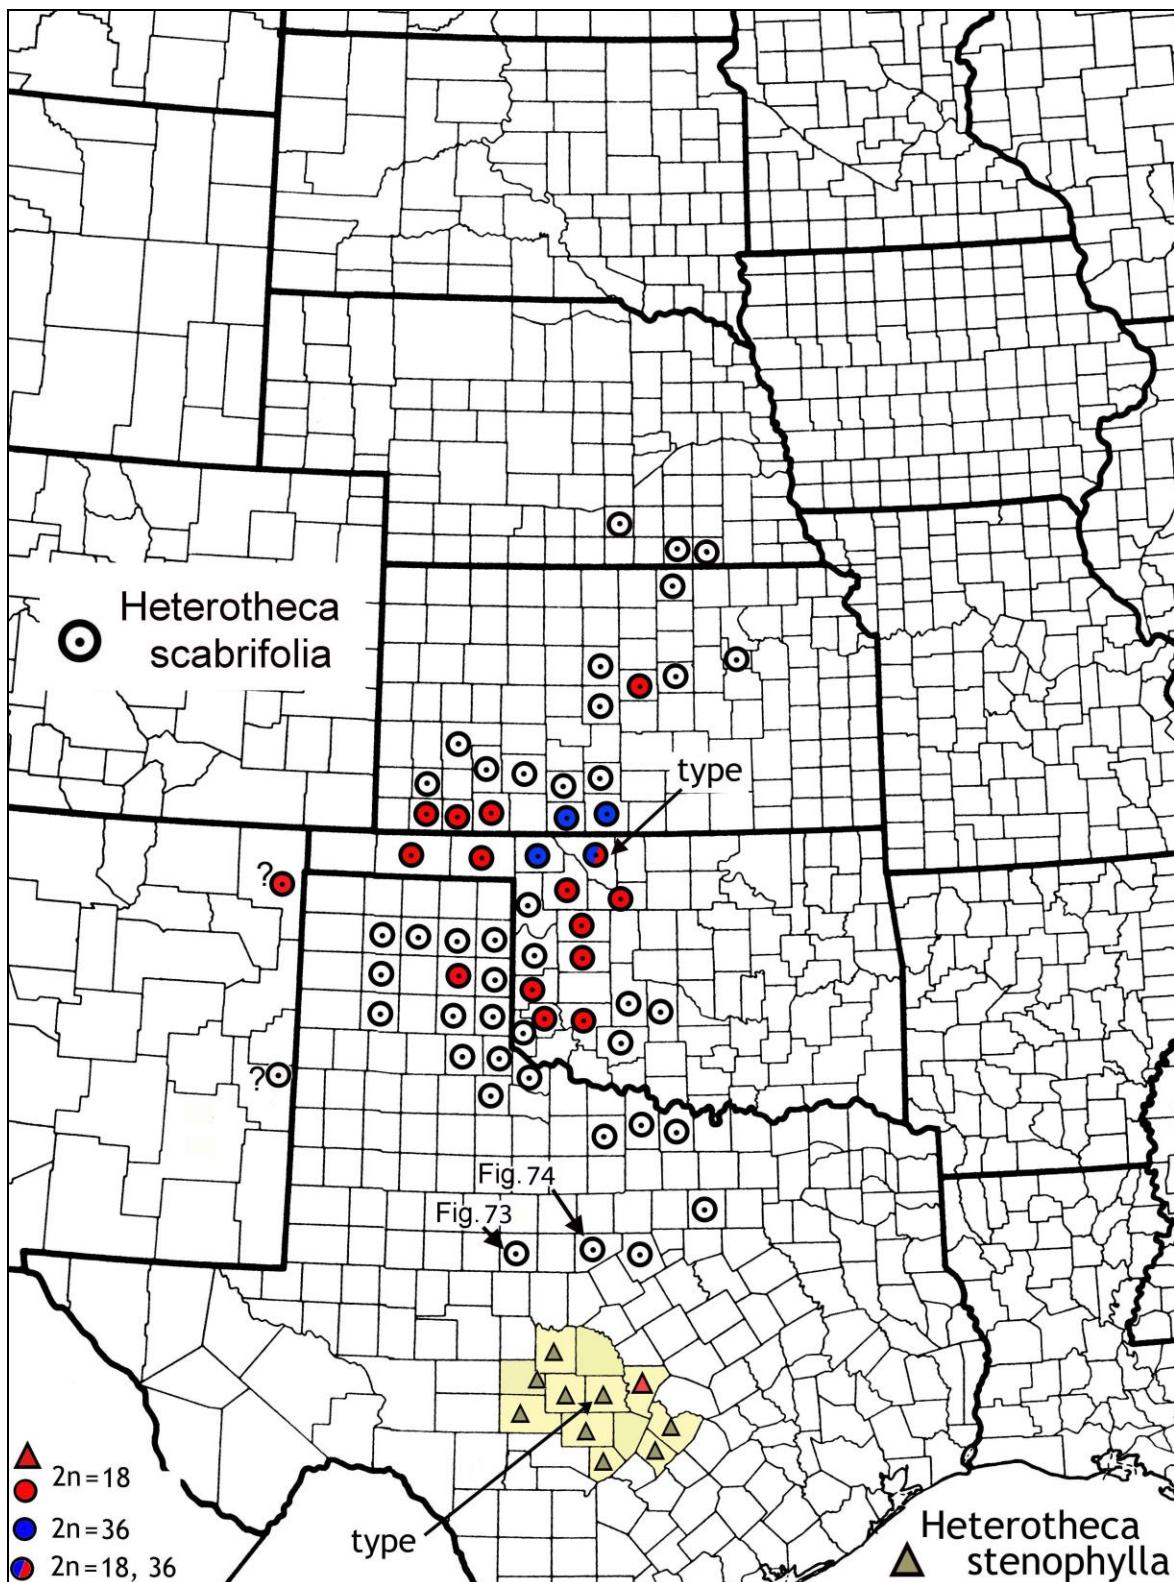

Map 5. Distribution of *Heterotheca* species. Names with arrows point to the type locality for *H. ballardii* and to type localities for *H. hispida* and synonyms.

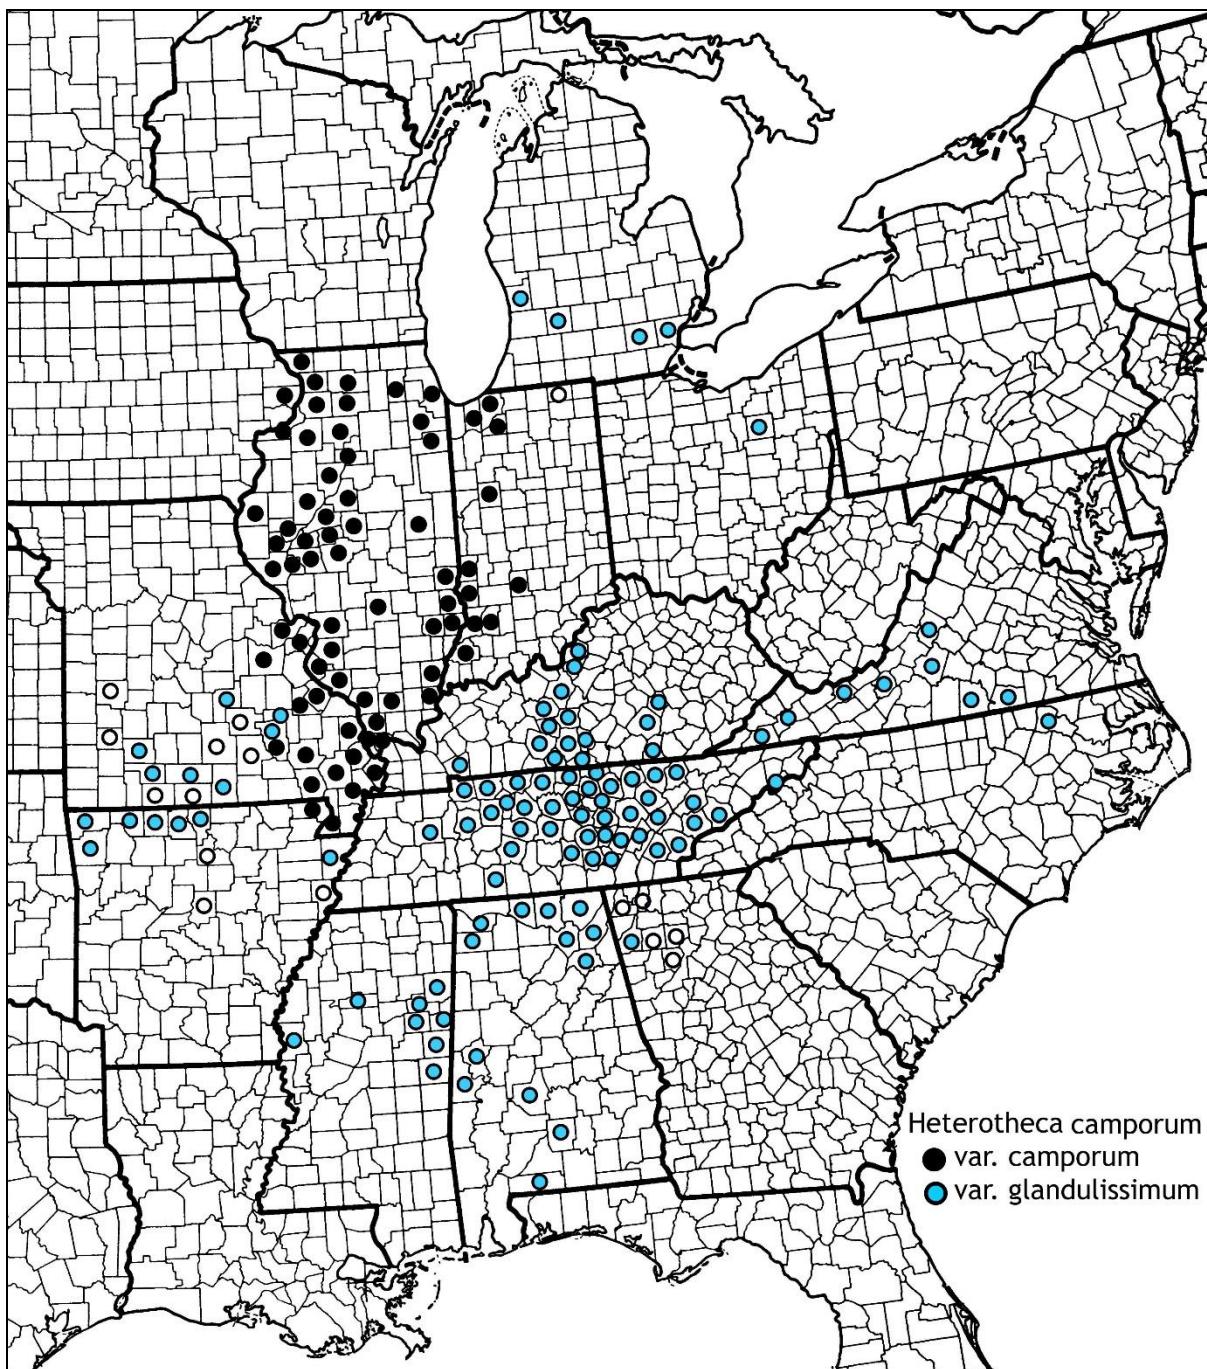

Map 6. Distribution of *Heterotheca canescens*. Yellow highlight outlines the route of Berlandier's 1828 trip — the type collection was made somewhere along his route

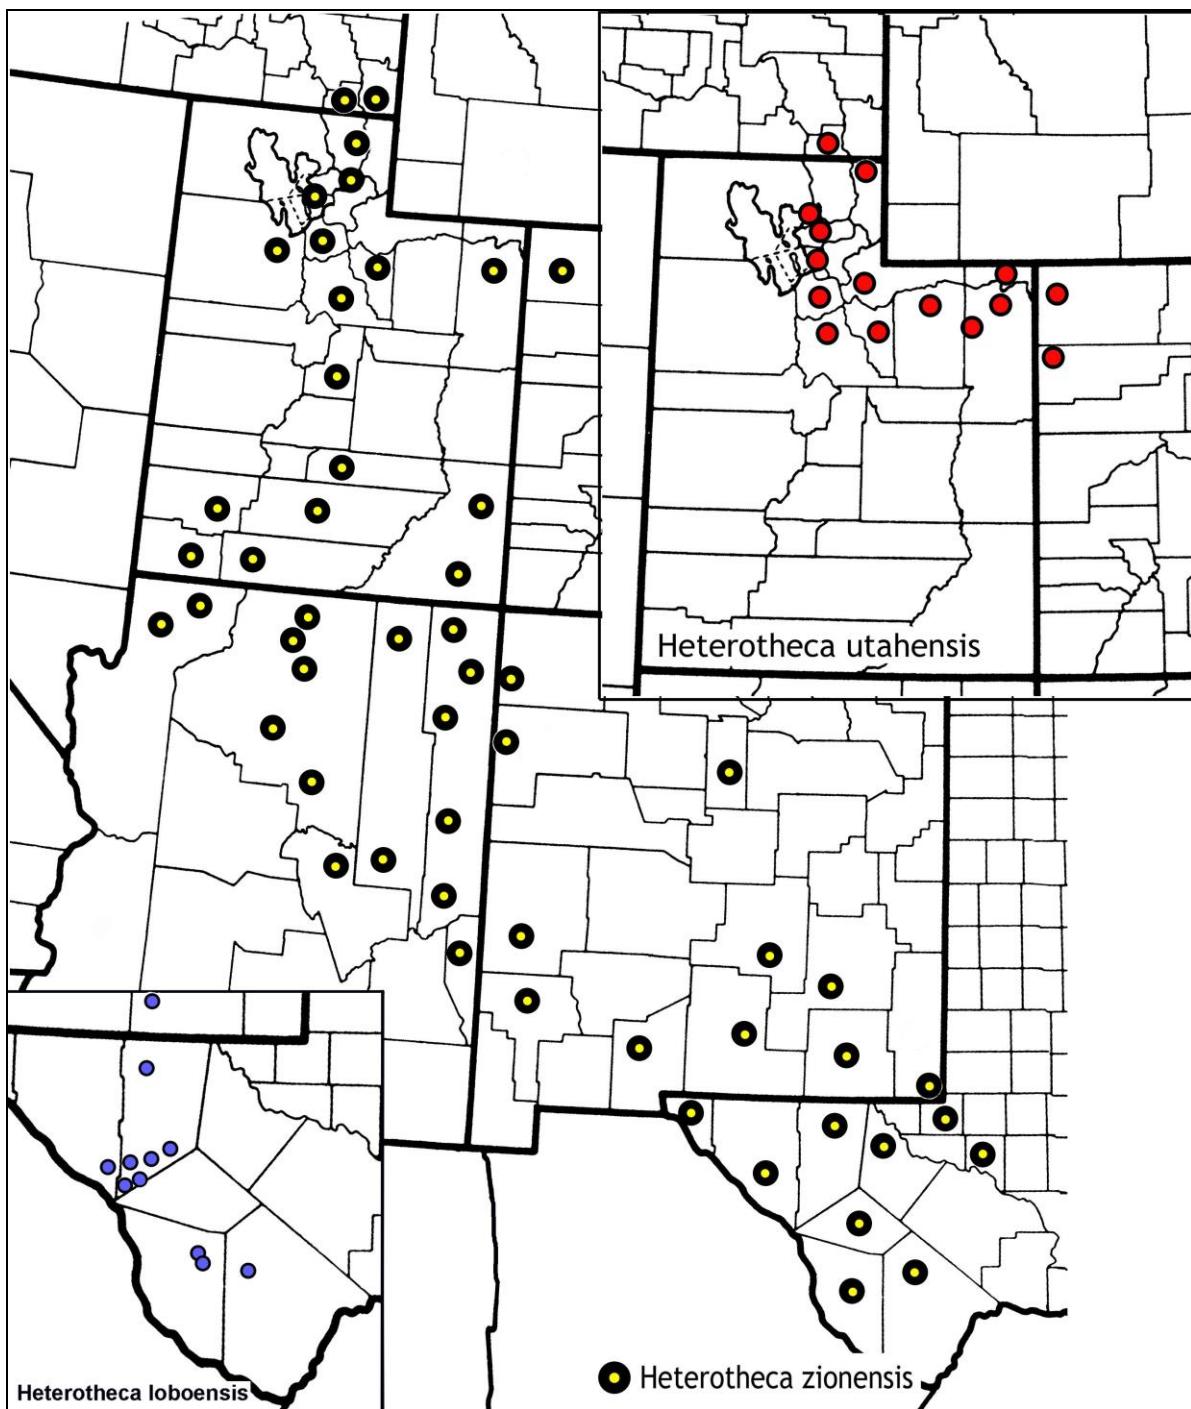

Map 7. Distribution of *Heterotheca angustifolia*. Blue symbols are tetraploid chromosome counts..

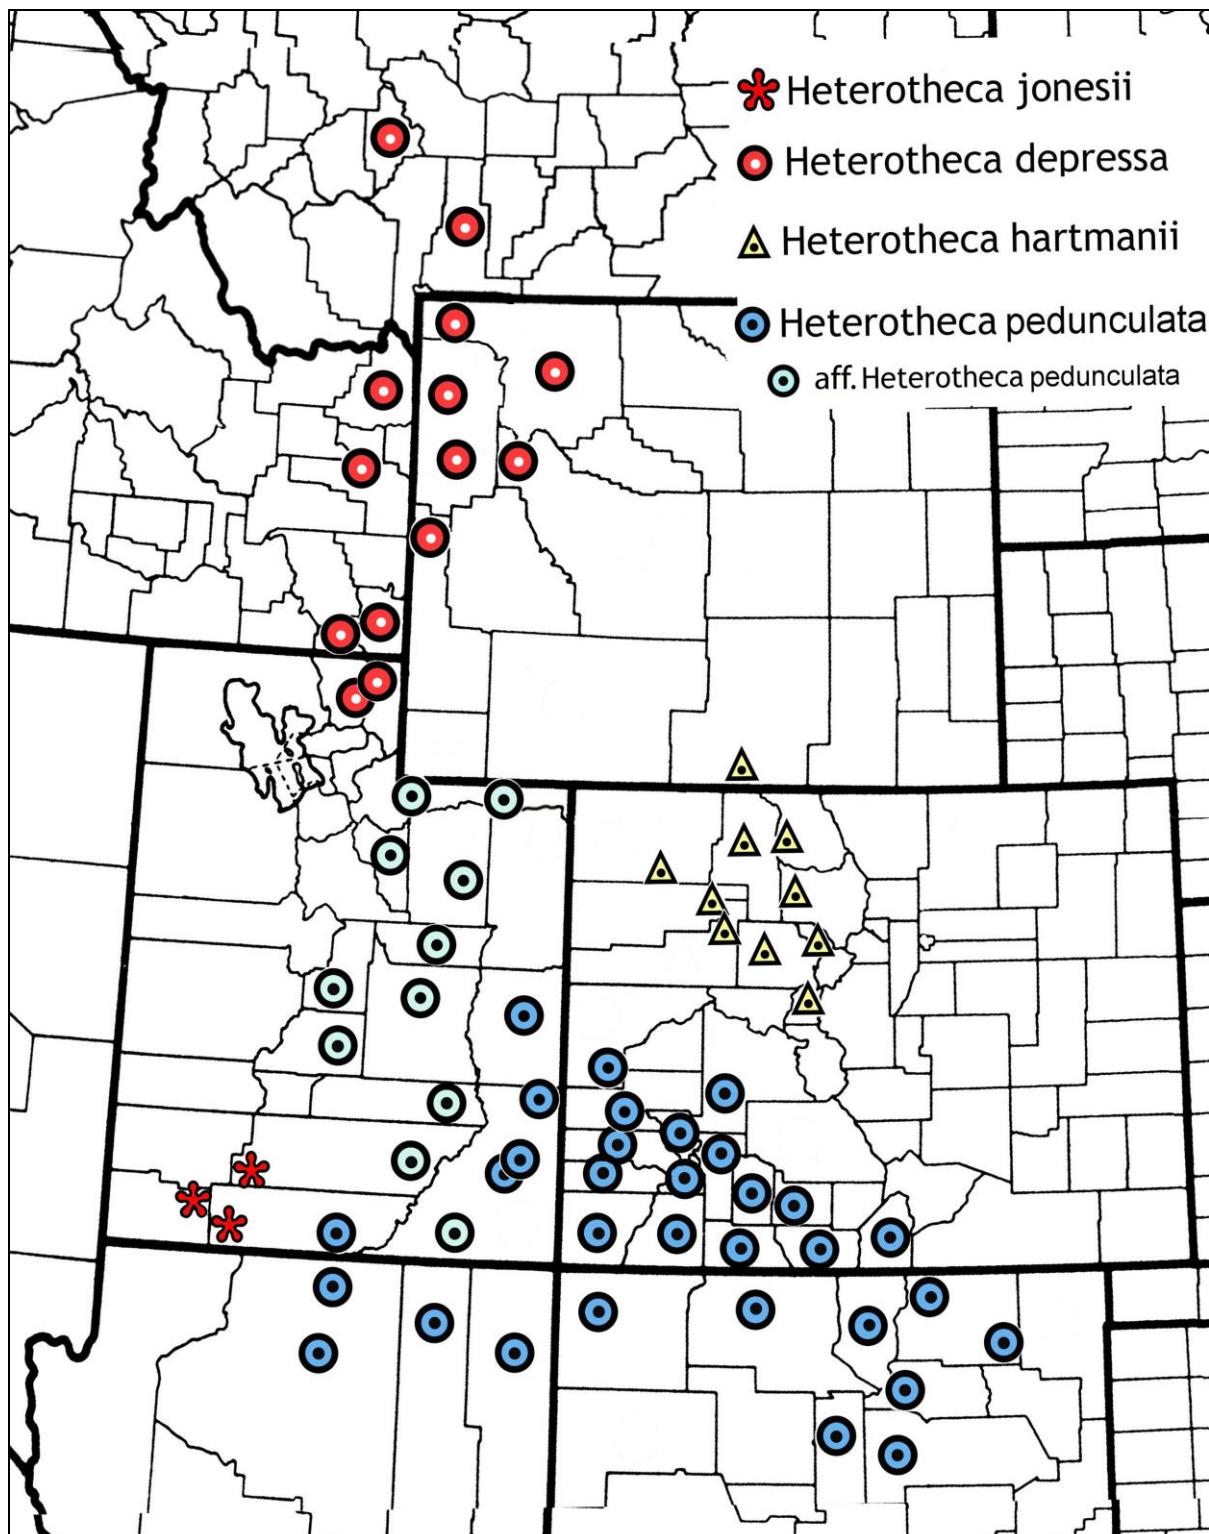

Map 8. Distribution of *Heterotheca stenophylla* and *H. scabrifolia*. Yellow highlight emphasizes the restricted geographic range of *H. stenophylla*. Putative morphological intermediates (see text) are illustrated in Figs. 73 and 74. Vouchers for New Mexico localities have not been seen in the present study (see text).

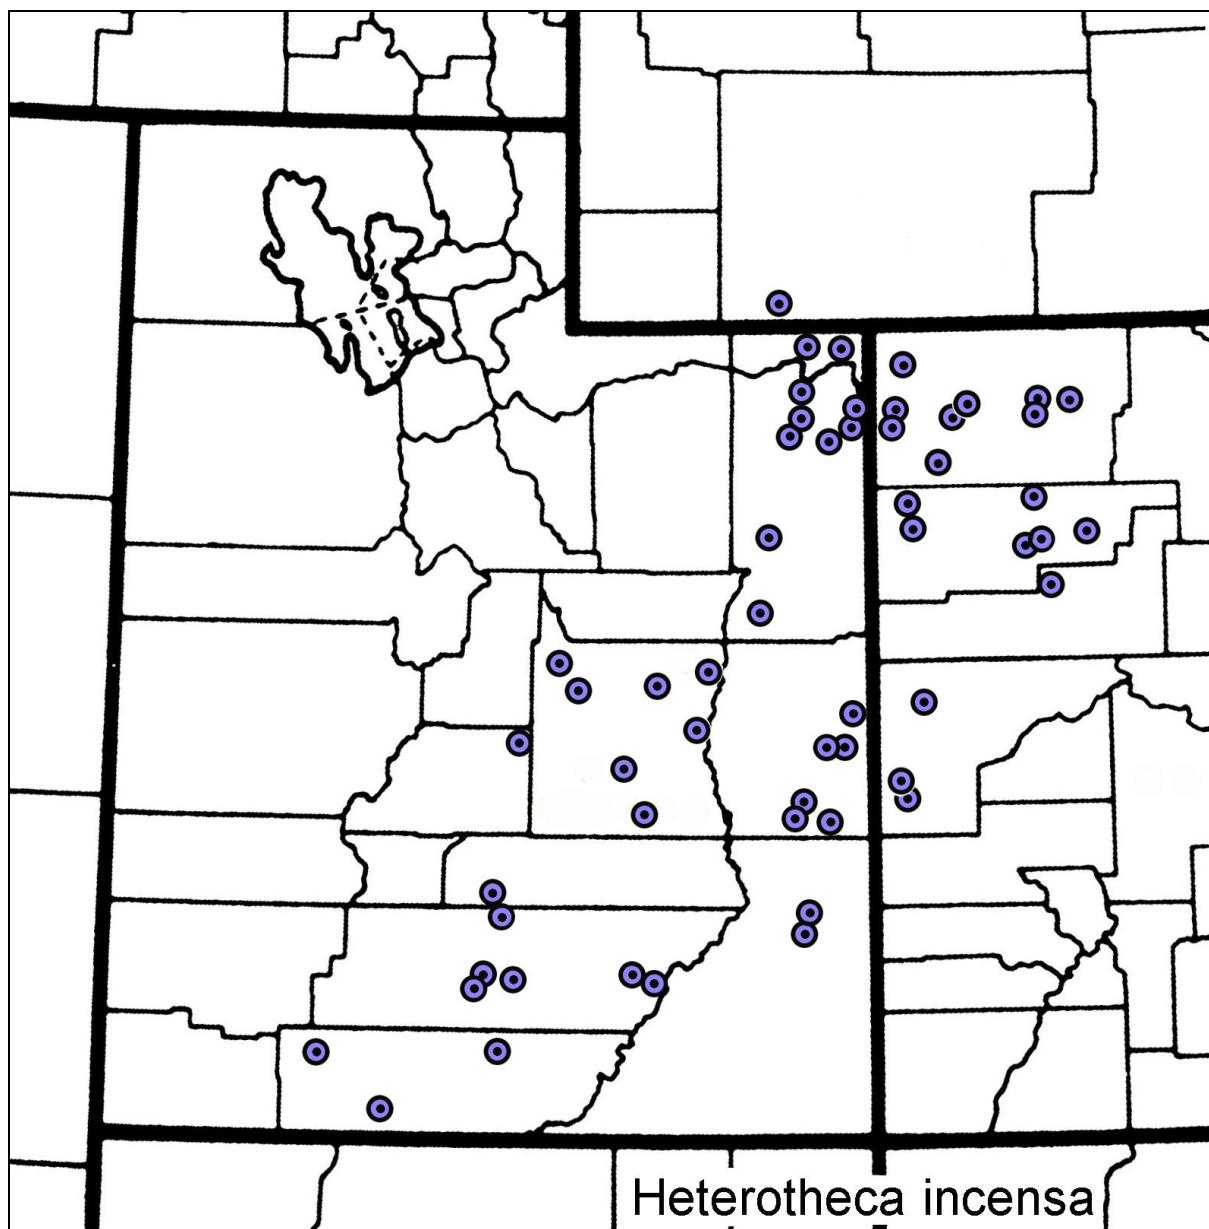

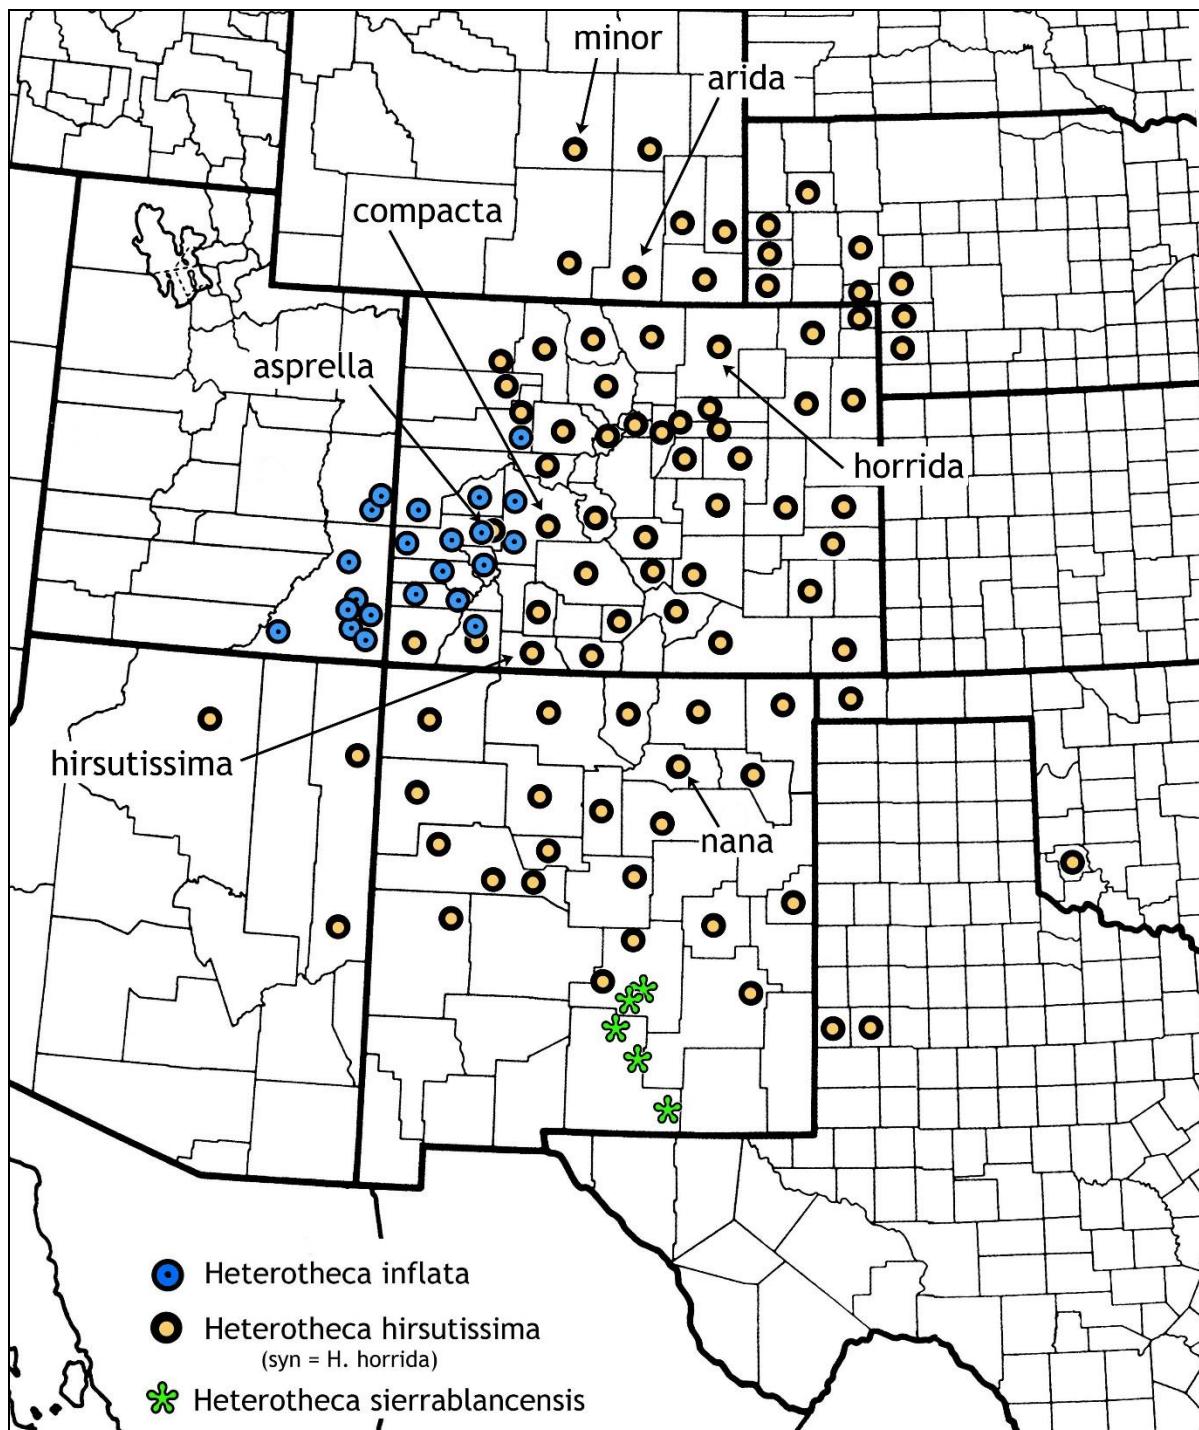

Map 10. Distribution of *Heterotheca zionensis*, *H. utahensis*, and *H. loboensis*.

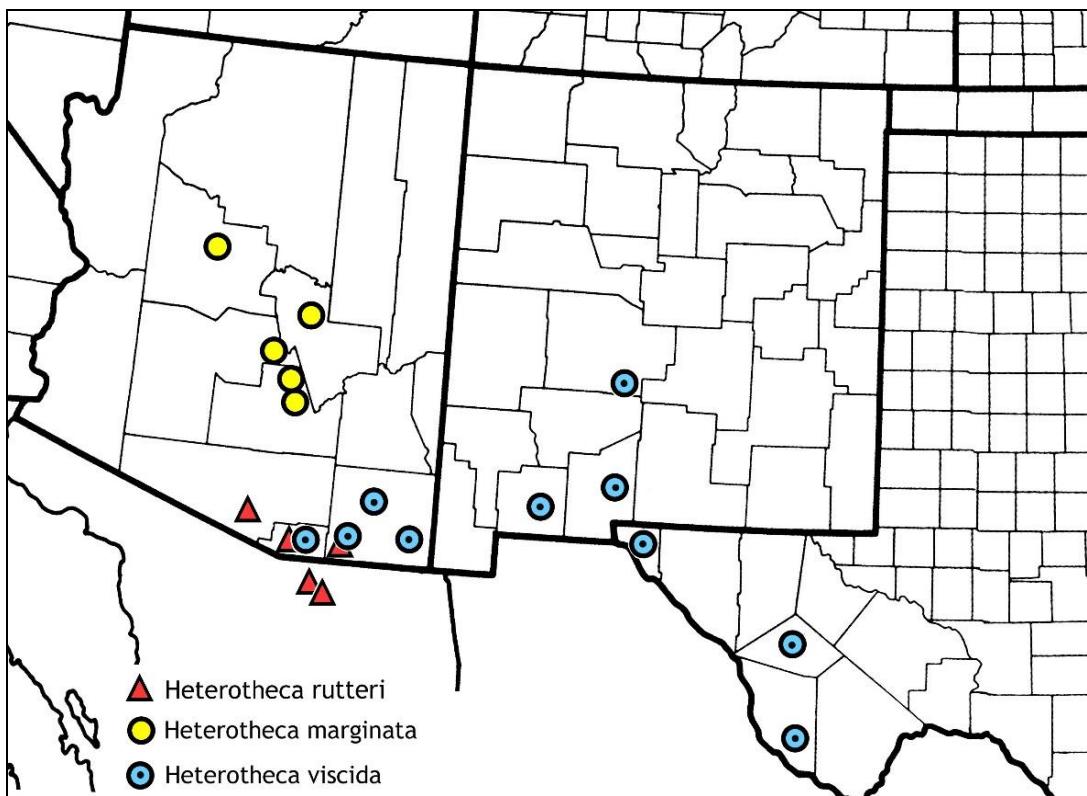

Map 11. Distribution of *Heterotheca* species. Symbols for *H. pedunculata* with lighter blue perhaps are a different species, yet undescribed. Also see text for comments on the "Uncompahgre variant" of *H. pedunculata*.

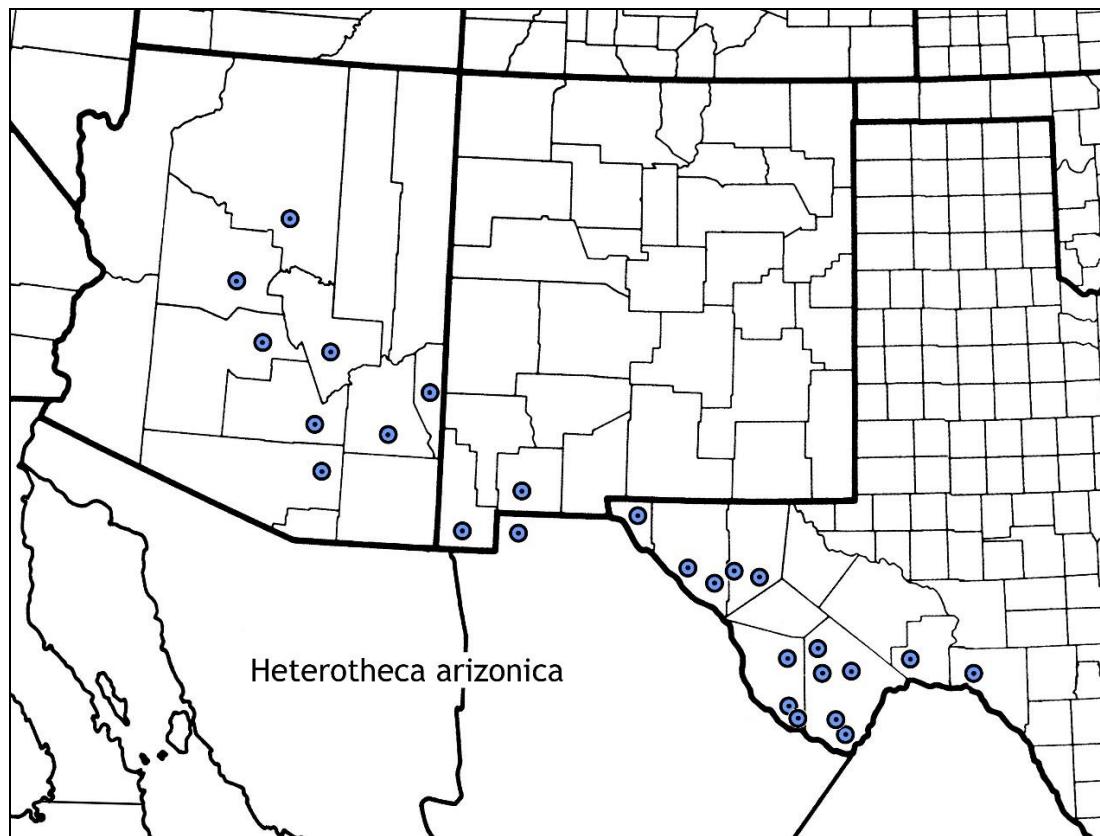

Map 12. Distribution of *Heterotheca incensa*.

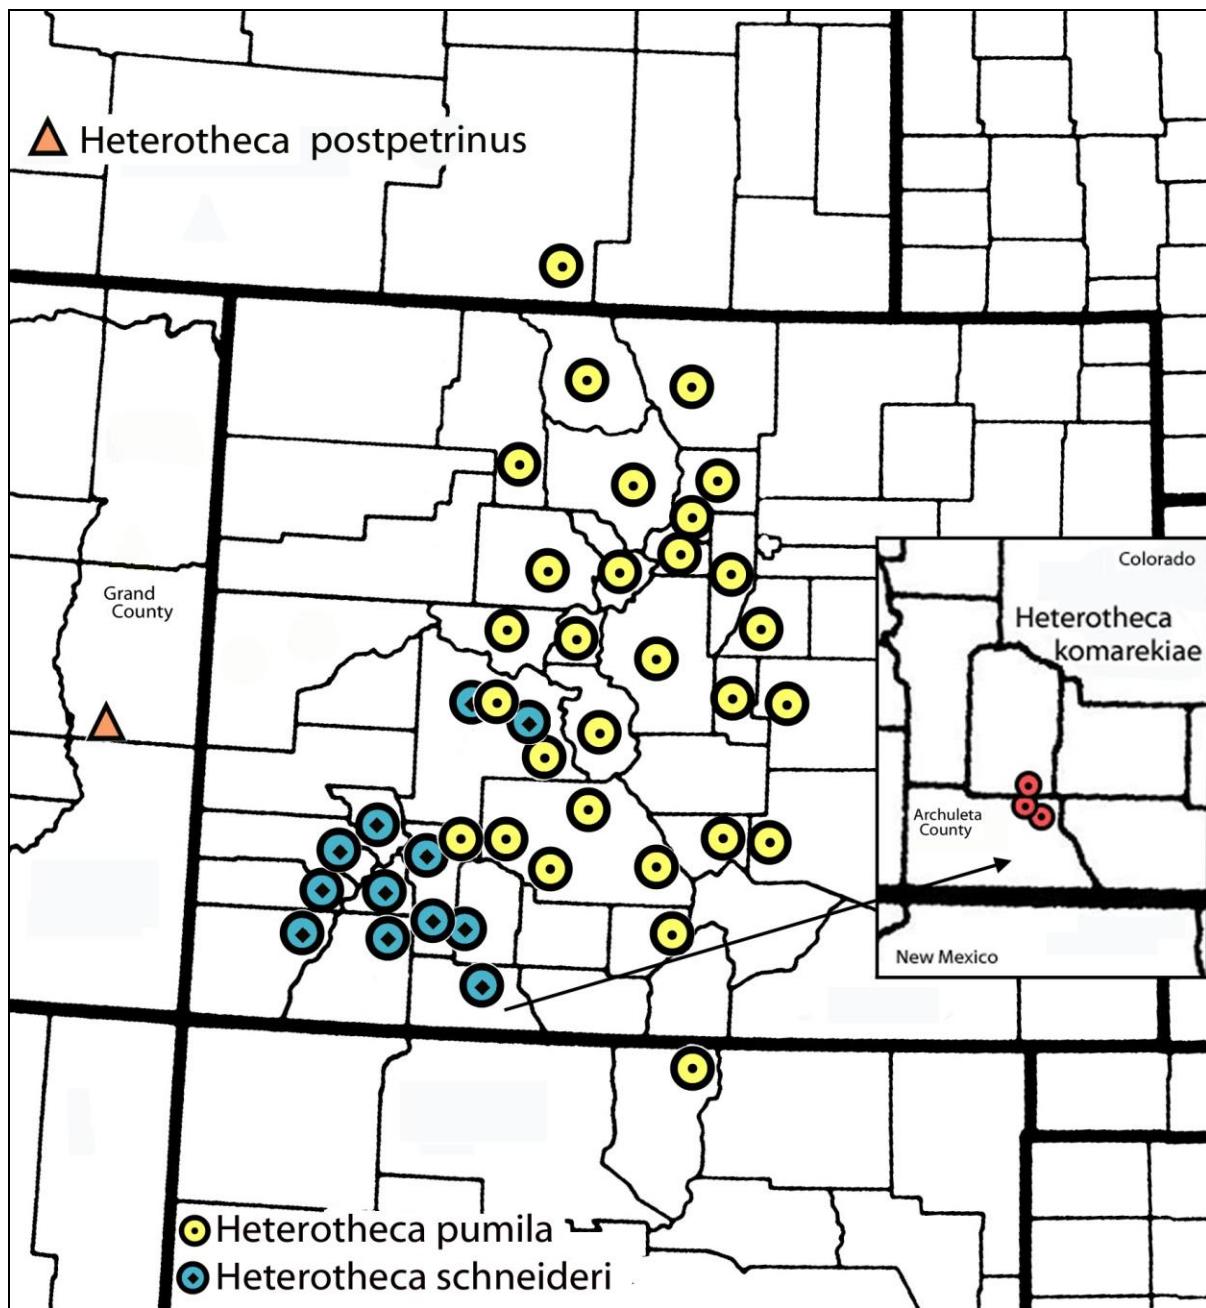

Map 13. Distribution of *Heterotheca* species. Names with arrows are types for *H. hirsutissima* and its synonyms. See text for comments on the disjunct locality in Oklahoma.

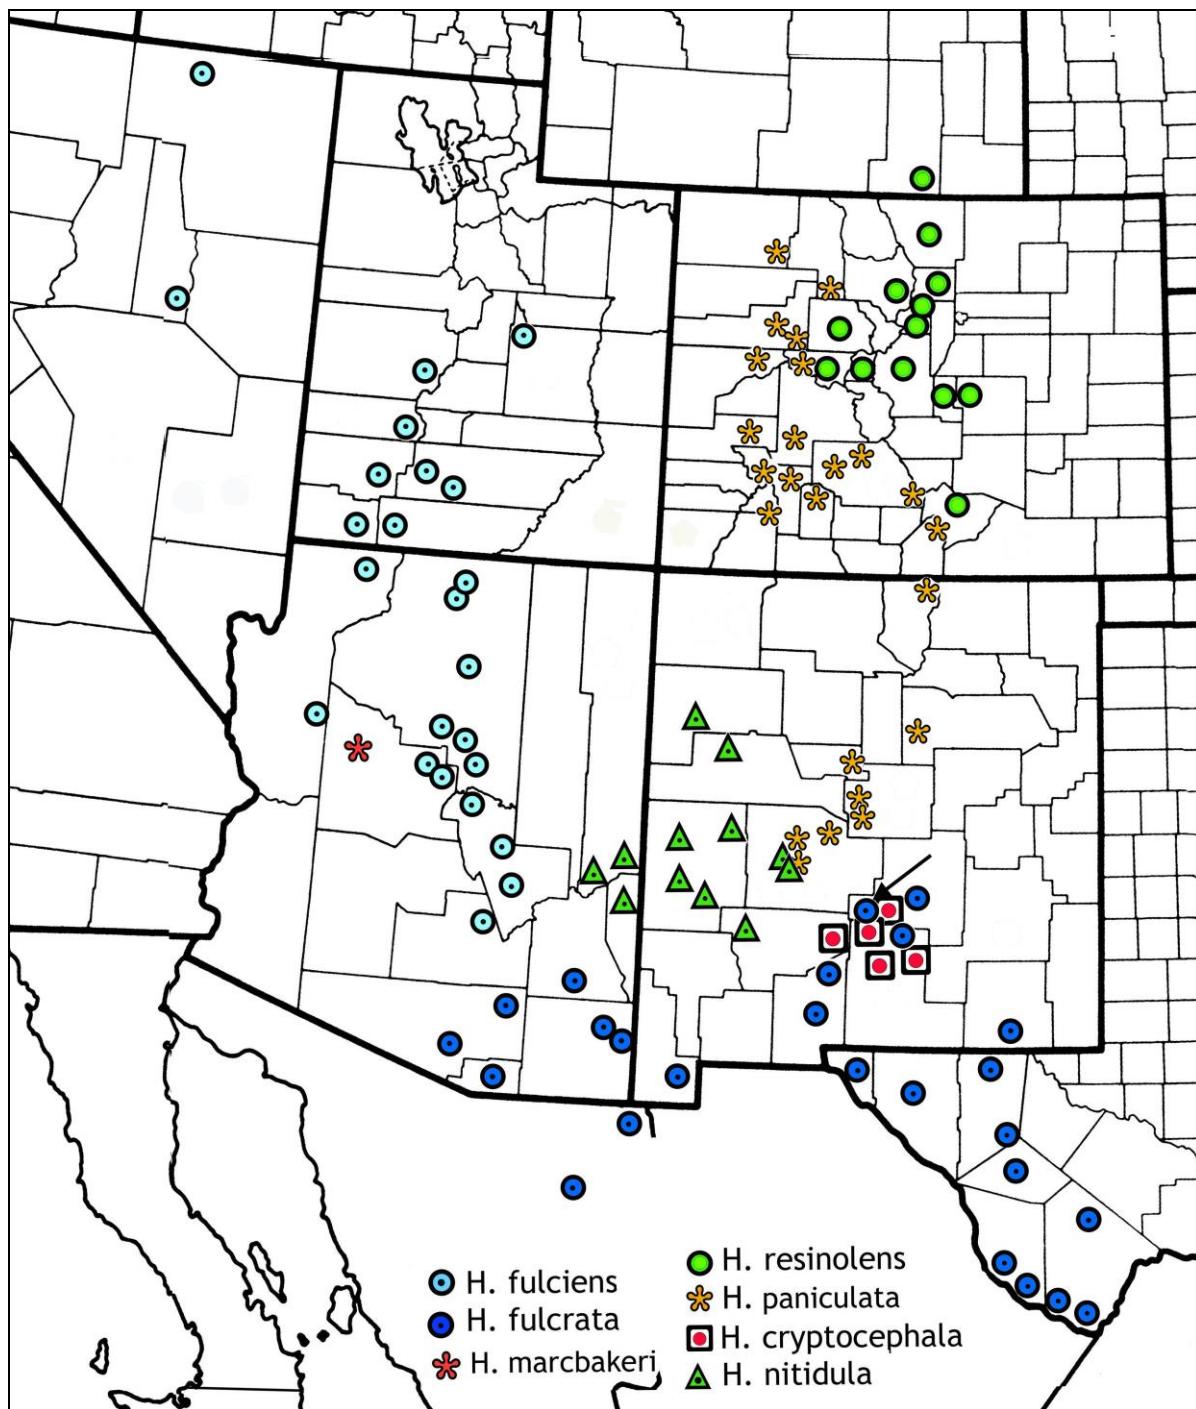

Map 14. Distribution of *Heterotheca rutteri*, *H. marginata*, and *H. viscidula*.

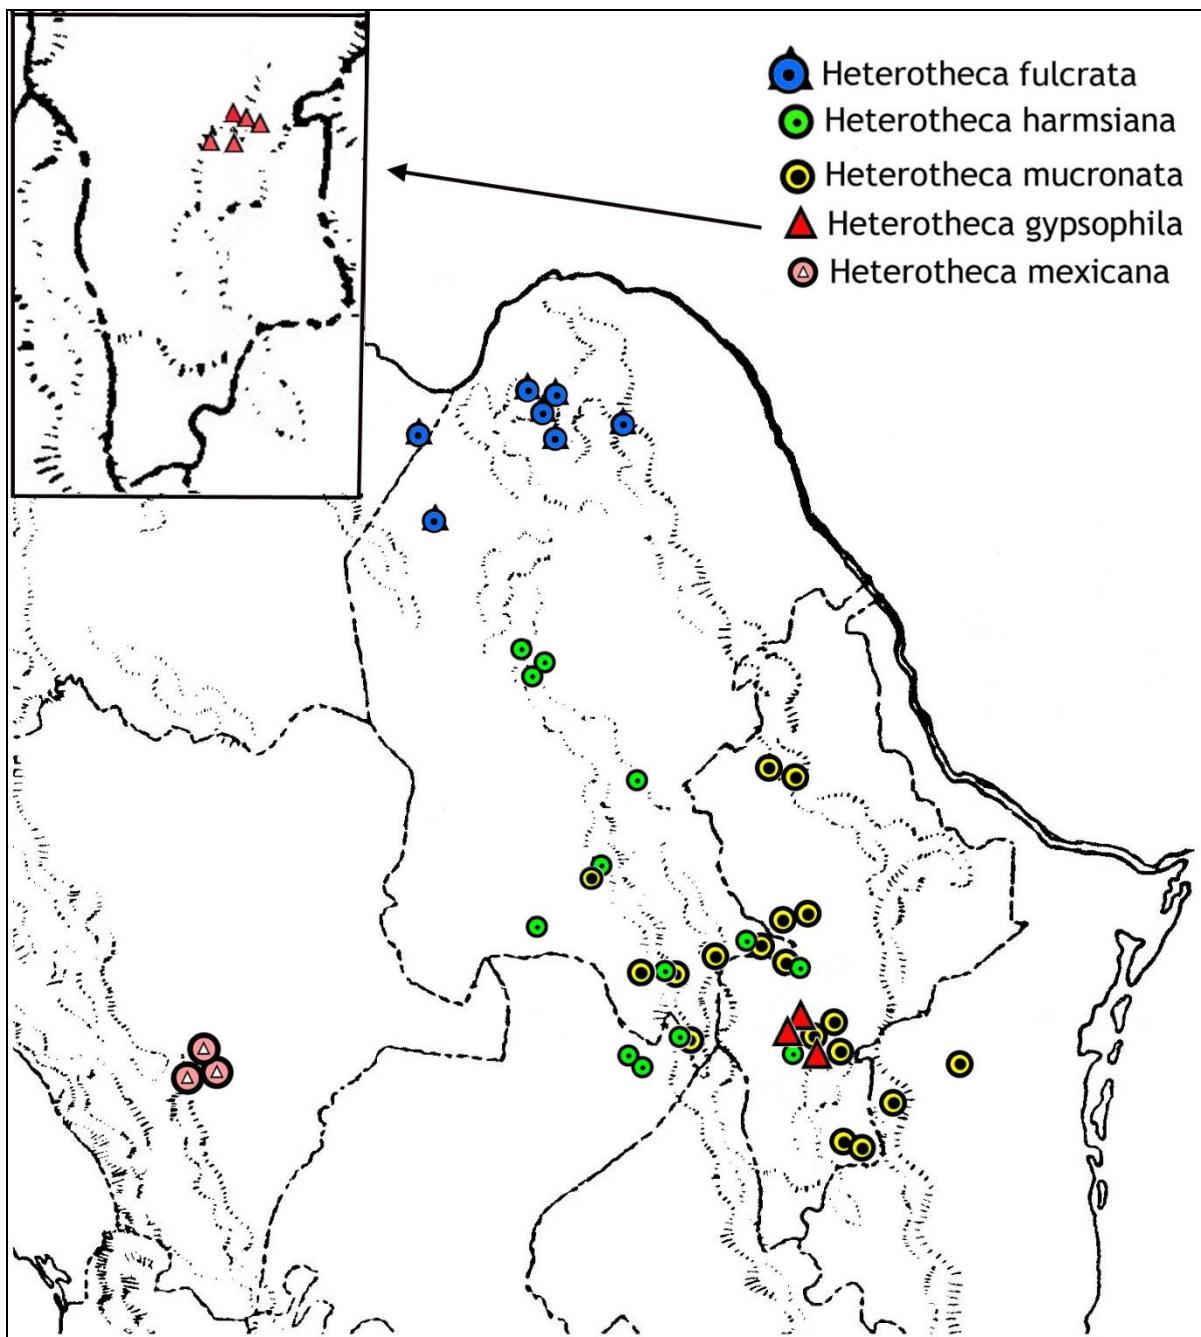

Map 15. Distribution of *Heterotheca arizonica*.

Map 16. Distribution of *Heterotheca pumila*, *H. schneideri*, *H. komarekiae*, and *H. postpetrinus*.

Map 18. Distribution of *Heterotheca* species. The range of *H. fulcrata* in the USA is shown in Map 17.

HETEROTHECA SECT. CHRYSANTHE Nesom **TYPE:** *Heterotheca villosa* (Pursh) Shinners

- 1. HETEROTHECA POLOTHRIX** Nesom, Sida 22: 373. 2006 [as nom. et stat. nov.]. *Chrysopsis villosa* var. *scabra* Eastw., Proc. Calif. Acad. Sci. 2:6: 294. 1896. *Heterotheca villosa* var. *scabra* (Eastw.) Semple, Phytologia 73: 453. 1992. **TYPE: Utah.** San Juan Co.: Willow Creek, 14 Jul 1895, A. Eastwood 38 (holotype: CAS image!). Not *Heterotheca scabra* (Pursh) DC. 1836 = *H. subaxillaris*.

Stems and leaves usually distinctly green from reduced non-glandular vestiture. **Stems** erect, usually little branched until distal 1/3, prominently sessile-glandular, loosely strigose to hirsute-strigose, hirsute-villous, or hirsute, sometimes essentially without non-glandular hairs. **Leaves** relatively widely spaced, usually ascending, oblong to oblong-lanceolate to oblanceolate, distal lanceolate to triangular-lanceolate, acute at apex, surfaces moderately to densely sessile-glandular, the glands little obscured by the sparsely strigose (nonglandular) vestiture, non-glandular hairs often less dense abaxially, often restricted to midvein area (middle 1/3) of adaxial surfaces, or sometimes nearly absent on both surfaces. **Heads** characteristically solitary on unbranched stems or appearing solitary on long, sparsely reduced-bracteate peduncles 2–5(–10) cm, sometimes few in a loosely corymboid arrangement when peduncles shortest; involucres 10–13 mm wide; phyllaries sparsely to moderately strigose, eglandular or minutely sessile-glandular, not viscid. **Ray flowers** 12–27. **Chromosome number**, $2n=36$ (Semple & Heard 7895, Semple 8817, 8819, 8823, 8827, 8828, 8897, from Arizona, Colorado, and Utah).

Considerable variation occurs, but the characteristic form of the species occurs over the whole range. In northeastern Arizona, San Juan Co., Utah, and southwestern Colorado, stem vestiture of *Heterotheca polothrix* sometimes is antrosely oriented and leaves have denser non-glandular vestiture, perhaps reflecting genetic influence of *H. pedunculata*. Some variants suggest gene exchange with *H. hirsutissima* where sympatric in the 4-Corners area.

In 2006, I included two species in the concept of *Heterotheca polothrix*, the typical expression (as in the present study) and *H. cinerascens* (recognized here as a distinct species). Semple (1987) first recognized the 'cinerascens' plants as distinct (as *H. horrida* subsp. *cinerascens*, from "western Utah and Nevada") but later (1996) included them as part of *H. villosa* var. *scabra*. The ranges of *H. cinerascens* and *H. polothrix* overlap slightly in southwestern Utah.

- a. Phyllaries glandular or mostly eglandular, sparsely strigose with non-glandular hairs; cauline leaves commonly widely spaced, ascending, grading gradually into peduncular bracts; heads usually solitary on long, sparsely reduced-bracteate peduncles or few in a loosely corymboid arrangement; leaves often with adaxial and abaxial surfaces distinctly different in vestiture, the adaxial more densely glandular and less densely hirsute-strigose 1. ***Heterotheca polothrix***
- a. Phyllaries completely glabrous or minutely glandular and resinous-viscid, without non-glandular hairs; cauline leaves and bracts often closely spaced, often overlapping, commonly spreading to deflexed, usually abruptly reduced and becoming bracteate distally; heads usually numerous in a corymboid arrangement, peduncular bracts characteristically continuing to immediately below heads; leaves densely and evenly sessile-glandular on both surfaces 3. ***Heterotheca cinerascens***

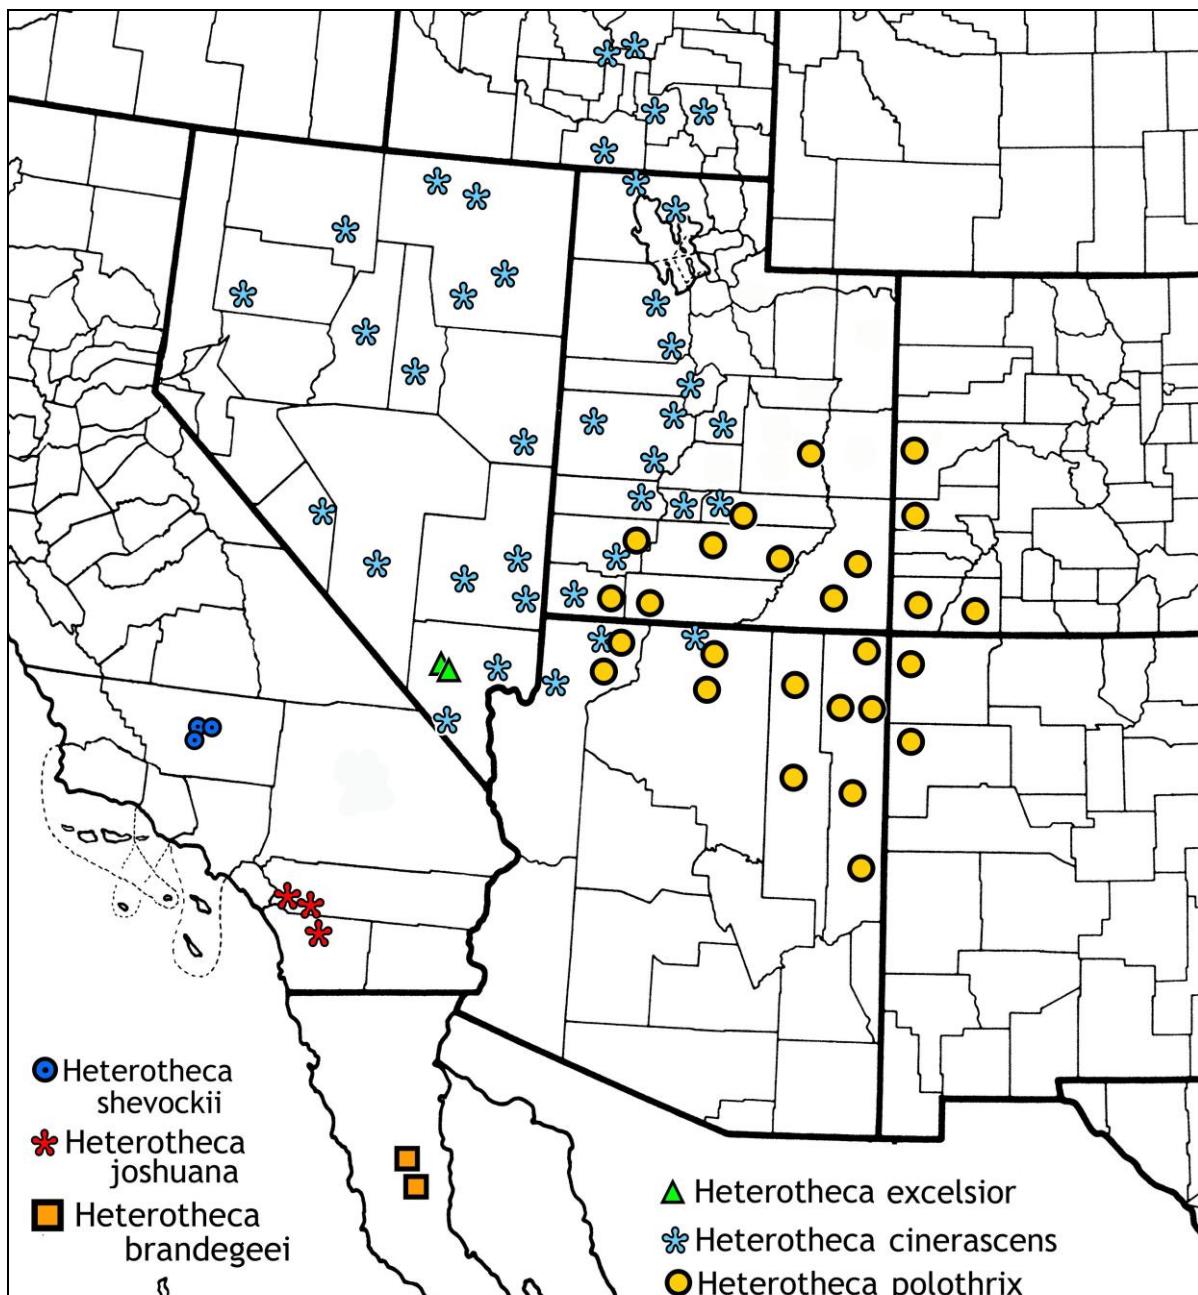

Figure 1. Distribution of *Heterotheca shevockii*, *H. joshuana*, *H. brandegeei*, *H. excelsior*, *H. cinerascens*, and *H. polothrix*.

Figure 2. *Heterotheca polothrix*, holotype (= *Chrysopsis villosa* var. *scabra*).

Figure 3. *Heterotheca polothrix*, McKinley Co., New Mexico.

Representative collections examined. **Arizona.** Apache Co.: Carrizo Mts, E. slopes, White Silver Mine Road, 7000-7500 ft, 26 May 1990, *Clifford AC-49* (BRY); Canyon de Chelly Natl Monument, 5700 ft, 13 Sep 1955, *Demaree 38385* (SMU); Hubbel Trading Post, Ganado, scattered across irrigation fields and ditches, 6300 ft, 2 Jul 1986, *Gandhi 220* (BRIT). Coconino Co.: Colorado River, Lees Ferry, River Mile 0, 2 May 1976, *Arnott 1994* (BRIT); Vermilion Cliffs Natl Monument, headwaters of Soap Creek above Cliff Dweller's Lodge, desert shrub, 6372 ft, 21 May 2003, *Atwood et al. 29266* (BRY); Navajo Mtn, 8000 ft, *Clute 38* (RM); San Francisco Mts near Clifton, 1 Nov 1880, *Greene 12856* (MO); Vermilion Cliffs Natl. Mon., 1570 m, 16 Jun 2003, *Higgins & Atwood 24673* (BRY); N side of Lee's Ferry, sandstone crevices, 7 Jul 1927, *Jaeger s.n.* (POM); 50 mi S of Lee's Ferry, 12 Jun 1890, *Jones s.n.* (POM); Grand Canyon, 7000 ft, 28 Jun 1898, *MacDougal 177* (RM); Cape Royal, N side of Grand Canyon, 7876 ft, 15 Jul 1927, *Pearson 7420* (RSA); halfway between Cameron and Desert View, Hwy 64, 15 Oct 1937, *Ramsey 2857* (RSA); 9.6 km E of Jacob Lake on US 89-Alt, pine woods, 12 Sep 1985, *Semple & Heard 7895* (MO). Mohave Co.: Near Robinson reservoir, T36N, R5W, S21, 12 Jun 1979, *Coombs & Bundy 2826* (BRY); Cottonwood Spring, T42N, R6W, S34, 5 Oct 1978, *Gierisch 4548* (BRY); Grand Canyon NP, Twin Springs Canyon, Redwall Narrows, beginning of perennial flowing water, 3080 ft, 28 Aug 2008, *Rink 8126* (BRY). Navajo Co.: 3.0 mi W of Boot Mesa, unnamed canyon drainage from N Todicheenie Bench, base of sandstone walls and talus slopes, 5600 ft, 23 Sep 2001, *Clifford & Heil 01-1314* (BRY); Holbrook, 18 Aug 1896, *Zuck s.n.* (MO). **Colorado.** La Plata Co.: ca. 10 mi N of Durango along US 550, ca. 2020 m, 24 May 2000, *King & Garvey 11292* (BRIT, MO, NY). Mesa Co.: Ca. 5 air mi NE of Gateway, dry wash and adjacent hillsides, pinyon-juniper, 5500 ft, 16 May 1994, *Lyon 3150* (RM); Gateway Nature Area N of Gateway between Colo Hwy 141 and Dolores River, base of N-facing Wingate cliff, 30 Aug 2010, *Yeatts 5953* (BRY, COLO, KHD). Montezuma Co.: Mesa Verde Natl Park, 8 Jul 1929, *Mathias 639*, mixed with *H. pedunculata* (PH). Montrose Co.: Western Montrose Co., bedrock, 5000 ft, 14 Jul 1924, *Payson 3922* (RM). **New Mexico.** McKinley Co.: Mesa between Peach Spring and Red Mesa canyons, rolling hills, sandy soil, ca. 6700 ft, 10 Sep 1976, *Wagner 2017* (UNM image!). San Juan Co.: 3 mi E of Farmington, alluvium of San Juan River, 31 Aug 1961, *Cannon s.n.* (UNM). **Utah.** Emery Co.: 10 mi W of Greenriver along I-70, roadside, 4700 ft, 11 Sep 1986, *Atwood 12432* (NY); Range Creek Canyon, ca. 0.7 road mi S of jct of Turtle Canyon and Range Creek roads, sandy loam with *Tamarix* and *Populus*, 4660 ft, 29 Jun 2007, *RCC 2007-27* (UT). Garfield Co.: 18 mi S of Notom Hwy 24 jct and ca. 2 mi N of Cedar Mesa Camp Ground road, pinyon-juniper, 1700 m, 15 Jun 1991, *Atwood 15588* (ID-2 sheets); ca. 3 mi N of Bakers Ranch, large side canyon just S of Millers Canyon in Halls Creek drainage, 4000-4500 ft, 30 May 1977, *Camp 25* (WTU); jct Calf Creek and Escalante River, sandy soil, 6000 ft, 21 Jun 1957, *Cottam 14687* (WTU); N of Escalante, sandy draw, 5900-6100 ft, 19 Jun 1938, *Pennell & Schaeffer 21963* (PH). Utah Hwy 95, vicinity of Hog Spring picnic area, just W of Glenn Canyon Natl Rec. Park, washes and ditches, 16 Jun 1987, *Semple 8819* (MO); Utah Hwy 12, 1 km S of Boulder, cracks in checkerboard sandstone, 16 Jun 1987, *Semple 8823* (MO); N of Escalante on Hells Backbone Bridge road, extensive rock outcrop below and E of road, common in sandy pockets, 16 Jun 1987, *Semple 8827* (BRIT); ca. 0.5 km NW of Hell's Backbone Bridge, ponderosa pine, 18 Sep 1987, *Semple 8899* (MO). Iron Co.: Cedar Breaks, dry meadow, 10,000 ft, 17 Jul 1930, *Goodman & Hitchcock 1618* (DS). Kane Co.: Side branch of Clear Creek ca. 2 mi N of East Entrance to Zion Natl Park, 6200 ft, 21 Jun 1979, *Ertter 2871* (WTU); along Colorado River, 2 mi below and on opposite side from Lake Creek, Shock Trail Bar, 18 Apr 1957, *Gaines 841* (WS); 0.5 km E of E boundary of Zion Natl Park, 17 Jun 1987, *Semple 8828* (MO); Clay Creek, dry hillsides, 8100 ft, 11 Aug 1927, *Taylor T-11* (RM); 1 mi S of Hwy 89 on hill of Chinley Fm, pinyon-juniper, 1600 m, 10 May 1992, *Thorne & Zupan 10134* (BRY, RM). San Juan Co.: Canyon No. 2, 1936, *Buss s.n.* (RSA); 8 mi N of Blanding, dry creek bed, 22 Jun 1938, *Cutler 2348* (MO); 4 mi W of Blanding, among pinyons, 5600 ft, 11 Sep 1939, *Cutler 3044* (SMU); Navajo Mts, Navajo Indian Reservation, ca. 40 air mi NE of Glen Canyon Dam, ponderosa pine, 8200 ft, 3 Aug 1967, *Gentry 1787* (ID! image!, SMU, WTU); Roan Bailey Mesa, ca 22 mi N of Monticello, 26 May 1986, *Grimes 2950* (MO); 30 mi SSE of Moab, E of US 163 near Lisbon Valley, just W of Big Indian Valley, W-facing dip slopes on carbonate cemented sandstone and mudstones, 6000-7000 ft, Jul 1984, *Jones 21* (BRIT); Sierra La Sal, 5-6000 ft, May-Oct 1899, *Purpus 7017* (MO); SW of Blanding, 2.1 km W of US Hwy 191 on Utah Hwy 95, cliff face of road cut, 16 Jun 1987, *Semple 8817* (MO). Wayne Co.: Fruita, sandy slopes, 4500 ft, 2 May 1944, *Cottam 9279* (UT); Natural Bridge near Fruita, dry sandy wash,

7000 ft, 6 Apr 1934, *Harrison* 7394 (KANU); ca. 5 mi N of Caineville, N Caineville Mesa, Emery sandstone, juniper-mtn mahogany, 6000 ft, 25 May 1986, *Kass* 2295 (BRY, RM); Canyonlands Natl Park, Virginia Park, 11 Jun 1967, *Kleiner & Harper s.n.* (UT); Canyonlands Natl Park, Virginia Park, 8 Aug 1967, *Kleiner & Harper s.n.* (UT); Canyonlands Natl Park, Virginia Park Canyon, 8 May 1968, *Kleiner & Harper s.n.* (UT); near Capitol Reef Natl Monument, 10 mi SSE of Fruita, sandy soil in steep narrow canyon, 1500-1650 m, 9 Jun 1953, *McVaugh* 14531 (SMU, VDB); ca 5 km S of Grover on Utah Hwy 12, 7900 ft, 18 Sep 1987, *Sepple* 8897 (BRY, MO); San Raphael Desert, sandy wash, 4500 ft, 7 Jul 1930, *Stanton* 494 (UT); Capitol Reef Natl Monument, along meadows and orchards of Robber's Roost Farm, 5400 ft, 18 May 1956, *Vickery* 571 (UT). Washington Co.: Zion Natl Park, valley floor of Zion Canyon near visitor center, pinyon-juniper, dry rocky slopes, 3800 ft, 15 Aug 1986, *Charlton* 526 (OBI); Zion Natl Park, Zion Canyon, 1-3 Aug 1925, *Pilsbry* s.n. (PH).

2. HETEROTHECA EXCELSIOR Nesom, sp. nov. **TYPE: Nevada.** Clark Co.: Charleston Mts [= Spring Mts], Excelsior Canyon, sandy soil with *Pinus scopulorum*, *Salix*, 1200 m, 7 Sep 1941, *Clokey* 8759 (holotype: MO 1293502!; isotypes: BRY-3 sheets!, CAS!, CM fide Seinet, CS fide Seinet, DS!, IDS-Fig. 6, LL!, MO-1293502!, NY-2 sheets!, PH-2 sheets!, POM!, RM-2 sheets!, SMU!, TENN-Fig. 5, TEX!, UC!, VDB!, WTU-2 sheets!).

Recognized by its long, unbranched, eglandular and loosely strigose stems, gradually reduced cauline leaves, and relatively small heads in a corymboid panicle. Similar to *Heterotheca polothrix* and *H. cinerascens* in its relatively large heads, eglandular stems, leaves glandular on both surfaces and with reduced non-glandular vestiture adaxially, and its southwestern USA geography. Similar to *H. polothrix* in its few-branched stems (below the inflorescence) but distinct in its branched inflorescence (vs. few-headed inflorescence), shorter stem vestiture, denser and finely strigose, non-glandular leaf vestiture (vs. hispid to hispid-hirsute or strigose-hirsute), and more densely imbricate phyllaries (vs. phyllaries in 3-4 series). Distinct from *H. cinerascens* in its non-glandular stem vestiture, ascending branches (vs. stiffly spreading) and rigid leaves, strigose phyllaries (vs. glandular, completely without non-glandular hairs), densely short-strigose leaf vestiture (vs. glandular and sparsely strigose or non-glandular hairs absent), lack of capitular bracts, and leaf apices without an indurate apiculum.

Stems apparently stiffly erect, 50-80 cm, unbranched until the distal 1/4-1/5, without axillary buds, loosely strigose to puberulent-strigose with upward-arching hairs, eglandular. **Leaves** (only cauline observed) oblong-oblanceolate to oblong-elliptic or lanceolate, not twisted, gradually reduced in size upward, closely ascending to spreading, mid cauline 2-35 x 4-6 mm, longest (proximal) to 40 x 9 mm, bracteate in the inflorescence, surfaces finely and densely strigose with short, thin-based hairs, more densely so abaxially, densely and minutely sessile-glandular on both surfaces, more conspicuously so adaxially, margins eciliate or with a few, spreading cilia at the very base. **Heads** in a compact to loose corymboid panicle; capitular bracts absent; involucres 6-9 mm wide (pressed), inner phyllaries 5-6 mm long, phyllaries loosely and finely strigose, glandular on a dark patch near the apex, imbricate in 4-5 series, linear-lanceolate, scarious-margined. Ray florets 10-21. The 24 sheets of the type collection include about 38 stems, all relatively consistent in morphology, but there is enough variation in vestiture and leaf shape and distribution to indicate that they were taken from more than a single plant.

Flowering Aug-Oct. Pine woods in sandy soil, rocky (sandstone) sites, ca. 1200 m. Apparently endemic to Red Rock Canyon National Conservation Area. Clokey's "Excelsior Canyon" refers to the site of a sandstone quarry operated by Excelsior Company, which operated between 1905 and 1912. All three known localities (including Willow Spring and Pine Creek Canyon) are in an area within a radius of 1.5-2 miles (Fig. 4).

Additional collection: Clark Co.: Spring Mts, common perennial in rocky sites about Willow Spring, ca. 4000 ft, 4 Oct 1968, *Niles* 855, NY, UT-2 sheets-Figs. 7 and 8). And see photo from Pine Creek Canyon, Figs. 9 and 10.

Figure 4. *Heterotheca excelsior* localities, Red Rock Canyon National Conservation Area, Clark Co., Nevada. Excelsior Canyon, Clokey 8759 (the type); Willow Spring, Niles 855; Pine Creek Canyon, photo by Stan Shebs (see Figs. 9 and 10). Google Earth.

Figure 10. *Heterotheca excelsior*. Pine Creek Canyon in Red Rock Canyon National Conservation Area, Nevada. Photo by Stan Shebs, 4 May 2007; Wikimedia Commons.

Over the course of this study, I annotated some sheets of *Clokey 8759* as *Heterotheca polothrix*, but the Spring Mountains locality is disjunct — west of the *H. polothrix* range — and it became clear that many features of these plants are not within the morphological spectrum of *H. polothrix*. The only other *Heterotheca* collections I have seen from Clark County are *H. cinerascens*, which is even more different than is *H. polothrix* (see diagnosis). *Heterotheca cinerascens* in typical form grows in the Spring Mountains (e.g., *Jaeger s.n.*, *Pinzl 9868*), including the Red Rock Canyon area. Photographs (habit and details) of a goldenaster on red sandstone are typical *H. cinerascens* (www.BirdandHike.com/Shrubs Around Las Vegas — Jim Boone).

Several UNLV collections (not seen) identified as *Heterotheca villosa* var. *villosa* from along Pine Creek in Red Rock Canyon National Conservation Area probably are *H. excelsior* — *Leary 592* and *3865*, *Fisher & Kennedy s.n.* These contrast with UNLV collections identified as *H. villosa* var. *hispida* from Clark County, including Red Rock Canyon NCA. *Pinzl 9868* from the Red Spring area of the Red Rock Canyon NCA is *H. cinerascens*.

3. HETEROTHECA CINERASCENS (Blake) Nesom, **comb. et stat. nov.** *Chrysopsis viscosa* A. Gray subsp. *cinerascens* Blake, Proc. Biol. Soc. Washington 35: 173. 1922. *Heterotheca horrida* subsp. *cinerascens* (Blake) Semple, Brittonia 39: 381. 1987. **TYPE: Utah.** [Beaver Co.: fide Welsh 1982]: Beaver Creek Cañon, common among rocks, oak region, 2 Sep 1901, *I. Tidestrom* 2873 (holotype: US image!; isotype: WIS image!).

A distinctive species, almost always in rocky habitats, characterized by sparsely to moderately puberulent-hirsutulous stems, stiff, sessile-glandular and otherwise sparsely and loosely strigose to hirsute-strigose, eciliate leaves, linear to linear-ob lanceolate or narrowly lanceolate capitular bracts, and evidently keeled phyllaries sessile-glandular and often resinous but otherwise glabrous. **Stems** mostly 10–40 cm, mostly erect from the base. **Leaves** narrowly elliptic-ob lanceolate to elliptic, (5)10–20(–30) mm wide, (1–)2–7 cm long, petiolate, the distal caudine usually deflexed or at least spreading, often abruptly smaller, surfaces densely and evenly sessile-glandular, also sparsely to moderately hirsute to hirsute-strigose, vestiture sometimes more reduced adaxially. **Heads** numerous in a loosely corymboid arrangement, without capitular bracts; involucres (7–)9–11 mm wide, phyllaries linear-lanceolate, inner 5–7 nmm long. **Ray flowers** 10–17. Chromosome numbers, $2n=18$ (Semple & Heard 7818, 7876; Semple et al. 9270), $2n=36$ (Semple & Heard 7857).

Flowering (Jun–)Jul–Oct. Steep rocky slopes, among boulders, rock outcrops, cliffs, crevices, on limestone, granite, lava flows, and tuff; (rarely 3000–4000) 4450–8200(–8850, rarely 9500–10,500) ft.

Additional and representative collections examined. **Arizona.** Coconino Co.: Vermilion Cliffs Natl Recreation Area, Navajo blow sand, pinyon-juniper-sagebrush community, 6061 ft, 13 Sep 2005, Higgins 26873 [influence of *H. polothrix*?] (BRY); Vermilion Cliffs Natl Monument, Cathedral Wash, Upper Lowrey Spring, Navajo sandstone, high desert shrub, riparian, 4602 ft, 2 Aug 2012, Hodgson 27296 (BRY). Mohave Co.: Parashant Canyon, sandy to gravelly canyon bottom, *Chrysothamnus-Brickellia-Acacia* community, 1100 m, 11 Oct 2000, Higgins & Atwood 21849 (BRY). **Idaho.** Bannock Co.: McCammon side of Indian Rocks State Park, dry rocks, with cheatgrass, sagebrush, bitterbrush, and cactus, 4684 ft, 2 Jul 1996 Chipman 246 (IDS image!, SRP image!), 13 Jul 1996, Chipman 281 (IDS image!, SRP image!, UTC image!), 6 Aug 1996, McDougall & Chipman 348 (IDS image!, SRP image!, UTC image!); head of Mill Creek Canyon ca. 4 mi SE of Bancroft, seep area, 6750 ft, 8 Aug 1978, Foster 7134 (RM). Blaine Co.: Craters of the Moon Natl Reserve, W edge of the Carey lava flow, ca 2 mi E of Carey, in "Crater Lake" area, a large complex of seasonally ephemeral and longer-lasting water pools, 4780 ft, 1 Aug 2006, Mancuso et al. 2995 (BRY, CRMO image!). Butte Co.: Craters of the Moon Natl. Monument, Big Cinder Butte Flow, 7 Aug 1936, Collector not specified [Natl Park Service] 123 (CIC); Craters of the Moon Natl. Monument, young pahoehoe flow, 5600 ft, 7 Aug 1936, Eggler 125 (MIN image!). Cassia Co.: Emery Canyon, Silent City of the Rocks, rocky ground, 23 Aug 1951, Baker 8676 (BRY, ID-2 sheets! images!, NY-4 sheets, UC, WTU-3 sheets); City of Rocks, base of rock, 6000 ft, 17 Jul 1974, Brown 862 (SRP image!); Keg Hollow Canyon, woodland to rockland, with *Pinus monophylla*, *Juniperus osteospermum*, and *Cercocarpus ledifolius*, 6600 ft, 22 Jul 1974, Brown 906 (CIC image!, IDS image!); Albion Mts, near City of Rocks, SW of Malta, pinyon-mountain mahogany community, coarse granitic sand, 1 Sep 1982, Goodrich et al. 17878 (BRY, ID! image!, NY); Albion Mountains, base of granite rocks and in soil pockets on rock faces at Twin Sisters, 10 Jul 1992, John 796 (IDS image!); City of Rocks, pinyon-juniper, 5700 ft, 16 Sep 1973, Johnson s.n. (ID! image!); main climbing area of lower City of Rocks, aspen understory, 6200 ft, 23 Oct 2006, Mansfield 6231 (CIC image!, ID! image!, NY); Albion Mountains, Sawtooth Natl Forest, Mt. Harrison proposed RNA, just S (below) Peak 8806, ca 1 mi NE of lookout on Mt. Harrison, ca 8 mi SE of Albion, deep, stony soil (quartzite), colluvial, unstable disturbed areas within *Artemisia tridentata* subsp. *vaseyanus*-*Symphoricarpos oreophilus*-*Bromus carinatus* community, 8700 ft, 10 Aug 1987, Moseley 1165 (ID! image!); ca 1.5 mi NE of Mount Harrison, *Pinus flexilis*/ *Cercocarpus ledifolius*, 8860 ft, 14 Sep 1973, Steele 765 (CIC image!, ID! image!); City of Rocks, 28 Jul 1952, Zappettini 46 (ID! image!). Power Co.: Craters of the Moon Natl Monument, Wapi Park, W end of park by aspen, burned area and adjacent lava flow, 5082 ft, 5 Jul 2002, Atwood 28744 (CRMO image!, NY); Craters of the Moon Natl Monument, S edge of Wapi Lava Field, 0.2 mi W of Wapi

water tower, transitional edge of Snake River plain, sandy site and fissured Pahoehoe lava flow, 4450 ft, 23 Jun 2006, *Atwood* 31595 (CRMO image!); Minadoka Natl Forest, Sublett Division [now Sawtooth NF; the Sublett Division is in SW Power Co.], 6500 ft, 10 Aug 1936, *Richardson* s.n. (ID! image!); Sublett Division, Minadoka Natl Forest [now Sawtooth NF], 6500 ft, 20 Aug 1936, *Richardson* 94 (ID! image!). **Nevada.** Clark Co.: Charleston Mts, sandstone cliffs near La Madre Spring [Red Rock Canyon Natl Conservation Area], 4700 ft, 12 Sep 1928, *Jaeger* s.n. (UC); Lincoln City, Condor Canyon, upland community, 5000 ft, 11 May 1988, *Koniak & Nelson* s.n. (BLM Herbarium, Las Vegas Dist image!); E side of Spring Mtns, Calico Hills, Red Spring area [Red Rock Canyon Natl Conservation Area], rock slope, 3651 ft, 27 Sep 1991, *Pinzl* 9868 (NY image, UTC image); Muddy Mts, ca. 1.5 mi W of Logandale, Jurassic outcrop, 1400 ft [m?], 9 Aug 1979, *Swearingen* 1206 (RSA); Muddy Mts, uncommon in wash which feeds into Colorado Quarry from unnamed valley, ca. 3000 ft, 11 May 1980, *Swearingen* 1428 (RSA). Elko Co.: 0.25 mi W of Collar Elbow Basin, pinyon pine, granitic soil, 7000 ft, 9 Aug 1979, *Foster* 8378 (BRY, NY, RM); Ruby Mts, mouth of Lamoille Canyon, dry soil in rock crevices, 14 Aug 1941, *Holmgren* 1763 (UC, UTC); N slope of Brown Creek Canyon, dry sagebrush slopes, 7500 ft, 28 Aug 1983, *Holmgren* 10265 (BRY, CAS, RSA, WTU); Jarbridge Wilderness, head of Cottonwood drainage, ledges, 9500 ft, 17 Aug 1976, *Lewis & Walters* 4538 (BRY); Ruby Mts, Lamoille Canyon, dry wash, 7500 ft, 27 Jul 1940, *Munz* 16176 (CAS, POM, UC, WTU); N end of Spruce Mtn, just E of Black Forest Mine Bldg complex, rock-lined narrow canyon, by rock outcrop with *Holodiscus*, 8200 ft, *Pinzl* 10152 (TEX); Soldier Creek [labeled as from Humboldt Co.], woodland, 8 Jul 1928, *Price* 216 (RM); Ruby Mts, Soldier Creek Trail area, E of Nev Hwy 227, cracks in canyon rock faces, 10 Aug 1990, *Semple et al.* 9270 (BRY); Bull Run Mts, ridge just E of the Bull Run Reservoir, 7400 ft, on very steep limestone ridges, 24 Aug 1984, *Tiehm* 9295 (BRY, CAS, ID! image!, NY, RSA, TEX, WTU); Jarbridge Mts, lower part of Camp Creek on the E side of the range, near the forks, with *Artemisia* in steep rock outcrops, 7000 ft, 2 Aug 1985, *Tiehm* 10070 (BRY, CAS, ID! image!, NY, TEX, VDB); Robinson Creek, E side of Ruby Mts, 7000 ft, 5 Aug 1936, *Train* 429 (MO); head of Copper Creek Basin, Jarbridge Mts, lava rimrock crevices, 8200-8800 ft, 6 Aug 1937, *Train* 662 (DS, NY); Jarbridge River Canyon, 1-3 mi from Jarbridge, 6800 ft, 17 Aug 1937, *Train* 783 (UC); W slope of Ruby Mts, Soldier Creek Canyon at Mine, dry granite slope, 6400 ft, 1 Sep 1940, *Train* 4650 (NY, UC); Ruby Mts, Lamoille Canyon, Lamoille Canyon Road, roadside, 2353 m, 30 Aug 2013, *Warman* 79 (UTC); Ruby Mts, Lamoille Canyon, 1.9 road mi beyond Thomas Creek Campground, gravelly soil, roadside, 8400 ft, 22 Aug 1984, *Williams* 84-105 (BRY, CAS, IDS, NY). Esmerelda Co.: Lone Mt area about 14 mi W of Tonopah, Springdale Canyon on the E side, in granite rock outcrops, 30 Jul 1983, *Tiehm* 8250 (BRY, CAS, NY, RSA, TEX). Eureka Co.: Monitor Range, N Fork Allison Creek, ca 34 mi from Austin, 7920 ft, 3 Jul 1979, *Goodrich* 13172 (BRY, NY); East Pahranagat Range, 3.7 road mi W of Pahranagat High School in Alamo, on silicic ash flow tuff rock outcrops, 4200 ft, 18 Jun 1982, *Tiehm* 7231 (MO); Roberts Creek Mts, Roberts Creek near the campground, in steep limestone outcrops, 7000 ft, 18 Jul 1983, *Tiehm* 8179 (CAS, NY, RSA, VDB); Diamond Mts, Davis Canyon on the NW side of the range, 0.2 mi E of the first creek crossing, 7000 ft, in steep rock outcrops N of the road, 19 Jul 1983, *Tiehm* 8187 (BRY, CAS, NY, RSA, TEX, WTU); Fish Creek Range, near the entrance to Goodwin Canyon just S of Eureka, in steep limestone outcrop, 6350 ft, 15 Sep 1983, *Tiehm* 8414 (CAS, NY, RSA, TEX, VDB); New York Canyon, dry rocky slopes, 7000 ft, 18 Oct 1937, *Train* 1248 (DS, MO, UC). Humboldt Co.: Little Humboldt Ranch, 6500 ft, 28 Aug 1940, *Holmgren* 756 (BRY, RM, WTU). Lander Co.: 17 mi from Austin, Birch Creek Canyon, dry rocky soil of decomposed granite, 7 Sep 1937, *Henning* 41 (NY, UT). Lincoln Co.: Panaca, 5 Sep 1912, *Jones* s.n. (POM-2 sheets); Mt. Irish, Aug 1898, *Purpus* 6352 (UC); East Pahranagat Range, 3.7 road mi W of Pahranagat High School in Alamo, tuff rock outcrops, 4200 ft, 15 May 1982, *Tiehm* 6890 (CAS) and 18 Jun 1982, *Tiehm* 7231 (CAS, NY, RSA); Mahogany Mts, jct of road to Deer Lodge Canyon and the road to Prohibition Flat, in sandstone outcrops near the junction, 6300 ft, 13 Sep 1983, *Tiehm* 8375 (CAS, NY, RSA, TEX, VDB); Clover Mts, Pine Canyon Reservoir, just N of the dam, on the W side of the reservoir, with pinyon-juniper, *Artemisia tridentata* on rocky steep slopes, 5740 ft, 5 Sep 2005, *Tiehm* 15068 (BRIT, BRY, CAS, ID! image!, NY, RSA); 10 mi W of Crystal Springs, E side Irish Mtn, W side of Pahranagat Valley, 5500 ft, 28 Aug 1938, *Train* 2395 (DS, MO, NY); 4 mi N of Caliente on road to Panaca, 4000 ft, 7 Sep 1938, *Train* 2473 (UC). Nye Co.: NE Forty-Mile drainage basin, Nevada Test Site, common on cliffs

and along rock outcrops of canyon wash, steep-walled canyon N of Twin Peaks, W of Back Rainier Mesa Rd and E of Pahute Mesa Rd, rays deep orange-yellow, 17 Sep 1971, *Beatley* 13226 (CAS, NY, RSA, TEX); Nevada Test Site and vicinity, *Beatley* 2916, 3132, 3930, 6439, 6525, 6582, 7280, 9693, 9915 (CAS, DS, NY, RSA); S end of Toquima Range NNW of Baxter Spring, canyon bottom, 7200-7600 ft, 25 Aug 1978, *Genz* 8895 (BRY); Monitor Range, E Dobbin drainage, Miniature Grand Canyon, crevices, 7500 ft, 26 Sep 1977, *Goodrich* 10775 (BRY); Toiyabe Range above Timblin Creek, 35 air mi SE of Austin, cracks and talus, 10,500 ft, 30 Aug 1978, *Goodrich* 12236 (BRY, NY); Grant Range, Troy Canyon on W side of the range, 2.2 road mi E of the Nyala road, granite outcrops, 6000 ft, 17 Aug 1983, *Tiehm* 8300 (BRY, CAS, NY, RSA, WTU); Monitor Range, East Dobin Creek, Miniature Grand Canyon at the canyon entrance, steep rock outcrops, 7650 ft, 30 Aug 2001, *Tiehm* 13761 (BRY, CAS, ID! image!, NY, RSA, UC, WTU). Pershing Co.: Juniper Range, rocks, 6000-7000 ft, May-Oct 1898, *Purpus* 6247 (UC); Juniper Mts, 6000-7000 ft, May-Oct 1898, *Purpus* 6248 (UC). White Pine Co.: Rocks on W side of cirque on N side of Mt. Sherman, 10,000 ft, 4 Aug 1939, *Hitchcock & Martin* 5679 (CAS, DS, IDS image!, NY, RSA, UC, WTU); Cherry Creek, 17 Jul 1891, *Jones* s.n. (POM); [Snake Range], Jeff Davis Mtn, on slopes, 2400 m, 27 Aug 1919, *Tidestrom* 11133 (LL); Snake Range, Murphy's Wash at the S end of the range, 4.9 road mi N of Big Springs Wash road, cracks of steep limestone canyon walls, 6600 ft, 9 Aug 1985, *Tiehm* 10104 (BRY, CAS, NY, TEX, VDB); Schell Creek Range, McCoy Creek on E side of range, 2 road mi W of main Spring Valley road, rock outcrops, 7000 ft, 10 Aug 1985, *Tiehm* 10127 (BRY, CAS, NY); Egan Range, foothills on E side of Jakes Wash, steep sandstone outcrops 6375 ft, 19 Jul 2000, *Tiehm* 13328 (BRY, CAS, CIC image!, ID! image!, RSA, UC, WTU); Diamond Mts, Mining Canyon, SE end of range, 11.2 road mi N of Hwy 50 on Rte 892, limestone canyon with pinyon-juniper, 6350 ft, 30 Aug 2009, *Tiehm* 15949 (BRY, CAS, CIC image!, NY). Utah. Beaver Co.: WahWah Mts, WahWah Mines, 13 air mi S of Wah Wah Pass, among quartzite boulders on N side of canyon, 7800 ft, with ponderosa pine, juniper, and *Cercocarpus*, 8 Aug 1969, *Holmgren* 3830 (NY, RSA, WTU); Tushar Mts, Beaver River Canyon, S-facing cliff base, pinyon-juniper-oak-*Cercocarpus*, ca. 7600 ft, 16 Aug 1984, *Taye* 3132 (BRY); ca. 5 km E of Beaver on Utah Hwy 153, at boundary of Fish Lake Natl Forest, near creek, edge of Gambel's oak woodland and near volcanic rocks, ca. 6000 ft, 10 Sep 1985, *Semple & Heard* 7818 (BRIT, BRY, MO); Wah Wah Mts, Pine Grove Canyon, pinon-juniper woodland, 13 Sep 1963, *Welsh & Christensen* 2705 (BRY, NY). Boxelder Co.: Raft River Mts, SW of Strevell, Clear Creek Campground, sagebrush hillside, 6400 ft, 26 Jul 1965, *Erdman* 2400 (BRY); Sulphur Springs, Bear River Bay [Great Salt Lake], cliffs in foothills, 14 Aug 1929, *Garrett* 5408 (LL) and *Garrett* 5408a (BRY, LL, RM). Iron Co.: Wah Wah Mts, 8 air mi N of Lund, Broae Hill, tuffaceous knoll NE of road across Blawn Wash, ca. 1750 m, 7 Sep 1988, *Ertter* 7941 (BRY, NY, RSA, UC); Cedar Breaks, dry meadow, 10,000 ft, 17 Jul 1930, *Goodman & Hitchcock* 1618 (DS); Three Peaks Recreational Area, ca 9 mi W to NW of Cedar City, granitic boulders on mountain summit, 1767 m, 24 Sep 2007, *Spujt* 16133 (BRIT, RSA); Pine Valley Mts, Paradise Spring Trail, pinyon-juniper-mahogany-oak, 7100 ft, 26 Jun 1986, *Warrick* 2182 (BRY). Juab Co.: 8 mi E of Leamington, Dog Valley Wash, ca. 5000 ft, 12 Oct 1983, *Baird* 293 (BRY); ca. 15 mi E of Leamington, 8 Sep 1965, *Welsh & Moore* 5146 (BRY, NY). Kane Co.: Paria Plateau, 18 Aug 1972, *Atwood & Moore* 4286 (ID); 1 km E of Zion Natl Park on Utah Hwy 9, red sand, junipers, 12 Sep 1985, *Semple & Heard* 7876 (BRY). Millard Co.: Canyon Mts, Oak Creek near Oak Creek Campground and Guard Station, 4.2 mi SE of Oak City, quartzite outcrop, 6300 ft, 7 Aug 1981, *Goodrich* 16084 (BRY); House Range, Painter Spring, granite, riparian, 6500 ft, 2 Sep 1981, *Kass & Preston* 624 (BRY); Pavant Range, Piute ATV trail on conglomerate outcrop, white fir community, 7800 ft, 18 Sep 1999, *Tilley* 961 (BRY). Piute Co.: Falls of Bullion Creek, [the MO label says "Marysville, Tate Mine"], 9500 ft, 24 Aug 1894, *Jones* 5903 (MO, NY, POM, RM, UC); Bullion Canyon, in and near the Gorge, 27 Jul 1905, *Rydberg & Carlton* 7288 (NY, RM-2); Tushar Mts, Bullion Canyon, outcrop cracks, aspen-white fir, 8791 ft, 20 Jul 1990, *Taye* 4886 (BRY). Sanpete Co.: Maple Canyon, vicinity of Ephraim, 24 Jul 1934, *Olsen* s.n. (UTC image!). Tooele Co.: Sheeprock Mts, narrows of Joe's Canyon, granite outcrop cracks, mountain brush community, 2250 m, 13 Sep 1995, *Bates* 918 (BRY); Stansbury Mts, Muskrat Canyon, quartzite slope, 7200 ft, 28 Jul 1981, *Taye* 1429 (BRY). Washington Co.: St. George, arid hills near Sugar Loaf, 20 Jun 1942, *Degener & Peiler* 16,639 (MO, NY); N of St. George, red sandstone ledges, 3000 ft, 8 Sep 1935, *Galway* s.n. (BRY-2 sheets); 2.8 mi N of St. George on road to Enterprise, dry rocky wash with *Rhus trilobata*, *Juniperus*, and *Artemisia tridentata*, 3000 ft, 7 Sep 1941, *Gould* 1357 (CAS, DS, ID!)

image!, NY, PH, POM); Dixie State Park, ca. 5 mi NW of Ivins, sandy soil, 3200 ft, 13 May 1967, Higgins 988 (BRY); Red Mts, Navajo sandstone and blow sand, *Artemisia-Quercus*-mixed shrub, 1250 m, 9 Jun 1999, Higgins et al. 20387 (RM); Pine Park, conglomerate ash of volcanic origin, ponderosa pine-oak-pinyon-juniper, 1750 m, 25 Sep 1999, Higgins 20871 (BRY, MO, RM); Zion NP, near canyon bottom, dry hot slopes, 15 Aug 1932, McDonald 1161 (RM); Zion Natl Park, Narrows Trail, ca. 1 mi N of Temple of Sinawave, 12 Jun 1970, Moor 2118 (BRY); St. George, 1875, Palmer s.n. (MO); W of Leeds on Silver Reef Road, 2.0 km into Dixie Natl Forest, road cut through red sandstone, 10 Aug 1985, Semple & Heard 7857 (BRY). Wayne Co.: Top of North Caineville Mesa, ca. 16 mi W of Hanksville, cap of Emery sandstone along NW rim, 5900 ft, 6 Sep 1985, Tuhy 2506 (BRY).

Variant: Leaves widely spaced, oblanceolate, 7 mm wide, 3–4.5 cm long: **Arizona**. Mohave Co.: Short Creek, crevices of rocks, 4500 ft, 10 Jun 1941, Cottam 8578 (RSA).

Variant: Vestiture completely glabrous, outer phyllaries foliaceous, and heads few-flowered (disc): **Nevada**. Clark Co.: Muddy Mts, 11 May 1980, Swearingen 1428 (RSA). *Swearingen 1206* (RSA) from the same area is typical *Heterotheca cinerascens*. The Muddy Mountain plants occur at ca. 3000 ft, at the lowermost elevational limit for the species.

Variant: Habit and aspect of *Heterotheca cinerascens* but phyllaries strigose: **Utah**. Washington Co.: Zion Natl Park, Emerald Pool Trail, 9 Oct 1937, Ramsey 1267 (POM) and Ramsey 1268 (POM).

Variant: Some collections from Zion National Park resemble *Heterotheca cinerascens* in vestiture but have long (40–50 cm), lax-flexuous stems, thin leaves relatively evenly spaced and even-sized (all the way to the heads), and solitary heads (on long peduncles). These are consistent in aspect and apparently are plants with suppressed lateral buds (buds sometimes occur in nodes immediately below the heads). **Utah**. Washington Co.: The Narrows Trail, 8 Sep 1938, Eastwood & Howell 6325 (CAS); The Narrows Trail, 13 Sep 1968, Howell & True 45301 (CAS); Zion Natl Park, no other locality data, 25 Jun 1933, Eastwood & Howell 1105-a (CAS); Zion Natl Park, Narrows Trail, rocky slopes, ca. 4420 ft, 30 Sep 1972, Nelson 10134 (RM); Zion Natl Park, no other locality data, 24 Sep 1928, Thackery 507 (TEX-2 sheets); Zion Natl Park, Zion Canyon, N Fork Virgin River, along river bottom, between trailhead and The Narrows, riparian, on alluvium, 8 Aug 1987, Thorne & Chandler 5586 (RM); Zion Natl Park, side canyon of Clear Creek along Washington-Kane county line, Navajo sandstone, 5240 ft, 15 Oct 1987, Thorne & Franklin 5749 (RM). This distinctive growth form, with solitary heads on long, flexuous stems, also occurs in plants identified here as *H. zionensis*, e.g., **Utah**. Garfield Co.: California Creek Canyon, Cox & Baumann s.n. (BRY). Washington Co.: South Ash Creek, Warrick 2717 (BRY). On the other hand, typical plants of *H. cinerascens* occur in the same area of Zion National Park (see citations above) and these monocephalous variants, highly distinctive in appearance, should be studied further.

4. HETEROTHECA JOSHUANA Nesom, sp. nov. **TYPE: California**. San Bernardino Co.: Joshua Tree Natl Park, Little San Bernardino Mts, Queen Mountain, near Oak Canyon, bouldery wash, locally infrequent in boulder crevices, 1460 m, 3 Nov 2008, T. LaDoux et al. 1841 (holotype: JOTR image!, Fig. 15).

Similar to *Heterotheca cinerascens* in aspects of vestiture (especially leaves with glandular surfaces and phyllaries glandular and without other hairs), different in its (1) stems with fine, spreading-ascending hairs (vs. puberulent-hirsutulous with patent hairs), (2) leaves linear to linear-lanceolate, sharp-pointed and apiculate, even-sized, and densely arranged (vs. narrowly elliptic-oblanceolate to elliptic, apex rounded, usually diminishing in size distally, characteristically more widely spaced), (3) heads smaller (rays 6–14 vs 10–17, involucres (5–)6–9 mm wide vs (7–)9–11 mm wide), and (4) consistent lack of prominent capitular bracts.

Plants perennial from a woody taproot; axillary buds produced along entire length of the stems. **Stems** mostly 20–25 cm, erect or slightly ascending from the base, internodes 1–7 mm long, densely minutely glandular, sparsely hirsute-strigose to stiffly villosulous with fine, spreading to spreading-ascending or ascending hairs of relatively even length. **Leaves:** basal and lowermost spatulate with narrow petiole, mostly 15–23 mm, caudine abruptly linear to linear-lanceolate, linear-ob lanceolate, or narrowly elliptic-lanceolate, 5–17(–21) x 1–2.5(–4) mm, distally carinate, epetiolate, stiffly spreading, continuing mostly unreduced in size up to the heads, apex sharply acute with a long, white-indurate, sharp-pointed, straight to slightly falcate apiculum, both surfaces minutely glandular, hirsute with ascending hairs to hispid-hirsute, margins eciliate. **Heads** solitary or 2–8 in a loosely corymboid cluster, peduncles 10–20 mm, capitular bracts linear to linear-lanceolate and very small if present, usually not evident; involucres (5–)6–9 mm wide, inner phyllaries 6–7 mm long, narrowly oblong-lanceolate, slightly keeled, sessile-glandular to minutely stipitate-glandular, without other hairs. **Ray flowers** 6–14, laminae ca. 1 mm wide. Chromosome number unknown.

Flowering (Apr–)Aug–Nov. Rocky habitats, commonly with *Quercus cornelius-mulleri*, *Pinus monophylla*, *Nolina parryi*, *Acacia greggii*, *Haplopappus cuneatus*, *Opuntia phaeacantha*, and *Opuntia basilaris*; ca. 2400–5200 ft (–5500 ft at top of Queen Mtn in Joshua Tree Natl Park). Little San Bernardino Mountains of Riverside and San Bernardino counties, California.

Heterotheca joshuana is distinctive in its linear to linear-lanceolate, even-sized, and densely arranged leaves (short internodes) with a long, white-indurate, sharp-pointed, straight to slightly falcate apiculum. Identification is further secure as *H. joshuana* apparently does not occur in sympatry with any other *Heterotheca* species and no similar species occurs in California, Arizona, or Mexico. Obvious similarities in vestiture and leaf arrangement and geographical proximity suggest that it is closely related to more northern *H. cinerascens* but the California plants are about 200 miles disjunct from the nearest populations of *H. cinerascens* in Clark and Nye cos., Nevada. While most of the Nevada and Idaho population systems of *H. cinerascens* also are essentially isolated and geographically disjunct from one another, the *H. joshuana* system is more distantly isolated and in a different ecology — the Colorado Desert (part of the Sonoran Desert) and Mojave Desert, both of which occur in the Joshua Tree National Park. It is a reasonable hypothesis that *H. joshuana* and *H. cinerascens* are sister taxa, with *H. joshuana* more derived in morphology than the widespread *H. cinerascens*.

Additional collections. California. Riverside Co.: Joshua Tree Natl Monument, Barker Dam, 4300 ft, 14 Oct 1966, *Baker & Baker s.n.* (JOTR image!); Joshua Tree Natl Monument, 1/2 mi S of Desert Queen Mine, boulder crevice, 4400 ft, 19 Oct 1966, *Baker & Baker s.n.* (JOTR image!); Joshua Tree Natl Monument at campground area by Hidden Valley, 9 Oct 1947, *Dunn 3533* (MO); Little San Bernardino Mts [W end], Morongo Pass [ca. 7 mi N of Whitewater on Hwy 62, at ca. 2400 ft], 15 Nov 1921, *Jaeger s.n.* ([POM]); Joshua Tree Natl Park, Little San Bernardino Mountains, Wonderland Wash, N of Wall Street Mill parking area, frequent on bouldery outcrops above wash, 4319 ft, 17 Aug 2005, *LaDoux 1545* (JOTR image!); Keyes Ranch, Morongo Pass, among rocks, 4000 ft, 30 Apr 1921, *Munz 4536* ([POM]); Wonderland of Rocks, Joshua Tree Natl Monument, 24 Oct 1942, *Roos 2571* ([POM]); Little San Bernardino Mts, [Joshua Tree Natl Park], Wonderland of Rocks, crevices in boulders, 4000 ft, 21 Oct 1950, *Roos 5011* (DS, NY, [RSA], UCR); Joshua Tree Natl Monument, granitic rocks at Hidden Valley Campground, 22 Aug 1979, *Thorne 53595* ([RSA]). San Bernardino Co.: Joshua Tree Natl Park, top of Queen Mountain, along climber's trail just W of peak, rocky wash and surrounding large bedrock outcrops, frequent through rock outcrops, 5182 ft, 5 Oct 2011, *Harding 31* (JOTR image!); Joshua Tree Natl Park, Queen Valley, Wonderland of Rocks near Wonderland Wash, 18 Sep 2012, *LaDoux et al. 3141* (JOTR image!). Collections cited by the Consortium of California Herbaria at POM-RSA were unavailable for study when I was there in 2016.

Figure 15. *Heterotheca joshuana*, holotype.

5. HETEROTHECA SHEVOCKII (Semple) Semple, Univ. Waterloo Biol. Ser. 37 (Rev. *Heterotheca Phyllothecea*): 148. 1996. *Heterotheca villosa* var. *shevockii* Semple, Phytologia 73: 453. 1992 [published 1993]. **TYPE: California.** Kern Co.: S end of Hot Springs Valley between Bodfish and Lake Isabella, at onramp of California Hwy 117 adjacent to Kern River, granitic roadbank of hwy with *Eriogonum fasciculatum* and ruderal vegetation, 2465 ft, 16 Nov 1981, J. Shevock 9110 (holotype: CAS image!; isotype: WAT).

Heterotheca shevockii grows only along the Kern River below Lake Isabella in chaparral and woodland habitat in sandy soils in crevices and ditches near the river and along roadsides. It has been abundantly collected. Apparently no other species of *Heterotheca* occurs in the same area. In its original description (as "var. *shevockii*"), Semple noted that it is "distinguished from other races of [*Heterotheca villosa*] by its unusually tall stems [up to 2 meters, pers. observ.] and lanceolate-deltoid leaves with inrolled margins. Smaller plants are similar to [*H. polothrix*] to which [*H. shevockii*] is undoubtedly closely related." The heads are large and without capitular bracts. Given its distinctive morphology and geography, it is securely identified but its evolutionary affinity is uncertain.

6. HETEROTHECA HIRSUTA (Greene) Nesom, **comb. nov.** *Chrysopsis hirsuta* Greene, Pittonia 3: 296. 1898. **TYPE: Washington.** [Spokane Co.]: Near Spokane, banks of Hangman Creek, 3 Sep 1896, C.V. Piper 2385 (holotype: NDG 53918, Fig 17; isotype: GH image!).

Chrysopsis barbata Rydb., Bull. Torrey Bot. Club 37: 130. 1910. *Heterotheca barbata* (Rydb.) Semple, Brittonia 39: 379. 1987. **TYPE: USA. Idaho.** Kootenai Co.: Valley of Spokane River, 17 Jul 1893, J.H. Sandberg, D.T. MacDougal, & A.A. Heller 664 (holotype: NY image!; isotypes: CAS! image!, GH-Fig. 18!, US image!).

Semple (1996) placed *Chrysopsis hirsuta* as a synonym of *Heterotheca villosa* var. *minor* but the type of *C. hirsuta* is essentially identical in morphology to the *C. barbata* type and probably was collected no more than 30 miles from the *C. barbata* type locality. Kootenai Co. (Idaho) and Spokane Co. (Washington) are directly adjacent on opposite sides of the Spokane River.

Chrysopsis elata Osterh., Bull. Torrey Bot. Club 57: 560. 1931. **TYPE: Colorado.** Eagle Co.: Red Cliff, 16 Aug 1906, G.F. Osterhout 3359 (holotype: RM image!; isotype: NY image!).

The protologue states that Osterhout "3335" is the type, but the RM and NY sheets both are labeled with the collection number "3359." The original manuscript, in Osterhout's hand, is stapled to the RM holotype and has "3359" as the type number. On Osterhout's distinctive red-colored type label, C.L. Porter in 1950 noted that publication of the number "3335" was in error.

Chrysopsis resinolens var. *ciliata* A. Nels., Bull. Torrey Bot. Club 28: 233. 1901. *Chrysopsis viscosa* var. *ciliata* (A. Nels.) Blake in Tidestrom, Contr. U.S. Natl. Herb. 25: 537. 1925. **TYPE: USA. Wyoming.** Albany Co.: Dunn's Ranch, sandy river bottoms, 16 Jul 1900, A. Nelson 7566 (holotype: RM! image!; isotype: NY image!, Fig. 22).

The collection number cited in the protologue is "Nelson 7560" and the NY specimen is labeled as "7560 ... n. var." on a label (ex Rocky Mountain Herbarium) apparently handwritten by Nelson, with "Dunns Ranch, July 16, 1900." The RM specimen, however, is labeled 7566 and Nelson's original notes state that 7566 = *Chrysopsis resinolens* var. *ciliata*; Nelson 7560 is listed as a moss (*Mnium serratum*). Thus the collection number in the protologue as well as the label on the NY collection are interpreted as resulting from errors in transcription, and holotype and isotype appear secure as cited here. The RM and NY collections are clearly the same entity.

Stems 15–40 cm, sparsely to moderately hirsute to hirsute-villous or villous with spreading to slightly deflexed hairs, sparsely to densely minutely glandular. **Leaves** caudate, narrowly elliptic to elliptic-lanceolate or elliptic-ob lanceolate, essentially epetiolate, mostly 2–4.5 cm, largest at midstem, leaf and bract surfaces loosely strigose to hirsute or hirsute-villous, at least the distal evidently sessile-glandular, petiole margins and at least proximal blade margins evenly long-ciliate. **Heads** more or less

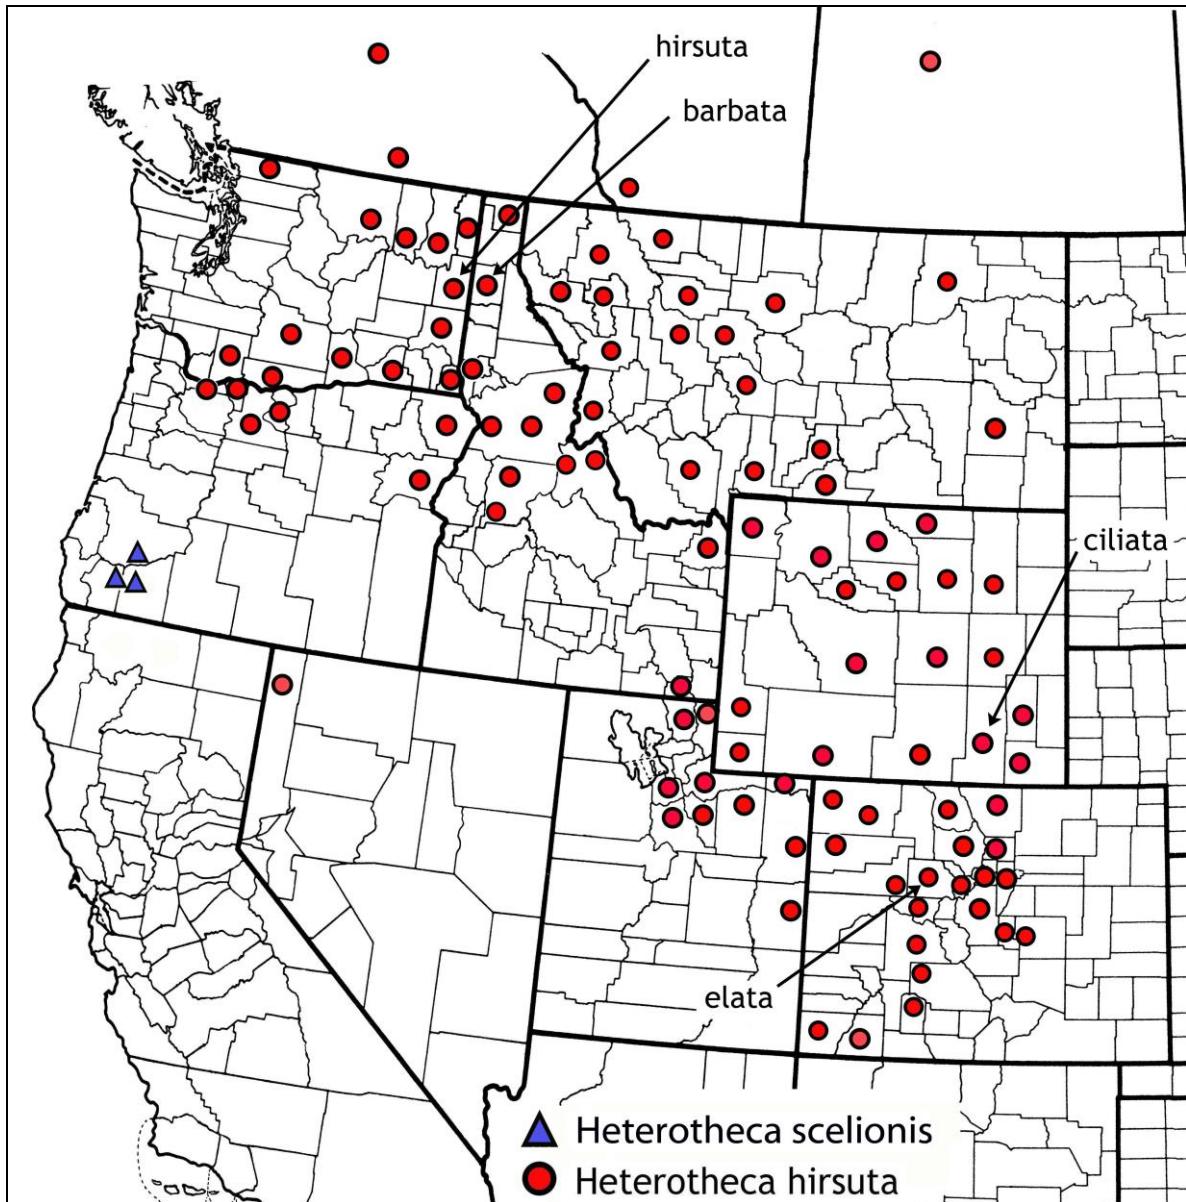

Figure 16. Distribution of *Heterotheca hirsuta* and *H. scelionis*. Arrows point to localities for the type and synonyms of *H. hirsuta*.

solitary on leafy-bracteate peduncles 4–10(–15) cm long, sometimes loosely corymboid; capitular bracts linear-oblong to linear-oblanceolate or oblanceolate, sometimes longer than the phyllaries. **Involucres** 8–12 mm wide; phyllaries 8–10 mm long, narrowly lanceolate to linear-lanceolate, sparsely villous, eglandular or minutely glandular distally. Chromosome number, $2n=18$ (Semple 9247 from Salt Lake Co., Utah; Windham 97-133 from Cache Co., Utah).

Aven Nelson described this taxon as a variety of *Heterotheca* [*Chrysopsis*] *resinolens*, but it is not clear that *H. resinolens* (in the sense of the present study) is closely related. The two are similar in their prominent capitular bracts and conspicuous sessile glands and relatively reduced non-glandular vestiture (the plants often with a dark green color), but *H. resinolens* differs in its larger stature, larger and more closely spaced leaves, larger heads with broader capitular bracts, and lack of coarsely ciliate leaves and bracts. It has a different geographical range and generally grows at higher elevations.

Figure 17. *Heterotheca hirsuta*. Spokane Co., Washington. Holotype of *Chrysopsis hirsuta*.

Figure 18. *Heterotheca hirsuta*. Kootenai Co., Idaho. Isotype of *Chrysopsis barbata*.

Figure 19. *Heterotheca hirsuta*, Lemhi Co., Idaho. Romano 269 (SRP).

Figure 20. *Heterotheca hirsuta*. Albany Co., Wyoming. Isotype of *Chrysopsis resinolens* var. *ciliata*.

Figure 21. *Heterotheca hirsuta*, Natrona Co., Wyoming. Hartman 38145 (RM).

Figure 22. *Heterotheca hirsuta*, Washoe Co., Nevada. Tiehm 10816 (NY).

I first identified and annotated *Heterotheca hirsuta* and "*Heterotheca* [*Chrysopsis*] *elata*" (or "*Heterotheca ciliata*") as separate species, concluding only later in the study, especially when looking at numerous collections from Idaho and western Montana, that a geographic discontinuity in their morphology was not easily apparent. Over the whole range, the plants have relatively sparse (though variable) leaf and stem vestiture of non-glandular hairs but leaf and bract surfaces usually are prominently sessile-glandular. Leaves (including petioles) and bracts are coarsely ciliate at least on the proximal margins. Capitular bracts are consistent and characteristic.

In Oregon, Washington, and Idaho (compared to Montana, Wyoming, Utah, and Colorado), leaf and bract margins of *Heterotheca hirsuta* often are evenly long-ciliate along the whole length, matching the long-hirsute stems and commonly giving the whole plant a shaggy appearance, stems are relatively taller and usually more strictly erect, axillary branches are longer, leaves are longer and narrower, and phyllaries are narrower. *Heterotheca hirsuta* in this area may prove to be evolutionarily distinct, and given the variability within the species as identified here and its wide range, it would not be surprising to find that more than a single entity is represented.

Some morphological variants of *Heterotheca hirsuta* in Montana and Wyoming perhaps reflect influence of sympatric *H. hispida*, which in typical form can hardly be confused with *H. hirsuta*.

Although the range of typical *Heterotheca hirsuta* reaches into central and southwestern Colorado, it has not been commonly collected there. The plants apparently long-disjunct in Washoe Co., Nevada (Fig. 22), are typical of the southern plants.

Additional (representative) collections examined. CANADA. Alberta. Lee Creek near golf course, Cardston, riverbottom forest, gravelly soil, 3800 ft, 24 Jul 1972, Shaw 1681 (BRY). British Columbia. 1 mi N of Heffley along road to Little Fork, N. Thompson River, open wooded slopes, 1400 ft, 15 Jun 1956, Calder et al. 17499 (UC); 5 mi E of Grand Forks, dry N slope of valley, roadside, 31 Aug 1937, McCabe 4640 (UC). Saskatchewan. (POM); valley of Methow River, gravel bar of river, 21 Jul 1921, St. John et al. 5518 (LL, UC); near Tonasket, dry open slopes, 2000 ft, 2 Jul 1932, Thompson 8697 (MO, LL, WTU); near Tonasket, rocky sagebrush banks of Columbia River, 18 Jun 1935, Thompson 11701 (CAS-2 sheets, LL, MO, PH, POM, WTU-2 sheets). Pend Oreille Co.: shores of Boundary Dam, Aug 1969, Layser 1113 (WTU; x *H. vespertina*). Skamania Co.: S of Dalles Airport, loose and stabilized dunes and volcanic rock outcrops between runway and RR River, 16 Jun 2001, 262 ft, Colwell 01-40 (ID, WTU). Spokane Co.: Spokane River, sand bar, 24 Sep 1913, Johnson 2020 (WTU); near Spokane, 1912, Nelson 60 (RM); by the Spokane River at Spokane Bridge, 14 Sep 1916, Suksdorf 9061 (GH, WS); S side of Spokane, sandy soil on hills above jct of Hwys 10 and 195, 1 Jul 1941, Weber 2234 (MO, NY, UC, WTU). Stevens Co.: Meyers Falls, RR embankment, 29 Jun 1903, Beattie & Chapman 2198 (UC, WTU); Kettle Falls, dry sandy roadside, 2 Jul 1939, Boner & Weldert 192 (CAS, DS, MO, NY, RM, UC, WTU); 3 mi NW of Northport, sandy alluvial soil, S slope, 1550 ft, 28 Jun 1932, Hedgecock s.n. (RSA); Myers Falls, sand 25 Aug 1902, Kreager 516 (UC); Gold Creek at hwy, dry gravelly soil, *Purshia* association, 1900 ft, 5 Aug 1937, Livingston s.n. (BRY). Whatcom Co.: Ross Lake, mouth of Lightning Creek, S-facing cliffs, 3 Aug 1989, Every & Vanbianchi s.n. (WTU). Whitman Co.: Wawawai, Jun 1898, Elmer 1017 (WTU). Yakima Co.: Yakima region, Oct 1883, Brandegee 838 (UC). **Wyoming.** Albany Co.: Centennial-Rambler Road, gravelly slopes, 1 Sep 1903, Gooodding 2070 (DS, MO, RM); Sheep Mtn, near aspen groves, 2 Sep 1903, Gooodding 2079 (DS, MO, NY, RM, UC); Medicine Bow Mts, Medicine Bow Natl Forest, along Rd 517 SE of Albany, grassy meadow, 14 Jul 1991, Keil 22283 (OBI, UC); Lookout, granite flats, 1 Aug 1913, Macbride 2595 (MO, RM); Hermosa, deep pine woods, 3 Aug 1913, Macbride 2601 (MO, RM); Cummins, 29 Jul 1895, Nelson 1497 (MO, RM); Laramie Hills, ravines, 18 Sep 1890, Nelson & Nelson 6851 (MO); Centennial, moist canyons, 7 Aug 1902, Nelson 8814 (MO); Bacon's Ranch, river bottoms, 15 Aug 1903, Nelson 8921 (MO, NY, RM, UC); Laramie Plains, 1 Jul 1909, Nelson 9310 (MO, RM, UC); near Tie Siding, Sep 1897, Osterhout 1327 (NY). Big Horn Co.: Red Bank, in the dryer meadows, 20 Jul 1901, Gooodding 331 (MO, NY, UC). Campbell Co.: South Pumpkin Butte, 5093 ft, 27 Jul 1978, Dueholm 5057 (RM). Carbon Co.: Windy Ridge Rd, rocky grassland, 6800 ft, 19 Jul 2008, Dorn 10509 (RM); Medicine Bow Mts, Cedar Ridge and Cottonwood Creek, ca. 3 air mi NW of Hwy 130-230 intersection, ca. 9 air mi SE of Saratoga, sagebrush at base of ridge, ca. 7050 ft, 22 Jun 2009, Lukas 9126 [atypical in reduced capitular bracts] (BRY); Beaver Creek, along road to North Park, 18 Aug 1916, Osterhout 5538 (RM). Fremont Co.: Sweetwater Rocks, Cranner Rock, 14.8 mi ESE of Jeffrey City, soil between granite boulders, 6280 ft, 13 Jun 1986, Haines 6313 (NY); Split Rock Historical Marker site E of Jeffrey City on Wyo Hwy 287, in soil pockets in cracks of gigantic outcrop, 26 Aug 1995, Semple & Zhang 10417 (BRY, MO). Johnson Co.: E side Lake Desmet, sagebrush plain, 4800 ft, 21 Jul 1979, Dueholm 8462 (RM); Big Horn Mts, Soldiers Park, 9000 ft, 19 Aug 1898, Williams s.n. (NY). Hot Springs Co.: Owl Creek

Mts, lower end of Wind River Canyon, along US Hwy 20/Wyo 789, 4 mi S of Thermopolis, rocky riparian, 4430 ft, 22 Jun 1997, *Evert* 33231 (RM). Laramie Co.: 1.5 mi NW of Granite Reservoir, grassy hillside, 7400 ft, 12 Sep 1991, *Dorn* 5318 (RM); Cherokee Park, rich moist meadowlands, 30 Jul 1923, *Nelson* 10007 (DS). Lincoln Co.: Salt River Range, along Greys River at Forest Park, ca. 16.5 air mi ESE of Thayne, 14 air mi NE of Afton, gravel soil of flood channel, 6900 ft, 13 Jul 1996, *Harrison* 727 (RM). Natrona Co.: Rattlesnake Mts, Burnt Wagon Draw and N slope of range, limber pine-covered N slope with drainages and open slopes and flats, 6800 ft, 26 Jun 1981, *Fonken* 1261 (MO); Platte River, rocky foothills, 27 Jun 1901, *Gooodding* 120 [x *H. hispida*?] (BRY); Seventeen Mile Well on Salt Creek Rd, sandstone hillsides, 8 Jul 1901, *Gooodding* 215 (DS-2 sheets, MO, POM-2 sheets, RM-2 sheets, UC). Park Co.: Bighorn Basin, along Co. Rd 7WC at Dry Creek, ca. 3 air mi WNW of Cody, riparian, 5200 ft, 17 Jul 2001, *Lum* 879 (BRY); Yellowstone Natl Park, Gardiner River, dry stony river bottom, 19 Jul 1899, *Nelson* 5967 (MO, NY); Cody, Shoshone Canyon, 15 Aug 1910, *Nelson* 9552 (MO, RM, UC); Bighorn Basin, along Gooseberry Creek, ca. 10.5 air mi SSE of Meeteetse, clay slopes with sandstone outcrops and ledges, 6000 ft, 31 Jul 1983, *Nelson* 10610 (BRY); Yellowstone Natl Park, Bechler Canyon, Three Rivers Jct, wet meadows along Gregg Littles Fork, pine-spruce-fir, 7225 ft, 29 Aug 1986, *Thorne* 5033 (BRY). Platte Co.: T28N R68W Sect 14-23 line, sandy wash, 4600 ft, 12 Sep 1992, *Dorn* 5376 (MO, NY, RM). Sheridan Co.: Sherman, gravelly ridges, 6 Aug 1901, *Nelson* 8575 (MO); Big Horn Mts, soil crevices of granite rocks above Story, 13 Jul 1934, *Rollins* 633 (MO). Sweetwater Co.: Rock Springs, dry prairie, 10 Jul 1942, *Degener & Peiler* 16096 (MO, NY); Leucite Hills, dry ledges, 18 Jun 1901, *Merrill & Wilcox* 508 (NY); Point of Rocks, rocky slopes, 12 Jun 1900, *Nelson* 7157 (MO). Washakie Co.: foothills of W slope of Bighorn Mts, 0.25 mi NE of Choate, slopes on S side of Billy Creek, 6800 ft, 23 Aug 1993, *Fertig* 14456 (RM).

7. HETEROTHECA SCELIONIS Nesom, sp. nov. **TYPE:** Oregon. Jackson Co.: E of Central Point, banks of the Rogue River at Bybee's bridge, dry gravelly places, 25 Jul 1918, A.A. Heller 13080 (holotype: US-Fig. 24; isotypes: CAS, DS, MO, NY, PH-2 sheets, WTU).

Similar to *Heterotheca hirsuta* in its glandular surfaces with reduced non-glandular vestiture and its long-ciliate leaf and bract margins but different in its linear peduncular bracts, lack of capitular bracts and broader, more triangular phyllaries. Distinct from *H. orovilloso* in its less dense vestiture of longer non-glandular hairs, linear-bracteate peduncles, triangular phyllaries with glandular surfaces, and long-ciliate petiole margins.

Stems 25–40 cm, erect to ascending-erect, branching mostly above midstem, hirsute to hirsute-villous with spreading to deflexed non-glandular hairs, sparsely to densely minutely glandular. **Leaves** cauline, basal mostly withered by flowering, 2–3 cm long, oblanceolate with a petiolate base, largest at midstem, midstem oblanceolate to oblong-oblanceolate and becoming epiptiolate, mostly 3–3.5 cm long, gradually decreasing in size distally, becoming linear and bracteate, leaf and bract surfaces loosely strigose to hirsute or hirsute-villous, at least the distal evidently sessile-glandular, petiole margins and at least proximal blade margins long-ciliate. **Heads** solitary on axillary branches 4–8 cm long, peduncles becoming linear-bracteate; capitular bracts absent. **Involucres** 9–12 mm wide (pressed); phyllaries narrowly triangular, shallowly keeled, in 4–5 series evenly graduate in length, longest 7–8.5 mm long, minutely glandular, without non-glandular hairs, medial area broad and darkened, margins narrow, whitish. **Ray flowers** 15–20, ligules ca. 10 mm long.

Flowering Jun–Aug. Sandy and rocky banks of creeks and rivers, 500–2400 ft. Known by collections from along the Applegate, Clearwater, Rogue, and Umpqua rivers and from Evans Creek, a tributary of the Rogue River.

The epithet ("of the rogue") alludes to the Rogue River, a major feature in the range of the species. The river's name supposedly originated with French fur trappers, who regarded native

Americans living along it as rogues. Latin pronunciation of the beginning "sc" of scelionis is "sh" as in shall.

Additional collections. **Oregon.** Douglas Co.: Sandy ground along Umpqua River, near Dillard, 13 Jul 1945, Peck 23728 (POM); Clear Water, [no date], Spalding s.n. (MO). Jackson Co.: Evans Creek near Wimer, 22 Jul 1892, Hammond 233 (MO, US-Fig. 25); no specific locality, 1917, Hawkins s.n. (MONTU, Fig. 26); along the Applegate River 2 mi S of Ruch, 25 Aug 1927, Wolf 944 (DS, RSA). Josephine Co.: Rogue River 10 mi N of Grants Pass, 9 Jul 1926, Abrams 11239 (DS); Woodville [now the town of Rogue River], Jun 1888, Howell 1805 (HPSU); Grant's Pass, 17 Jun 1909, Howell 1806 (HPSU, Fig. 27); Grant's Pass, 17 Jun 1909, Howell 1807 (HPSU, Fig. 28); Rogue Canyon, 3 mi below Galice, sandy along river, 850 m, 4 Jul 1948, Ripley & Barneby 9625 (CAS).

Heterotheca scelionis varies in density of vestiture but the otherwise morphological and geographic cohesiveness and consistency of ecology support its recognition. The species overlaps in distribution with *H. oregona* in Douglas and Josephine counties but it otherwise is not sympatric with any other goldenaster.

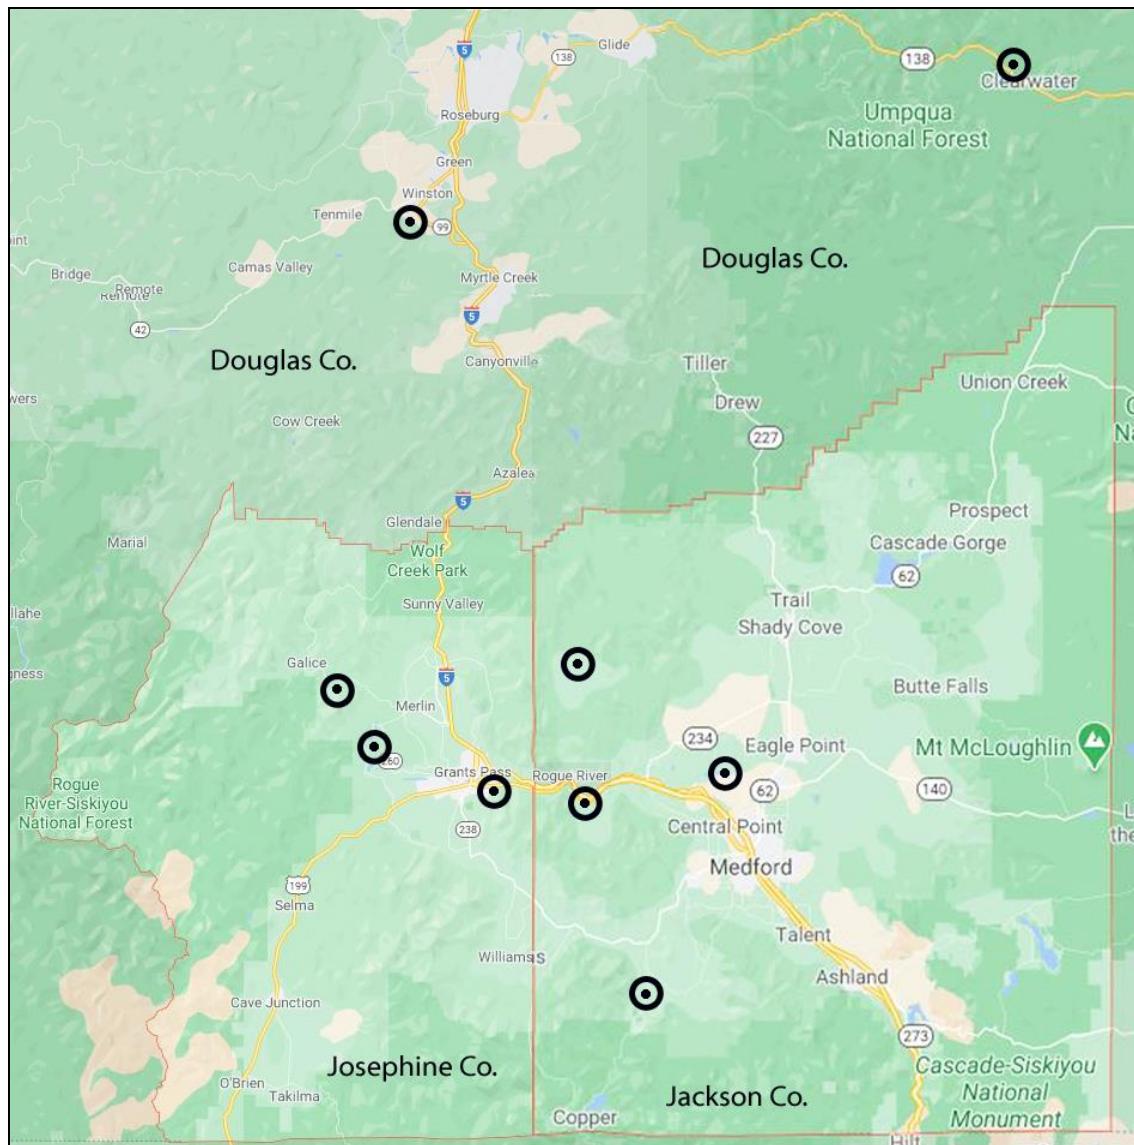

Figure 23. Distribution of *Heterotheca scelionis*. Douglas, Jackson, and Josephine counties, Oregon.

Figure 24. *Heterotheca scelionis*. Jackson Co., Oregon. Holotype (US).

Figure 27. *Heterotheca scelionis*. Grant's Pass, Josephine Co., Oregon. Howell 1806 (HPSU).

Figure 28. *Heterotheca scelionis*. Grant's Pass, Josephine Co., Oregon. Howell 1807 (HPSU).

8. HETEROTHECA VESPERTINA Nesom, sp. nov. **TYPE:** **Washington.** Chelan Co.: Sandbars of Columbia River at Entiat [at mouth of Entiat River], 28 Jun 1934, J.W. Thompson 10809 (holotype: MO!; isotypes: DS-2 sheets, LL, POM, US-Fig. 30, WTU-2 sheets).

Similar to *Heterotheca villosa* sensu stricto in its strigose, often silvery-sericeous stems and leaves but distinct in its lack of capitular bracts, broader involucres, fewer ray flowers, and different geography.

Perennials from a thick, woody taproot. **Stems** erect, (10–)15–40 cm tall, vestiture all strigose with appressed hairs or understory appressed with spreading overstory hairs, eglandular. **Leaves** usually ascending, narrowly to broadly oblong-ob lanceolate or oblanceolate, epetiolate, not clasping, or sometimes proximal petiolate, mostly 2–4 cm long, relatively even-sized along the stem or sometimes smaller approaching the inflorescence, strigose with closely appressed hairs, sometimes silvery-sericeous, margins usually eciliate, sometimes long-ciliate or sometimes ciliate only along proximal margins. **Heads** solitary or in close clusters on bracteate peduncles 10–30 mm long, with narrow peduncular or subpeduncular bracts often as long as or longer than the involucre, without capitular bracts. **Involucres** (8–)11–15 mm wide (pressed), inner phyllaries 7–9 mm long; phyllaries strigose to strigose-sericeous with loosely appressed hairs, eglandular, tips not differently colored. **Ray flowers** (8–)14–16. Chromosome number, $2n=18$ (*Semple* 2001, 2002, Nez Perce Co., Idaho; *Semple & Brouillet* 7082, Klickitat Co., Washington; *Chinnappa & Chmielewski* 257, Alberta; *Taylor & Taylor* 5342, British Columbia).

Heterotheca vespertina is characterized by its large, often solitary (long-pedunculate) heads, inconsistently produced capitular bracts, and appressed caudine and leaf vestiture of fine-based hairs, usually giving plants a silvery-sericeous aspect. It is similar in vestiture to *H. villosa* but the two entities are allopatric — they perhaps are an evolutionarily vicariant pair but convergence is common in *Heterotheca* and their relationship is speculative. Although both entities are variable over their relatively wide ranges, *H. vespertina* differs consistently from *H. villosa* in its lack of prominent capitular bracts, broader involucres, and fewer ray flowers. Their allopatry is significant in the recognition of *H. vespertina* as distinct.

1. Heads usually in a compact corymboid arrangement, capitular bracts present; involucres 7–12 mm wide (pressed), inner phyllaries 6–8 mm long; ray flowers 16–28; phyllary tips often purplish 11. ***Heterotheca villosa***
1. Heads solitary (long pedunculate) or in a loosely corymboid arrangement; capitular bracts present or absent; involucres (8–)11–15 mm wide (pressed), inner phyllaries 7–9 mm long; ray flowers (8–)14–16; phyllary tips not colored 7. ***Heterotheca vespertina***

Additional collections examined. CANADA. British Columbia. Jackman Flats, ca. 110 km on the Jasper-Kamloops road, sandy soil with open lodgepole pine forest, 600 m, 14 Aug 1997, *Breteler* 13887 (MO); E side of Kootenay Lake near Sanca Creek, open, rocky, W-facing cliffs, 18 Jun 1953, *Calder & Saville* 9345 (CAS, ID, WTU); W side of Okanagan Lake, 26 Jun 1953, *Calder & Saville* 9699 (NY, WTU); Ashcroft, 28 Jun 1907, *Cowles* 206 (MO); Lytton, 16 Jul 1899, *Diehl s.n.* (BRY); Ashnola River Road (km 7), open *Pinus ponderosa*, gravel floodplain, 900 m, 29 Jun 1980, *Douglas* 11661 (BRY); Glacier, Jul 1896, *Dudley s.n.* (DS); 2 mi N of Lytton (jet of Fraser and Thompson rivers), bone-dry banks and cutting of dry river bench, 21 Jun 1933, *McCabe* 187 (UC); Skagit River, 17 Jun 1905, *Macoun* 76937 (NY). **USA. Idaho.** Clearwater Co.: 6 mi NE of Ahsahka, gravelly banks of the N Fork Clearwater River, 11 Jul 1946, *Christ & Smith* 15408 (NY). (POM); Methow River, gravel bar, 21 Jul 1921, St. John et al. 5518 (WS, WTU). Pend Oreille Co.: Box Canyon, stony bank of Pend Oreille River, 3 Aug 1902, Kreager 397 (UC, WS, WTU). Skamania Co.: Dalles of the Columbia, 2 Aug 1880, Engelmann s.n. (MO). Walla Walla Co.: Fish Hook ferry, 210 m, 18 Sep 1894, Leiberg 931 (NY). Whatcom Co.: Ross Lake Natl Rec Area, Lightning Creek Trail, ca. 1 mi above Ross Lake, 2400 ft, 14 Jul 2002, Legler 43 (WTU). Whitman Co.: Snake Canyon E of Steptoe Canyon, crumbly basalt, 9 Jul 1964, Daubenmire 6410 (WS); Snake River Canyon opposite Clarkston, Aug 1934, Clarke s.n. (WTU); Wawawai, 8 Jul 1898, Piper s.n. (NY, WS); Snake River, Indian, sandy bank, 20 May 1923, St. John & Warren 3396 (NY, UC); alluvial fan entering Snake River, 0.2 mi E of USGS Gaging Station, 2 Jun 1965, Wakefield 671 (WS, WTU). Yakima Co.: S bank Naches River, near confluence of Yakima River, ca. 40 ft, 3 Oct 1992, Gage & Rodman 855 (WTU); Naches River, E of Naches town, 15 Oct 1942, Hoover 6001 (CAS, OBI); near Yakima, 17 Jul 1927, Jones 1792 (WTU); N Yakima, Aug 1895, Watt s.n. (WS).

9. HETEROTHECA OROVILLOSA Nesom, sp. nov. TYPE: California. Plumas Co.: Marble Mts, 4 Aug 1939, Howell 15049 (holotype: UC; isotype: CAS).

Distinct in its caespitose habit, hirsute (1-storied vestiture) stems, mostly oblanceolate and essentially epetiolate leaves, solitary or loosely arranged heads on relatively long, bracteate peduncles without capitular bracts, and northeastern California-southwestern Oregon geographic range.

Perennials from a thick, woody taproot, sometimes with woody, rhizome-like caudex branches. **Stems** erect-ascending from the base, 10–40 cm, eglandular to evenly and densely sessile-glandular, sparsely to densely hirsute to hirsute-villous with curving, spreading to spreading-ascending or deflexed non-glandular hairs in a single story. **Leaves** evenly distributed up to the peduncles, mostly oblanceolate or oblong-oblanceolate to narrowly obovate or oblong-lanceolate, without a distinct petiolar region, 1.1–3 cm x (1–)2–8(–10) mm, mostly even-sized, sparsely to moderately hirsute-strigose, hirsute-villous, or pilose at least along the midvein, usually densely sessile-glandular to stipitate-glandular (especially adaxially), sometimes eglandular, margins ciliate proximally. **Heads** solitary or loosely arranged on relatively long (2–8 cm), bracteate peduncles, usually without capitular bracts or sometimes (especially in El Dorado, Placer, Sierra cos.) with 1–2 linear to linear-lanceolate bracts. **Involucres** 9–18 mm wide (pressed), inner phyllaries 7–10 mm; phyllaries finely loosely strigose to strigose-hirsute or villous-hirsute, sometimes sparsely so, eglandular to minutely sessile-glandular, margins prominently hyaline. **Disc corollas** glabrous. **Ray flowers** 9–24. **Chromosome numbers**, $2n=18$ (Plumas Co., Suripto & Ahmed 9313, as cited by Semple 2008), $2n=36$ (Shasta Co., Semple & Suripto 5715).

Flowering Jun–Aug(–Sep). Along rocky stream and lake sides, meadows, low alkaline areas, roadsides and roadbanks, rock outcrops, cliffs and rock crevices, lava beds, fir and mixed conifer, pine-fir, yellow pine, juniper-sagebrush, sagebrush scrub; (1200–)3600–8200(–8650) ft. California, sw Oregon (Josephine Co.), nw Nevada (Washoe Co.).

These plants previously have been identified as expressions of a broadly conceived *Heterotheca villosa* but they form a geographically discrete population system not sympatric with any other similar species. The southward-disjunct populations in Kern County appear to belong with the species.

Early in the study I thought two species existed among these plants and annotated some collections as "H. doradoensis" based on the strongly expressed glandularity of stems and leaf surfaces, but geographic patterns in vestiture are not evident *Heterotheca orovillosa* apparently varies widely in glandularity as well as in ecology.
