

10 out of 14 peer-reviewed studies on base stations found significant increases in symptoms and conform to WHO standards of scientific quality

10 out of 14 peer-reviewed studies both found significant increases in the symptoms being analysed, and conformed to the specified WHO / ICNIRP standards of scientific quality, including their assessment criteria of consistency and replication. This review about studies on base stations will appear in a special issue of Pathophysiology. Included are only those studies that are about base station exposures and not those that used mobile phone radiation patterns but exposed in the far field. Therefore some studies that could in principle be included because they studied far field exposure are not among those considered in this review (presented by Dr Michael Kundi on Sept 23, 2008 at the London EMF International Conference).
