

# PRAIRIE MOON NURSERY®

EXPERTS IN NATIVE SEEDS & PLANTS | SINCE 1982

In our first 25 years, We relied on hand-harvesting seed from mixed plantings and we still do for many species. To meet increased demand, we began to mono-crop plantings from seed or transplants. While we have made progress, our production experiments continue. Each year brings welcome surprises and some failures. Climate, disease, insects and weeds all play a role. White Wild Indigo, for example, was very sporadic this year. Blister beetles devoured the flowers in several fields, while a nearby planting went untouched, yielding over 150 pounds of seed.

This photo of a 10-year-old planting illustrates one type of seed production. Echinacea pallida seed was drilled into Smooth Brome grass, producing a bountiful crop the last six seasons. When we've added native grasses and additional flowers to similar sites, these Brome fields have developed into diverse prairies with surprisingly little competition from weeds.

Our next 10-year plan calls for developing multiple sites for many species. As we adapt to the changes each season brings, we embrace the challenges and opportunities, grateful to be supported and informed by you, our partners in growing for a healthy planet.

2019 PRICING AND  
CULTURAL GUIDE

# USING OUR CULTURAL GUIDE

### SOIL MOISTURE

WET	Soggy or marshy most of the year.
WET-MESIC	Excessively wet in winter, spring and after heavy rain but often dries in summer.
MESIC	Medium. Water soaks in with no run-off.
DRY-MESIC	Well drained. Water is removed from soil readily but not rapidly.
DRY	Excessively drained.

*Approximate plant height is given with standard foot (') and inch (") abbreviations. Height is for mature full-grown plants in flower. Actual height will vary considerably due to competition, sun exposure, soil conditions, and weather. In young native plantings (less than 10 years) plant heights may be greater than in older plantings when competition reduces height.*

### COMMENTS

ANNUAL	Completes its life cycle during one season.
BIENNIAL	Grows vegetatively during the first year, completes its life cycle during the second.
CALCAREOUS	Needs alkaline soil with a pH of 7 to 8.
ACIDIC	Needs acid soil with a pH of 4 to 6.
HEMIPARASITIC	Requires a "host" plant species. See Germ Code K.
SAND	Species thrives particularly well in sandy or well-drained soils.
COOL	Actively grows during the spring and fall when soil temperatures are cool.
WARM	Actively grows during the summer when soil temperatures are warm.
AGGRESSIVE	May not be suited for small landscape plantings.
RHIZOMATOUS	Fast-spreading root system.
*	Highly recommended for home landscaping.
**	Recommended for home landscaping, but potentially aggressive. Could overwhelm small landscapes.
NEW!	New native for 2019.
	Available in Potted Plant Trays (p.4-9).
	Available in 3-Packs
	Pollinator Favorites: bees, butterflies, birds
	Deer Resistant: (attn: deer may browse on any plant if food is scarce.)

### BLOOM TIME

April	A
May	M
June	J
July	J
August	A
September	S
October	O

### SUN EXPOSURE

FULL SUN	Plants normally grow in full sun. Should do well with up to 20% shade.
PART SHADE	Partially shaded (20% to 70% shade). Sun reaches ground level at woodland edges or through openings between trees. Prairie species will often grow in larger openings, with shade-tolerant species growing under trees.
SHADE	70% to 100% shade.

**Find this species in the Native Gardener's Companion on the "PAGE#" listed.**

## STARTING FROM SEED

The seeds of many native plants have built-in dormancy mechanisms that protect them from germinating before killing frosts or in times of drought. In the wild, seeds will lie dormant until the proper conditions for growth occur. But in cultivation, the successful gardener must become familiar with several simple pre-sowing seed treatment methods which will unlock the dormancy mechanism and stimulate quicker, more consistent germination.

We have developed the following seed germination codes to help you successfully grow the native seed sold in our catalog. These seed treatment suggestions have been compiled from our own experience, available literature, and feedback from other growers and customers. These are only suggestions and not the definitive source of germination information. If your experience reveals successful methods other than these, please let us know.

Until you are ready to plant or apply pre-sowing treatment, seed should be stored under refrigeration (33–40°F) or in a cool, dry place. Avoid rapid or frequent changes in temperature or humidity and protect against rodents. Sow seeds shallowly and keep seedlings carefully weeded. Periodic watering is helpful to establish seedlings. If seed does not germinate the first year, don't give up; germination may occur the second year or even later.

**Seedling ID Guide for Native Prairie Plants - Central Region**

This guide is the result of collaboration between the USDA - NRCS Elsberry Plant Materials Center and the MO Department of Conservation. Color photos illustrate seed, seedling, juvenile plant, and flowering stage for 40 common prairie flowers and grasses (no sedges). 5" in length x 4" high, this sturdy, laminated, pocket-size book is great for the field. Spiral-bound. • 94 pages

**\$10.00**

## GERMINATION CODES AND INSTRUCTIONS

- A** NO PRE-TREATMENT NECESSARY other than cold, dry storage (also called dry cold stratification). Seed purchased from Prairie Moon has been stored under these conditions. Seed should germinate upon sowing in a warm location.
- B** HOT WATER TREATMENT: Bring water to a boil, remove from heat, pour over seeds, and soak at room temperature for 24 hours prior to planting.
- C** STRATIFICATION NEEDED: Seeds germinate after a period of cold, moist stratification. Approximate number of days needed is indicated in the parentheses, next to germination code C (i.e. C (60) = 60 days of cold, moist conditions needed). See indoor stratification recommendations, opposite page.
 

PLEASE NOTE: You do not need to stratify if you are fall planting or using a seed drill. Also, do not use this method if you are planting a seed mix and cannot keep the site moist.
- D** SURFACE SOW: Seeds are very small or need light to naturally break dormancy and germinate.
- E** SEEDS NEED A WARM, MOIST PERIOD FOLLOWED BY A COLD, MOIST PERIOD. Mix seeds with sterile medium, place mixture in a labeled, sealed plastic bag and store in warm (about 80°F) place for 60–90 days. Then place in refrigerator (33–38°F) for 60–90 days before sowing. Or, sow outdoors and allow one full year for germination.
- F** SEEDS NEED A COLD, MOIST PERIOD FOLLOWED BY A WARM, MOIST PERIOD FOLLOWED BY A 2ND COLD, MOIST PERIOD.
- G** SEEDS GERMINATE MOST SUCCESSFULLY IN COOL SOIL. Sow seeds in late fall (after hard frost) or early spring.
- H** SEEDS NEED SCARIFICATION: For spring planting, Prairie Moon scarifies these seeds before shipping. Seeds for fall or frost planting are not scarified to prevent premature germination and winter kill.
- I** LEGUME, RHIZOBIUM INOCULUM - INCLUDED
 

Add inoculant to dampened seed and mix thoroughly at time of stratification (code C) or outdoor seeding. Inoculum aids in the fixation of atmospheric nitrogen and improves the long-term health of native plant communities.
- J** DEHULLED We remove the hulls from these legume seeds.
- K** HEMIPARASITIC SPECIES that needs a host plant. Good hosts for many parasitic species include low-growing grasses and sedges.
- L** PLANT FRESH SEED OR KEEP MOIST. Refrigerate until planting or starting other treatment.
- M** BEST PLANTED OUTDOORS IN THE FALL.
- ?** UNSURE: Your input would be of interest to us.

### INOCULUM FOR LEGUMES

We include genus-specific inoculum with legume seed free of charge. Additional inoculum can also be purchased. Choose from 19 different rhizobial inoculum strains on our website; search "inoculum".

**INOCULSM** Inoculates up to 2 oz seed .....\$1.50

### Stratification Sand

We use fine sand as a medium to artificially stratify seed. We send one cup of sand which can be used to stratify up to 1/2 oz of seed (slightly more or less depending on seed size). We like this sand because, unlike other seed starting media, the uniform color and fine texture allows you to see your seed. *(includes shipping and handling)*

**STRAT** Seed Stratification Sand .....\$7.00

BARE ROOT PLANTS ship during the dormant seasons: Spring (April-May) and Fall (Oct). POTTED PLANTS ship early-May through late-June.

From the same Creative Team that brought us the Emmy-award winning pilot *Mysteries of the Driftless*, a new feature-length documentary film, *Decoding the Driftless*, has just been released.

By producing informative and entertaining films about critical environmental issues, the non-profit Sustainable Driftless, Inc. is planting the seeds of positive change in the minds of millions of people. Its new film, *Decoding the Driftless*, is about the beautiful diversity and ecological importance of the Driftless Region, a geologically unique area in the heart of our country.

**YOUR UNWAVERING SUPPORT HAS ALLOWED US TO DONATE TO WORTHWHILE ENVIRONMENTAL GROUPS.**

We have been a proud sponsor of Decoding the Driftless since its inception and we were excited when our own Kaitlyn O'Connor, Education and Outreach Specialist, had the opportunity to showcase the endangered goat prairie habitat of southeast Minnesota as part of the film.

Awareness of the incredible world of nature around us is foundational to all other good and necessary actions in sustainability. As a business located in the Driftless Region, as advocates for ecological integrity, and as promoters of environmental education, we are proud to promote this exciting film.

**HELP SPREAD THE WORD AND JOIN US IN SUPPORTING ENVIRONMENTAL EDUCATION**
