# PREFACE TO THE FRENCH EDITION

## PREFACE TO THE FRENCH EDITION

*This preface outlines the history and options of an editorial undertaking which, since it took shape gradually over a ten-year period, could naturally not be brought up to date in every detail. I hope that what follows will answer most of the questions of readers taken aback by such and such an omission or such and such an editorial decision. My most important concern, however, is that these remarks should help elicit the indispensable additions and corrections that it is to be hoped will be submitted as time goes on.*

To participate in the step-by-step construction of an international dictionary of psychoanalysis is a strange adventure, marked not only by enthusiasm but also from time to time by disillusion. The process might well be compared to the education of children, a realistic view of which (sometimes attributed to Freud) asserts that one may be almost certain that one's hopes will not be fully realized. All the same, the years I spent with the editorial board assigning and patiently gathering in the more than fifteen hundred articles comprising this work, and the subsequent years preparing all this material for publication, have been among the most exciting I have known. One reason was the variety and cordiality of the international connections that the project created; another was the growing awareness of the vigorous multifacetedness of psychoanalysis as a whole, which has been evolving for over a century now within so many different nations, languages and cultures.

The charge of dogmatism, too often leveled at psychoanalysis, simply evaporates in face of the heterogeneity apparent to anyone who explores the many ways in which psychoanalytic theory and practice are understood and experienced around the world. Freud's metapsychological concepts, which he called "*Grundbegriffe*"—a set of foundations few in number but solidly anchored—have constantly demonstrated their usefulness, and they have endured almost unchanged. On the other hand, most Freudian, post-Freudian or even para-Freudian notions are like so many living organisms—ever prone to modification, and tending to be forgotten and (sometimes) resurrected; above all, they are subject to divergent interpretations, reflecting the element of the unforeseeable that is inevitably present for any analyst who refuses to be tied down by rigid theoretical models. Such divergences result too from the lessons of clinical practice and the temporary or permanent changes which that experience imposes on analytic theory; they are the traces of an empirical inquiry that has continued unabated from Freud's earliest tentative explorations to the confrontation with life as it is lived today. The coexistence in this dictionary of ideas that are oftentimes in contradiction with one another, or that have been developed in different ways from one continent to another, is testimony to their main characteristic: they are provisional conceptual tools, and their ephemeral quality indicates that in psychoanalysis, in one sense at least, everything always remains to be discovered, for the questions asked are forever being posed anew.

Once the idea of this dictionary had been conceived, based on the principle of a diversity of viewpoints, I proposed to the publishers, Calmann-Lévy, that an editorial board be formed, to be made up of recognized colleagues belonging to French psychoanalytic schools of differing orientations. I owe a great debt of gratitude to the friends who constituted that small group: Professors Sophie de Mijolla-Mellor, Roger Perron, and Bernard Golse, joined during the first stages by Dr. Jacques Angelergues. They all made vital contributions during those crucial early days. It is in their name, moreover, that I shall now describe our work methods and the route we took.

At a very early stage, thanks to a letter announcing our plan, we won the allegiance of a number of distinguished psychoanalysts. They became a kind of support committee, and their prestige lent weight to our approach to potential contributors. Simultaneously, we solicited the participation and counsel of not a few researchers known to us from our years as practitioners of psychoanalysis; we were also able to draw on connections built up over the fifteen-year existence of the International Association for the History of Psychoanalysis (IAHP). In this way a group of “advisors” was assembled, each of whom was asked to assume responsibility for a particular segment of our vast field of operations, to suggest to the editorial committee those concepts or individuals that they felt should absolutely be included as entries in the panoramic vision of the dictionary, and to identify the authors who in their view would be the best fitted to write those articles. Their advice was gratefully received and closely followed.

At the same time, we consulted a good number of indexes of existing psychoanalytic works in order to reach a first list of concepts; and the IAHP’s *Revue Internationale d’histoire de la psychanalyse* (International Review of the History of Psychoanalysis; discontinued in 1992) was a good source in determining which figures or events were the most frequently cited. In 1995 and 1996, at our editorial committee meetings, we debated all the proposed topics thus accumulated, rejecting some and adding others, until we arrived at a list that, truth to tell, was never completely finalized until the very last days before the manuscript was delivered. Our choices were made in a collegial spirit, before each of us was put in charge of a variable number of entries to assign to their respective authors along with general composition and format guidelines intended to impose some measure of uniformity on the immensely varied material to be produced.

Since almost a third of the entries commissioned were written in languages other than French, our commitment to an international approach was indeed undeviating, but there is no denying that this dictionary was conceived and realized by psychoanalysts trained and practicing in France. The selection of topics and the content of the entries may well reveal a somewhat “French” cast of mind. How indeed could it be otherwise? But it is my sincere hope that foreign readers will adopt an actively critical attitude in this connection, by suggesting, even contributing, additions. Nothing could be more in tune with our desire for the widest possible opening onto the world at large.

On the other hand, of course, by opting for a great diversity of contributors we risked losing a sense of unity, and unity is reassuring. We were quite aware that alert critics were bound to underscore the lacunae, the inadequacies, even the outright contradictions that would appear among entries written, say, by a French author, an English or American analyst, and a colleague from South America—each loyal, moreover, to a particular theoretical orientation. Similarly, the very topics chosen by our advisors must perforce reflect their personal judgments rather than ours. Occasionally we editors proposed additional subjects, but by and large we allowed the advisors’ selection to stand, out of respect for the agreement we had with them; in any event, it would have ill behooved the editorial board or the editor-in-chief to claim a knowledge superior to that of the advisors whom we had chosen as our guides in the matter.

It should be noted that despite our request that authors abide by specified space limitations, some were so carried away by their attachment to their assigned topic that they turned in longer contributions than anticipated. In some cases we were obliged to ask for significant cuts, and I should like to thank all contributors concerned for their good-natured and prompt acquiescence to what were surely painful self-amputations. As for those who found it easier to abide by our space constraints, their contributions were retained unmodified, at the risk of giving readers the mistaken impression, in view of disparities of length, that we meant either to downplay or to highlight some particular concept or individual.

Such editorial changes to submitted manuscript as we made were minor, concerned chiefly with formal aspects (style, ordering of paragraphs, standardization of references, etc.). In no case was any kind of censorship exercised by me or by any member of the editorial board, and no important revision was made without first suggesting it to the author concerned. It was out of the question that any article be published in seriously modified form without the writer's full approval. All articles are signed, and while the editors are responsible for their publication in the context of this dictionary, they belong in the moral and literary senses to their individual authors. With this in mind, each contributor had a contract and was remunerated appropriately, the main purpose being to acknowledge his or her authorship and to keep our collaboration, friendships notwithstanding, within a clearly legal framework.

Let me reiterate, as a last point, that this dictionary was created over a period of years. As with all such enterprises, and especially one involving so many contributors sprinkled across the globe, it was bound to be overtaken here and there by events, with no realistic prospect of a complete updating prior to publication. We must hope that such time-related shortcomings will be rectified as future editions appear.

Why is a dictionary of psychoanalysis needed? Interestingly, it was rather late on in the history of psychoanalysis that the call for a clearer definition of Freudian terms, whose precision was threatened by their wider and wider currency, was first heard. The teaching offered before the Second World War at the Berlin and later at the Vienna Institute of Psychoanalysis certainly helped show up the need for analysts in training to have to hand a work that, though not a manual, would furnish precise information on a still vigorously evolving body of theory. The fact that Freud lent his support to the idea, coupled no doubt with the anxiety aroused by the defections and misapplications then plaguing the young discipline of psychoanalysis, provided added impetus.

Thanks to Richard F. Sterba's *Reminiscences of a Viennese Psychoanalyst* (Detroit: Wayne State U. P., 1982), we are acquainted with the circumstances under which the first tentative attempt to compile a dictionary of psychoanalysis was made:

In 1931, at the suggestion of A. J. Storfer, I had undertaken the task of writing a psychoanalytic dictionary (*Handwörterbuch der Psychoanalyse*). Storfer actually began this work with the definition of a few terms beginning with the letter A, but he found the task too time consuming. He asked me to continue the work with him, to which I agreed. It was a project for which my experience in 1925 and 1926, working on the index of the *Gesammelte Schriften von Sigmund Freud* (Collected Works of Sigmund Freud) was an enormous help. Soon, however, Storfer lost interest in or courage for the enormous project and dropped out of our partnership. As ransom for dissolving the partnership, he gave me the index galleys and typescript pages and all of the eleven volumes of the *Gesamtausgabe*. I carried on the work alone. The dictionary was supposed to appear gradually in sixteen issues, of which the first was published on the occasion of Freud's eightieth birthday, 6 May 1936.

The preface to the first issue was the facsimile of a letter Freud wrote to me. When I had finished the letter A of the dictionary, I had given a copy to Anna Freud and asked her to submit it for Freud's scrutiny. After a short while I received this letter from Freud, which I quote here in English translation: "Your 'dictionary' gives me the impression of being a valuable aid to learners and of being a fine

achievement on its own account. The precision and correctness of the individual entries is in fact of commendable excellence. English and French translations of the headings are not indispensable but would add further to the value of the work. I do not overlook the fact that the path from the letter A to the end of the alphabet is a very long one, and that to follow it would mean an enormous burden of work for you. So do not do it unless you feel an internal obligation—only obey a compulsion of that kind and certainly not any external pressure” (pp. 99–100; Freud’s letter translated by James Strachey, *Standard Edition*, Vol. 22, p. 253).

In the wake of this first effort, and very soon in the case of North America, there appeared several dictionaries, or lexicons presenting select passages from Freud’s writings, designed to help define psychoanalytic concepts for analysts in training in the institutes; some went further, offering explanations meant to make psychoanalytic theory more accessible to the general reader. Important works falling under this general rubric are the *Glossary of Psycho-Analytical Terms* published under the editorship of Ernest Jones in 1924, a harbinger of the *Standard Edition*; the lists generated by the *French Commission Linguistique pour le Vocabulaire Pschanalytique* in 1923–24; or the *New German-English Psycho-Analytical Vocabulary* of 1943. It is also well worth citing the *Encyclopedia of Psychoanalysis* edited by Ludwig Eidelberg (New York: Free Press, 1968) and Charles Rycroft’s idiosyncratic *Critical Dictionary of Psychoanalysis* (London: Nelson, 1968).

In France, the initiatives of Daniel Lagache began as early as the 1950s, with the start of a dictionary in installments published in Maryse Choisy’s journal *Psyché*, and they culminated in that matchless work tool, the *Vocabulaire de la psychanalyse*, by Jean Laplanche and Jean-Bertrand Pontalis (Paris: PUF, 1967; translated as *The Language of Psycho-Analysis*, London: Institute of Psycho-Analysis/Hogarth, 1973). It should be borne in mind, however, that Laplanche and Pontalis’s in-depth study was restricted for the most part to the concepts of psychoanalysis as developed in Freud’s work alone.

Later French dictionaries of psychoanalysis were also intentionally circumscribed in one way or another. Pierre Fédida’s *Dictionnaire abrégé, comparatif et critique des notions principales de la psychanalyse* (Paris: Larousse, 1974) is a case in point. Some works pointed up the theoretical contributions of Jacques Lacan, such as the *Dictionnaire de la psychanalyse* edited by Roland Chemama and Bernard Vandermersche (Paris: Larousse, 1993; expanded edition, 1998), or Pierre Kaufmann’s *L’Apport freudien* (The Freudian Contribution). Kaufmann’s book (Paris: Bordas, 1993) is presented as a psychoanalytic encyclopedia rather than a dictionary, which would presumably be more condensed. In fact, despite the inclusion of a few biographical sketches, very brief, and limited to the main figures in the history of psychoanalysis, the work does not display the diversity and world-wide scope what we have pursued in our own dictionary. Nor does it deal with the principal concepts developed on the basis of practices derived from or collateral to psychoanalysis, such as those of Jungian analytical psychology.

Outside France, noteworthy titles—among many others which we have made no attempt to inventory here—include *A Dictionary of Kleinian Thought* by Robert K. Hinshelwood (London: Free Association Books, 1989), the *Bibliographisches Lexicon der Psychoanalyse* of Elke Mühlleitner (Tübingen: Diskord, 1992), and Dylan Evans’s *Introductory Dictionary of Lacanian Psychoanalysis* (London: Routledge, 1996), the first restricted to Kleinians, the second to members of the Vienna Society between 1902 and 1938, and the third to the thought of Jacques Lacan. More recently, in the United States, Burness E. Moore and Bernard D. Fine have edited *Psychoanalysis: The Major Concepts* (New Haven: Yale University Press, 1995), which elaborates in a distinctly encyclopedic manner on some forty major psychoanalytic themes.

The present dictionary differs markedly in fact from all its predecessors in the field, including Elizabeth Roudinesco and Michel Plon’s *Dictionnaire de la psychanalyse* (Paris:

Fayard, 1997) or the collected psychoanalytic articles of the French *Encyclopaedia Universalis* (1997).

It is the only work that presents not just some nine hundred concepts or ideas, but also three hundred and sixty biographies of eminent psychoanalysts from around the world, one hundred and seventy of their most noted works, and fifty countries where psychoanalysis has taken root; more than a hundred entries deal with events that have punctuated the history of psychoanalysis in its multifarious lines of development; the institutions that have embodied that development are likewise described in detail, as are the contributions of movements, such as analytical psychology and individual psychology, which stemmed from psychoanalysis.

A chronological approach was a guiding principle, and even if it could not be followed in every single entry, our contributors were urged to hew fast to a historical perspective. Only thus can theoretical choices be relativized so that they lose their rigidly fixed character and reveal themselves to be variable according to time and place. By offering a dais to a large number of psychoanalysts of different theoretical and practical persuasions, moreover, we hoped to arrive at a kind of overall picture that was contradictory precisely because it was alive—a candid shot, as it were, of psychoanalysis today, complete with the more or less conflict-prone schools in the context of which it has developed up to now and, it is to be hoped, will continue to evolve in the future. Our intention was to distinguish our dictionary as clearly as possible from works written by a small number of collaborators expressing the point of view of a particular psychoanalytic group or tendency.

All the same, it must be understood that we believe unequivocally that psychoanalysis was conceived and has developed in the context of Freudian ideas. The reference to Freud is cardinal in this work, and other theoretical and practical options have a place here only insofar as they have a direct or indirect, temporary or permanent connection with Freud, with Freud's history, or with the history of the psychoanalytic movement that Freud founded.

Psychoanalysis was created as the twentieth century opened, and it developed along with that century, affecting its historical, cultural and moral character by reason of the new way of thinking it represented. The reader should not therefore be surprised to find entries here whose subjects are writers, philosophers—even a literary movement like Surrealism, or such events as the First and Second World Wars. But in such cases we chose not to offer a detailed and biographical or historical account, or a complete account of an individual's work, but rather to confine ourselves to the subject's relationship to psychoanalysis. This also makes it possible, however, to trace the ways in which the sound and fury of the world reverberated within psychoanalysis, causing it to change or readapt. It should be remembered, too, that if psychoanalysis has a closer intimacy with the individual's psychic suffering than do other approaches, this is attributable to the intense personal involvement of those who helped refine its powers; for this reason we paid particular attention to the biography of the pioneers and their chief successors. Readers who find certain biographical details merely anecdotal are urged to bear in mind that no theoretical proposition should be entirely detached from the conscious and unconscious life of its originator, and this goes for Freud as much as for anyone else. We have nevertheless refrained from any hasty or "wild" interpretations of individual figures: nothing could be more radically at odds with the psychoanalytic approach than to pass judgment on a human being in just a few lines.

It was indeed never the mission of this dictionary to rank individuals or tendencies. Of course, it is impossible to avoid assuming criteria of worth, but even these cannot claim to exist *sub specie aeternitatis*; rather, they are mainly reflections—setting aside the enthusiasm of a particular author for his or her subject—of the spirit of the times or of geogra-

phical context. The articles concerned with Jung or Jungian notions were thus assigned to colleagues belonging to the societies of analytical psychology. Matters Adlerian were handled likewise. And topics relating to a Sándor Ferenczi, Melanie Klein, Jacques Lacan or Françoise Dolto were entrusted to writers close to them and their ideas. All is not told—and gossip hounds are likely to be disappointed. In our view, a dictionary such as this is neither holy writ nor pamphlet, but a kind of mirror held up to the time of its writing, bearing all the signs of that time's fashions and conformities, and addressed to future generations, who with the benefit of hindsight will assuredly be able to read far more between the lines than is discernible to us.

With respect to our handling of Freud's works, we decided that the best way to avoid entanglement in the thickets of editions and translations around the world was to adopt as our basic system of reference the chronological bibliographical tags updated in Ingeborg Meyer-Palmedo and Gerhard Fichtner's *Freud-Bibliographie mit Werkkonkordanz* (Frankfurt on the Main: S. Fischer, 1989). Our "Freud Bibliography" lists works of Freud according to this system; in each case the title is given in German and in English, along with a reference where applicable to the *Gesammelte Werke* and to the Standard Edition. It should be noted that we list only those works of Freud that are mentioned in the dictionary. Similarly, the "General Bibliography" is confined to works referred to in the text, and is in no sense intended to replace Alexander Grinstein's *Index of Psychoanalytic Writings* (New York: International Universities Press, 1956-75).

"A strange adventure," I wrote at the beginning of this preface, and the reader will perhaps have surmised on the basis of the above description of our *modus operandi* that the going was not always painless, or without its conflicts and clashes, even its moments of despondency. Yet we were always boosted by encouraging words from friends and colleagues who had got wind of our project in its earliest days and, from near or far, followed its progress throughout. Nor did we ever relinquish the conviction that this dictionary would answer a clear need in the analytic profession and among students or researchers who would find it to be a tool unlike any produced thus far.

If there is such a thing as a "language of psychoanalysis," albeit one considered opaque at times by its critics, we are confident that the present work will show it to be neither a wooden nor a dead language. It has grown up from roots shared by all psychoanalysts, but, as the range of our entries shows, from these common origins have sprung a variety of "dialects." Each of them—Adlerian, Jungian, Rankian, Ferenczian, Lacanian, or Bionian—has developed in its own way, and inevitably affected the others in the process. Each, to a greater or lesser degree, has weathered conflict, or eclipse and revival—testimony to a salutary psychoanalytic "heteroglossia," and to the kind of freedom that stimulates thought. The infinite variety of human beings, the diversity of their personal histories and the complexity of a psychological approach that encompasses the dimension of the unconscious can never be forced into the mold of a hypostasized language or submit to the dictates of some Big Brother preparing the "Newspeak" dictionary.

You think, I dare say, that our chief job is inventing new words. But not a bit of it! We're destroying words—scores of them, hundreds of them, every day. We're cutting the language down to the bone. . . .

Don't you see that the whole aim of Newspeak is to narrow the range of thought? In the end we shall make thoughtcrime literally impossible, because there will be no words in which to express it. Every concept that can ever be needed will be expressed by exactly one word, with its meaning rigidly defined. . . . Every year fewer and fewer words, and the range of consciousness always a little smaller (George Orwell, 1984. London: Secker and Warburg, 1987 [1949], pp. 53–54, 55).

*Alea jacta est.* This work is now in the hands of its readers. They are invited to handle it as they will. To contribute notes or offer corrections. To convey to us their critical thoughts and to suggest topics they would like to see dealt with in the future. Such active expressions

of interest would be the best possible reward for me personally and indeed for all those who have lent their hand over these last years to this portrait of psychoanalysis in the world of today.

ALAIN DE MIJOLLA  
PARIS, JUNE 19, 2001

# PREFACE TO THE AMERICAN EDITION

## PREFACE TO THE AMERICAN EDITION

I am thrilled and honored to be a part of the initiative Thomson Gale (represented by Frank Menchaca as well as the highly-effective and ever-smiling Nathalie Duval) has undertaken to share this Dictionary, whose production I directed in France, with an American audience. This enormous and very difficult work has been successfully completed by a highly-motivated team, including (amongst the many others whom I shall not name): Rachel J. Kain, Rita Runchock, and Patricia Kamoun-Bergwerk; the remarkable American advisors Edward Nersessian and Paul Roazen who reviewed all the texts; Nellie Thompson, whose aid was invaluable at various stages in the project; Matthew von Unwerth, who compiled the “Further Readings” sections, and above all, the translators and revisers who fulfilled the difficult task of rendering texts into English that had for the most part been written by authors from France, Spain, Germany, and Portugal.

These translators encountered difficulties raised by more than just the languages in which the authors wrote about these psychoanalytic concepts or biographies they were charged with. Despite a common foundation stemming directly from Freud’s ideas, divergent conceptions leading them to be grasped from slightly more theoretical versus clinical viewpoints, depending on where one is standing, were necessarily in evidence—a fact that had to be both respected and, at the same time, made more accessible to American readers.

However the sheer number of authors and the scope of their starting-points, as much national as related to different schools of psychoanalysis, nonetheless help us to avoid any sort of monolithic thinking, and beckon the reader to go beyond his or her reading of these dictionary entries with research that deepens their insight. For example, we have avoided repeating the precise definitions of terms cited by specific entries that the dictionary defines elsewhere. We have instead trusted that this dictionary would avail itself from page to page, concept to concept, psychoanalyst to psychoanalyst, to the likings of the systematic research or slightly poetic wanderings that constitute the most effective, or the most enlivened, approaches to getting to know a work such as this.

In the Preface to the French edition I offer detailed “directions for use” to readers of this work, so there is no need to revisit that subject. Let me rather use the few lines afforded me here to reiterate the particular importance of this American edition—in my eyes at any rate. It speaks English, like most of the countries in the world today, and English is, of course, an indispensable vector for any thought with claims to universality. Since its humble beginnings in Vienna, psychoanalysis has obviously had a global impact not only in the clinical and therapeutic realms, but also in the arenas of culture and thought. The twentieth and early twenty-first centuries have been marked by ideas whose development has deeply affected the existence of each and every one of us. Our sexual and political lives, our

morality, our ways of understanding our relationships with others—all bear the unmistakable stamp of Freud's legacy. By virtue of his family background and his many-sided education and training, Freud ended up at the point of intersection of cultural influences out of (and against) which psychoanalysis was gradually forged. This dual process, by no means painless, ensured the new discipline a position and multiple functions, which, as we may now plainly see as we look back over the years, have themselves been subject to continual evolution.

A procedure for psychopathological investigation, a method with therapeutic aims, or a conceptual apparatus to account for the workings of the psyche (*l'esprit*) in its external productions as well as its corporeal bonds—out of this ideological and scientific past which Freud conveyed, psychoanalysis has, in turn, modified the conditions of research into the most varied domains of knowledge and none, today, may pretend to be totally beyond its influence.

No matter what position pharmacology assumes, (and we must believe in its progress), the encounter with the mentally ill, the listening to their discourse and the decryption of their delusional sayings in order to glean their secret message, like the patient reestablishing vanished relational capacities, will forever remain an affair that takes place between two human beings, from one psychical apparatus to another. The hope that inspired Jung and Bleuler when they first took responsibility for the schizophrenics in the Burghölzli Asylum was as great as their disappointment. This phenomena repeated itself always and everywhere: Psychoanalysis began by appearing as “The Solution” to the unsolvable problems of mental illness. The example of America, beacon of enthusiasms and of disappointments, is illustrative in this respect—even more spectacularly so in that the all-powerful American Psychoanalytic Association permitted only doctors, psychiatrists for the most part, to join its ranks for the better part of 60 years.

Such is not the case today. Yet even though this puncturing of belief-systems might make us think of a destructive tidal wave, this investigatory drive remains—a drive that mobilizes psychoanalysts for their research into new clinical terrain, as they attempt to shed light on and treat ever more diverse and grave pathological conditions. One day, no doubt, new psychopathological conceptions will effect another exploratory synthesis of the psyche and its dysfunctions, thereby authorizing new avenues of approach that will once again appear to us as nothing short of miraculous. But in the meantime, the patient and modest relational exchange, which underpins the psychoanalytic approach to patients in the psychical domain, remains today's most developed adjuvant therapy, whose ever-greater efficacy and more precise pinpointing may be looked for in the progress of the neurosciences, neurobiology, genetics or immunology.

Although it continues to furnish, as Freud suggested, a “yield of knowledge” for other scientific domains, psychoanalysis gains its creative power and persistent originality from its position on the margins, due to the fact of its being the “other” that cannot be integrated into these disciplines, including literature, history, philosophy, etc. It is the “other” which disrupts through its theoretical *a priori* of a subversive discourse subjacent to all manifest discourse and which, (as the example of Freud himself proves), can never forget that its own words, as well as its thoughts, are condemned to expressing double-meanings, to contradiction, to interrogation; and which could therefore never be thought of as a finished product, a self-enclosed theory, still less a dogma.

The turbulent political events of recent years have refueled the diffusion of psychoanalysis into territories that had previously been closed to it. Therefore both theory and practice will have to rub shoulders with new cultures, languages and other philosophical, religious, medical and scientific traditions. No doubt they will thereby come to brave new storms, know new successes and, fleeting declines. But we must always hope they will be capable of enriching themselves with these various contributions. For only thus is the never-ending

research into the human psyche and its creations embarked upon anew—a quest that constitutes the psychoanalyst's true place in the world of yesterday, today and, for an unforeseeable time still, tomorrow.

Once again, I am particularly pleased and proud that the American edition of this dictionary is contributing, more so than all those that came before it, to extending and diffusing this perpetual renewal of Freudian thought throughout the world.

ALAIN DE MIJOLLA

# INTRODUCTION TO THE AMERICAN EDITION

## INTRODUCTION TO THE AMERICAN EDITION

Psychoanalysis is over 100 years old. Over the course of the 20th century, many new terms and concepts have been added to Freud's original constructs. This evolution has occurred not just in Vienna, Berlin, or Europe, but rather, all over the world. Consequently, new ideas have been formulated throughout and across the increasingly far-flung psychoanalytic community, and despite the existence of an international organization with a rich scientific program, regularly published journals, and an abundance of meetings and exchanges, the language of psychoanalysis is not as uniform as one would expect. Some concepts are understood differently and more importantly, have varying implications in different parts of the world. Other ideas are highly developed and given special status in some countries, while they are unknown or rarely utilized in others. To complicate matters further, schools of thought have developed with variant degrees of deviation from Freud's metapsychology.

A student entering the field of psychoanalysis today has a more difficult task than students of previous generations, in that there is much more to learn and understand, and a greater imperative to be in communication with colleagues in other parts of the world. To integrate the disparate concepts elaborated in different parts of the world, today's practitioner and anyone interested in the history of psychoanalysis must know, understand, and be capable of evaluating many divergent ideas and theoretical constructs. Well-informed dialogue among colleagues from different countries with other perspectives demands that psychoanalysts have a resource—a handbook, so to speak—that provides a brief, concise, but nevertheless sufficiently rigorous exposition of the lexicon of the field.

There have been some attempts in the past to create a dictionary and a glossary of psychoanalysis; *The Language of Psychoanalysis* by Laplanche and Pontalis is one such major effort in this direction; another is the glossary prepared under the aegis of the American Psychoanalytic Association. However, neither of these two works, as useful as they have been, has been able to cover all the disparate concepts, and many analysts have felt the need for an international encyclopedia of psychoanalysis. This need has become even more acute as psychoanalysts have become increasingly interested in facilitating an international exchange of ideas.

When Dr. de Mijolla decided to embark on this project, he was undertaking a Herculean task, but one whose value is unquestionable. Naturally, it would be impossible for one person to develop such an encyclopedia alone, and therefore, it was essential that he obtain the help of psychoanalysts from all over the world. Thus, the 1569 entries in this volume are the work of many contributors, with some contributing more than one entry. While such an arrangement made the timely development of an encyclopedia possible, it also created difficulties in the achievement of a uniform style. On the other hand, there is an

important advantage to this way of proceeding, in that authors known to be experts on a particular subject could contribute an entry in their area of specialization, enhancing the quality of the entries.

A second challenge, and one more specific to the English edition, is the difficulty in translating from the original French text. The team working on this edition has done its best to make the translations as fluid and easily comprehensible as possible. Nevertheless, given the number of translators and the inherent difficulties of interpretation, there may occasionally be a certain degree of rigidity to the sentences or differences from entry to entry. The final product, however, manages to offer a text that is simultaneously eminently approachable and extremely useful.

It will also become clear upon perusing the dictionary that a substantial number of the authors are French. As a result, there is more material on areas of psychoanalysis that have either developed more fully in France or are mostly used by French analysts. This, of course, makes the dictionary a unique source for anyone interested in understanding specific notions and concepts that are prevalent in the thinking of French psychoanalysts. It does, however, engender less coverage of ego psychology, conflict theory, and relational theory by the French authors; moreover, the impression of a negative view of ego psychology, in particular, and American psychoanalysis in general may be an artifact of the composition of the group of contributors. This is not surprising, given the lack of acceptance of Hartman's views in France, particularly by Lacan. Additionally, the animosity that developed between Rudolph Loewenstein and Jacques Lacan had no small hand in the increasingly critical attitude taken by the latter towards ego psychology. Some in France consider ego psychology to be too close to the conscious, and perhaps even too superficial, and therefore are dismissive of it, a viewpoint for which the reader may see evidence in some of the entries. On the other hand, American analysts, if writing about French psychoanalysis, could possibly take a prejudicial attitude and accuse French psychoanalysts of doing "wild analysis." However, with the increase in dialogue and exchange between French and American analysts, these sorts of prejudices are diminishing, and the sharing of perspectives has enriched the members of both groups. As one example of such cross-fertilization, this current edition of the encyclopedia has attempted to present ego psychology and compromise theory in a more balanced way, with the addition of a number of new entries, such as that of Dr. Charles Brenner on modern conflict theory. In addition, to supplement those entries that refer too exclusively to French works, this edition has added a list of suggested readings with references to American sources, compiled by Matthew von Unwerth.

The reader may also notice that the biographies of some prominent psychoanalysts are not mentioned in this volume, as only deceased analysts are included. Unfortunately, some omissions are unavoidable in any reference work that attempts to be as comprehensive as this encyclopedia. Hopefully, the reader will find the addition of photos from the archives of psychoanalysis enlivening and enriching.

Finally, I would like to thank those whose beneficent help made this work not only possible, but even enjoyable. Alain de Mijolla is of course, first and foremost, not only for entrusting me with this task, but also for allowing me a free hand, to a large extent, and for trusting my opinion on those occasions when independent judgment was needed. Nathalie Duval was another important anchor, enormously supportive and unfailingly good-humored, even at the most difficult moments. Her staff, too, was of great help, always in the background, unassuming, but faithfully executing the necessary tasks to ensure the work could proceed smoothly. A special word of thanks goes to the editors and translators whose work could not have been easy, considering the amount of highly technical material that required faithful interpretation. I would particularly like to single out the work of Donald Nicholson-Smith who never ceased to amaze me with his understanding of the semantics of psychoanalytic

language and the elegance and precision of his translations. And, finally, in the end, my gratitude and I am sure that of yours, the reader, goes to the men and women who penned the original entries, as well as a special grateful acknowledgment to those analysts who have added their contributions to this new edition of the encyclopedia.

# DIRECTORY OF CONTRIBUTORS

## ДИРЕКТОРЪ ОЕ КОНТРИБУТОРЪ

With texts originating from regions all over the world, each possessing its own unique conventions, and in order to maintain the Dictionary's character as an international work, we have refrained from standardizing the biographies sent to us by the 463 authors who contributed to it.

Liliane Abensour  
*Psychoanalyst*  
*Member*  
*Société psychanalytique de Paris*

# THEMATIC OUTLINE

## THEMATIC OUTLINE

*This outline provides a general overview of the conceptual structure of the International Dictionary of Psychoanalysis. The outline is organized by four major categories: Concepts/Notions, Biographies, Works, and History. All categories are subcategorized, with the exception of Biographies. The entries are listed alphabetically within each category or subcategory. For ease of reference, one entry may be listed under several categories.*

### **I. Concepts/Notions**

Abandonment  
Absence  
Abstinence/rule of abstinence  
Act, action  
Acting out/acting in  
Action-language  
Action-(re)presentation  
Action-thought (H. Kohut)  
Active technique  
Activity/passivity  
Actual neurosis/defense neurosis  
Acute psychoses  
Adaptation  
Addiction  
Adhesive identification  
Adolescence  
Adolescent crisis  
Adoption  
Affects, quota of affect  
Agency  
Alpha-elements  
Aggressiveness/aggression  
Alchemy  
Alcoholism  
Alienation  
Allergic object relationship  
Allergy  
Alpha function  
Alter ego  
Altruism  
Amae, concept of

Ambivalence  
Amentia  
Amnesia  
Amphimixia/amphimixis  
Anaclisis/anaclitic  
Anality  
Anagogical interpretation  
Analyzability  
Analysand  
Analyse quatrième  
  
**Analytical Psychology (Jung)**  
Active imagination  
Amplification  
Analytical psychology  
Archetype  
Collective unconscious  
Compensation  
Complex  
Ego  
Extroversion/introversion  
Individuation  
Interpretation of dreams  
Numinous  
Psychological types  
Projection and “participation mystique”  
Self  
Shadow  
Synchronicity  
Transference/counter-transference  
  
Animal magnetism  
Animistic thought

Animus-Anima  
Anorexia nervosa  
Anticathexis/counter-cathexis  
Anticipatory ideas  
Antinarcissism  
  
**Anxiety**  
Annihilation anxiety  
Anxiety  
Anxiety dream  
Anxiety, development of  
Signal anxiety  
  
Aphanisis  
Aphasia  
Applied psychoanalysis and the interaction  
of psychoanalysis  
Archaic  
Archaic mother  
Archeology, the metaphor of  
Arrogance  
As if personality  
Asthma  
Attachment  
Attention  
Autistic capsule/nucleus  
Autistic defenses  
Autobiography  
Autoeroticism  
Automatism  
Autoplastic  
Autosuggestion  
Basic assumption

Basic fault  
 Belief  
 Benign/malignant regression  
 Beta-elements  
 Beta-screen  
 Binding/unbinding of the instincts  
 Biological bedrock  
 Birth  
 Bisexuality  
 Bizarre object  
 Black hole  
 Blank/non-delusional psychoses  
 Body image  
 Borderline conditions  
 Boredom  
 Boundary violations  
 Breakdown  
 Breastfeeding  
 Breast, good/bad object  
 Bulimia  
 Capacity to be alone  
 Catastrophic change  
 Cathartic method  
 Cathectic energy  
 Cathexis  
 Censoring the lover in her  
 Censorship  
 Certainty  
 Change

**Character**

Character formation  
 Character neurosis  
 Child analysis  
 Childhood  
 Children's play  
 Civilization (*Kultur*)  
 Claustrophobia  
 Clinging instinct  
 Collective psychology  
 Combined parent figure  
 Compensatory structures  
 Complementary series

**Complex**

Castration complex  
 Complex  
 Dead mother complex  
 Father complex  
 Nuclear complex  
 Oedipus complex  
 Oedipus Complex, early  
 Compromise formation  
 Compulsion

Concept  
 Condensation  
 Conflict  
 Conscious processes  
 Consciousness  
 Constitution  
 Construction-reconstruction  
 Contact and psychoanalysis  
 Contact-barrier  
 Container-Contained  
 Contradiction  
 Conversion  
 Coprophilia  
 Counter-identification  
 Counter-Oedipus  
 Counterphobic  
 Counter-transference  
 Creativity  
 Cruelty  
 Cryptomnesia  
 Cultural transmission  
 Cure  
 Danger  
 Dark continent  
 Daydream  
 Day's residues  
 Death instinct (Thanatos)  
 Decathexis

**Defense**

Defense  
 Defense mechanisms  
 Manic defenses  
 Neuro-psychosis of defense  
 Neurotic defenses  
 Deferred action  
 Deferred action and trauma  
 Déjà-vu  
 Delusion  
 Demand  
 Dementia  
 Depersonalization

**Depression**

Basic depression  
 Depressive position  
 Postnatal/postpartum depression  
 Transference depression  
 Deprivation  
 Desexualization  
 Destrudo  
 Determinism  
 Developmental disorders  
 Dipsomania

Direct analysis  
 Directed daydream (R. Desoille)  
 Disavowal  
 Discharge  
 Discourse  
 Disintegration, feelings of, anxieties  
 Disintegration products  
 Dismantling  
 Disorganisation  
 Displacement  
 Doing/Undoing  
 Double bind  
 Double, The  
 Doubt

**Dream**

Birth, dream of  
 Convenience, dream of  
 Dream  
 Dream-like memory  
 Dream screen  
 Dream symbolism  
 Dream work  
 Dream's navel  
 Examination dreams  
 Hypocritical dream  
 Irma's injection, dream of  
 Latent dream thoughts  
 Mourning, dream of  
 Nakedness, dream of  
 Punishment, dream of  
 Premonitory dreams  
 Repetitive dreams  
 Typical dreams

**Drive**

Drive/instinct  
 Partial drive  
 Sexual drive  
 Subject of the drive  
 Dualism  
 Dynamic point of view  
 Early interactions  
 Economic point of view  
 Elasticity

**Ego**

Antilibidinal ego/internal saboteur  
 Ego  
 Ego, alteration of the  
 Ego autonomy  
 Ego boundaries  
 Ego, damage inflicted on  
 Ego (ego psychology)  
 Ego feeling

- Ego functions  
 Ego ideal  
 Ego ideal/ideal ego  
 Ego identity  
 Ego-instinct  
 Ego interests  
 Ego-libido/object-libido  
 Ego psychology  
 Ego, splitting of the  
 Ego states  
 Ego-syntonic  
 Pleasure ego/reality ego  
 Tube-ego
- Emotion  
 Empathy  
 Encopresis  
 Encounter  
 Enuresis  
 Envy  
 Eros
- Eroticism**  
 Eroticism, anal  
 Eroticism, oral  
 Eroticism, urethral
- Erotogenic masochism  
 Erotogenic zone  
 Erotogenicity  
 Erotomania  
 Erythrophobia (fear of blushing)  
 Estrangement  
 Ethics  
 Event  
 Excitation  
 Exhibitionism  
 Experience of satisfaction  
 Externalization-internalization  
 Face-to-face situation  
 Facilitation  
 Family  
 Family romance
- Fantasy**  
 Fantasy  
 Fantasy, formula of  
 Fantasy (reverie)  
 Pregnancy, fantasy of  
 Primal fantasy  
 Rescue fantasies  
 Unconscious fantasy  
 “Vagina dentata,” fantasy of
- Fascination  
 Fatherhood
- Fear  
 Feces  
 Female sexuality  
 Feminine masochism  
 Femininity  
 Feminity, rejection of  
 Fetishism  
 Fixation  
 Flight into illness  
 Foreclosure  
 Forgetting  
 Formations of the unconscious  
 Fort-Da  
 Fragmentation  
 Framework of the psychoanalytic treatment  
 Free association  
 Free energy/bound energy  
 Free-floating attention  
 Friendship  
 Fright  
 Frustration  
 Functional phenomenon  
 Fundamental rule  
 Fusion/defusion  
 Fusion/defusion of Instincts  
 Gain (primary and secondary)  
 Gender identity  
 General theory of seduction  
 Genital love  
 Gift  
 Gifts  
 Good-enough mother  
 Graph of Desire  
 Grid  
 Group analysis  
 Group phenomenon  
 Group psychotherapies  
 Guilt, feeling of  
 Guilt, unconscious sense of  
 Hallucinosi  
 Hallucinatory, the  
 Handling  
 Hatred  
 Helplessness  
 Heredity of acquired characters  
 Hermeneutics  
 Heterosexuality  
 Historical reality  
 Holding  
 Homosexuality  
 Hospitalism  
 Humor  
 Hypercathexis
- Hypnoid states  
 Hypnosis  
 Hyponchondria  
 Hysteria  
 Hysterical paralysis  
 I  
 Id  
 Idealization  
 Idealized parental imago  
 Ideational representation  
 Ideational representative
- Identification**  
 Heroic identification  
 Identification  
 Identification fantasies  
 Identification with the aggressor  
 Imaginary identification/symbolic identification  
 Projective identification
- Identificatory project  
 Identity  
 Ideology  
 Illusion  
 Imaginary, the (Lacan)  
 Imago  
 Imposter  
 Impulsive acts or impulsivity  
 Incest  
 Incompleteness  
 Indications and contraindications for psychoanalysis for an adult  
 Individual  
*Infans*  
 Infant development  
 Infant observation  
 Infant observation (direct)  
 Infant observation (therapeutic)  
 Infantile amnesia  
 Infantile psychosis  
 Infantile schizophrenia  
 Infantile sexual curiosity  
 Infantile, the  
 Inferiority, feeling of  
 Inferiority, feeling of (individual psychology)  
 Inhibition  
 Initial interview(s)  
 Innervation  
 Insight  
 Instinct  
 Instinct for knowledge or research  
 Instinctual impulse  
 Instinctual representative

- Integration  
 Intellectualization  
 Intergenerational  
 Internal object  
 Internal/external reality  
 interpretation  
 Interpretation of dreams  
 Intersubjective/intrasubjective  
 Introjection  
 Introspection  
 Invariant  
 Isakower phenomenon  
 Isolation  
 Jokes  
 Jouissance (Lacan)  
 Judgment of condemnation  
 Knot  
 L and R schemas  
 Lack of differentiation  
 Language and disturbances of language  
 Latency period  
 Latent  
 Law of the father  
 Lay analysis  
 Letter, the  
 Libidinal development  
 Libido  
 Lie  
 Life instinct (Eros)  
 Lifting of amnesia  
 Linking, attacks on  
 Listening  
 Logic(s)  
 Look/gaze  
 Lost object  
 Love  
 Love-Hate-Knowledge ( L/H/K links)  
 Magical thinking  
 Mania  
 Manic defenses  
 Manifest  
 Masculine protest (individual psychology)  
 Masculinity/femininity  
 Masochism  
 Mastery  
 Mastery, instinct for  
 Masturbation  
 Maternal  
 Maternal reverie, capacity for  
 Matheme  
 Maturation  
 Megalomania  
 Melancholia  
 Melancholy
- Memoirs of the future  
 Memory  
 Mentalization  
 Metaphor  
 Metapsychology  
 Metonymy  
 Midlife crisis  
 Mnemic symbol  
 Mnemic trace/memory trace  
 Model  
 Modesty  
 Money and psychoanalytic treatment  
 Moral masochism  
 Mother goddess  
 Mothering  
 Motricity, psychomotricity  
 Mourning  
 Mutative interpretation  
 Mutual analysis  
 Mysticism  
 Myth of the hero  
 Myth of origins  
 Mythomania  
 Myths  
 Name-of-the-Father
- Narcissism***  
 Narcissism  
 Narcissism of minor differences  
 Narcissism, primary  
 Narcissism, secondary  
 Narcissistic defenses  
 Narcissistic elation  
 Narcissistic injury  
 Narcissistic neurosis  
 Narcissistic rage  
 Narcissistic transference  
 Narcissistic withdrawal  
 Narco-analysis  
 Need for Ccusality  
 Need for punishment  
 Negation  
 Negative capability  
 Negative hallucination  
 Negative therapeutic reaction  
 Negative, work of the  
 Neopsychoanalysis
- Neurosis***  
 Actual neurosis/defense neurosis  
 Choice of neurosis  
 Failure neurosis  
 Fate neurosis  
 Infantile neurosis
- Neurosis  
 Obsessional neurosis  
 Phobic neurosis  
 Traumatic neurosis  
 War neurosis
- Neurotica  
 Neutrality, benevolent neutrality  
 Nightmare  
 Nirvana Neurasthenia  
 Nocturnal/night terrors  
 Nonverbal communication  
 Normality  
 Nostalgia  
 Object  
 Object *a*  
 Object relations theory  
 Object, change of/choice of  
 Obsession  
 Occultism  
 Oceanic feeling  
 Omnipotence of thoughts  
 Omnipotence, infantile  
 Ontogenesis  
 Operative thinking  
 Optical schema  
 Orality  
 Organ pleasure  
 Organic psychoses  
 Organic repression  
 Organization  
 Orgasm  
 Orgone  
 Other, the  
 Otherness  
 Overdetermination  
 Over-interpretation  
 Pain  
 Pair of opposites  
 Parade of the signifier  
 Paradox  
 Paranoia  
 Paranoid position  
 Paranoid psychosis  
 Paranoid-schizoid position  
 Paraphrenia  
 Parapraxis  
 Parenthood  
 Parricide  
 Pass, the  
 Passion  
 Penis envy  
 Perceptual identity  
 Persecution  
 Perversion

- Phallic mother  
 Phallic woman  
 Phallus  
 Phantom  
 Phobia of committing impulsive acts  
 Phobias in children  
 Phylogenesis  
 Physical pain/psychic pain  
 Pleasure in thinking  
 Pleasure/unpleasure principle  
 Preenatal  
 Prehistory  
 Premature-prematurity  
 Prepsychosis  
 Prereflective unconscious  
 Primal repression  
 Primal scene  
 Primal, the  
 Primary identification  
 Primary love  
 Primary masochism  
 Primary need  
 Primary object  
 Primary process/secondary process  
 Primitive  
 Primitive agony  
 Primitive horde  
 Principle of (neuronal) inertia  
 Principle of constancy  
 Principle of identity preservation  
 Principles of mental functioning  
 Perception-consciousness (Pcpt.-Cs.)  
 Pictogram  
 Preconception  
 Preconscious, the  
 Privation  
 Process  
 Processes of development  
 Progressive neutralization  
 Prohibition  
 Projection  
 Protective shield  
 Protective shield, breaking through the  
 Proton-pseudos  
 Protothoughts  
 Psychodrama  
 Psi system  
 Psyche/psychism  
 Psychic apparatus  
 Psychic causality  
 Psychic energy  
 Psychic envelope  
 Psychic reality  
 Psychic structure
- Psychic temporality  
 Psychical representative  
 Psychoanalyst  
 Psychoanalytic epistemology  
 Psychoanalytic family therapy  
 Psychoanalytic filiations  
 Psychoanalytic treatment  
 Psychoanalytical nosography  
 Psychobiography  
 Psychogenesis/organogenesis  
 Psychogenic blindness  
 Psychohistory  
 Psychological tests  
 Psychoses  
 Psychoses, chronic and delusional  
 Psychosexual development  
 Psychosomatic  
 Psychotherapy  
 Psychotic defenses  
 Psychotic/neurotic  
 Psychotic panic  
 Psychotic part of the personality  
 Psychotic potential  
 Purposive idea  
 Puberty  
 Puerperal psychoses  
 Purified-pleasure-ego  
 Quantitative/qualitative  
 Rationalization  
 Reaction-formation  
 Real, the (Lacan)  
 Real, Symbolic, and Imaginary father  
 Real trauma  
 Reality principle  
 Reality testing  
 Realization  
 Reciprocal paths of influence (libidinal coexcitation)  
 Regression  
 Relations (commensalism, parasitism, symbiosis)  
 Relaxation principle and neo-catharsis  
 Relaxation psychotherapy  
 Remembering  
 Reminiscences  
 Reparation  
 Repetition  
 Repetition compulsion  
 Representability  
 Representation  
 Representation of affect  
 Representative  
 Repressed
- Repressed, derivative of the; derivative of the unconscious  
 Repression  
 Repression, lifting of  
 Repudiation  
 Resistance  
 Return of the repressed  
 Reversal into the opposite  
 Rite and ritual  
 Rivalry  
 Sadism  
 Sadoomasochism  
 Schizophrenia  
 Scopophilia/scopophilia  
 Scotomization  
 Screen Memory  
 Secondary revision  
 Secret  
 Seduction  
 Seduction scenes  
 Selected fact  
 Sense/nonsense  
 Sexual theories of children  
 Sexual trauma  
 Sexuality  
 Sexualization  
 Sexuation, formulas of  
 Shame  
 Signifier  
 Signifier/signified
- Self**  
 Bipolar self  
 False self  
 Grandiose self  
 Heroic self  
 Self  
 Self-analysis  
 Self-consciousness  
 Self-esteem  
 Self-hatred  
 Self-image  
 Self mutilation in children  
 Self-object  
 Self-preservation  
 Self psychology  
 Self-punishment  
 Self-representation  
 Self-state dream  
 Self (true/false)  
 Self, the  
 Turning around on the subject's own self  
 Sexual differentiation  
 Signifying chain

- Skin-ego  
 Silence  
 Sleep/wakefulness  
 Slips of the tongue  
 Smell, sense of  
 Skin  
 Social feeling (individual psychology)  
 Somatic compliance  
 Somnambulism  
 Specific action  
 Split object  
 Splitting  
 Splitting of the subject  
 Splitting of the object  
 Splitting, vertical and horizontal  
 Squiggle
- Stages**  
 Anal-sadistic stage  
 Genital stage  
 Libidinal stage  
 Mirror stage  
 Oral-sadistic stage  
 Oral stage  
 Phallic stage  
 Quasi-independence/transitional Stage  
 Stage (or phase)  
 Stammering  
 State of being in love  
 Stranger  
 Strata/stratification  
 Structural theories  
 Subconscious  
 Subject  
 Subject of the unconscious  
 Subject's castration  
 Subject's desire  
 Sublimation  
 Substitute/substitutive formation  
 Substitutive formation  
 Sucking/thumbsucking  
 Sudden involuntary idea  
 Suffering  
 Suggestion  
 Suicidal behavior  
 Suicide  
 Sum of excitation  
 Superego  
 Supervised analysis (control case)  
 Suppression  
 Symbiosis/symbiotic relation  
 Symbol  
 Symbolic Equation  
 Symbolic realization
- Symbolic, the (Lacan)  
 Symbolism  
 Symbolism, process of  
 Symptom  
 Symptom/sinthome  
 Symptom-formation  
 System/systemic  
 Tenderness  
 Time  
 Taboo  
 Taboo of virginity  
 Tact  
 Technique with adults, psychoanalytic  
 Technique with children, psychoanalytic  
 Telepathy  
 Termination of treatment  
 Therapeutic alliance  
 Thing, the  
 Thing-presentation  
 Thought  
 Thought-thinking apparatus  
 Thought identity  
 Tics  
 Topographical point of view  
 Topology  
 Totem/totemism  
 Training analysis  
 Training of psychoanalysts  
 Trance  
 Transcultural
- Transference**  
 Idealizing transference  
 Lateral transference  
 Mirror transference  
 Negative transference  
 Psychotic transference  
 Resolution of the transference  
 Transference depression  
 Transference  
 Transference/counter-transference (analytical psychology)  
 Transference hatred  
 Transference in children  
 Transference love  
 Transference neurosis  
 Transference of creativity  
 Transference relationship  
 Twinship transference/alter ego  
 transference  
 Transformations  
 Transgression  
 Transitional object  
 Transitional object, space
- Transitional phenomena  
 Translation  
 Transmuting internalization  
 Transsexualism  
 Trauma  
 Truth  
 Turning around  
 Ulcerative colitis  
 Unary trait  
 Unconscious, the  
 Unconscious concepts  
 Unpleasure  
 Unvalidated unconscious  
 Vertex  
 Violence, instinct of  
 Visual  
 Voyeurism  
 Want of being/lack of being  
 Weaning  
*Weltanschauung*  
 Wish  
 Wish for a baby  
 Wish-fulfillment  
 Wish, hallucinatory satisfaction of a  
 Wish/yearning  
 Witch of Metapsychology, the  
 Word association  
 Work (as a psychoanalytical notion)  
 Word-presentation  
 Working over  
 Working-off mechanisms  
 Working-through

# CHRONOLOGY

## ΧΡΟΝΟΛΟΓΙΑ

*This chronological list was based upon the 17,000 sources of historical data that I have gathered for over twenty years and upon the articles published in this Dictionary. It can neither presume completion, since my choices were necessarily arbitrary, nor absolute precision, which does not exist in any work of history, no matter the scrutiny and rigor of its author. As with the Dictionary, it will indefinitely remain subject to additions and revisions. It should therefore only be considered as a point of departure for the more thorough research of our vigilant readers, to benefit future publications. —Alain de Mijolla*

DATE	EVENT
1815–1855	<p>December 18, 1815 – Jakob (Kallamon Jacob) Freud, Sigmund Freud's father, son of Schlomo Freud and Peppi [Pesel] (née Hoffmann), is born in Tysmenitz, Galicia (Poland)</p> <p>1833 – Presumed date of birth of Emanuel Freud, Sigmund's half-brother, in Tysmenitz, Galicia (Poland)</p> <p>1834 or 1835 – Presumed date of birth of Philipp Freud, Sigmund's half-brother, in Tysmenitz, Galicia (Poland)</p> <p>August 18, 1835 – Amalie (Amalia, Malka) Nathanson, Sigmund Freud's mother, daughter of Jacob Nathanson and Sara (née Wilenz), born in Brody</p> <p>January 15, 1842 – Josef Breuer born in Vienna (Austria)</p> <p>October 3, 1846 – James J. Putnam born in Boston, Massachusetts (USA)</p> <p>July 29, 1855 – Jakob Freud and Amalie Nathanson marry in Vienna</p> <p>August 18, 1855 – Johann (John) Freud, son of Emanuel Freud and Maria Freud-Rokach, Sigmund's nephew and playmate, born in Freiberg (Moravia)</p>
1856–1860	<p>May 6, 1856 – Sigismund Schlomo born in Freiberg (Moravia) at 6:30 pm, delivered, as all of Emmanuel and Maria's children, by the midwife Căcilia Smolka; circumcised on May 13</p> <p>October 1857 – Julius, Sigmund Freud's first brother, born in Freiberg (died on April 15, 1858 at the age of six months)</p> <p>October 24, 1858 – Wilhelm Fliess born in Arnswalde (Choszczno)</p> <p>December 31, 1858 – Anna, Sigmund's first sister, born in Freiberg</p>

- August 1859–March 1860 – Jakob Freud leaves for Vienna; Amalia, Sigmund, and Anna follow, stopping in Leipzig en route. Emanuel Freud's family emigrates to Manchester (England) with Philipp Freud
- March 21, 1861 – Regine Debora (Rosa) Freud, Sigmund Freud's second sister, fourth child of Jakob and Amalie, born in Vienna
- August 23 – Francisco Franco da Rocha born in Amparo, State of São Paulo (Brazil)
- 1861–1865
- February 12, 1861 – Louise Andreas-Salomé, called "Lou," born in St. Petersburg (Russia)
- March 22, 1861 – Maria (Mitzi) Freud, Sigmund Freud's third sister, fifth child of Jakob and Amalie, born in Vienna
- July 26, 1861 – Martha Bernays, Sigmund Freud's future wife, daughter of Berman Bernays and Emmeline (née Philipps), born in Hamburg
- July 23, 1862 – Esther Adolfine (Dolfi) Freud, Sigmund Freud's fourth sister, sixth child of Jakob and Amalie, born in Vienna
- May 3, 1864 – Pauline Regine (Paula) Freud, Sigmund Freud's fifth sister, seventh child of Jakob and Amalie, born in Vienna
- June 18, 1865 – Minna Bernays, the younger sister of Martha, Sigmund Freud's wife, born in Hamburg
- June 20, 1865 – Josef Freud (Sigmund Freud's uncle) arrested for trafficking counterfeit rubles in Vienna
- October 1865 – Sigmund Freud admitted to the Leopoldstatter Real- and Obergymnasium
- 1866–1870
- April 15 or 19, 1866 – Alexander Gotthold Efraim Freud, Sigmund Freud's brother, eighth and last child of Jakob and Amalie, born in Vienna
- October 13, 1866 – Georg Groddeck born in Bad Kösen an der Saale (Germany)
- March 18, 1868 – Wilhelm Stekel born in Boyan (Bukovnia)
- February 7, 1870 – Alfred Adler, second of six brothers, born in the Viennese suburb of Rudolfsheim (Austria)
- 1871–1875
- August 31, 1871 – Hermine Hug-Hellmuth-Hug von Hugenstein born in Vienna (Austria)
- October 13, 1871 – Paul Federn born in Vienna (Austria)
- August–September 15, 1872 – Along with two school friends (Eduard Silberstein, Horaz Ignaz Rosanes) Freud visits the Fluss family in Freiburg. Freud claims to be in love with Gisela Fluss
- February 23, 1873 – Oskar Pfister born in Zurich (Switzerland)
- March 24, 1873 – Edouard Claparède born in Geneva (Switzerland)
- July 7, 1873 – Sándor Ferenczi born in Miskolc (Hungary), the eighth of eleven children of Baruch Fraenkel (who will adopt the name Bernát Ferenczi), bookseller, printer, concert agent, and Róza Eibenschütz's agent
- July 1873 – Freud is accepted to his *Matura* (excellently "vorzüglich")

- October 1873 – Freud attends the Wiener Universität, at the medizinischen Fakultät
- October 12, 1874 – Abraham A. Brill born in Kanczugv (Austria)
- July 26, 1875 – Carl Gustav Jung born in Kesswill (Switzerland)
- August 1875 – Freud travels to England to the Manchester home of his half-brothers Emanuel and Philipp Freud
- August 28, 1875 – Marco Levi Bianchini born in Rovigo (Italy)
- 1876
- March – Freud studies in Trieste at Karl Claus’s Institute of Comparative Anatomy
- May 24 – Poul Bjerre born in Göteborg (Sweden)
- October – Freud attends the Ernst Brücke Physiologische Institut as “Famulus”
- 1877
- January 4 – Freud’s first publication: “Über den Ursprung der hinteren Nervenwurzeln im Rückenmarke von Ammocoetes (Petromyzon Planeri)” (1877a)
- May 3 – Karl Abraham born in Bremen (Germany)
- October 12 – Nikolai Ossipov born in Moscow (Russia)
- 1878
- January 22 – Ernst Lanzer (the Rat Man) born in Vienna (dies in Russia in 1918)
- May 10 – Mosche Wulff (or Moshe Woolf) born in Odessa (Russia)
- July 27 – August Aichhorn born in Vienna (Austria)
- 1879
- January 1st – Ernest Jones born in Gowerton, Glamorgan, Wales (Great Britain)
- March 12 – Viktor Tausk born in Zsilina (Slovakia)
- 1880
- November 6 – Sylvia May Payne born in Wimbledon, Surrey (Great Britain)
- December – Treatment of Bertha Pappenheim begins (Anna O.) under Josef Breuer
- 1881
- January 10 – Hanns Sachs born in Vienna (Austria)
- March 31 – Freud becomes a medical doctor
- April 5 – Ludwig Binswanger born in Kreuzlingen, canton of Thurgovia (Switzerland)
- April 8 – Carl Müller-Braunschweig born in Braunschweig (Germany)
- June 25 – Felix Boehm born in Riga (Lithuania)
- June 26 – Max Eitingon born in Mohilev (Russia)
- November 28 – Stefan Zweig born in Vienna (Austria)
- 1882
- March 30 – Melanie Klein-Reizes born in Vienna (Austria)
- April – Freud first meets Martha Bernays
- April 4 – Ernst Simmel born in Wroclaw (Poland)
- July 2 – Marie Bonaparte, princess of Greece and Denmark, born in Saint-Cloud (France)
- October – Freud, having given up a career in research, goes to work in different capacities at the General Hospital of Vienna

- November 1 – Ida Bauer (Dora) born (dies in New York in 1945)
- November 12 – Johan H.W. van Ophuijsen born in Sumatra (Dutch East Indies)
- Jean-Martin Charcot is named Professor of the Clinic of Mental Illnesses
- 1883
- June 28 – Joan Riviere-Hogson Verrail born in Brighton (Great Britain)
- July 13 – Josef Breuer tells Freud about the case of Anna O.
- December 24 – Emil Oberholzer born in Zweibrücken (Switzerland)
- 1884
- January 23 – Hermann Nunberg born in Bendzin, Galicia (Poland)
- April 22 – Otto Rank (Rosenfeld) born in Vienna (Austria)
- June 14 – Eugenia Sokolnicka-Kutner born in Varsovia (Poland)
- October 9 – Helene Deutsch-Rosenbach born in Przemysl (Poland)
- 1885
- March 24 – Susan Isaacs-Sutherland born in Bolton, Lancashire (Great Britain)
- April 1885 – Freud’s research and publications on cocaine
- April 28 – Freud tells Martha that he destroyed his old notes, letters, and manuscripts
- June 19 – A traveling stipend is awarded to Freud for a six-month stay in Paris and Berlin
- July 18 – Freud is named Privatdozent in Neuropathology, a decision that will not become official until September 5
- September 15 – Karen Horney-Danielsen born in Hamburg (Germany)
- October 13 – Freud begins his internship under Professor Jean-Martin Charcot at the Salpêtrière Hospital in Paris
- 1886
- February 28–April 3 – Freud leaves Paris for Berlin and an internship with professor Baginsky, at the Clinic of Children’s Diseases, to prepare for his future post at the Kassowitz Clinic in Vienna
- March 28 – Henri Flournoy born in Geneva (Switzerland)
- April 25 – Freud opens his medical practice in Vienna on Easter Day, at No. 7 Rathausstrasse
- May 22 – Angélo Hesnard born in Pontivy, Morbihan (France)
- September 13 – Civil marriage of Sigmund Freud and Martha Bernays at the Wandsbek Rathaus. Brief religious ceremony on September 15
- October 16 – Adelheid Lucy Koch born in Berlin (Germany)
- 1887
- January 6 – Sergei Pankejeff, the Wolf Man, born in Russia on January 6 in the Gregorian Calendar (December 24, 1886, in the Julian Calendar), died in Vienna in 1979
- January 29 – René Spitz born in Vienna (Austria)

- July 9 – Heinrich Meng born in Hohenhurst (Germany)  
 September 7 – Julio Pires Porto-Carrero born in Pernambuco (Brazil)  
 September 26 – James Strachey born in London (Great Britain)  
 October 12 – Karl Landauer born in Munich (Germany)  
 October 16 – Mathilde Freud (first child of Sigmund and Martha) born in Vienna, Maria-Theresienstrasse 8  
 November 10 – Arnold Zweig born in Glogau (Silesia)  
 November 24 – Freud's first letter to Wilhelm Fliess
- 1888  
 January 13 – Edward Glover born in Lesmahagow, Scotland (Great Britain)  
 May 12 – Theodor Reik born in Vienna (Austria)
- 1889  
 February 19 – René Allendy born in Paris (France)  
 May 1 – First day of treatment of Emmy von N . . . "Don't move! Don't say anything! Don't touch me!"  
 July 19–August 9 – Freud travels to Nancy to visit Hippolyte Bernheim, then to Paris  
 August 8–12 – First International Congress of Experimental Hypnotism and Therapy in Paris, for which Freud is registered  
 August 11 – William R. Fairbairn born in Edinburgh, Scotland (Great Britain)  
 September 21 – Edoardo Weiss born in Trieste (Italy)  
 October 23 – Frieda Fromm-Reichmann born in Karlsruhe (Germany)  
 November 13 – Imre Hermann born in Budapest (Hungary)  
 December 6 – Jean Martin Freud (second child of Sigmund and Martha) born in Vienna, Maria-Theresia-Str. 8  
 Clark University founded (USA); Stanley Hall (1844–1924) is named president
- 1891  
 January 22 – Franz Alexander born in Budapest (Hungary)  
 February 19 – Oliver Freud (third child of Sigmund and Martha) born in Vienna, Maria-Theresia-Str. 8  
 May 2 – Freud publishes his first book, dedicated to Breuer, *Zur Auffassung der Aphasien* (Towards an Interpretation of Aphasia)  
 August 17 – Abram Kardiner born in New York (USA)  
 September – The Freud family moves to 19 Berggasse, where they will reside until 1938  
 September 12 – Géza Róheim born in Budapest (Hungary)  
 October 11 – Dorothy Burlingham-Tiffany born in New York (USA)
- 1892  
 March 7 – Siegfried Bernfeld born in Lemberg, Galicia (Poland)  
 April 6 – Ernst Freud (fourth child of Sigmund and Martha) born in Vienna, 19 Berggasse  
 May 6 – Jacob Freud gives Sigmund the second volume of the Philippon Bible for his thirty-fifth birthday

- June 28 – First letter in which Freud uses the familiar “you” with Wilhelm Fliess
- October – In the case of Frl E. von R., Freud renounces hypnotism and creates the “concentration technique” for what he calls “psychic analysis”
- November 8 – Therese Benedek born in Budapest (Hungary)
- 1893
- February – Translated in Spanish in the Barcelona *Medical Sciences Review*, volume XIX, no. 3, “Psychic Mechanisms of Hysterical Phenomena: Preliminary Communication.” The article is also published in the *Gaceta Médica de Granada* (“Grenada Medical Gazette”), volume XI, 232 and 233. According to James Strachey, it’s “the very first publication of a translation of a psychological work by Freud in the world”
- April 12 – Sophie Freud (fifth child of Sigmund and Martha) born in Vienna, 19 Berggasse
- July 22 – Karl A. Menninger born in Topeka, Kansas (USA)
- July 29 – Pierre Janet defends his medical thesis in Paris: “Contribution to the Study of Mental Accidents Among the Hysterical”
- August 16 – Jean-Martin Charcot dies suddenly in Quarré-les-Tombes in the Morvan (France)
- October 3 – Clara M. Thompson born in Providence, Rhode Island (USA)
- 1894
- April – Frederick W. H. Myers reports on the “Preliminary Communication” during a session at the Society for Psychological Research (London). Jones states that this report was the basis for his interest in Freud’s work (Great Britain)
- April 20 – Edward Bibring born in Stanislaw, Galicia (Poland)
- May 3 – Phyllis Greenacre born in Chicago, Illinois (USA)
- August 2 – Raymond de Saussure born in Geneva (Switzerland)
- November 4 – Heinz Hartmann born in Vienna (Austria)
- November 5 – René Laforgue born in Thann, Alsace (Germany)
- William James writes a summary of the “Psychic Mechanisms of Hysterical Phenomena: Preliminary Communication” in the *Psychological Review* (USA)
- 1895
- February – Wilhelm Fliess operates on Emma Eckstein, Freud’s patient, and forgets a dressing in the operating room
- March 4 – First account of a dream as “wish fulfillment,” Rudi Kaufmann’s dream on sleeping (Frau Breuer’s nephew)
- May 15 – Freud and Josef Breuer publish *Studies on Hysteria*
- July 24 – Freud’s first complete analysis of one of his own dreams about “the injection given to Irma” on the night of July 23–24 during his vacation at the Bellevue Hotel, near Vienna
- August – Freud goes to Italy for the first time, accompanied by his brother Alexander

- September 21 – While returning to Berlin in the train, after a meeting with W. Fliess, Freud edits the beginning of the “Outline of a Scientific Psychology”
- November 29 – Minna Bernays, Martha’s sister, comes to stay with the Freuds and remains with them until the end of her life
- December 3 – Anna Freud, sixth and last child of Sigmund and Martha, born in Vienna, 19 Berggasse
- 1896
- March 30 – First appearance of the word “psycho-analysis” in an article by Freud in French on “L’Hérédité et l’étiologie des névroses” (Heredity and Etiology of Neuroses) in the *Revue neurologique* (1896a)
- April 7 – Donald W. Winnicott born in Plymouth (Great Britain)
- October 23 – Jakob Freud dies after four months of illness. He is buried two days later (dream: “We are asked to close our eyes/an eye”)
- December 3 – Michael Balint (Bàlint, Mihály) born in Budapest (Hungary)
- 1897
- January – Freud’s first four dreams of Rome date from January of this year
- March 27 – Wilhelm Reich born in Dobrzycynica, Galicia (Poland)
- May 10 – Margaret Mahler-Schönberger born in Sopron (Hungary)
- July – Beginning of Selbstanalyse (self-analysis)
- July 17 – Heisaku Kosawa born in Atsugi, Kanagawa (Japan)
- September 8 – Wilfred R. Bion born in Mattra (United Provinces, India)
- September 21 – Cesare Musatti born in Dolo, Venice (Italy)
- September 21 – Letter to Wilhelm Fliess: “I don’t believe anymore in my neurotica”
- September 23 – Freud joins the B’nai-B’rith-Gesellschaft
- September 26 – Max Schur born in Stanislav (Ivano-Frankovsk, Ukraine)
- October 15 – Letter to Wilhelm Fliess: first mention of the future “Oedipus complex”
- December 2 – Otto Fenichel born in Vienna (Austria)
- December 5 – First conference on dreams at the B’nai-B’rith-Gesellschaft
- December 22 – Nicola Perrotti born in Penne, Pescara (Italy)
- December 25 – In Breslau Freud meets with Wilhelm Fliess, who talks to him about bisexuality and bilaterality
- 1898
- February 9 – Rudolph M. Loewenstein born in Lodz (Poland)
- February 9 – “I am giving up self-analysis to devote myself to a book on dreams” writes Freud to W. Fliess
- May 6 – Richard F. Sterba born in Vienna (Austria)
- August 21 – John Rittmeister born in Hamburg (Germany)

- September 22 – First analysis, written to Wilhelm Fliess, on forgetting the name of Signorelli, the painter of the “Last Judgment” in Orvieto
- 1899
- January 11 – Grete Bibring-Lehner born in Vienna (Austria)
- February 3 – Paula Heimann-Glatzko born in Danzig (Germany)
- July 20 – Edmund Bergler born in Austria
- August 6 – Werner Kemper born in Hilgen, Rhenania (Germany)
- August 27 – Final writing and first corrections to the drafts of *The Interpretation of Dreams*
- September 11 – The manuscript of *The Interpretation of Dreams* is delivered to the printer
- October 24 – Date of the dedication in the copy of *The Interpretation of Dreams* sent to Wilhelm Fliess: “Seinem theuern Wilhelm z. 24 OKT 1899”
- November 27 – Durval Marcondes born in São Paulo (Brazil)
- 1900
- January 8 – “The new century, which interests us especially owing to the fact that it includes in itself the date of our death, only brought me a stupid report in the Zeit,” wrote Freud to Wilhelm Fliess
- March 23 – Erich Fromm born in Frankfurt (Germany)
- April 24 – Freud gives a conference on *Fécondité* by Emile Zola before the B’nai-B’rith-Gesellschaft
- April 26 – Ernst Kris born in Vienna (Austria)
- May 27 – Marianne Kris-Rie born in Vienna (Austria)
- September 24 – “I’m slowly writing the ‘Psychopathology of Everyday Life,’” writes Freud to Wilhelm Fliess
- October 14 – The beginning of Dora’s treatment announced; it ends on December 31
- 1901
- April 14 – Jacques Lacan born in Paris (France)
- August 7 – “You side against me saying that ‘he who read the thoughts of others only finds his own thoughts,’ which takes away all validity from my research,” Freud writes to Wilhelm Fliess, their distance more pronounced day by day.
- August 30–September 14 – Freud’s first trip to Rome accompanied by his brother Alexander
- September 23 – Sacha Nacht born in Racacini, Bacau (Romania)
- November 23 – Muriel M. Gardiner born in Chicago, Illinois (USA)
- The *Archives de psychologie* founded in Geneva by Edouard Claparède and his uncle Théodore Flournoy (Switzerland)
- Freud publishes *Zur Psychopathologie des Alltagslebens (Über Vergessen, Versprechen, Vergreifen, Aberglaube und Irrtum)* (The Psychopathology of Everyday Life, 1901b)
- 1902
- March 5 – Freud is named “outstanding professor”
- March 11 – Freud’s last letter to Wilhelm Fliess before Swoboda affair in 1904

- April 9 – Annie Reich-Pink born in Vienna (Austria)  
 June 15 – Erik Homburger Erikson born in Frankfurt (Germany)  
 October – Freud sends postcards inviting Alfred Adler, Wilhelm Stekel, Max Kahane, and Rudolph Reitler to scientific meetings entitled “Psychological Wednesday Society” (“*Psychologischen Mittwoch-Vereinigung*”). Alfred Meisl and Paul Federn will join him in 1903
- 1903
- February 14 – Marriage of Carl G. Jung and Emma Rauschenbach  
 June – Otto Weininger’s book, *Geschlecht und Charakter* (Sex and Character) published. He commits suicide on October 4  
 August 11 – Celes Ernesto Cárcamo born in La Plata (Argentina)  
 August 28 – Bruno Bettelheim born in Vienna (Austria)  
 August 3 – Daniel Lagache born in Paris (France)
- 1904
- April 26 – Freud resumes contact with Wilhelm Fliess, but Fliess later accuses Freud of being at the source of the plagiarism of his discovery on bisexuality, for which Hermann Swoboda is later found guilty  
 June 24 – Angel Garma born in Bilbao (Spain)  
 August 14 – Emilio Servadio born in Sestri, Genoa (Italy)  
 August 17 – Sabina Spielrein is admitted to the Burghölzli Shelter, where she will be treated by Jung in a method inspired by Freud (Switzerland)  
 September 4 – Freud’s improvised voyage with his brother Alexander in Greece. Trip to the Acropolis in Athens
- 1905
- Eduard Hitschmann joins the “*Psychologischen Mittwoch-Vereinigung*”  
 Otto Rank and Eugen Bleuler write to Freud  
 Publication of two books by Freud: *Der Witz et seine Beziehung zum Unbewußten* (The Joke and its Relationship with the Unconscious, 1905c), *Drei Abhandlungen zur Sexualtheorie* (Three Essays on the Theory of Sexuality, 1905d), and of two articles, “*Über Psychotherapie*” (On Psychotherapy, 1905a) and “*Bruchstück einer Hysterie-Analyse*” (Dora: An Analysis of Case of Hysteria, 1905e), begun in 1901  
 Ragnar Vogt, future leading professor of psychiatry in Norway, draws on Freud’s psycho-cathartic method in *Psykiatriens grundtræk* (Outline of Psychiatry) (Norway)
- 1906
- February – First article on psychoanalysis in the USA written by James J. Putnam in the *Journal of Abnormal Psychology* (USA)  
 April 11 – Carl Gustav Jung’s first letter to Freud  
 May 8 – In Freud’s letter to Arthur Schnitzler: “I have often asked myself with astonishment where you gather knowledge of such and such a hidden point, when I only acquired it after tedious investigative work, and I came to envy the writer that I already admired.”  
 September – Freud’s *Sammlung kleiner Schriften zur Neurosenlebre aus den Jahren 1893–1906*, Volume I (Collection of Articles on Neuroses, Dating from 1893 to 1906) published

1907

October 10 – First meeting of the Psychological Wednesday Society where Otto Rank “functions as paid secretary.” The sessions take place every Wednesday at 8:30 pm at Freud’s home. The conferences begin at 9:00 pm. The order of the speakers in the discussion is determined by drawing lots.

January 1 – After the publication of *Psychologie der Dementia praecox* by Carl G. Jung, Freud writes to him: “Please quickly renounce this error that your writing on dementia praecox did not very much please me. The simple fact that I expressed criticism can prove it to you. Since, if it were otherwise, I would find sufficient diplomacy to hide it from you. It would really be wiser to go against the best that were ever associated with me. I see, in reality, in your essay on d. pr. the most important and rich contribution to my work that I have come across, and I don’t see among my students in Vienna, who probably have a non univocal advantage over you from personal contact with me, in fact only one can put himself on the same rank as you for comprehension, and none are up to do as much for the cause as you, and ready to do it.”

January 30 – Max Eitingon visits Freud, with a patient

February 26 – John Bowlby born in London (Great Britain)

March 3 – Carl G. Jung and Ludwig Binswanger’s first visit with Freud on Sunday, March 3 at 10:00 am

June 8 – Edouard Claparède, the director of the laboratory of experimental psychology in Geneva, visits Carl G. Jung to be introduced to the technique of association (Switzerland)

June 25 – Enrique Pichon-Rivière born in Geneva (Switzerland)

June 25 – Karl Abraham’s first letter to Freud

July 4 – First reading in France of “The Psycho-Analytical Method and Freud’s ‘*Abwehr Neuropsychosen*’” by Adolf Schmiergeld and P. Provotelle during the session of the Neurology Society in Paris

September 2–7 – First International Congress of Psychiatry, Psychology and Assistance for the Insane in Amsterdam. Carl G. Jung responds to attacks against Freud (Netherlands)

September 27 – First session of the Freud-Gesellschaft in Zurich, founded by Carl G. Jung (Switzerland)

October 1 – First consultation of the Rat Man

October 9 – Freud announces his intention to dissolve the Psychological Wednesday Society to create the Vienna Psychoanalytical Society

November 6 – Freud presents the case of the Rat Man to the Vienna Psychoanalytical Society and Otto Rank notes: “The technique of the analysis has changed in the sense that the psychoanalyst no longer seeks to obtain the material that interests himself, but allows the patient to follow the natural and spontaneous course of his thoughts”

December 15 – Karl Abraham’s first visit with Freud

*Studie über Minderwertigkeit von Organen* (Study on the Inferiority of Organs) by Alfred Adler published (Austria)

- 1908
- February 2 – Sándor Ferenczi, accompanied by Fülöp Stein, visits Freud for the first time
  - April 15 – The Wiener Psychoanalytische Vereinigung (Vienna Psychoanalytical Society) founded
  - April 26–27 – Zusammenkunft für Freudsche Psychologie, first international congress on Freudian psychology in Salzburg, a meeting suggested by Carl G. Jung. Freud's conference on the Rat Man lasts four hours
  - April 30 – Ernest Jones and Abraham A. Brill visit and lunch with Freud in Vienna
  - May 3 – Freud's first letter to Stefan Zweig
  - May 8 – Cyro Martins born in Porto Alegre (Brazil)
  - June 2 – Kurt Eissler born in Vienna (Austria)
  - August 27 – First meeting of the Berlin Psychoanalytical Association founded by Karl Abraham with Iwan Bloch, Magnus Hirschfeld, and Otto Juliusburger (Germany)
  - September 2–15 – Freud travels to England to visit his elder brothers
  - September 20 – Alexander Mitscherlich born in Munich (Germany)
  - September 26 – Ernest Jones settles in Toronto at the Toronto Lunatic Asylum (Canada)
  - October 3 – Ignacio Matte-Blanco born in Santiago (Chile)
  - November 6 – Françoise Dolto-Marette born in Paris (France)
  - Nikolai Ossipov meets Freud in Vienna. He edits the translations of Freud's works and founds the first psychoanalytical circle in Moscow, the "little Fridays" (Russia)
  - Ludwig Jekels edits the first publications of Freud in the Polish language (Poland)
  - Nervöse Angstzustände und ihre Behandlung* (Nervous Anxiety States and Their Treatment) by Wilhelm Stekel published (Austria)
- 1909
- January 18 – Freud's first letter to Oskar Pfister
  - February 7 – Marriage of Mathilde, the first of Freud's children to marry, to Robert Hollitscher
  - March – First half-volume of the *Jahrbuch für psychopathologische und psychoanalytische Forschungen*. Directors: Eugen Bleuler and Freud. Editor-in-chief: Carl G. Jung
  - March 10 – Alfred Adler gives a conference at the Vienna Society: "From Psychology to Marxism"
  - April 25 – Oskar Pfister's first visit with Freud
  - May 30 – Sabina Spielrein's first letter to Freud for an interview on the subject of his relationship with Carl G. Jung
  - July 2 – Pieter van der Leeuw born in Zutphen (Netherlands)
  - August 27 – Freud, Carl G. Jung and Sándor Ferenczi arrive in New York, at the invitation of G. Stanley Hall. Freud is named Doctor Honoris Causa at Clark University (Worcester, Massachusetts) where he gives, beginning on September 6, five conferences on psychoanalysis. On November 9, 1909, Putnam writes to him: "Your visit to America had a profound impact on me; I work and I read your writings with an even greater interest." (USA)

October 16 – Jeanne Lampl-de Groot born in Schiedam (Netherlands)

November 17 – Correspondence begins between Freud and James Jackson Putnam

Study Group in Sydney founded by Dr. Donald Frazee (Australia)

First article on psychoanalysis written by a Spanish psychiatrist, Dr. Gayarre, “Sexual Origin of Hysteria and General Neurosis,” published in the *Clinical Review of Madrid* (Spain)

*Psychoterapia (Psixoterapija – Obozrenie voprosov lecenija i prikladnoj psixologii)* founded. It is published until 1917 (Russia)

Freud publishes “Analyse der Phobie eines fünfjährigen Knaben (Der kleine Hans)” (Little Hans) 1909b, first study of the case from which the clinical material, originating from the cure of a child by his father, Max Graf, confirms the Freudian theories of child sexuality

Freud publishes “Bemerkungen über einen Fall von Zwangsneurose (Der Rattenmann)” (Remarks on a Case of Obsessional Neurosis (The Rat Man), 1909d)

*Der Mythos der Geburt des Helden. Versuch einer psychologischen Mythendeutung (The Myth of the Birth of the Hero)* by Otto Rank published (Austria)

*Traum und Mythos. Eine Studie zur Völkerpsychologie. Schriften zur angewandten Seelenkunde (Dreams and Myths)* by Karl Abraham published (Germany)

1910

February – Beginning of the first analysis of the “Wolf Man,” Sergei Konstantinovich Pankejeff. It concludes on July 14, 1914

March 30 – First public definition of countertransference in Freud’s conference at the Nuremberg Congress: “Our attention is directed to the ‘counter-transference’ which registers with the physician as a consequence of the influence the patient exerts upon the unconscious feelings of his analyst. We are all ready to require that the physician recognizes and controls in himself this counter-transference.” (1910d)

March 30 – Berliner Psychoanalytische Vereinigung (Berlin Psychoanalytic Society) founded (Germany)

March 30–31 – 2nd Congress of the International Psychoanalytical Association in Nuremberg (Germany) during which the International Psychoanalytical Association is founded with its headquarters in Zurich (Switzerland). President: Carl G. Jung. Secretary: Franz Riklin. The existing psychoanalytical associations become local branches. Its official monthly mouthpiece, the *Korrespondenzblatt*, founded. The *Zentralblatt für Psychoanalyse; Medizinische Monatsschrift für Seelenkunde* (Central sheet for psychoanalysis; Medical monthly for Psychology) is founded; Freud is the editor-in-chief and the editors are Alfred Adler and Wilhelm Stekel

April – The Wiener Psychoanalytische Vereinigung (Vienna Psychoanalytical Society) leaves Freud’s residence and meets at Doktorenkollegium, Rothenturmstr. 19 (Austria)

April 10 – Margarethe Hilferding-Hönigsberg becomes the first female member of the Viennese Psychoanalytical Society (Austria)

May 2 – The American Psychopathological Association founded by Ernest Jones, in conjunction with A.A. Brill, August Hoch, Morton Prince, and James Putnam. President: Morton Prince (USA)

July 2 – Herbert Rosenfeld born in Nuremberg (Germany)

August 23 – Freud's letter to Poul Bjerre (Sweden) marks the beginning of their correspondence

August 30 – Freud "analyzes" Gustav Mahler during his stay in Leiden (Holland)

September 24 – Arminda Aberastury born in Buenos Aires (Argentina)

October 12 – Alfred Adler is elected president and Wilhelm Stekel vice-president of the Viennese Psychoanalytical Society (Austria)

December – Freud's first letter from France, from Dr. Pierre Morichau-Beauchant, in Poitiers: "This letter will show you that you also have disciples in France who passionately follow your work" (France)

Germán Greve Schlegel publishes the first psychoanalytical article known in Latin America, in Chile: "Sobre Psicología y Psicoterapia de Ciertos Estados Angustiosos." The presentation of this study in Buenos Aires in 1910 was noted by Freud in the *Zentralblatt für Psychoanalyse* (1911) and in *Contribution to the History of the Psychoanalytical Movement* (1914d) (Chile)

The term *Oedipus complex* appears in Freud's article entitled "Contribution to the Psychology of Love" (1910h)

The Flexner report, underlining the lack of teaching standards in teaching medicine, is published in America. It becomes one of the bases for refusing non-doctors in American psychoanalytical associations (USA)

Freud publishes *Über psychoanalyse* (Five Lectures on Psycho-Analysis, 1910a), deriving from conferences given in the United States

Freud publishes *Eine Kindheitserinnerung des Leonardo da Vinci* (Leonardo da Vinci and a Memory of His Childhood, 1910c)

1911

January – Psychoanalytical group in Munich founded by Leonhard Seif (Germany)

January 17 – Poul Bjerre gives a conference on "Freud's Psychoanalytical Method" before the Association of Swedish Doctors (Sweden)

February 12 – New York Psychoanalytic Society founded by Abraham A. Brill with fifteen physicians, in opposition to the American Psychoanalytic Association that Ernest Jones founds in May (USA)

February 22 – Alfred Adler and Wilhelm Stekel resign from their posts at the head of the Vienna Society; Freud resumes the presidency with Eduard Hitschmann as vice-president and Hanns Sachs as librarian

May – Jan van Emden and August Stärke visit Freud (Holland)

May 2 – Leonid Drosnes visits Freud (Odessa)

May 9 – American Psychoanalytic Association founded in Baltimore by Ernest Jones with James Putnam and eleven members, the majority physicians (USA)

June – Alfred Adler leaves the Vienna Psychoanalytical Society (Wiener Psychoanalytischen Vereinigung). Nine members and the editorial staff of *Zentralblatt* follow suit in July (Austria)

June 28 – First psychoanalytical lecture addressed to the medical community by David Eder at a conference of the British Medical Association: while he speaks, the audience leaves (Great Britain)

August 14 – Maurice Bouvet born in Eu, Seine Maritime (France)

September – Sigmund Freud writes “On Psycho-Analysis” (1913n [1911]), at the request of Andrew Davidson, secretary of the Branch of Psychological Medicine and Neurology at the Australian Medical Congress in Sydney (Australia) where, in addition, lectures are given by Carl G. Jung and Havelock Ellis

September 20 – Ralph Greenson born in Brooklyn, New York (USA)

September 21–22 – 3rd Congress of the International Psychoanalytical Association in Weimar (Germany). President: Carl G. Jung

October 30 – Emma Jung writes to Freud about the uneasiness between her and her husband since the publication in the *Jahrbuch* of the beginning of “Wandlungen und Symbole der Libido” (Metamorphosis and Symbols of the Libido) by Carl G. Jung

December – Eugen Bleuler resigns from the International Psychoanalytical Association

Freud, A. Einstein, D. Hilbert, E. Mach, etc., sign a Call (*Aufruf*) for the creation of an association to express positivist philosophy

1912

March – *Imago. Zeitschrift für die Anwendung der Psychoanalyse auf die Geisteswissenschaften* founded (1912–1941). Editorial Director: Sigmund Freud. Editors-in-chief: Otto Rank and Hanns Sachs

July 30 – Ernest Jones suggests, at Sándor Ferenczi’s instigation, the founding of a Secret Committee excluding Carl G. Jung and including as members himself, Freud, Karl Abraham, Ferenczi, Otto Rank, Hanns Sachs, and, starting in 1919, Max Eitingon

September – Carl G. Jung is invited by Smith Ely Jelliffe to give nine conferences at Fordham University, in New York (USA)

September 3 – Jacob A. Arlow born in New York (USA)

September 27 – Lou Andreas Salomé first letter to Freud

November 6 – Wilhelm Steckel resigns from the Vienna Psychoanalytical Society (Austria)

November 24 – Presidents’ conference in Munich: Carl G. Jung and Franz Riklin for the IPA, Freud, Ernest Jones, Karl Abraham, and J.H.W. van Ophuijsen. Freud faints (Germany)

December 18 – Carl G. Jung’s letter to Freud marks the rupture: “I am in fact not at all neurotic—good thing (. . .) You know well how far the patient can go in his self-analysis, he doesn’t come out of his neurosis—like you. One day when you will be completely freed from complexes and you no longer play the father towards your sons, in whom you constantly sight the weaknesses, that you will put yourself into that position, then I want to

1913

reverse myself and eliminate all at once the sin of my disagreement with you.”

Jean-Jacques Rousseau Institute founded in Geneva by Edouard Claparède (Switzerland)

January 15 – To replace the *Zentralblatt für Psychoanalyse*, the *Internationale Zeitschrift für ärztliche Psychoanalyse* is founded at the instigation of S. Ferenczi and O. Rank

May 19 – Budapest Psychoanalytic Society founded by Sándor Ferenczi. President: S. Ferenczi, Vice-president: I. Hóllós, Secretary: S. Rádo, Treasurer: Lajos Lévy (Hungary)

May 25 – First meeting of the Secret Committee. Freud offers to each a Greek intaglio taken from his own collection that they will have mounted in signet rings. Ernest Jones is the president

August 5 – Carl G. Jung uses the expression “analytical psychology” for the first time in a conference (“General Aspects of Psychoanalysis”) before the London Psycho-medical Society (Great Britain)

August 6–12 – 17th International Medical Congress in London. Confrontation between Pierre Janet and Ernest Jones to whom Freud then wrote: “I will not know how to say how much I was overcome by your report to the Congress and by the way in which you had undone Janet in front of your compatriots” (Great Britain)

September 7–8 – 4th Congress of the International Psychoanalytical Association in Munich. President: Carl G. Jung, who resigns from his post as editor-in-chief of the *Jahrbuch* (Germany)

October – *The Psychoanalytic Review* in New York founded by Smith Ely Jelliffe and William Alanson White, Director of the Government Hospital for the Insane, Washington, DC (USA)

October – Freud publishes *Totem and Taboo* (1912–1913) as a book

October 15 – Frances Tustin born in Darlington (Great Britain)

October 30 – The London Psycho-Analytic Society founded by Ernest Jones. President: E. Jones, Vice-president: Douglas Bryan, Secretary: M. D. Eder

Alfred Adler transforms the Verein für Freie Psychoanalytische Forschung (Society for Psychoanalytical Research), founded after his secession, into Verein für Individualpsychologie (Society for Individual Psychology) (Austria)

A. A. Brill (New York) publishes the first English translation of *The Interpretation of Dreams* (USA)

1914

April 20 – Carl G. Jung resigns from the International Psychoanalytical Association. Karl Abraham is elected as provisional president of the association

May – Boston Psychoanalytic Society founded. President: James Putnam, Secretary: Isador Coriat (USA)

June – Freud publishes “Zur Einführung des Narzißmus” (On Narcissism: An Introduction, 1914c) and “Zur Geschichte der psychoanalytischen Bewegung” (On the History of the Psychoanalytical Movement, 1914d)

- June 28 – The Serbian nationalist Gavrilo Princip assassinates Archduke Franz Ferdinand in Sarajevo
- July 6 – The Washington Psychoanalytic Society founds St. Elizabeth’s Hospital in Washington, DC, with acting president William Alanson White, Hospital Superintendent (USA)
- July 10 – The Zurich local branch (Carl G. Jung, Eugen Bleuler, Alfons Maeder, etc.) vote fifteen to one for its definitive withdrawal from the International Psychoanalytical Association (Switzerland)
- July 28 – Austria-Hungary declares war on Serbia, the first stage of the First World War
- November 2 – Beginning of the First World War
- December – Publication of the *Jahrbuch der Psychoanalyse* is suspended by Deuticke, the editor
- First official recognition of psychoanalysis in Europe with a lecture by Gerbrandus Jelgerma at the University of Leyde (Netherlands)
- Publication of *La psycho-analyse des névroses et des psychoses. Ses applications médicales et extra-médicales* (Psychoanalysis of Neuroses and Psychoses. Their Medical and Extra-Medical Applications) by Emmanuel Régis and Angélo Hesnard, first book in France devoted to psychoanalysis (France)
- 1915
- March–July – Freud works on twelve essays on metapsychology of which only five will be published between 1915 and 1917
- June 10 – Serge Lebovici born in Paris (France)
- September 15 – Freud observes his grandson Ernst Wolfgang Halberstadt, eighteen months old, indulge in the game “fort-da” with a spindle
- October–March 1916 – Last series of conferences during the winter semester at the University published under the title of *Vorlesungen zur Einführung in die Psychoanalyse* (*Introductory Lectures on Psychoanalysis*, 1916–1917a [1915–17]), “in front of an auditorium of around 70 people, among which were two of my daughters and one daughter-in-law,” writes Freud. Otto Fenichel takes part
- Sulla psicoanalisi, Cinque Conferenze sulla psicoanalisi*, the first work of Freud translated into Italian by Marco Levi Bianchini published for the “Biblioteca Psichiatrica Internazionale” (Italy)
- Genserico Pinto publishes his thesis, *Da Psicanálise. A sexualidade das Neuroses*, in Rio de Janeiro (Brazil)
- 1916
- February 28 – Danilo Perestrello born in Rio de Janeiro (Brazil)
- May 6 – Freud’s sixtieth birthday, celebrated discreetly because of the war. Edouard Hitschmann gives him an “undelivered speech”
- September 15 – Serge Viderman born in Rimnic-Sarat (Romania)
- 1917
- March 24 – Neederlandsche Vereeniging voor Psychoanalyse (Netherlands Society for Psychoanalysis) founded by Gerbrandus Jelgersma, Jan van Emden, Johan H.W. van Ophuijsen, and Johann Stärke (Netherlands)

- May 27 – Georg Groddeck’s first letter to Freud, who replies on June 5: “Whoever recognized that transference and resistance constitute the pivot of treatment belong forever to our uncivilized horde”
- November 7 – The Bolsheviks take power in Russia (October Revolution)
- Ruíz Castillo, at the suggestion of José Ortega y Gasset, buys the publishing rights for the complete works of Sigmund Freud in Spanish, past and future. López Ballesteros is responsible for the translation (Spain)
- Geza Róheim publishes in *Imago* the first psychoanalytical article written by an anthropologist, “Spiegelzauber” (The Magic Mirror), an excerpt of a book that will be published in 1919
- 1918

- André Breton visits Freud in Vienna (France)
- The New Library of Psycho-Analysis founded by Ernest Jones. The publication is ensured by Leonard and Virginia Woolf at the Hogarth Press (Great Britain)
- A psychoanalytical association founded in Moscow with Vera and Otto Schmidt, Ivan Ermakov, Mosche Wulff, I.W. Kannabich, Alexander Riom Luria. It was not be recognized at the 7th Congress of the IPA (Russia)
- 1922
- January 22 – Indian Psycho-Analytical Society in Calcutta founded by Girindrasekhar Bose (India)
- February 20 – Berliner Psychoanalytische Institut (BPI) (Berlin Psychoanalytical Institute) founded, comprised of the polyclinic, a training institute (conferences, seminars on case studies, didactic and controlled analyses) and a commission on the cursus (Germany)
- May 14 – Freud’s letter to Arthur Schnitzler: “I think that I avoided you from a kind of fear of meeting my double”
- May 22 – Lehrinstitut der Wiener Psychoanalytischen Vereinigung (“Ambulatorium,” the Vienna psychoanalytical polyclinic) opens under Eduard Hitschmann’s direction (Austria)
- June 13 – Anna Freud becomes a member of the Vienna Psychoanalytical Society
- July 25 – François Perrier born in Paris (France)
- August 13 – Willy Baranger born in Bône (Algeria)
- September – A psychoanalytical work group is created in Leipzig around Therese Benedek (Germany)
- September 25–27 – Seventh Congress of the International Psychoanalytical Association in Berlin (Germany). President: Ernest Jones. A prize is created for a competition whose subject is: “Relationship of analytical technique and analytical theory”

- December 14 – Francesco Corrao born in Palermo (Italy)  
 The first volume of the Spanish translation of Freud's works published, translated by López Ballesteros with a foreword by José Ortega y Gasset. Published in seventeen volumes between 1922 and 1932 (Spain)
- 1923
- March 4 – Freud's first letter to Romain Rolland: "I will keep until the end of my days the joyful memory of having been able to exchange a greeting with you. Since for us your name is associated with the most precious of all the beautiful illusions, the one of love expanding for all humanity." (France)
- April – Freud publishes *Das Ich und das Es* (*The Ego and the Id*, 1923b)
- April 20 – Freud's first operation by the oto-rhino-laryngologist Marcus Hajek, Schnitzler's brother-in-law: excision on the right side of the upper jaw of a leucoplast. Freud writes to Jones on the April 25: "I still have not begun working again, and I cannot swallow anything. They assured me the thing is benign, but as you know, nobody can guarantee the evolution when it will begin again to develop. Personally, I had diagnosed an epithelioma, but they didn't go along with me. Tobacco is the suspect in the etiolation of this tissue in rebellion."
- June 19 – Heinz Rudolf Halberstadt ("Heinerle" or "Heinele"), Sophie's second son, dies in Vienna at four and a half years old, from military tuberculosis. Freud writes to Ludwig Binswanger on October 15, 1926: "He was the favorite of my children and grandchildren, and since Heinele's death I can no longer stand my grandchildren, and I no longer have a taste for life. That's the secret of my indifference—what was called courage—facing my own risk of death."
- July 8 – Didier Anzieu born in Melun (France)
- August 2–7 – Angélo Hesnard presents the annual psychiatric report during the 17th Congress of Alienists and Neurologists of France and of French-language countries (Besançon): "Psychoanalysis. Etiological, methodological, therapeutic and psychiatric value of doctrine." In its conclusion he writes: "It is there that Psychoanalysis, relieved from its terminological errors, from its doctrinaire utterances, and from the symbolic artifice of semiological research, is connected with Psychiatry, of which it is tributary, and with clinical psychology (...) It is there that this doctrine-method, still awkward, but very perfectible, has its incontestable rights to our scientific and French sympathy." (France)
- August 26 – Meeting of the Secret Committee at the Castel Toblino, then at San Cristoforo, at the Lago Caldorazzo. This will be the last, due to the dissensions, particularly between Ernest Jones and Otto Rank, and the Committee will be dissolved in April 1924. This is likewise Freud's last stay in Italy
- October – Edoardo Weiss gives a conference on psychoanalysis at the Florence Congress of the Italian Society of Psychology (Italy)
- October 4 and 11 – Operations on Freud's tumor at the Auersperg Sanatorium. He is henceforth required to wear a prosthesis that makes eating and speaking painful for him
- October 22 – Maud (Magdalena) Mannoni-van der Spoel born in Courtrai (Belgium)

- October 25 – René Laforgue's first letter to Freud (France)
- November 19 – Piera Aulagnier-Spairani born in Milan (Italy)
- December – *Das Trauma der Geburt (The Trauma of Birth)* by Otto Rank published (Austria)
- Because of Freud's illness, Paul Federn will assume the vice-presidency of the Vienna Psychoanalytical Society from 1923 to 1938
- Buch vom Es. Psychoanalytische Briefe an eine Freundin* by Georg Groddeck published (Germany)
- The New York Psychoanalytic Society designates the first Educational Committee, in charge of organizing and improving its pedagogical activities (USA)
- 1924
- April 21–23 – 8th Congress of the International Psychoanalytical Association in Salzburg, for the first time in the absence of Freud (Austria). President: Karl Abraham
- April 27 – Otto Rank's departure for several months in America (USA)
- May 14 – Romain Rolland visits Freud in Vienna (France)
- July 6 – Serge Leclair (Liebschutz) born in Strasbourg (France)
- September 9 – Dr. Hermine Hug-Hellmuth is murdered by her eighteen-year-old nephew, Rudolph Hug, her sister's illegitimate child whom she took care of after her sister's death (Austria)
- 1925
- February 24 – The Viennese municipality, by decree, forbids Theodor Reik to practice psychoanalysis (Austria)
- April – First publication of the future review *L'Evolution psychiatrique, Psychanalyse—psychologie clinique* (Psychiatric Evolution, Psychoanalysis—Clinical Psychology) edited by Angélo Hesnard and René Laforgue (France)
- June 7 – Società Psicoanalitica Italiana (S.P.I.) founded by Marco Levi Bianchini. The journal *Archivio Generale di Neurologia, Psichiatria e Psicoanalisi* becomes its official mouthpiece (Italy)
- June 20 – Josef Breuer dies in Vienna (Austria)
- July – Melanie Klein is invited to London where she gives a series of six conferences in English on "*Frühanalyse*" (Great Britain)
- August 14 – The Narkompros (Ministry of Public Instruction) orders the closing of Detski Dom (Children's Home), founded and directed by Véra Schmidt (Russia)
- September 2–5 – 9th Congress of the International Psychoanalytical Association in Bad Homburg (Germany). President: Karl Abraham. Training Committee founded by Max Eitingon, who becomes president and states the rules of supervision
- September 30 – Freud begins the analysis of princess Marie Bonaparte; he writes of her to Sándor Ferenczi on October 18: "She not at all an aristocrat, rather *ein Mensch* and the work with her is going marvelously." (France)
- October – Rudolph M. Loewenstein settles in Paris as a didactician. He eventually becomes the analyst of Sacha Nacht, Jacques Lacan, and Daniel Lagache (France)

December 15 – Robert J. Stoller born in Crestwood, New York (USA)

December 25 – Karl Abraham dies in Berlin. Freud writes to Ernest Jones five days later: “Abraham’s death was without a doubt the biggest loss that could hit us, and it hit us. I called him, in jest, in certain letters ‘mon rocher de bronze.’ I felt reassured in the absolute trust he inspired in me as well as all the others. I applied to him the words of Horace: ‘Integer vitae scelerisque purus’ (The onewhose life has integrity and is without reproach). Max Eitingon succeeds him in the presidency of the IPA

Lehrinstitut der Wiener Psychoanalytischen Vereinigung (Training Institute of the Vienna Psychoanalytical Society) is created by the Vienna Psychoanalytical Society under the direction of Helene Deutsch, Anna Freud, and Siegfried Bernfeld. The committee consists of P. Federn, H. Nunberg, W. Reich, and E. Hitschmann (Austria)

The analytical cure is recognized by the new Prussian enactment on honorarium and the German general convention of physicians (Germany)

Adolf Josef Storfer succeeds Otto Rank as director of the Internationalen Psychoanalytischen Verlag. Max Eitingon, Sandor Rado, and Sándor Ferenczi replace Rank at the editorial desk of the *Internationale Zeitschrift für (ärztliche) Psychoanalyse*

Freud publishes *Selbstdarstellung* (An Autobiographical Study, 1925d [1924])

1926

January 21 – Freud publishes *Hemmung, Symptom und Angst* (Inhibitions, Symptoms and Anxiety, 1926d [1925])

March 24 – *Geheimnisse einer Seele* (Mysteries of a Soul), first film on psychoanalysis, produced by G. W. Pabst, presented in Berlin (Germany)

April 13 – Last meeting between Otto Rank and Freud, who writes to Sándor Ferenczi: “I found no motive to show a particular tenderness, at the time of his parting visit; I was frank and hard. But we don’t have to put a cross on him.”

April 24 – The Berliner Psychoanalytische Vereinigung becomes the Deutsche Psychoanalytische Gesellschaft (D.P.G.) (Germany)

August 1 – First Conference of Psychoanalysts in the French Language (Geneva), presided over by Raymond de Saussure (Geneva) with reports by René Laforgue (Paris) on “Schizophrenia and Schizonoia” and by Charles Odier (Geneva), “Contribution to the Study of Superego and Moral Phenomenon.” The creation of a Linguistic Commission is decided upon to unify French psychoanalytic vocabulary (Switzerland)

September – Freud publishes *Die Frage der Laienanalyse* (The Question of Lay Analysis, 1926e)

September – *Sigmund Freud*, a biography by Honorio Delgado, published (Peru)

September – Melanie Klein leaves Berlin for London (Great Britain)

September 22 – Sándor Ferenczi leaves for America for a six-month stay (USA)

September 28 – The Psychoanalytical Clinic founded in London with the donation of an ex-patient, Prynns Hopkins. Ernest Jones states: “The team includes a director, myself, an assistant director, Dr. Edward Glover, nine physicians, the Doctors Bryan, Cole, Eder, Herford, Inman, Payne, Rickman, Riggall and Stofddart, with five assistants” (Great Britain)

October – The Wolf Man begins analysis again with Ruth Mack Brunswick

November 4 – Société psychanalytique de Paris founded by Marie Bonaparte, Eugénie Sokolnicka, Angélo Hesnard, René Allendy, Adrien Borel, René Laforgue, Rudolph Loewenstein, Georges Parcheminey, and Edouard Pichon (France)

November 23 – A circular letter written by Anna Freud under her father’s dictation reestablishes the *Rundbriefe* (circular letters), and the Secret Committee acts henceforth as the “central management of the International Psychoanalytical Association”

November 28 – Freud is named Honorary Member of the Swiss Society of Psychiatry in place of Emil Kraepelin

*Zeitschrift für psychoanalytische Pädagogik* founded by Heinrich Meng (Germany) and Ernst Schneider (Switzerland)

*Almanach der Psychoanalyse* founded and published by the Internationaler Psychoanalytischer Verlag (International Psychoanalytical Publishers). Thirteen volumes appear before the Nazis liquidate the publishing house in 1938

1927

January 10 – Joseph Sandler born in Cape Town (South Africa)

April 10 – Schloss Tegel—Psychoanalytische Klinik Sanatorium (Tegel Castle—Psychoanalytical Clinic Sanatorium) founded by Ernst Simmel (Germany)

June 25 – Revue française de psychanalyse (French Review of Psychoanalysis) founded (France)

September – Tenth Congress of the International Psychoanalytical Association in Innsbruck (Austria). President: Max Eitingon

Sociedade Brasileira de Psicanálise founded in São Paulo by Durval B. Marcondes. President: Franco da Rocha. It will be recognized provisionally in 1929 by the International Psychoanalytical Association but without final establishment (Brazil)

Freud publishes *Die Zukunft einer Illusion* (*The Future of an Illusion*, 1927c)

The Burlingham-Rosenfeld/Hietzing Schule (Burlingham-Rosenfeld School or Hietzing School) founded in Vienna by Dorothy Burlingham and Eva Rosenfeld, a private school placed under Anna Freud’s care (Austria)

Melanie Klein becomes member of the British Psychoanalytical Society (Great Britain)

1928

September 30 – Ernst Simmel inaugurates the new premises of the Berliner Psychoanalytische Institut (BPI) (Berlin Psychoanalytical Institute), arranged under Ernst Freud’s direction (Germany)

October – Sándor Ferenczi gives conferences in Spain. He writes to Georg Groddeck on October 17: “Aside from

that, the doctors, here, are still half-Breuerians, already half-Jungians, without having ever been Freudians.” (Spain)

Tokyo Psychoanalytic Institute founded by Kenji Otsuki. It is recognized by the International Psychoanalytical Association in 1931 (Japan)

A subsidiary of the Sociedade Brasileira de Psicanálise de São Paulo founded in Rio by V. Rocha, Durval B. Marcondes, and Julio Pires Porto-Carrero (Brazil)

Schweizerische Ärtegesellschaft für psychoanalyse (Swiss Medical Association for Psychoanalysis) founded by Emil Oberholzer and Rudolf Brun. It is never recognized by the IPA and dissolves in 1938 (Switzerland)

1929

February 10 – Frankfurter Institut der “Südwestdeutsche Psychoanalytische Arbeitsgemeinschaft” (Frankfurt Institute of Psychoanalysis) founded by Karl Landauer, Frieda Fromm-Reichmann, and Heinrich Meng. It is tied to the Institut für Sozialforschung (Institute for Social Research) of Max Horkheimer and Theodor Adorno (Germany) and its role is to disseminate the ideas of psychoanalysis by didactic analyses and theoretical courses at the university without therapeutic training (Germany)

July 28–31 – Eleventh Congress of the International Psychoanalytical Association in Oxford (Great Britain). President: Max Eitingon. The New York Psychoanalytical Society, through the intervention of A. A. Brill, its president, agrees to welcome analysts who are not doctors (USA). La Sociedade Brasileira de Psicanálise de São Paulo is recognized provisionally (Brazil)

August – Freud writes *Das Unbehagen in der Kultur* (Civilization and Its Discontents, 1930a [1929]), which is published at the end of December but dated 1930

October 24 – The stock market crash in New York ruins Max Eitingon

December 25 – Sándor Ferenczi distances himself from Freud and writes to him: “Psychoanalysis practices too unilaterally the analysis of obsessional neurosis and the analysis of character, that is to say, the psychology of the ego, neglecting the organic-hysterical base of the analysis; the cause is the overestimation of fantasy—and the underestimation of traumatic reality in pathogenesis.”

The first translation in Japanese of Freud’s work published (Japan)

Lehrinstitut der Wiener Psychoanalytischen Vereinigung founded from a department for borderline and psychotic patients by Paul Schilder; Eduard Bibring succeeds its management after Schilder’s emigration to America (Austria)

Adolf J. Storfer founds the bi-monthly journal *Die Psychoanalytische Bewegung* at the International Psychoanalytical Publishers. It is published until December 1933 (Austria)

Franz Alexander emigrates from Germany and settles in Chicago (USA)

## “A. Z.”

“A. Z.” is the pseudonym used by the author of “Tratamiento psicoanalítico de un caso de neurosis compulsiva” (Psychoanalytic treatment of a case of compulsive neurosis), a text published in Peru in 1919 in *Revista de psiquiatría y disciplinas conexas* (Review of psychiatry and associated disciplines).

The first account of psychoanalytic treatment ever published in Spanish, this case history concerned a thirty-year-old patient with a curious “intermittent obsession related to double vision produced by a strabismus resulting from incorrectly performed tenotomies; an obstinate attachment to the false (unclear and deflected) image perceived by the eye affected. The subject felt subjectively attracted by this sensation.” Having tried in vain to relieve his malaise in Europe the patient undertook a course of treatment with the author, who came to the conclusion that the patient persisted in seeing the false image in order to avoid confronting the fantasies that derived from his perverse infantile polymorphism.

There is strong evidence to suggest that “A. Z.” was the dermatologist Carlos Aubry (1882–1996), a physician known to have been so eccentric and unmercenary that he died penniless, having refused to accept payment from his patients. Valdizán (1923) states in his *Diccionario*: “Apart from his specialty [dermatology], he mastered several psychological disciplines, as witnessed by his contribution to the Review.” Aubry confined himself to reports and never published another article in the Review. His thesis (1906) dealt with the reflex of convergence, and the use of striped projection to illustrate double vision.

## ABANDONMENT

Strictly speaking, the notion of abandonment is not a psychoanalytic concept. It was initially applied in situations where very young children were deprived of care, education, and affective support, and were neglected by or separated prematurely from their maternal environment, with no reference to the causes of this deprivation. From a purely descriptive point of view, pediatricians and psychologists taking an interest in child development have long recognized the somatic and psychic effects of such states of deprivation.

The notion is nevertheless appropriately included in a dictionary of psychoanalysis, for two reasons. Firstly, the concept of abandonment is not applied solely to children, but also to adults who experience the feeling of abandonment, separation, or bereavement, whether real or imaginary. Secondly, certain

psychoanalysts very quickly developed an interest in the mental disorders and disturbances observed in the emotional development of children subjected to such traumatic experiences, as well as the possible pathogenic role of the family environment. Abandonment raises the fundamental problem of object loss and renunciation of the love object, or the work of mourning. It also calls into question the metapsychological status of anxiety.

In a primary and passive sense, abandonment refers to the experience of a state that is imposed by loss or separation: being or feeling abandoned. In a secondary and active sense, the complement of the previous one, it applies to the psychic process that leads a person to deny the cathected object, separate from it, and abandon it.

Published in 1950, Germaine Guex's *La Névrose d'abandon* (Abandonment neurosis) contributed considerably to propagating the notions of the abandonment complex and the abandonment-type personality. Although now dated, this work nevertheless had the virtue of stressing the influence of disturbances and conflicts occurring during pre-oedipal phases of psychic development in the causation of certain forms of neurotic character disorders and depression, which Guex related to affective frustration experienced during childhood, essentially in relation to the mother. Subjects thus frustrated turn out to be both affectively insatiable and extremely dependent on others, so that every separation is a major crisis for them. Other more recent writers, particularly Otto Kernberg and Heinz Kohut, have studied narcissistic personality disorders and borderline states between neurosis and psychosis from a similar perspective. They stress the difficulties that arise when the analytic treatment of these patients reproduces their affective dependence in the transference, thus rendering the analysis interminable.

Among clinical work by child psychoanalysts we have to bear in mind Anna Freud's and Dorothy Burlingham's observations of young children who were separated from their families during World War II, as well as René Spitz's work on the severe consequences of hospitalism and anaclitic depression in infants. John Bowlby's study of children's mourning led to attachment theory, which is amply developed in a book that is both a comprehensive survey and a reference, although his views are sometimes closer to psychobiology and behaviorism than to psychoanalysis.

Abandonment is also at the root of a certain number of asocial or delinquent behaviors linked to educational deprivation and indicating a defect in the organization of the ego and the superego. On this subject Donald Winnicott referred to the "antisocial tendency" as an alarm signal that is sounded by distressed children. These problems had already attracted the attention of some of Freud's collaborators in the period between the two World Wars. In Austria in the 1920s August Aichhorn initiated an educational experience in the light of analytic practice and aimed at children who were victims of exclusion. His book *Verwahrloste Jugend* (1925) (*Wayward Youth*, 1935), prefaced by Freud, recounts this experiment, which still retains much of its pertinence.

Psychoanalysis must never underestimate the importance of objective reality either in theory or practice, but it owes it to itself to remain especially attentive to the manifestations of unconscious psychic reality, to the activity of the representations and fantasies that constitute it, and to its verbal and affective modes of expression in conscious life. From this point of view, abandonment or separation anxiety is an inevitable condition of existence that appears very early on in the course of psychic development and whose ongoing influence varies from one individual to the other, depending on the situations they encounter. In his second theory of anxiety, as outlined in *Inhibitions, Symptoms, and Anxiety* (1926d [1925]), Freud shows that for the ego, the emergence of this affect takes on the value of a danger signal, a danger that may be real or imaginary, but whose prototype is the threat of castration linked to the development of the Oedipus complex. Here the ego feels threatened with the loss of the love object or the loss of the love of the object.

According to Freud, this fundamental anxiety expresses the original state of distress (*Hilflosigkeit*, literally: helplessness) linked to the prematurity of an individual at the start of life, which renders him or her completely dependent on another for the satisfaction of both vital and affective needs. The resulting need to feel loved will never cease throughout life. This need seems to be more narcissistic than object related because through it is expressed a nostalgic desire that precedes any differentiated object relationship: the desire to recover, in a fantasied fusion with the mother, a state of internal well-being and complete satisfaction, protected from the outside world, free of all conflict,

of all ambivalence and all splitting. For Melanie Klein, the internal feeling of loneliness is born out of the inevitable dissatisfaction of this aspiration for an impossible narcissistic completeness, one that takes the form of a definitively unattainable ideal. However, the feeling of being alone can also be a source of satisfaction for the child, marking the acquisition, through games for example, of a certain degree of autonomy in relation to the presence of the mother. Donald Winnicott stressed this capacity to be alone in the presence of the mother, which he considered to be a decisive stage in the evolution of the child.

Over and above the shock it produces, object loss initiates a process of intrapsychic work, which Freud identified as the work of mourning and which results, in the best cases, in renunciation of the lost object. But the success of this long and painful process is quite variable, depending on the individual, the degree of maturation of the psychical apparatus, and the solidity of the narcissistic organization. Bereavement or loss often leave indelible traces on the ego, a sense of being abandoned is only one of many aspects, since mourning is clinically multifaceted. In his 1915 essay, *Mourning and Melancholia* (1916–17g [1915]), Freud compares two responses, in order to better highlight their differences in relation to the loss of the object and the ambivalence of the ego with respect to it. In melancholia, the lost object is neither conscious nor real: it is a part of the ego, unconsciously identified with the lost object, which becomes the target for guilt feelings and self-accusing projections. “The shadow of the object fell upon the ego,” wrote Freud (p. 249). But it must be added that all mourning, all loss, all separation, affects the ego at its narcissistic base: being separated from the object is also being deprived of a part of one’s self (Rosolato, 1975).

Logically, we should differentiate more between the work of mourning (with the tragic dimension given by the death of the object), and the work of separation (which brings into play the presence, whether real or imaginary, of a third party separator and does not mobilize the same affects as mourning). Additionally, separation, with all the intrapsychic conflicts it gives rise to, is a normal process that leads to the individuation and autonomy of the child. It is the father, in this case, or the authority replacing him, who is the third party separator. Lastly, the problem of separation and abandonment is not merely a question of vicissitudes in the primary relation with the mother. Freud insisted

on the crucial importance of the need to be protected by the father, and on the intensity of the feeling of nostalgia that is directed toward him in his absence. He considered the identification with the prehistoric father as a “direct and immediate identification” that “takes place earlier than any object-cathexis” (1923b, p. 31). Clinical experience of depression both in adults and children confirms the importance of the feeling of being abandoned by the father, and of the absence of the father in the mother’s desire.

## **ABEL, CARL (1837–1906)**

Carl Abel was a German linguist known for his research on Indo-European and Hamito-Semitic lexicology, which was published in his *Einleitung in ein Aegyptisch-semitisch indoeuropäisches Wurzelwörterbuch* (1886).

It was his theory of the “opposite meanings of primitive words” that interested Freud when, after alluding to the idea in the *Interpretation of Dreams* (1900a), he wrote an article on the subject ten years later,

entitled "The Antithetical Meaning of Primal Words" (1910e). The theory appeared in Abel's article "Über den Gegensinn der Urworte," which appeared in *Sprachwissenschaftliche Abhandlungen*, published in Leipzig in 1885.

Basing his thesis on the fact that a Latin word such as *sacer* signified both "sacred" and "taboo," Abel proposed a theory of the way vocabulary evolves in languages. For Abel, a word in its primitive state can have opposite meanings, which are gradually distinguished through the progress of the rational intellect. "When learning to think about force, we have to separate it from weakness; to conceive of darkness, we must isolate it from light."

For Freud, primitive words mark a stage of symbolization that precedes the separation of opposites brought on by the reality principle. This cultural phenomenon is comparable to the dream process, which enables a representational content to assume a value as the expression of a desire and an antithetical desire. Consequently, the logic of the primary process is felt in a cultural formation as fully developed as language.

Is there a linguistic basis to Abel's theory? Some eminent linguists such as Émile Benveniste have claimed the entire theory to be false. If Latin has only one word for "sacred" and "taboo," they claim, it is because Roman culture doesn't differentiate between them. It is translation that creates the illusion of opposite meanings. According to Benveniste, the Latin concept corresponding to the word *sacer* simply characterizes a field that extends beyond the frontiers of the human and constitutes the undifferentiated domain of the sacred and the taboo.

Benveniste's reasoning is rigorous but it is worth pointing out that there are rhetorical figures such as euphemism or antiphrasis designed to create a reversal of meanings similar to that of primitive words. So when someone remarks of an idiot "What a genius!," they assign an antiphrastic value to the word "genius," which, in conjunction with its primary value, turns the signifier "genius" into a good example of a primitive word combining the opposite meanings of "intelligent" and "stupid." The fact remains, however, that the rhetorical figure is based on an initial disjunction of opposite values rather than the confusion that Abel assigns to his construction. For we can only refer to an idiot as a "genius" if "genius" initially means genius, not if the term refers to any unit that incorporates the meanings of both "genius" and "idiot." The process

works by an enrichment of the opposite meanings assigned from the outset. It is also possible that the lack of differentiation that occurs in dreams results in a conjunction of opposed values that is closer to the mechanism described above than to any initial blurring, which, according to Abel, is characteristic of the meanings of primitive words.

## **ABERASTURY, ARMINDA, KNOWN AS "LA NEGRA," (1910–1972)**

The Argentine psychoanalyst Arminda Aberastury was born on September 24, 1910, in Buenos Aires, and died there on December 24, 1972, by committing suicide. Because of her dark hair she was affectionately known as "La Negra," and it was this name that others used when they referred to her.

In 1937 she married the psychiatrist Enrique Pichon-Rivière, a pioneer of psychoanalysis in Argentina. The couple had three children: Enrique, Joaquin, and Marcelo. In 1953, she became a training analyst with the Asociación psicoanalítica argentina (APA). She taught for nearly twenty years at the Teaching Institute, where she was the director, and introduced the teaching of child psychoanalysis as part of the training of the analyst candidate.

She later held the chair of child and adolescent psychology in the School of Philosophy and Literature at the University of Buenos Aires. In Latin America she distributed psychoanalytic information to pediatricians, child care workers, teachers, doctors, and pediatric dentists. She corresponded with Melanie Klein, whom she met in London in 1952. She translated Klein's *The Psychoanalysis of Children* and became a spokeswoman for Klein's theories.

Aberastury believed that genital libido developed before the anal stage, leading to the existence of a “primary genital stage,” chronologically situated between the sixth and eighth month of life, which became a key theoretical concept for psychoanalysis. The growth of genital instincts, weaning, teething, the development of the musculature, learning to walk, the acquisition of language, the disruption of the mother-child symbiosis were all said to constitute a complementary series that structured this phase of development, and which would explain specific symptoms and dysfunctions. The genital origin of erogenous manifestations was found in the activity of play. The theory, which included genital identity and the father in the mother-child relation from the first moments of life, helped refine Kleinian theory. Aberastury’s ideas on paternity were published posthumously.

The chair of pediatric dentistry in Buenos Aires provided Aberastury with an excellent opportunity for developing and applying her theories. It was here at the Hospital Británico that she began to make use of psychodrama and group psychotherapy in her work with children. Aberastury extended the treatment to their guardians, basing her methods on her observations of the application of psychoanalysis to groups of fathers and mothers.

Between 1946 and 1974 the APA review published twenty-four articles by Aberastury on a wide range of subjects: infant psychoanalysis; treatment indications; applied psychoanalysis; the creation of a diagnostic test, “El constructor infantil,” based on a construction game familiar to children in Argentina; clinical cases; transference; music; technique; philosophy; language; unconscious fantasies; supervision; etc. A year after her death by suicide, a chronological list of her 145 published works appeared in the APA review (no. 3/4, 1973). Aberastury also published articles in the reviews of associations in Uruguay, Brazil, and France, as well as in *The International Journal of Psycho-Analysis* and, in Argentina, in reviews of child and adolescent psychiatry and psychology.

## ABRAHAM, KARL (1877–1925)

Karl Abraham, a German psychoanalyst and doctor, was born May 3, 1877, and died December 25, 1925, in Berlin. The son of Nathan Abraham, a businessman, and Ida Oppenheim, he was the youngest of two sons in an Orthodox Jewish family. After studying medicine in Würzburg, Berlin, and Freiburg-im-Breisgau, he married his cousin Hedwig Bürgner in 1906. They had two children; his daughter was the well-known psychoanalyst Hilda Abraham.

Abraham began his training in psychiatry in Berlin, then in Zurich with Eugen Bleuler, where the physician-in-chief was Carl Gustav Jung. It was here that he became familiar with Freud’s writings. In 1907 he opened an office in Berlin and, in 1910, founded the Berlin Institute of Psychoanalysis. From 1914 to 1918 he was mobilized as chief physician in a psychiatric unit. It was during this time that he grew interested in studying war neuroses. He was president of the International Psychoanalytic Association (IPA) from 1918 to 1925.

A student and friend of Freud, he was a member of the secret “Committee” from its inception. In 1918, he received an award in recognition of his work in analysis. Co-editor of the *Jahrbuch für Psychoanalyse*, *Internationale Zeitschrift für Psychoanalyse*, and *Zentralblatt für Psychoanalyse*, he was the analyst and teacher of Felix Boehm, Helene Deutsch, Edward and James Glover, Karen Horney, Melanie Klein, Carl Müller-Braunschweig, Sándor Radó, Theodor Reik, and Ernst Simmel.

In addition to his research on collective psychology (“Dreams and Myths,” 1909/1949), Abraham made important original contributions to the study of the development of the libido, including *Versuch einer Entwicklungsgeschichte der Libido auf Grund der Psychoanalyse seelischer Störungen* (1924) (*A Short Study of the Development of the Libido Viewed in the Light of*

*Mental Disorders*, 1929). Abraham's starting point was Freud's theory of the stages of pregenital organization (1916–1917). He introduced a differentiation in the phase of libido development designated by Freud as oral-cannibalistic by proposing the existence of two aspects of oral activity—sucking and biting. Based on this hypothesis, he inferred two different modes of infantile object relation, incorporation by sucking and destruction by biting. This last relation was said to introduce the conflict of ambivalence into the infant's life. Starting with this conflict, Abraham interpreted the ego disturbances of the melancholic adult: the ambivalence of the instinctual life causes a withdrawal of libidinal cathexis from the object; the liberated libido then turns toward the ego, which introjects the object. Abraham links the psychogenesis of melancholy with the disappointing mother during the early infantile phase of libido development. If it occurs before the successful mastery of oedipal wishes, that is, during the phase preceding the triumph of the narcissistic stage, then an associative link is made between the Oedipus complex and the cannibalistic stage of libido development. This would make possible the consecutive introjection of the two love objects, the father and mother.

Even before Abraham had begun to study manic-depressive psychosis (from 1916 to 1924), he had made an important discovery in the research on schizophrenia in *Die psychosexuelle Differenz der Hysterie und der Dementia Praecox* (1908) (*Psychosexual Differences between Hysteria and Dementia Praecox*, 1949): Disturbances of ego functions are secondary with respect to the disturbances in the libidinal area. Thus Abraham could make use of libido theory to understand dementia praecox. In this same work Abraham introduced the concept of “autism,” which was later taken up by Eugen Bleuler (1911).

Abraham is one of the founders of psychoanalytic research on psychoses, on collective psychoanalytic psychology and, with Sándor Ferenczi and Ernst Simmel, on the psychoanalysis of war neuroses. His principal work, “Examination of the Earliest Pregenital Stage of Libido Development,” has continued to stimulate research in the field down to the present day. The Psychoanalytic Training Institute he created in Berlin has become a model for other institutes throughout the world and the current Institute of Psychoanalysis in Berlin bears his name. Abraham published five books and 115 articles and made numerous presentations at

IPA congresses. His complete works have been collected and translated into several languages.

## **ABRAHAM, NICOLAS (1919–1975)**

Nicolas Abraham, a psychoanalyst and philosopher, was born on May 23, 1919, in Kecskemet, Hungary, and died on December 18, 1975, in Paris. He came from an educated family, and his father was a rabbi and printer. After spending his childhood in Hungary, he studied philosophy in Paris. He worked in the Department of Aesthetics of the Centre National de la Recherche Scientifique (French National Center for Scientific Research) during the 1940s and 1950s and was trained in analysis at the Psychoanalytic Society of Paris. He worked closely with Maria Torok, who continued their research activity after Abraham's death.

Between 1959 and 1975 Abraham's work contributed to the renewal of psychoanalytic theory and practice. Together with Maria Torok he introduced several key concepts of contemporary psychoanalysis: the family secret, transmitted from one generation to the next (theory of the phantom), the impossibility of mourning following the emergence of shameful libidinal impulses

in the bereaved before or after the death of someone (mourning disorder), secret identification with another (incorporation), the burial of an inadmissible experience (crypt). In *The Wolf Man's Magic Word* (1986) and *The Shell and the Kernel* (1994), Nicolas Abraham explored the ravages of trauma and the other enemies of life, and his discoveries flesh out Freud's theories and help expand the limits of analysis.

Abraham's clinical experience forced him to modify some of the fundamental assumptions of Freudian theory (oedipal fantasies, the castration complex, the death impulse) and isolate hitherto unknown sources of human suffering. The principle of trauma that emerges, trauma that arrests spontaneous self-creation (or introjection in the sense defined by Sándor Ferenczi in 1909 and 1912), constitutes the fulcrum around which these discoveries were organized. Abraham also redirected the focus of classic psychoanalysis, centered on libidinal conflicts, to the possibility of psychic development and discovery that can be realized at any age, as well as to the obstacles to such development encountered in catastrophes such as social shame, war, mourning, racial or political persecution, hate crimes, and concentration camps.

In France, Abraham's work constituted a third way between orthodox Freudianism and Lacanianism. Overcoming various forms of resistance, it has achieved worldwide recognition and has been translated into English, German, and Italian; translations into Swedish, Hungarian, and other languages are currently underway. His influence can be found in the growing interest of contemporary psychoanalysis in the transgenerational point of view and in the analysis of the singular traumas of the individual within the family environment.

## ABSTINENCE/RULE OF ABSTINENCE

The term “abstinence/rule of abstinence” designates a number of technical recommendations that Freud stated regarding the general framework of the psychoanalytic treatment. As is the case with the fundamental rule, these recommendations have two symmetrical sides, that of the patient and that of the analyst.

The problems posed when acting out takes the place of remembering led Freud to recommend, “One best protects the patient from injuries brought about through carrying out one of his impulses by making him promise not to take any important decisions affecting his life during the time of his treatment—for instance not to choose any profession or definitive love-object—but to postpone all such plans until after his recovery. At the same time one willingly leaves untouched as much of the patient's personal freedom as is compatible with these restrictions, nor does one hinder him from carrying out unimportant intentions, even if they are foolish” (Freud 1914g, p. 153). This advice to abstain from all important decisions was, for a long time, stated at the beginning of each treatment, even while reflections on the place and function of “acts” in the course of a treatment, both within and outside the analytic situation, continued to stimulate much theoretical and practical debate.

Freud described the need for the analyst to observe abstinence in his article “Observations on Transference-Love”: “I have already let it be understood that analytic technique requires of the physician that he should deny to the patient who is craving for love the satisfaction she demands. The treatment must be carried out in abstinence. By this I do not mean physical abstinence alone, nor yet the deprivation of everything that the patient desires, for perhaps no sick person could tolerate this. Instead, I shall state it as a fundamental principle that the patient's need and longing should be allowed to persist in her, in order that they may serve as forces impelling her to do work and to make changes” (Freud 1915a, pp. 164–165).

Thus it is after years of psychoanalytic practice that the notion of abstinence appeared as such in Freud's work. The theory of unconscious desire and of the transference had to be elaborated and their application to the progression of the treatment put to the test in order for their technical consequences to be recognized. The transferential demands and the counter-transferential responses that Freud's followers made him become aware of, such as the case of Jung and Sabina Spielrein, as well as what he then learned about the practice of "wild analysis," quickly persuaded him to enunciate a recommendation. His followers subsequently and little by little transformed the recommendation into a "principle," and then a "rule," which became quite rigid.

It is clear that, from the beginning, it was never a matter of moral prescription, but a technical one that accorded with the metapsychological demands, particularly the economic ones, involved in the psychoanalytic situation. In the twenties, when Freud and then Sándor Ferenczi experimented with the "active technique," frustration (*Versagung*) resulting from interdictions or injunctions that, it was hoped, would turn the patient away from modes of satisfaction judged to be pathological. In 1918, Freud wrote, "By abstinence, however, is not to be understood doing without any and every satisfaction—that would of course not be practicable; nor do we mean what it popularly connotes, refraining from sexual intercourse; it means something else which has far more to do with the dynamics of falling ill and recovering. You will remember that it was a *frustration* that made the patient ill, and that his symptoms serve him as substitutive satisfactions. [...] Cruel though it may sound, we must see to it that the patient's suffering, to a degree that is in some way or other effective, does not come to an end prematurely." (Freud 1919a [1918], pp. 162–163) And Ferenczi continued, "[...] the 'active therapy,' hitherto regarded as a single entity, breaks up into the systematic issuing and carrying out of *injunctions* and of *prohibitions*, Freud's 'attitude of abstinence' being constantly maintained" (Ferenczi, pp. 193–194). It is in this sense, then, that Rudolph Lowenstein—and also Anna Freud—explained that while some analysts think it necessary to prohibit their patients from performing this or that perverse sexual practice, it would not be wise to recommend the same to homosexual patients (Lowenstein).

It was chiefly in the United States that a slippage took place that turned the recommendation of

abstinence into an increasingly restrictive "rule." Karl Menninger and Phillip Holzman (1973) even considered it the "second fundamental rule" of psychoanalysis. But the risk of insinuating a moral judgment left a lingering ambiguity, and proponents of relaxing the rule argued that some analysts used it to prohibit their patients from having sexual relations or extramarital affairs.

Over the years, the notion of abstinence came to be invoked less and less, and it has even been proposed that analysts speak instead of a "rule of the reality principle." Above all, it has been replaced by "neutrality," a concept not explicitly mentioned by Freud (Mijolla), and even a "benevolent neutrality" (Stone, 1961) or a "compassionate neutrality" (Greenson; Weigert 1970). In the evolution of these attitudes, the mark of Sándor Ferenczi's important influence on matters of practice is obvious, since the prescriptions of abstinence pushed to the extreme were those of the "active technique" and since the frequent tendency of "benevolent neutrality" to drift towards more and more established "benevolence" of the maternal type characterized the last years of his practice.

## ACT/ACTION

The terms “act” and “action” are related, both referring to a form of behavior (motor, verbal, etc.) intended to modify the environment, either to avoid a danger or unpleasure, or to satisfy a need or desire. The term “act,” however, refers primarily to this event in its uniqueness and effectiveness, whereas “action” designates both a process, which can be more or less complex and durable, and the result of that process. These definitions are not psychoanalytic in themselves, and there is no coherent body of thought in psychoanalysis concerning them, in spite of the rather fragmentary references found in Freud and subsequent attempts to give these concepts a theoretical status.

The first psychoanalytic use of the term by Freud is probably his reference to “specific action,” that is, the behavior that results in the satisfaction of a need (Manuscript E, 1894, and “Project for a Scientific Psychology,” 1895, in 1950a). This idea, which he returned to only intermittently, may seem narrowly behaviorist. However, even in these early works, Freud gives the term an entirely different dimension. He writes that since the infant is incapable of satisfying its own needs, “specific action” by another person is needed, and he elaborates on what he considers essential to the process: “If the satisfaction of the need is not satisfied in this way, it is manifested as desire through hallucinatory satisfaction. But the impossibility of maintaining this hallucinatory satisfaction in the face of the persistence of the need gives rise to the representation; the object is born, within the movement of desire, from its presence-absence.” A preliminary version of these ideas is found in the following comment by Freud that appears in the “Project”: “The initial helplessness of human beings is the primal source of all moral motives.”

Freud would return to and develop these ideas in his “Formulations on the Two Principles of Mental Functioning” (1911b), where he attempts to show that, whenever the reality principle gets the upper hand of the pleasure principle, “motor discharge was now employed in the appropriate alternation of reality; it was converted into *action*. Restraint upon motor discharge (upon action) which then became necessary, was provided by means of the process of *thinking*, which was developed from the presentation of ideas” (1911b, p. 221).

This idea, whereby thought is a suspension of adaptive perceptual-motor activity, a “trial activity” involving representations, was in fact familiar to a number of

authors at the beginning of the twentieth century, as has been shown by Henri Wallon (1942). It was discussed at greater length by Freud in the last part of *Totem and Taboo* (1912–13a), which he concludes with this quote from Goethe: “In the beginning was the deed.”

Although the topic was not fully developed by Freud, the terms “act” and “action” appear frequently in his writings, whether he is discussing failed acts, compulsive acts, symptoms, repetitive acts (1914g), the suspension of motor activity during dreams, etc. The prohibition against action within the analytic situation stimulated, both during Freud’s lifetime and after, a number of reflections on the infractions constituted by *actings*.

Since Freud’s day, there have been many attempts to understand these issues. Heinz Kohut advanced the concept of “action-thought,” a concrete thought process halfway between action and thought. Roy Schafer (1976) attempted to refine metapsychology in terms of the actions that constituted thought acts. Daniel Widlöcher (1986) attempted to reformulate it in terms of “unconscious presentations of actions” that generate thought actions.

Throughout these approaches the reference to impulse is vague or explicitly eliminated. However, there are no benefits to this. To understand the problem of action and its relationship with mental activity, we must take account of representation and fantasy. If “in the beginning was the deed,” (from Goethe’s *Faust*, part I, scene 3, quoted by Freud in 1912–13a, p. 161) this indeed involves understanding the development and functioning of psychic activity within two closely related points of view: representations and symbolization processes that terminate in secondary thought, and the organization of fantasy, where fantasies can be considered to be “representations of actions” (Perron-Borelli, 1997; Perron-Borelli, and Perron, 1997).

## ACTING OUT/ACTING IN

The term “acting out” corresponds to Freud’s use of the German word “agieren” (as a verb and as a noun). It should be distinguished from the closely related concept of “passage à l’acte,” inherited from the French psychiatric tradition and denoting the impulsive and usually violent acts often addressed in criminology.

“Acting out” refers to the discharge by means of action, rather than by means of verbalization, of conflicted mental content. Though there is this contrast between act and word, both sorts of discharge are responses to a return of the repressed: repeated in the case of actions, remembered in the case of words. Another distinction occasionally drawn is between acting out and acting in, used to distinguish between actions that occur outside psychoanalytic treatment (often to be explained as compensation for frustration brought on by the analytic situation, by the rule of abstinence, for example) and actions that occur within treatment (in the form of nonverbal communication or body language, but also of prolonged silences, repeated pauses, or attempts to seduce or attack the analyst).

Freud first mentioned acting out in connection with the case of “Dora” (1905e [1901]), noting with

respect to her transference that his patient took revenge on him just as she wanted to take revenge on Herr K.: Dora “deserted me as she believed herself to have been deceived and deserted by him. Thus she acted out an essential part of her recollections and phantasies instead of reproducing them in the treatment” (p. 119).

The notion of acting out is closely bound up with the theory of the transference and its development. Though Freud treated the transference as the cause of acting out—and as an obstacle to treatment—in the Dora case, he subsequently described transference as a great boon to analysis, provided it could be successfully recognized and its significance conveyed to the patient. Acting out is thus attributable to a failure of the interpretive work or to the patient’s failure to assimilate it. In his paper “Remembering, Repeating, and Working-Through” (1914g), Freud revisited the distinction between remembering and acting out: “The patient does not *remember* anything of what he has forgotten and repressed, but *acts* it out. He reproduces it not as a memory, but as an action; he *repeats* it, without, of course, knowing that he is repeating it” (p. 150). The examples that Freud gave here involved the repetition of feelings (feeling rebellious and defiant, or “helpless and hopeless”) that had formerly been directed at a person or situation in childhood but that now manifested themselves, either directly or indirectly (through dreams, silences, and so on), vis-à-vis the analyst. Freud’s assessment of such instances of acting out was nuanced, for he realized that they were at once a form of resistance against the emergence of a memory and a particular “way of remembering” (p. 150).

Inasmuch as acting out occurs outside as well as inside the analytic situation, Freud went on, “We must be prepared to find, therefore, that the patient yields to the compulsion to repeat, which now replaces the impulsion to remember, not only in his personal attitude to his doctor but also in every other activity and relationship which may occupy his life at the time—if, for instance, he falls in love or undertakes a task or starts an enterprise during the treatment” (p. 151). Acting out and repeating are ultimately the same process, involving “everything that has already made its way from the sources of the repressed into [the patient’s] manifest personality—his inhibitions and unserviceable attitudes and his pathological characteristics” (p. 151).

All the same, acting out in reality could have grave consequences, precipitating disasters in the patient's life and dashing any hope of cure through psychoanalysis. It is thus up to the analyst, relying on the patient's transference-based attachment, to control the patient's impulses and repetitive acts, notably by extracting a promise to refrain, while under treatment, from making any serious decisions regarding professional or love life. The analyst, however, must be "prepared for a perpetual struggle with his patient to keep in the psychical sphere all the impulses which the patient would like to direct into the motor sphere; and he celebrates it as a triumph for the treatment if he can bring it about that something that the patient wishes to discharge in action is disposed of through the work of remembering" (p. 153).

In Freud's thinking, then, acting out was long associated with the transference. In *An Outline of Psycho-Analysis* (1940a [1938]) Freud emphasized the need to clearly demarcate between "actualization" in the transference from acting out, whether inside or outside the analytic session: "We think it most undesirable if the patient *acts* outside the transference instead of remembering. The ideal conduct for our purposes would be that he should behave as normally as possible outside the treatment and express his abnormal reactions only in the transference" (p. 177).

Many other authors have deployed the notion of acting out, typically when considering personalities more inclined to act out than to remember in the context of the transference. Thus Anna Freud (1968) saw pre-oedipal pathologies in this light, and León Grinberg hypothesized that acting out is a reaction to inadequate mourning for the loss of an early object. Such approaches take acting out to be inappropriate or even disruptive acts precipitated by the pressure of unconscious wishes.

## **ACTION-LANGUAGE**

The notion of "action-language" was proposed by Roy Schafer to refer to a code or group of rules, within the framework of a conceptualization that aims to legitimize existence to all conscious or unconscious activity, and all mental acts capable of being externalized by means of words or gestures, so that these mental acts can be related to unconscious conflicts (slips of the tongue, parapraxes), representations of self and object, bodily fantasies, feelings and emotions, desires and beliefs, or courses of action that the subject uses to "put aside" certain ideas or invest others.

Action-language involves a strategy (favoring the use of action verbs and adverbs over nouns, adjectives,

and the verbs *have* and *be*) for listening to, acknowledging, translating, retranslating, interpreting, and organizing the data or the modalities of action of the agent or his or her person, that is, the analysand, within the context of the transference and resistance.

The analysand acts in a conflicted way, whether at the unconscious, preconscious, or conscious level. He or she follows actions of thinking or ideas that possess mental qualities, and verbalizes according to different narrative registers. According to Schafer, the concept's originator, who drew his inspiration from the works of Ludwig Wittgenstein and Jean-Paul Sartre, action-language is an alternative to the traditional, mechanistic terminology of metapsychology, encumbered by psychoeconomic, spatial, biological, physiochemical, or anthropomorphic metaphors. Such metaphors, according to Schafer, are devoid of content, anachronistic, attributive and conducive to fragmentation, archaic and childish. Terms such as *motives*, *propulsive energy forces*, *regulating principles*, *structures*, *functions*, *instincts*, and *objects*, used by Sigmund Freud and psychoanalysts in a general way, can only very partially account for the mind's activities of ideation and speech (including inner thoughts, associations, and substitutive formations).

By contrast, action-language purports to bring, through the rigorous descriptions of mental acts it entails, greater clarity and effectiveness to treatment, in that the causal explanation based on the concrete and active "existence" of the person ostensibly leads to a personal recharacterization of his or her psychic reality. Further, by getting away from notions of the "mind-machine," action and its language can supposedly bring us back to the true hermeneutics that is psychoanalysis. The idea, moreover, is not to replace or alter psychoanalytic technique, but to find a metalanguage that is faithful to its origins.

A number of charges (psychologism, personalism, phenomenological reductionism, disregard of the unconscious, a flattening of discourse, the inadequacy of the rules of transcription) have been leveled against this undertaking "in the first person," which aims to provide a foundation for psychoanalysis and to oppose any reification of the subject.

## **ACTION-(RE)PRESENTATION**

The notion of action-presentation (or action-representation) is based on two Freudian models: on the one hand, the idea that representation derives from the failure of hallucinatory wish-fulfillment, developed in *The Interpretation of Dreams* (1900), and on the other, the model that establishes the unconscious "thing-presentation" as a mental "representative" of the instinct, elaborated in "Repression" (1915d) and "The Unconscious" (1915e). Such a grouping of concepts aims to bring out the dynamic functions of fantasies within the general realm of a theory of representation (Perron-Borelli, 1997).

Action-presentations, which are ubiquitous in dreams because of the hallucinatory process induced by the inhibition of motor discharges, are at the core of fantasmatic organization. Indeed, fantasies cannot be reduced to object-presentations: They originate in a dynamic organization that from the outset brings together intrapsychic processes and, at their most basic level, an action-presentation and an object-presentation.

The action-presentation occupies a central position in the "fundamental structure of fantasy," the product of a later and more complex elaboration, that makes possible the representation of all forms of the subject's desire toward the object. This involves a representational structure, made up of three parts (subject-action-object) and based on an elaboration of the primal scene, which allows all its variants to be represented. This structure thus takes on the role of a system of transformations capable of representing the plurality

and mobility of desires and the identifications (bisexual) that characterize the oedipal organization.

Within the dynamics of this fundamental structure, the action-presentation is the pivot point around which the displacement of objects, as well as the inversion of subject and object positions linked to the related dynamics of drives and identifications (inversion of active/passive or sadistic-masochistic movements, among others), can be effected.

The role played by action-presentations in fantasies sheds light on the dynamic links between fantasies and effective actions (Perron-Borelli 1997; Perron & Perron-Borelli 1987). This allows for a clearer understanding of behaviors enacted during treatment (Freudian *agieren*, or acting out), compulsive behaviors, phobias of impulsive acts, and the like. Such an approach emphasizes the importance of fantasy elaboration inasmuch as it prepares and makes possible fulfillments (satisfactions) through action.

This concept of action-presentations, closely linked to the dynamics of fantasy, can be compared to the idea of “unconscious action-presentation” used by Daniel Widlöcher in *Métapsychologie du sens* (Metapsychology of meaning; 1986). However, this author adopted a very different theoretical framework. Far from seeing the action-representation as being articulated with an underlying drive, he seemed to attempt to erase the very notion of the drive. According to him, the unconscious is made up of a sort of “memory of actions” that can only be grasped through the analytic listening process.

The conceptions of Roy Schafer and Heinz Kohut are even further from the fundamental bases of Freudian metapsychology. In *A New Language for Psychoanalysis* (1976), under the label “action language,” Schafer essentially reduced mental processes as a whole to mental “activities” of representation and speech that are connotable by action verbs. For its part, Kohut’s idea of “action-thought,” put forward in *The Analysis of the Self* (1971), is the expression of a concrete, creative thought in which action and thought are conflated.

### **ACTION-THOUGHT (H. KOHUT)**

*Action-thought* is the expression of a concrete, creative kind of thought merged with action. This category has its origin in pioneering experiments that illustrate a new scientific principle by which psychoanalytic patients reveal insights they are in the process of acquiring. In the psychoanalytic context, action-thought is creative—and thus quite distinct from resistance, from acting out, or from the thinking that replaces memories dismantled by interpretation. The notion is part of the theory of the autonomous development of narcissism, as worked out by Heinz Kohut and his followers.

Action-thought was first considered by Kohut in *The Analysis of the Self* (1971), where he spoke of a kind of sublimation presupposing the modification of archaic narcissistic fantasies. He expanded on the idea of nonreplicable scientific experiments expressing the concrete, creative thought of genius in his later work *The Restoration of the Self* (1977, pp. 36ff; see also Koyré, Alexandre, 1968). The notion advanced was that creation sometimes takes place in such a way that thought and action are indistinguishable, as when scientists believe they have gleaned knowledge from external reality when in fact that knowledge was already a part of their own mental reality. Kohut addressed the clinical relevance of action-thought in a

letter written on May 16, 1974, in which he recounted that a patient prone to concrete thought carried out a meticulous exploration of the analyst's office; this in no way involved an expression of childlike curiosity, but rather of thinking in and through action.

In 1977, when Kohut was proposing a generalized self psychology, action-thought was a crucial concept that clearly set his approach to the treatment of narcissistic patients and its termination apart from that of ego psychology. Returning to the analogy of scientific discovery and advances in knowledge of reality, Kohut alluded to the moment when facts could not yet be distinguished from theory since thought and action were not yet differentiated.

The concept of action-thought was emblematic of Kohut's new theory of narcissism, according to which the patient acted out the stages leading to a new mental equilibrium dependent on a modification in his or her narcissism. In the clinical context, this changed narcissism was the vehicle of messages interpretable by the patient, messages that would not be ignored but could be transformed. This was a sign of progress, for psychoanalytic treatment could not arrive at change by interpretation alone, but called too for a "transmuting internalization" of the narcissistic functions as assumed and verbalized by the analyst (Kohut, 1977, pp. 30–32).

Action-thought was thus cardinal for Kohut, who felt that narcissism was a factor in all creativity, which he understood to be a positive transformation of some aspect of the individual's narcissism. The repair of narcissism—the essential goal in the psychoanalysis of narcissistic personalities—tended to be seen as the universal road to therapy. And neurosis itself, Kohut felt, was at risk of being reduced to narcissistic weaknesses left over from the oedipal period.

## **ACTIVE IMAGINATION (ANALYTICAL PSYCHOLOGY)**

Active imagination in Carl Jung's analytical method of psychotherapy involves opening oneself to the unconscious and giving free rein to fantasy, while at the same time maintaining an active, attentive, conscious point of view. The process leads to a synthesis that contains both perspectives, but in a new and surprising way.

"The Transcendent Function" (1916b [1958]) is Jung's first paper about the method he later came to call active imagination. It has two parts or stages: *Letting the unconscious come up* and *Coming to terms with the unconscious*. He describes its starting points (mainly moods, images, bodily sensations); and some of its many expressive forms (painting, sculpting, drawing, writing, dancing, weaving, dramatic enactment, inner visions, inner dialogues). In this early essay he links his method to work with dreams and the therapeutic relationship. The term "transcendent function" encompasses both the method and its inborn dynamic function that unites opposite position in the psyche.

Jung discovered active imagination out of his own need for self-healing in a certain period of his life. It all began with symbolic play: "I had no choice but to...take up that child's life with his childish games" (Jung, 1962/1966, p. 174). He found that as long as he managed to translate his emotions into symbolic images, he was inwardly calmed and reassured. When he opened to the raw material of the unconscious, he did not identify with the affects and images, rather, he turned his curiosity toward the inner world of the imagination. This led to a deep process of renewal, as well as insights that gave him a new orientation. In the years that followed, he recommended it to many of his patients and students. He presents active imagination as an adjunctive technique, but by linking it to his symbolic method of dream interpretation and work with the analytic relationship, Jung laid the groundwork for a comprehensive method of psychotherapy.

Active imagination is a direct extension of Freud's free association (Jung, 1929, p. 47). Other related notions include the transcendent function; the natural healing function of play and imagination; Sandplay; active vs. passive attitudes toward fantasy; reductive and constructive ways to understand the unconscious content; creative formulation vs. understanding; liberation from the analyst (Chodorow, 1997).

Jungian analysts hold a wide range of views on active imagination (Samuels, 1985). For some it is a peripheral technique not much used anymore. For others it is the essence and goal of analysis.

## **ACTIVE TECHNIQUE**

A method advocated by Sándor Ferenczi starting in 1919, the active technique consisted of formulating to the patient, at certain moments of stagnation in the treatment, injunctions or interdictions concerning his or her behavior in such a way as to provoke tensions within the psychic apparatus, with the aim of reactivating the process and of bringing to light repressed material.

Only the patient was encouraged to perform certain actions. The psychoanalyst remained inactive and attentive to the emergence of new mnemonic material in the associations of the patient. The process was used only as an “adjuvant” in order to precipitate the emergence of new associations, the interpretation of which remained, just as in the classic technique, the principle task of the analysis.

Impasses with the active technique led Ferenczi, several years later, to abandon an economic and authoritarian conception of psychoanalytic treatment and replace it with neocathartic relaxation and technical elasticity, an approach facilitated by empathy and benevolence.

“We owe the prototype of this ‘active technique’ to Freud himself,” wrote Ferenczi in 1919 (p. 157), noting that at the beginning of the Freud’s work, the cathartic method was a technique of great “activity,” as much on the analyst’s part as the patient’s. The idea in those days was to apply pressure as a way of awakening memories and precipitating the abreaction of blocked affects. This approach was succeeded by the technique of free association, a non-directive method founded on the apparently passive listening and receptivity of the analyst.

However, recalled Ferenczi, it was while developing analytic technique that Freud was led, during the analysis of anxiety hysterics, to require of his patients that they directly confront the critical situations that gave rise to their anxieties, not in order to habituate themselves to those situations, but rather to achieve the “ligature of customary, unconscious paths of discharge of excitation and the enforcement of the preconscious cathexis as well as the conscious ones of the repressed material.” (p. 157)

Thus Ferenczi was led, following Freud, to break at certain points in the treatment with the receptive and passive attitude of the analyst monitoring the associative material of patients, and to intervene actively at the level of their psyche.

“The patients, in spite of close compliance with the ‘fundamental rule’ and in spite of a deep insight into their unconscious complexes, could not get beyond ‘dead ends’ in the analysis until they were compelled to venture out from the retreat of their phobia, and to expose themselves experimentally to the situation they had avoided with anxiety, but, in exposing themselves to this affect, they at the same time overcame the resistance to hitherto repressed material which now became accessible to analysis in the form of ideas and reminiscences” (Ferenczi, 1921/1999, p. 189).

“I really meant,” Ferenczi continues, “that the description of ‘active technique’ should be applied to this procedure, which does not so much represent an active interference on the part of the doctor as on the part of the patient upon whom are imposed certain *tasks* besides the keeping to the fundamental rule. In the cases of phobia the task consisted in the *carrying out of unpleasant activities*.” (p. 189)

Thus “[i]n stimulating what is inhibited, and inhibiting what is uninhibited” (p. 201), in demanding that patients renounce certain satisfactions and in advising

them to perform certain unpleasant acts, Ferenczi hoped to provoke an increase in psychic tension, a new distribution within the libidinal economy, and thus to allow new mnemonic material to become accessible, and ultimately to accelerate the course of the analysis.

For Freud, then, the active technique was a kind of “agent provocateur,” the injunctions and the prohibitions serving only as an adjuvant, promoting the repetition that must then be interpreted or reconstructed in memory.

Later, Ferenczi came to have serious reservations about the usefulness of the active technique. Badly applied, or poorly employed by novice analysts, this method risked exacerbating the patient’s resistances and hampering the deployment of the transference. It was liable to reinforce the patient’s masochism by organizing his or her submission (Bokanowski, T. 1994). Ferenczi specifically questioned the wisdom of an arbitrarily decided date for the termination of the treatment.

So Ferenczi progressively distanced himself, above all in his critical study, “Contra-Indications to the ‘Active’ Psychoanalytical Technique” (1926/1999), from an authoritarian orientation of the treatment founded on frustration and abstinences. He introduced the new notions of “elasticity,” that is, patience and empathy, and “relaxation.” He even mentioned (1933/1999) the aggressive features of the active technique that aimed at a “forced relaxation” in the patient (p. 296).

It was no longer up to the analyst, but rather to the patient, to determine the opportune moment when the treatment had sufficiently progressed to allow him or her to tackle the renunciation of neurotic satisfactions and the overcoming of inhibitions.

In “Analysis, Terminable and Interminable” (1937c), Freud criticized in the firmest manner any intervention of the psychoanalyst at the level of material reality for the purposes of moving the analysis along or of making a negative transference appear artificially when it was not yet manifest.

## ACTIVITY/PASSIVITY

The terms “activity” and “passivity” were already in use before Freud. For example, Richard von Krafft-Ebbing used them to compare sadism and masochism. Freud initially employed the terms within the framework of the theory of psychosexuality and, more specifically, with respect to the drives, creating paired opposites associated with masculine/feminine. He then used these terms in his dynamic analysis of ego as agency.

For both paired opposites, “Instincts and Their Vicissitudes” (Freud, 1915c) is a key reference. In it Freud referred to activity/passivity as one of “three polarities” that govern “our mental life as a whole” (p. 133), along with the pairs ego/outside world and pleasure/unpleasure. But even in 1896 Freud had already evoked the polarity of activity/passivity in his theory of seduction, which he based on clinical findings and individual histories of neuroses. Hysteria, he wrote at the time, results from “sexual passivity during the pre-sexual period” (1896b, p. 163) that is reacted to by indifference, contempt, or fear. In contrast, in obsessional neurosis,

(*Zwangsneurose*) pleasure is active: the seduced infant actively, aggressively, repeats an experienced sexual attack on another infant. This alteration of the sexual attack experienced by the child from passive to active can also occur in masturbatory activity.

Freud subsequently modified his views by acknowledging a “spontaneous” infantile sexuality not forcibly induced by an adult seducer. This was the theme of his *Three Essays on the Theory of Sexuality* (1905d). In this work Freud described libidinal development as proceeding from “a number of separate instincts and erotogenic zones, which, independently of one another, have pursued a certain sort of pleasure as their sole sexual aim” (p. 207) and have gradually unified under genital sexuality, which becomes primary. Therefore, the “opposition found in all sexual life clearly manifests itself” within a development stage, whether it be the second pregenital or anal-sadistic phase. This is an opposition not between masculine and feminine but between active and passive. Freud noted, “The *activity* is put into operation by the instinct for mastery through the agency of the somatic musculature; the organ which, more than any other, represents the *passive* sexual aim is the erotogenic mucous membrane of the anus” (p. 198). This association comes into play during the anal sadistic phase, since, for Freud, earlier sexual activity, that of oral, or “cannibalistic,” organization, does not yet display these “opposing currents.”

Primarily within a clinical framework Freud noted the opposition of active and passive with respect to homosexuality as well as the opposites sadism/masochism and voyeurism/exhibitionism. He wrote that sexual intent “manifests itself in a dualistic form: active and passive.” A 1915 addition to the *Three Essays* generalized these ideas, designating activity and passivity as “universal characteristics of sexual life” (p. 159).

In “Instincts and Their Vicissitudes” (1915c) Freud further elaborated these ideas, which led him from the use of clinical findings to an analysis of the internal mechanism of the drive. Every drive is active in itself; it is a “piece of activity” (p. 122). However, the aim of the drive, which is always satisfaction, can be achieved by various means. One way is the “change from activity to passivity” (p. 127). For instance, in sadism/masochism, the active goal of tormenting and watching is replaced by the passive goal of being tormented, of being watched. Therefore, three simultaneous or successive positions of the subject with respect to the object can result in satisfaction: active, passive (a rever-

sal back to oneself), and “reflected means” (observing oneself, self-inflicted pain). This flexibility of the instinctive aims of the drive contrasts with the fixity of perverse sexuality.

In developing his theory of psychosexuality, Freud closely linked the pairs activity/passivity and masculine/feminine, which he sometimes used as synonyms. In some texts, in fact, Freud’s clinical observations shows them to be nearly indistinguishable, for example, in the Wolf Man’s regression from passive desires to masochistic and feminine desires toward his father (1918b [1914]). Later and in a context less closely associated with individual clinical analysis, Freud insisted on the importance of not “identify[ing] activity with maleness and passivity with femaleness” (1930a, p. 106).

As for the role of active and passive in the theory of the ego, Freud, in 1915, emphasized that transformations of the drive by repression and reversal protect the psychic apparatus. These transformations depend on “the narcissistic organization of the ego and bear the stamp of that phase. They perhaps correspond to the attempts at defense which at higher stages of the development of the ego are effected by other means” (p. 132). The transformations between active and passive imply a narcissistic consistency and a drive that is also no longer “poorly connected and independent” (Freud, 1915c).

After 1920 and his introduction of the structural theory (ego, id, superego), Freud could refer to a passive ego confronting an id, or a masochistic or feminine ego confronting a sadistic superego (1928b). He then renewed his study of psychoses, melancholy, and trauma. It was around this time that Freud introduced the death drive and its essentially destructive effect through unbinding. With the notion of unbinding Freud could better distinguish the activity of the drive from its potential for destructive aggression. The internal organization of sadism/masochism (mastery, sadism, primary and secondary masochism) could then be conceived as protecting the psyche by binding the death drive (1924c). The repetition compulsion also reintroduces psychic binding through the interplay of activity and passivity in the face of trauma. This occurs during the child’s play when the child “makes the transition from passivity to activity [in order to] psychically control her impressions of life.” These perspectives are extensively explored in contemporary psychoanalytic work.

## **ACT, PASSAGE TO THE**

A particular kind of action defined by its disruptive and even criminal character. Whether the aggression characterizing such an act is directed at the self or at others, it is generally considered psychopathological. In “passage to the act” it is the idea of “passage” that is important, for it refers to the relationship between the act and the supposed mental process that prepares for and facilitates it.

The French term *passage à l'acte* was borrowed by psychoanalysis from psychiatry and criminology. It is important that this notion not be confused with that of acting-out/acting-in, which should be limited to the framework of the treatment and the dynamics of the transference. More generally speaking, passage to the act, like inhibited action and procrastination, raises the issue of the connection between thought and action. Freud emphasized on several occasions how one could be substituted for the other. In obsessions, for instance, thought replaced action by virtue of a kind of regression (1909d); in the case of primitive peoples, by contrast, the act seemed to replace thought in a way consonant with Goethe's dictum, “In the beginning was the deed” (1912–13a, p. 161).

It was not in a philosophical context that the notion of passage to the act was developed, however, but rather in connection with the often unpredictable

character of certain antisocial and violent acts. What the word “passage” denoted was the sudden lurch from a fantasied act to a real act, a shift that would normally be inhibited by defense mechanisms.

Jacques Lacan drew attention to the way anxiety was resolved by a passage to the act (1962–63). For many authors, passage to the act is the effect of a pre-oedipal mode of psychic functioning dominated by primary processes, by an inability to tolerate frustration, respect reality-testing, or curb a tendency to impulsiveness. In this view a weak ego may be responsible for a propensity to pass to the act; but a grandiose ego, eager to exert omnipotent control over its surroundings, can also be the culprit. The “act” here is more like a motor discharge than an action intended to transform reality, which requires the subject to delay the discharge by means of a thought-process permitting the psychic apparatus to endure tension so long as release is thus deferred (Freud, 1911b).

Passage to the act concerns the relationship between the act and its mentalization; it could indeed be regarded as a near-total exclusion of any mental process from the act. Any understanding of such an act, which is not assumed but rather presented by the agent as passively experienced, must depend on an effort of decipherment (Chasseguet-Smirgel, 1987; Balier, 1988). For this reason passage to the act has been likened to somatization, since both are characterized by a lack of psychic working-out, even by alexithymia.

Alternatively, it might be argued that passage to the act does not rely on an absence of mentalization, but rather on a kind of “telescoping” (Aulagnier, 1975/2001) of fantasy and reality. In this perspective, far from being the consequence of a failure of mentalization, the passage to the act results from an overflowing of the fantasy world into reality because an element of reality has impinged on the fantasy scenario and opened a breach enabling the act to externalize it.

It is hard, therefore, to reduce the notion of passage to the act to a simple causality. Instead, instances of passage to the act should be defined in terms of the particular individual involved, and their specific psychodynamic features examined case by case. Thus schizophrenic and paranoid homicidal passages to the act present considerable differences, even if both embody an inadequate attempt to dissipate unbearable anxiety. A paranoid passage to the act is liable to occur when the persecuting object is lost sight of and the

persecutory system is destabilized (Zagury, 1990). The passage to the act in borderline conditions depends rather on a lack of identifications (Bergeret, 2002), while such acts in adolescents may be fostered by the emergence of destabilizing instinctual impulses conducive to either excess or asceticism.

If one resists the temptation to simplify the notion, it appears that passage to the act may have a large variety of etiologies. Meanwhile, the notion clearly belongs to a very broad philosophical discussion of the relationship between thought and action.

## **ACTUAL NEUROSIS/DEFENSE NEUROSIS**

The distinction between the actual neurosis and the neurosis of defense was made by Freud very early on in the context of his theory of the sexual origins of neurosis. In 1898, in an article entitled “Sexuality in the Aetiology of the Neuroses,” he clearly described these

two categories of neurosis in terms of both aetiology and treatment: “In every case of neurosis there is a sexual aetiology; but in neurasthenia it is an aetiology of a present-day kind, whereas in the psychoneuroses the factors are of an infantile nature” (1898a, p. 268). This contrast between actual and infantile sexuality in the causation of the two kinds of neurosis entailed correspondingly different therapeutic approaches, namely prophylaxis and deconditioning in the case of actual neuroses (pp. 275–76) and psychoanalysis in that of the defense neuroses.

Into the class of actual neuroses fell, chiefly, neurasthenia and anxiety neurosis. Later (1914c, p. 83), Freud added hypochondria. In his view the distinction between neurasthenia and anxiety neurosis depended on the specificity of the sexual noxa in each: “Neurasthenia can always be traced back to a condition of the nervous system such as is acquired by excessive masturbation or arises spontaneously from frequent emissions; anxiety neurosis regularly discloses sexual influences which have in common the factor of reservation or of incomplete satisfaction” (1898a, p. 268). The mechanism of actual neurosis was essentially linked to a disjunction between the somatic sexual excitation and object representations in the unconscious. This failure of somatopsychic communication was caused by particular conditions of mental functioning and generally led to symptoms.

The defense neuroses subsumed conversion hysteria, anxiety hysteria (phobic neurosis), and obsessional neurosis. In contrast to the actual neuroses, they were caused by psychic conflict. In “The Neuro-Psychoses of Defense” (1894a), Freud described the mechanism of these conditions as a disjunction between ideas and affects. The idea, erotic in character, underwent repression, whereas the affect had a specific fate for each type of neurosis: somatic conversion in hysteria, displacement in obsessional neurosis, and projection in phobic neurosis.

Freud rounded out his psychodynamic conception of the defense neuroses in 1906, in “My Views on the Part Played by Sexuality in the Aetiology of the Neuroses,” describing neurotic symptoms as compromises between two mental currents: the libidinal current, determined by the subject’s sexual “constitution,” and the repression carried out by the ego (1906a, p. 277).

The distinction between actual and defense neuroses has taken on fresh significance in present-day

psychoanalysis as a result of new thinking on psychosomatic disorders. The fact that it corresponds so closely with the distinction drawn by Pierre Marty in his classification of psychosomatic conditions between well and badly-mentalized neuroses has led to its becoming both a model for the economic assessment of psychosomatic processes and a frame of reference for the analysis of clinical findings.

In this perspective, the symptoms of actual neuroses belong to the same instinctual framework as those of hysteria and, more generally, those of the transference neuroses. What differentiates them is the specific process affecting sexuality and the relations between the instincts. This postulate is the foundation of Freud's psychosomatic monism and shifts the duality into the instinctual realm.

The somatic symptoms of actual neurosis express more or less far-reaching material degradation of organs and functions. From the psychoanalytical standpoint, however, we must treat them, along with Freud, as resulting from the intensification of the organ's erotogenic function and from the distortion of the action of the instinct in its own terms. It is only logical, if psychosomatic phenomena are to be considered from the standpoint of psychoanalysis, that all reference to any conceptual framework other than the instinctual one be excluded from a comprehensive approach to the somatic symptom or to somatic illness.

Such an approach must be congruent with the internal coherence of the psychoanalytic apparatus, a coherence with three dimensions, clinical, theoretical, and therapeutic. From the psychic point of view, which is to say from the point of view of psychosexuality, the organization of the actual neuroses is characterized by an overall incapacity for working matters out, and this for determinate reasons of both a structural and a developmental kind. This is the reason why patients suffering from such neuroses have been excluded from psychoanalysis intervention, the sole purpose of which for Freud was to uncover the role of the unconscious in mental life—a point about which he was categorical. In his twenty-fourth Introductory Lecture, entitled “The Common Neurotic State,” he noted that, “It was more important for me that you should gain an idea of psycho-analysis than that you should obtain some pieces of knowledge about the neuroses; and for that reason the ‘actual’ neuroses, unproductive so far as psycho-analysis is concerned,

could no longer have a place in the foreground” (1916–17a, p. 389). Thus the classification of actual neurosis could not be applied to any mental organization in which psychoanalysis was led to identify psychic conflicts or defense mechanisms such as repression—these being firm indications, in Freud's eyes, of psychoneurosis.

In his broad conception of the neuroses, however, Freud included the actual neuroses, clearly defining their place and according them an important role with not inconsiderable theoretical consequences: “A noteworthy relation between the symptoms of the ‘actual’ neuroses and of the psychoneuroses makes a further important contribution to our knowledge of the formation of symptoms in the latter. For a symptom of an ‘actual’ neurosis is often the nucleus and first stage of a psychoneurotic symptom” (1916–17a, p. 390). This view of things opens up a whole area of psychosomatic research; it also provides the theoretical context for Freud's notion of somatic compliance.

## ACUTE PSYCHOSES

The notion of acute psychosis as envisaged by psychiatry is situated on the border of psychoanalysis. The acute psychoses, sudden and severe disorganizations of the mind, all have in common a disturbance of the relational faculties, a loss of contact with what is commonly accepted as reality, and a diminishing or absence of critical abilities with regard to the pathological.

There are multiple different forms of acute psychosis. Among these are melancholic and manic episodes, which can clinically exist in alternation (hence the framework of manic-depressive psychosis) and which are associated with Freud's writings on the "narcissistic neuroses"; acute delusional psychoses, some of which are linked to the development of chronic psychosis; and finally, dream-confusion disorders, for which the possibility of an organic etiology must always be investigated. As varied as they are, these disorders all have in common the temporal features of an "attack": They are sudden, uncontrollable, incomprehensible, and reversible.

Since antiquity, *melancholia* has referred to a form of madness characterized by "black bile": dejection, sadness, spiritual pain, feelings of abjection and guilt that may be expressed in delusional form, and despair that may lead to suicide. Emil Kraepelin incorporated melancholia into manic-depressive psychosis. Karl Abraham, in his 1912 publication "Notes on the Psycho-Analytical Investigation and Treatment of Manic-Depressive Insanity and Allied Conditions," attempted to apply a psychoanalytic approach to cases that were "cyclical" (1912/1927, p. 138) in their evolution. His way of envisioning the psychogenesis of the attack, and his reference to a "hidden structure" and ambivalence stimulated the thinking of Sigmund Freud, who had been investigating melancholia as early as 1895. In a manuscript sent to Wilhelm Fliess that year, Freud compared it to "mourning—that is, longing for something lost" (Manuscript G, p. 200). In 1917 he published "Mourning and Melancholia," where he envisioned melancholia as the pathological form of mourning. In the work of mourning, the subject is able to gradually achieve detachment from the lost object; in melancholia, by contrast, the subject identifies with the lost object and believes himself or herself to be guilty of its disappearance.

The acute psychoses, and especially attacks of melancholia, owing to their frequent recurrence and

possible alternation with mania, from the outset presented psychoanalysis with the problem of the relationship between attack and structure. "Structure" implies that no term of the field in question can be approached without taking into consideration the terms that are articulated together with it; no single term takes effect without the others. The three conditions that Freud posited as the origin of melancholia—loss of the object, ambivalence, and regression of the libido into the ego—provide the framework of a structure. Whatever may reactivate such a mechanism around the loss of object provokes another melancholic attack, and Freud explored this "struggle of ambivalence" (1916–1917g [1915], p. 257) in which the ego itself becomes carried away in the process of accusation of the object, or even its "condemnation to death." He posited that this process can come to an end in the unconscious, either through exhaustion or through exclusion of the object, which is thereafter deemed worthless. The ego can then revel in the satisfaction of recognizing itself as the best, as superior to the object. The accumulation of a cathexis that is at first bound, and then liberated at the end of the melancholic process—the enabling condition for possible mania—implies regression of the libido to narcissism. In *The Ego and the Id* (1923b), he analyzed the ego's dependency states, writing: "If we turn to melancholia first we find that the excessively strong super-ego which has obtained a hold upon consciousness rages against the ego with merciless violence" (p. 53). What dominates the superego here is "a pure culture of the death instinct" (p. 53). In "Neurosis and Psychosis" (1924b [1923]) he restricted the "narcissistic neuroses," characterized by withdrawal of the libido onto the ego, to disorders of the melancholic type.

In order to envisage acute psychoses as a whole, Melanie Klein's theoretical elaboration must be mentioned. In 1935 Klein stopped referring to "developmental stages" and instead began using the term *position* to differentiate psychotic anxieties in children from psychoses in adults. In this view, psychosis is seen sometimes as a temporal regression reversible to either the paranoid or the depressive position, sometimes as the "fertile moment" of a psychosis arrested in such a "position," and sometimes as a cyclical episode that can be clinically treated, even if the subject's anchorage in such a "position" remains structurally determined.

It should be noted that the various acute psychoses were the object of a clinical and psychopathological

synthesis by Henri Ey (in the third volume of his *Études psychiatriques*) that often challenges psychoanalysis.

Acute psychosis is an expression of the complexity of what is happening on different levels in the patient; the possibility of some severe organic dysfunction cannot be ruled out, nor can the possibility of a reactive crisis. In any event, the patient's acute state requires specific types of care, and his or her history is essentially done away with by the urgency of the circumstances. The anguish of people close to the patient and the team of caregivers in the face of madness must be taken into account. Research confirms the effectiveness of a psychotherapeutic approach based on psychoanalytic conceptions associated with traditional methods of treatment of the acute episode. In the most favorable conditions, such an approach still makes structural study possible.

## **ADAPTATION**

Adaptation is not part of Freudian vocabulary (it does not appear in the index of the Standard Edition, for example). The idea of adaptation, however, is present throughout Freud's work. It appears as early as 1895, in his "Project for a Scientific Psychology" (1950a), when he discusses the mechanisms of perception, attention and memory. The idea runs through all of Freud's subsequent work whenever he discusses the relation between psychic reality and the "reality of the outside world." It is found, for example, in "Instincts and their Vicissitudes" (1915c) and "Repression" (1915d), when he writes that dangers that can't be avoided through behavioral means are "rejected toward the interior." Other texts where the concept appears include "Neurosis and Psychosis" (1924b), "The Loss of Reality in Neurosis and Psychosis" (1924e), and "An Outline of Psycho-Analysis" (1940a). In fact, there are few texts by Freud where the question of adaptation isn't found, even if the word itself rarely appears.

Adaptation and the related theoretical issues are central to the development of ego-psychology, which was, for the most part, based on Freud's structural theory and the work of Anna Freud (1936/1937) and Heinz Hartmann, author of *Ego Psychology and the Problem of Adaptation* (1938/1958). It was in this period that a theoretical schism developed, leading to differences in clinical psychoanalytic practice between those analysts (especially English-speaking) who adapted this point of view and those who preferred other options, either along the lines developed by Melanie Klein and her successors or the rather different approach taken by Lacan and his successors.

Jacques Lacan was, in fact, highly critical of the primacy given to the problems of adaptation in ego-psychology. He emphasized that naively establishing "external reality" as a given prior to and outside of psychic activity is a theoretical absurdity since that exterior reality is constructed through close interaction with psychic reality itself. He also pointed out the dangers of an analytical practice in which the analyst, within the framework of a normative and "normalizing" enterprise, developed mastery, or even a sense of excessive power, in assuming that his or her own "adaptation" is by definition better than that of the patient. Whatever one might think of these criticisms and their rebuttals, there is little doubt that they have had considerable impact, well beyond the field of

Lacanian thought, especially in the French-speaking world. Unfortunately, this has had the effect of “throwing the baby out with the bathwater” through the unjustified condemnation of any psychoanalytic consideration of the problems of adaptation. These problems cannot be avoided, however, to the extent that psychic processes are constantly being adjusted in terms of their internal equilibrium and modified as a result of the impact of outside events.

## ADDICTION

The Latin *addictus* refers to a person who is bound and dependent as a result of unpaid debts. Metaphorically, this term came to be used for any behavior that results from a heavy dependence on something, such as a drug. A number of common substances or those that can be freely purchased can be used as drugs or

become addictive substances: medication, alcoholic beverages, glue, and so on. Psychoanalytically, the power of a particular addiction depends both on the unconscious fantasies that underlie the subject’s ingestion, and the substance’s actual chemical effect.

Sigmund Freud refers to addiction in an early paper on “Hypnosis” (1891d, p. 106), and in a letter to Wilhelm Fliess of December 22, 1897, he refers to masturbation as the “primary addiction” (1950a, p. 272; 1985c, p. 287). Karl Abraham (1908/1927) studied alcohol addiction. Sándor Radó (1933) associated addiction with a regression to childhood. Otto Fenichel (1945) developed the concept of addiction as a regression to infantile stages, and his descriptions of alcohol as a means of diluting the superego are especially interesting. Herbert Rosenfeld (1965) referred to the manic-depressive signs that underlie addiction, and connected addiction to pathological narcissism of the Self. Donald Winnicott (1951/1953) associated addiction with a pathology of the transitional. Winnicott’s transitional object, a creation/discovery of the subject, opens up an intermediary zone of experience, which then expands into play and cultural life, while the transitional object is disinvested and loses its meaning. In addiction, this process of opening up and development is held back, and the transitional object continues to carry out its original function (counteracting depressive anxiety), in the form of a continuing disavowal. The transitional object is concretized, is “fetishized,” and becomes susceptible to replacement by a drug as an object that can be manipulated by the omnipotent subject, enabling him to deny the separation and the resulting depression.

A number of authors who have studied compulsive behavior have included a dependence on alcohol or another substance into their inquiry. Dostoyevsky, in *The Brothers Karamazov*, provides a clear description of the motivations that underlie addictive behavior, such as sexual dependency and pathological games.

Addiction to a substance is sometimes replaced with another form of dependence, for example, addictions to food, to sex with prostitutes, to gambling, to spree-buying, to physical exercise, to web surfing, or to playing video games (whereby the internal world is projected onto the characters who fight, kill, love, or hate on screen). There is also the addiction to pseudo-religious cults, which serves as a substitute for a dependence on and subjugation to drugs. It is important to note that the other can also become an addictive object

(McDougall, 1982), serving as a drug might, to fill holes in the subject's identity.

## **ADHESIVE IDENTIFICATION**

At very early stages the infant fails to develop a sense of a containing skin. It can then only gain a sense of holding together by sticking, in fantasy, to the outside of objects, giving rise to a form of mimicry which Esther Bick termed adhesive identification. The concept first appears in a Donald Meltzer publication (1975).

Esther Bick's infant observation work showed the skin as a primary object stabilizing the ego in the paranoid-schizoid position. She described the most primitive experiences of falling apart in pieces or, even worse, as a shapeless liquid leaking out. She also described protective measures that an infant may perform with its body and its perception in order to give a greater experience of remaining coherent and contained. She noticed various muscular or verbal abilities which developed precociously as if they were methods for substituting a second skin over a leaky primary containing object.

Certain children, however, seem to have been particularly doomed to the experience of leaking, and almost all emotional experience is felt as a rent in the containing skin. Such a raw experience of bleeding and leaking may then be covered by a particular form of sticking to an object, adhering to it. That person is then incorporated as the skin that prevents leaks.

One of the consequences is that while the concentration is upon sustaining a complete surface, there is no sense of depth to the person. He feels literally that he cannot contain. Ordinary projection and introjection are not possible.

This process gives rise then to a form of object-relationship in which there is a very shallow attempt at mimicry of the object, in contrast to an identification in which the identity of the other person is more richly carved into the person's own self. This description of very early phenomena has been useful in understanding infantile autism (Meltzer et. al., 1975; Tustin, 1981).

The "skin ego" concept of Didier Anzieu (1985) is a more versatile notion, being applicable outside the psycho-analytic setting, in groups and organizations. Pierre M. Turquet (1975) also used the notion of the skin as container in large group experience.

The infantile notion of the skin and its deviations (adhesive identification and the "second skin ") can appear to have reductionist properties, since all phenomena at a later stage can be attributed to experiences at the level of developing the skin boundary. In addition, there is a problem in that the theories of the skin and adhesive identification were derived firstly from a non-psychoanalytic setting (infant observation, and in group phenomena) so that its status in psycho-analytic work, practice and theory, is disputed.

## **ADLER, ALFRED (1870–1937)**

An Austrian physician, psychologist, and psychotherapist, Alfred Adler was born February 7, 1870, in Vienna and died May 28, 1937, in Aberdeen, Scotland. The son of a grain merchant, he was raised in Vienna and received his medical degree in 1895. After opening his medical practice, he took an interest in social issues and, in 1902, became part of Sigmund Freud's circle of friends. He was one of the most active members of the group and one of the most original. After creating the International Psychoanalytic Association (IPA) in 1910, he became the head of the Vienna group and, with Stekel, became co-editor of the *Zentralblatt für Psychoanalyse*, founded the same year.

In 1911 he left the IPA with nine other members because of irreconcilable theoretical differences and founded the Verein für Freie Psychoanalytische Forschung (Society for Free Analytic Research), which he transformed in 1913 into the Verein für Individualpsychologie (Society for Individual Psychology). After 1914 he was editor (with Carl Furtmüller) of his own publication, *Zeitschrift für Individualpsychologie* (Journal of Individual Psychology), the publication of which was interrupted in 1916, becoming, in 1923, the *Internationale Zeitschrift für Individualpsychologie*

(International Journal of Individual Psychology). In 1912 he tried to obtain a research position at the University of Vienna, but was refused.

Interested in practice and educational issues in particular, after 1919 he established a number educational clinics (for teachers, parents, and students), which served as models for practitioners abroad. In 1929 he created the first dispensary of individual psychology (for adults and children). He was also involved in the training of teachers, for he had worked at the Vienna teacher's college since 1924, which brought him closer to the city's educators, on whom he exercised considerable influence.

After 1926 he gave lectures throughout Europe and the United States, initially at Columbia University, then, after 1933, as professor of medical psychology at the Long Island College of Medicine in New York, as well as a consultant at the hospital. To honor him for his scientific achievements, he was named an honorary citizen of the city of Vienna in 1930 and was made a doctor *honoris causa* in the United States, to which he had emigrated in 1935, primarily for political reasons.

His two major works are *A Study of Organ Inferiority and its Psychological Compensation: A Contribution to Clinical Medicine* (1907) and *The Neurotic Constitution* (1912/1972), in which he makes a clear break with Freud. *The Practice and Theory of Individual Psychology* (1927), *Understanding Human Nature* (1927), and *Die Technik der Individualpsychologie* (1928–1930) were the result of his many talks, and were intended for a broader public.

Adler rejected Freud's theory of the libido and, with the creation of individual psychology, which was developed as a new direction in psychotherapy, he created the first significant schism in the psychoanalytic movement. He considered the individual as a complete being, including social and sociological aspects that began with the infant's feelings of inferiority, compensation, and the search for power and supremacy, as well as the sense of belonging to a collectivity. Adler considered psychic development to be the formation of an unconscious life plan, or even a lifestyle, starting with early childhood, and that later symptoms had to be taken into account from this point of view—in this sense Adler's approach was teleological. As an ego-centered psychology, Adler's individual psychology has had its greatest influence

on other psychotherapeutic currents, such as humanist psychology and neoanalysis.

## **ADOLESCENCE**

In psychoanalysis, adolescence is a developmental stage, a key moment during which three transformations occur: the disengagement from parental ties that have been interiorized since infancy; the sexual impulse discovering object love under the primacy of genital and orgasmic organizations; and identification, the impetus for topographic readjustment and the affirmation of identity and subjectivity. These transformations begin with the onset of adolescence, concluding when infantile sexual activity has reached its final form. Adolescence is, therefore, a completion of the process of ego maturation. It is characterized by the conflict that these transformations bring about and the ensuing crisis resulting from the wish for adult sexual activity and the fear of giving up infantile pleasure.

There is little discussion of the concept of adolescence in Freud's own writing. However, the term

“puberty” is frequently found. More than two hundred and fifty references to the concept have been found in his work, even outside of the *Minutes of the Vienna Psychoanalytic Society*. Referring to the Standard Edition, the majority of entries catalogued for the word “adolescence” are found in the *Studies on Hysteria* (1895d) and half of them are by Joseph Breuer. However, the references do not fully take into account linguistic issues and the associated problems of translation. For example, in the majority of French translations of Freud's work, there is frequent reference to the term “adolescence.”

Although adolescents appear among the first cases of clinical psychoanalysis, such as that of Katharina, who was eighteen at the time, and especially that of Dora, most references to the role of puberty from the perspective of development appear in *Three Essays on the Theory of Sexuality* (1905d). In *Some Reflections on Schoolboy Psychology*, (1914f), a text that is often mentioned in connection with adolescence, the problem of growing up is presented by Freud as an extension of the oedipal complex. The schoolboys see their teachers as substitute parents. They transfer to them the ambivalence of the feelings they once had for their father. From this point of view, adolescence works toward a separation from the father.

Although adolescence in Freud and in subsequent psychoanalytic thought is often presented as an infantile screen-memory, that is, as the formation of a compromise between the repressed elements of infantile sexuality and the defenses typical of adolescence, it is also, through the theory of deferred action, an opportunity for new psychic activity, a kind of rebirth in which the past can only be understood in light of the present. Human history is understood in terms of its past, but its past is illuminated in terms of its present, and, in the case of adolescence, in terms of the traumatic present.

In fact, psychoanalysts have always had, whether manifestly or latently, a bipolar idea of adolescence. First, as the occasion of two instinctual currents through which the adolescent, burdened by the re-emergence of infantile impulses on the one hand and the discovery of orgasm (arising in adolescence) on the other, must confront oedipal conflicts, the now realizable threat of incest, and the parricidal and matricidal feelings as condensations in fantasy of the aggression associated with all growth: “growing up is by nature an aggressive act” (Donald Winnicott).

Second, as an expression of the bipolarity of the ties between impulse and defense (Anna Freud), between identification and identity (Evelyne Kestenberg), between object libido and narcissistic libido (Philippe Jeammet), and between the “pubertary,” which reflects the powerful sensual current that no longer recognizes its goals, and “*adolescens*,” which reflects the category of the ideal (Philippe Gutton). This leads contemporary psychoanalysts to consider that the capacity of the psychic apparatus to perform the work of binding can be seen as a fundamental indicator of the fact that the process of adolescence has been harmoniously completed. Dreams and action represent the creative activities of this capacity (François Ladame) whereas unbinding (Raymond Cahn) is the source of serious psychic pathology. The enigmatic discrepancy between the bipolarity of the impulse and the transformational object (Alain Braconnier) constantly underlies the analysis of transference and counter-transference during adolescence.

There are other theorizations as well: Adolescence as a “crisis” (Pierre Mâle, Evelyne Kestenberg) or breakdown (Moses Laufer), as an impasse in the process of development, that is, in the integration of the sexualized body into the psychic apparatus. These approaches reveal the difficulties and resistances the subject experiences in giving up the forms of libidinal satisfaction in which his infantile body was engaged, difficulties and resistances that are manifest in the transference through the representation and acting out of the “central masturbation fantasy.”

Although it is no longer psychoanalytically possible to consider adolescence in terms of a traditional genetic psychoanalytic psychology, that is, as the final stage of development that makes it possible to access an adult stage, it is still difficult to provide a comprehensive interpretation centered on any given aspect of adolescence. The psychic impact of puberty determines the remodeling of identification, the expression of fantasies, and self and object representations. The psychic impacts of the social and the cultural determine the alterations of these same intrapsychic elements, as well as presenting psychoanalysts with the problem of addressing the contradiction between a focus on external objects versus a focus on internal objects. From the point of view of psychoanalytic practice, the attention given to mental functioning, and to affects in particular, enables psychoanalysts to understand many of the disturbances found in adolescence

in a way that broadens and extends the notion of crisis or the process of individuation, as well as their relationship to anxiety and, especially, depression. The concepts of “depressive threat” and “self-sabotage” help describe, clinically and theoretically, the process of change specific to the adolescent, whose pathology reveals the failures and avatars that are so magnificently exemplified in our culture through the heroic figures of Narcissus, Oedipus, Hamlet and Ophelia, Electra and Orestes, and, of course, Romeo and Juliet.

## ADOLESCENT CRISIS

The concept of adolescent crisis is not generally found in the vocabulary of psychoanalysis. It was not used by Freud and was not created by any psychoanalyst. In France the concept gained currency following the success of Maurice Debesse's *La crise d'originalité juvénile* (The crisis of juvenile originality; 1941), which helped spread and popularize the concept. Subsequently, authors interested in adolescence, including psychoanalysts, picked up the term for their own uses, supporting it or criticizing it. The initial ambiguity and lack of precision associated with the term probably contributed to its success, but also turned it into a grab-bag of ideas and the source of considerable misunderstanding. It has been used to refer to the culmination of the developmental process at the end of childhood and the beginning of adulthood, as well as to the behavioral manifestations and disturbances that so often occur at this age.

Under the heading of "adolescent crisis" and in the guise of the assumed originality of adolescents, the most atypical behavior has been considered "normal" for this age. This atypical behavior is claimed to be the price paid for the crisis, which has been compared to a temporary disorganization when the young adolescent leaves the stable environment of childhood for an as yet uncertain adulthood. Along with this change in environment must be considered the maturation of the drives, quantitative effects that are said to push the adolescent toward temporary anarchic behavior before it is channeled into more stable pursuits. The crisis, understood from its most obvious expression in a range of boisterous behavioral expressions, is said to be a sign of normality. On the contrary, the lack of such drama in adolescence would be a sign of excessive repression and a portent of a disturbed future. The adolescent would face no psychic work in making the transition to adulthood.

An alternate approach, based largely on the North American developmental school, known through the

work of Peter Blos and Margaret Mahler, sees adolescence as the culmination of a process of maturation. This developmental approach further suggests that we use the concept of crisis sparingly. It belongs more to a romantic vision of adolescence than to any scientific reality. According to this view, some adolescences would be pathological, but most, the silent majority, would not. Follow-up studies of difficult adolescences, although fragmentary, suggest that the evolution in adolescence is far from being as favorable as claimed. Yet the vast majority of adolescences go unnoticed, without any of the customary clinical or subjective manifestations of an adolescent crisis.

The psychoanalytic approach to the intrapsychic changes associated with puberty has developed in several phases. Three main explanatory models have been proposed, each of which can be seen as a confirmation of the others. The initial model of change was based on the first discoveries in psychoanalysis, those associated with *Studies on Hysteria* (1895d) and *The Interpretation of Dreams* (1900a). This model of change enabled the transition from symptoms to representations as a result of the change in the topographical register from the unconscious to the conscious through the lifting of repression. This model characterizes the Freudian approach to adolescence. Action deferred until puberty actualizes and brings into the field of consciousness, more or less disguised, the parameters of infancy and in particular the Oedipus complex, repressed during the latency period. Adolescence becomes a repetition of infancy. The second model of change is based on the displacement of libidinal investment. It was taken up by Anna Freud when she made mourning the central parameter of the process of adolescence. The third model is a structural change of personality.

Freud's view of adolescence is not without ambiguity and seems to alternate between change and continuity, though it leans toward the latter interpretation. Adolescence is essentially defined by its relation to infancy. It represents access to the genital stage and is, in this sense, the culmination of libidinal evolution (Freud, 1905d). Consequently, it clarifies earlier stages and gives deferred meaning to certain infantile experiences that have remained suspended and potentially traumatic until pubertal genital development provides them their fullest expression.

Little has been said concerning the intrapsychic transformations of puberty. In these models, the

understanding of adolescence is filtered through the understanding of childhood. The advantage of adolescence lies in its ability retrospectively to clarify childhood through the retroactive effect of the two-stage evolution of human sexuality and to serve as the doorway to adulthood. As a transitional period, it has no density of its own. The changes of adolescence are seen only as the continuation of a process begun at the start of personality development. Adolescence is not so much a crisis as a culmination of what existed embryonically in the infant.

The real change should be sought within obstacles to development, that is, in pathology and what Moses and Eglé Laufer refer to as “breaks in development.” For these authors, the adolescent’s pubescent body becomes a stand-in for the dangerous incestuous parent. Actualization through transference of this conflict-ridden oedipal bond enables the unconscious or preconscious fantasy that structures this bond to be brought up to date in what the authors refer to as the “central masturbatory fantasy.” They assign this fantasy a key role in the adolescent’s bond with his objects and his own body—a representative of parental objects. In accordance with Freudian ideas, the fantasy is organized during infancy, but the changes to the body in adolescence are what make it traumatic and capable of provoking reactions of repudiation and the various forms of arrested development that can result from such repudiation.

During the decade since 1995, this conception of adolescence as the fulfillment and repetition of infancy has been modified by authors focusing on the specificity of this stage of life. The process of mourning becomes especially important. Anna Freud was the first to draw attention to the similarity of adolescence, emotional disappointments, and periods of mourning. The adolescent libido must detach itself from the parents so it can focus on new objects, and this results in mourning for the nursing mother and the infant body. During this interval between old and new investments, the unattached libido searches for new objects to invest in and returns to the adolescent ego, where it leads to the narcissistic inflation and grandiose fantasies characteristic of this age. Moroseness, biliousness, moments of uncertainty, even depersonalization and periods of depression are signs of the more or less durable vacuity of libido investment.

Can adolescence be better understood with respect to a past that is repeated or fulfilled, or a future to

which it will be subordinated and that will confer subsequent meaning to it? Or should we rather see it as an essential stage in development that can be reduced neither to what came before nor to what will follow? Does adolescence have an identity of its own, such that the nature of the changes that affect it imprint a specific mark on the evolution and destiny of the subject? If so, what is the nature of these changes, and how can they influence the subject’s course of development?

The most specific change in adolescence is navigating between the dual tasks of integrating a genitally mature body in society and partaking an autonomy that appears in this period in life. The effects of puberty on the body modify the adolescent’s relationship to his drives by giving him, along with a pubescent body, a means to discharge them. The adolescent needs autonomy—a distance from earlier objects of attachment, the parents. Autonomy in turn challenges the narcissistic assumptions of the subject and serves to reveal the quality of his internal world, the (secure or insecure) character of his attachments, and the ability of his ego to take control of functions that have until then devolved to his parents. The connections between internal and external reality are questioned and thus undergo important changes.

Adolescence thus corresponds to a need for psychic work in the development of every human being—a need that every individual is confronted with and for which every society must provide a solution. Here we see with particular acuity what Freud defined as a drive, namely a need for work by the psyche owing to its bond to the somatic. Indeed, the origin of this excess of psychic work typical of adolescence is the extra somatic development associated with puberty, but with the particular features that deferred action confer upon it. For the adolescent, the image he constructed of himself during childhood vacillates while he awaits a new cultural and symbolic status. Thus, aside from the conflicts of identification and the Oedipus complex, the most profound strata of personality and the self in its initial period of constitution are summoned and tested during adolescence.

There is indeed a crisis of adolescence in the sense that, psychically, the subject will be different after puberty. But this crisis always has a form and conclusion generally conditioned by culture and the familial systems to which each of us belongs. Consequently, an internal crisis of the psyche is consubstantial with the somatic impact puberty has on the psyche and with

the psychosocial impact of adolescent autonomy, but the external expression of this crisis largely depends on events that transpired during infancy and on the nature and quality of the current social environment.

The family is capable of promoting or interfering with this process. A kind of resonance often occurs between the midlife crisis that parents experience when their children reach adolescence and the problems faced by the adolescent. Such resonance adds to the confusion between generations and blurs limits on behavior for the adolescent. Similar resonance occurs when the adolescent actualizes the parents' unresolved conflicts with their own parents that they then reenact with their children. Such resonance amplifies conflicts and contributes to the adolescent's feeling of being misunderstood and subject to foreign forces.

External reality appears as a possible mediator capable of reinforcing or weakening the structures of the psychic apparatus. Its essential role is to make the growth of object investments associated with the two-fold phenomenon of separation from infantile objects and the resumption of processes of identification narcissistically acceptable. External objects, especially parents, can serve as mediators for internal objects, their concrete attitudes helping to correct whatever is terrifying or constricting in the internal objects, and thus helping to nuance and humanize the superego and ego ideal. They can also create the conditions for pleasure that can be used and exchanged and that authorizes the adolescent libidinally to reinvest object ties without having to become conscious of the importance of those objects. This resembles the conditions typical of the transitional objects of early childhood, or what some authors prefer to call "transformational objects." Because of their diversity, these external objects, coupled with visual reminders of the difference between the sexes, may strengthen a third function that vacillates and is regression and lack of differentiation.

What is true of parents is also true of the mediator figures provided by society: teachers, social workers, friends, ideologies, and religions. These can be temporary supports, offering adolescents a foothold that preserves their need for investment in a narcissistically acceptable self-image before they discover their own way. As with religion and some ideologies, these supports can also provide the adolescent with an outlet that hides discoveries of infantile fusional needs that subjugate the individual to an undifferentiated totalitarian relation.

If the needs for psychic transformation appear to be inherent in adolescence, the forms assumed by these changes are particularly dependent on how society operates. Thus, in this connection, there is an emphasis the role of the generational crisis and modern forms of revolt against the father. We can also raise questions about the impact of a transition from a society structured around precise operational rules and explicit prohibitions to a more liberal society. This transition favors a transition from an adolescence dominated by the problematic of conflicts associated with prohibitions and their possible transgression to an adulthood dominated by the problematic of fear of dissolution of those ties and of expression of needs of dependence. Prohibitions, though they can lead to revolt, lead to misunderstanding the need of dependence. Freedom, together with the requirements of performance and success, brings to light narcissistic uncertainties and needs for completeness.

## ADORNO, THEODOR AND FREUD

Any serious history of the Frankfurt School requires that a major role be accorded to Freud's significance in the

development of critical theory. Freudian thought played a central role in the works of Herbert Marcuse, Max Horkheimer, and, more recently, Jürgen Habermas. But none was more influenced by Freud than Theodor Adorno. In a sense, Adorno was an orthodox Freudian. He supported instinct theory (*Triebtheorie*), in contrast with the “revisionism” of Erich Fromm and Karen Horney, who faulted Freud for biological determinism, and in contrast with the sociological reductionism of Talcott Parsons, who wanted to integrate psychoanalysis into a more comprehensive theory of “social action.” Yet Adorno also parted ways from Freud in his belief that Freud tended to collapse external reality into a psychological universe. Even here, however, Adorno remained surprisingly well disposed toward Freud. Though he viewed Freud’s psychological atomism as mistaken because it minimized the importance of social factors, he considered it to be profoundly correct in that, under advanced capitalism, humans are reduced to isolated monads. In a sense, Freud was right even when he was wrong.

Though Marxism too played a crucial role in the development of Adorno’s thought, the main features of his version of critical theory can be said to be Freudian. Adorno did not lose sight of the fact that every object is the product of history and that the subject plays an active role in the acquisition of knowledge. This idea clearly fits well with psychoanalytic thought, which, while inheriting some principles of nineteenth-century empiricism and materialism, is fully hermeneutic in its clinical application and adheres to a nonpositivist conception of truth.

Far from presupposing a neutral, knowing, analyst, psychoanalysis requires the analyst actively to intervene and holds that objectivity is attainable only intersubjectively. Similarly, in the methodology of critical theory, the object is observed from an immanent, interior viewpoint, not from a transcendent perspective like the one adopted by the sociology of knowledge. This is precisely the point of view of psychoanalysis, which aims to make conscious the social determinants of individual pathologies by seeking those determinants not in the external world but rather through the imprint that they leave on the mental and emotional life of the patient.

Finally, a fundamental principle of critical theory is the principle of nonidentity—the view that, under present social conditions, no synthesis can unite sub-

ject and object, particular and universal, the individual’s aspirations to happiness and the imperatives of society. This principle of critical theory closely corresponds with Freud’s idea of an insurmountable conflict between desire and fulfillment, between the demands of instinct and the requirements of civilization. The foregoing affinities show that both Adorno’s critique of culture and his theory of personality owe much to Freudian thought.

Adorno’s critique was based on two psychoanalytic categories: identification and projection. Through identification, the individual internalizes the father, his symbolic substitutes, and, in the final analysis, society as a whole. In projection, the individual projects onto the external world impulses, emotions, and ideas. Neither of these mechanisms is intrinsically pathological. Identification is essential for an individual’s social integration; projection is necessary for the individual’s acquisition of knowledge, which arises from assimilating sense data, analyzing it through internal reflection, and transforming it into ideas about external reality.

However, all of this changes in the present state of capitalism or, more generally, in industrialized society. Whereas in earlier stages of social development, identification allowed individuals a margin of autonomy, inasmuch as socialization was achieved through the family and could produce free individuals, now it is directly accomplished by the social order, by industrialized society, and in accordance with other specialized demands aimed at producing social consensus.

Similarly, Projection has ceased to be an instrument for producing useful knowledge of reality because the same demands for conformity that directly subordinate the individual to the group have rendered superfluous the process of inner reflection through which facts about the world are processed. In consequence, modern humans project only resentment, destructive instincts, and inner emptiness, converting the world into a paranoid social order filled with hostile institutions.

In short, in the case of genuine identification, the subject internalizes a social model that creates greater autonomy, while with false identification, typical of advanced capitalism, individuality is effaced. Likewise, with real projection, the subject can acquire knowledge about reality by processing sense data, while with false projection, the subject perceives a illusory reality portraying his inner emptiness.

Another field that Adorno investigated with help from Freud was the theory of personality. He elaborated his ideas in a work he authored with several colleagues, *The Authoritarian Personality* (1950), an empirical study that attempted to explain the correlation between personality structure and viewpoints concerning social and political problems. The hypothesis was that subjects with an authoritarian personality structure, as measured using psychoanalytic variables, are more likely to profess reactionary political ideas, while nonauthoritarian subjects are more likely to hold liberal views. To the great surprise of the authors, the expected correlation did not materialize, because many authoritarian individuals were liberal and many nonauthoritarian individuals were reactionary.

Adorno proposed two possible explanations for this anomaly. One was that the sociological environment, a “general cultural environment,” shapes everyone in it, independently of individual personality structures, requiring all to embrace the values of the established order. Adorno’s other explanation, the orthodox psychoanalytic perspective, was that liberal or conservative authoritarian individuals imperfectly identify with their fathers, in consequence of which their behavior is at once submissive yet rebellious, obedient to authority yet hostile. One is left with either false liberals, whose progressive views are negated by deep-seated destructive tendencies, or faithless conservatives, who are intrinsically fascist rather than genuine supporters of the status quo, which in American society includes freedom of choice and equal opportunity. The reverse is true of nonauthoritarian individuals. In these individuals, the oedipal conflict resulted in an accommodating attitude toward authority. These individuals are liberal in aspiring to authentic change yet conservative in wanting to defend what is best in the American tradition.

The two components of Adorno’s theory—the critique of culture and the theory of personality—are transparently complementary. His critique of culture focused on advanced, postindustrial society and its mechanisms for stabilizing and reproducing itself on the cultural and psychological levels. Similarly, at the core of his theory of personality is the kind of human being that postindustrial society needs and creates in order to perpetuate itself. Adorno linked these components using conceptual tools borrowed from Freud. Perhaps in the early twenty-first century, with Adorno’s exclusive reference to Freud, such analyses appear anachronistic in terms of contemporary analytic thought, but even so they show the impressive and

continual fecundity of psychoanalysis for better understanding modern and postmodern society.

### **AGENCY**

The term “agency” denotes a part of the psychic apparatus that functions as a substructure governed by its own laws, but that is coordinated with the other parts.

In Freud’s work this term first appeared in chapter VII of *The Interpretation of Dreams* (1900a), as a synonym or near-synonym for the term *system*, which he had been using for several years: “Accordingly, we will picture the mental apparatus as a compound instrument, to the components of which we will give the name of ‘agencies’ or (for the sake of greater clarity) ‘systems.’” (pp. 536–537) The term *apparatus*, used in a sense that never changed in Freud’s work, explicitly gives the psyche a status comparable to that of the major organic systems (respiratory, circulatory, etc.).

An agency is thus a functional sub-whole, or, in modern terms, a substructure within an encompassing structure. This idea clearly came from Freud’s extensive prior work in neurophysiology and then neurology. If Freud suggested in this text that the term *system* was “clearer,” this is doubtless because it was more familiar to him. Indeed, he had been using it for years, particularly in “Project for a Scientific Psychology” (1950c [1895]), to evoke this type of functional groupings

within the nervous system, whose workings he was trying to conceptualize at the time. He posited these systems as “producing” perception, consciousness, memory, and so forth. In the passage cited from *The Interpretation of Dreams*, he thus distinguished the agencies, or systems, of memory and perception (envisioned as being mutually exclusive), and censorship, but also the agencies that comprise his first topography: the unconscious, the preconscious, and consciousness (or perception-consciousness).

In Freud’s writings from that point on, the terms *agency* and *system* remained close in meaning. However, *system* tended to be reserved for topographical distinctions, while *agency* was used more broadly to refer to an organization being considered from the topographic, dynamic, and economic viewpoints in combination. It is because they are considered in this way that the id, the ego, and the superego of the structural theory are referred to as agencies rather than as systems. Freud tended to posit the agencies as being exclusive: A single phenomenon cannot at the same time belong to the realm of the id and that of the ego, for example. By virtue of this very fact, when Freud at the end of his life came to see the opposition between conscious and unconscious as being simply a difference in “quality” of certain psychic processes—as described in “An Outline of Psycho-Analysis” (1940a [1938])—those two terms were no longer considered as denoting agencies.

In the conceptual architecture of metapsychology, the term *agency* is therefore situated at a level that makes its definition somewhat uncertain. Béla Grunberger thus generated heated controversy when he proposed, in *Narcissism: Psychoanalytic Essays* (1971/1979), to consider narcissism as an agency having the same status as the id, the ego, and the superego. Similar controversies arose over the concept of the self as developed by Heinz Kohut, for example.

## AGGRESSIVENESS/AGGRESSION

In the strict sense of the term, aggressiveness corresponds to certain fantasies and behaviors that Freud discovered in the clinical context, but he hesitated at first to give the term a definition that met the requirements of his own subsequent metapsychological signposts. Only after having shown the importance of ambivalence in the transference (Freud, 1912b) was he in a position to think of aggressiveness as a common relational occurrence, but one without a unique or even homogeneous origin. Afterward, his position never changed: he always regarded aggressiveness as the manifestation in fantasy or symptoms of a combination of hostile and erotic affective currents.

In 1900 Freud without hesitation connected aggressiveness to sadism. In 1905 he added a connection to masochism, adopting the position of Joseph Breuer. For Freud, the masculine position in sex led to a degree of sadistic activity, while the feminine position favored masochistic passivity. By 1924 this latter view led to the hypothesis of a specifically feminine masochism. However, Freud moderated this preliminary opinion in a note added to his *Three Essays on the Theory of Sexuality* (1905d) in 1915 after he made the distinction between a triangular genital position and the phallic-narcissistic position, limited to existential conflicts between strong and weak.

In 1908 Freud further clarified aggressiveness with his conception of bisexuality. Moreover, Freud (1914c) was careful to make clear that he reproached Alfred Adler for not having taken into account the libidinal satisfaction linked to aggressiveness, even though it now seems obvious that Adler’s idea was really more about primitive violence than aggressiveness, which, by its nature, appears after sexualization. Thoughts or

behaviors put into motion by aggressiveness require the person to have an imagination capable of integrating a certain level of ambivalence, while the archaic functioning of violence described by Karl Abraham is of a preambivalent nature and involves a more primitive brutality and violence.

The first shift, in 1914, in Freud's theories involving drives, objects, aims, and the particular nature of eroticization had an irreversible effect on his view of the relationship between aggressiveness and narcissism. Narcissistic objects result from primary identifications and defensive violence, while with ego objects, ambivalence causes the person to oscillate between love and its equally eroticized opposites: aggressiveness, hate, and sadism.

In the case of the "Wolf Man" (1918b), as in the case of "little Hans" (1909b), Freud connected a child's early aggressive manifestations with early attempts at seduction. In *The Ego and the Id* (1923b), Freud described how in authentic aggression, eroticization is responsible for modifying the nature of primitive hostility, just as the need for tenderness replaces the need for mastery. In 1925 Freud became interested in the narcissistic exhibitionism that precedes aggressiveness in infantile fantasy. The overly precocious genital quality that Freud attributed to the narcissistic, imaginary phallus by sometimes confusing it with the penis, the real sexual organ specific to the boy, makes it difficult to give a more complete description of the genital specificity of aggressiveness. In contrast, it is easier to describe the early narcissistic forms of hostility that occur prior to a more commingled (and thus ambivalent) manifestation of the two great strains of the drives: sexuality and self-preservation.

Freud did not hesitate, in his theoretical shift of 1932, twelve years after the shift of 1920, to return to the principles of the first theory of the drives by opposing to the libidinal drives the primitive instincts of self-preservation, from which he then derived aggressiveness (1933a). In 1930 he made clear that he discerned in the psyche of the child a brutal original energy that would soon be rapidly sexualized and bring forth aggressiveness, hate, and sadism. Oral and anal metaphors thus came to illustrate this two-stage view of the origin of aggression.

Melanie Klein and her followers insisted on the presence of a precocious affective interaction, one teeming from the first with hostility and mistrust between

the child and its environment and easily recognized in clinical practice. An illustration of this hypothesis is the notion of "projective identification." Proponents of these views have certainly recognized clinically what derives from a violent instinct of self-preservation and what belongs to an already object-related libidinalized aggression, even though they imperfectly distinguish between the two.

The distinction between the dynamics of primitive instinctual violence and the dynamics of drive pressures giving way to aggressive thoughts or behaviors can be understood at three levels: the level of the specific origins of drives, the level of the particular history of the psychogenetic processes in question, and the level of Freudian metapsychology.

Freud never changed his view on the origin of fantasies or behaviors emanating from aggression. What is involved is a particular form of the sexual drives deflected from their primary aim and entangled with the brutal, hostile primitive impulses. These primitive impulses thus lose their initial, purely self-protective aim. The conjunction of these two fundamental instinctual currents in the service of aggressiveness thus constitutes a kind of layering of the drives. Such a layering does not exist in the infant's original genetic equipment in its pure state, though violent instincts, just like the sexual drives, exist in a pure and specifiable state in the basic affective equipment of the newborn.

From the psychogenetic point of view, psychoanalytic research has gradually enriched the study of affective development beginning at the pre-oedipal and pregenital periods. These studies have further clarified and developed Freud's views of the origins and organization of narcissism. The (primary and secondary) narcissistic stages necessarily involve some sort of objects, but Freud clearly demonstrated that narcissistic objects, focused primarily on a relationship of power, differ radically from oedipal objects, which involve dissimilarity, equality, and complementarity. For aggressiveness to come into play, an object relationship must develop out of an organized fantasy arising from the Oedipus complex and genitality. Aggressiveness is a secondary development, as Freud conceived of it.

From the point of view of conflicts, the classical Freudian notion topographically places aggressiveness within the framework of the activities of the ego. From

an economic point of view, aggressiveness is conceived as arising in connection with an already genitalized object. Finally, from a dynamic point of view, aggressiveness occurs when the sexual drives become bound to brutal, primitive impulses. In this way, the sexual drive tinges the brutal impulses with pleasure, with the result that they become sexually perverse and destructive. In a less pathologic course that arises with the start of the Oedipus complex and is finalized during adolescence, violent primitive impulses reinforce the sexual drives in their appropriate purpose in the service of love and creativity. Such is how Freud described aggressiveness in his elaboration of the concept of *anaclysis*.

Aggressive fantasies can involve a simultaneous libidinal satisfaction in attacking an object who represents (consciously or unconsciously) an oedipal rival, whereas in narcissistic conditions, the resulting violent primitive anger (rage) seeks to protect the self without taking into account the injuries inflicted on one who is experienced simply as an external threat and not as a genuine object (other). Confusion in this regard can be avoided through the use of transference and counter-transference.

The notion of aggression directed at the self, so often invoked in clinical practice, implies that an already eroticized sadism is turned back upon the subject, and not simply that partial or full desexualization leads to an act of self-punishment.

## **AICHHORN, AUGUST (1878–1949)**

An Austrian educator with an interest in psychoanalysis, the pioneer of a new approach to reeducating problem children, August Aichhorn was born July 27, 1878, in Vienna, Austria, where he spent his entire life, and died October 13, 1949. He was raised, along with a twin brother who died when Aichhorn was 19, in a Catholic family of modest means. He became a teacher and continued his studies at the Technische Hochschule of Vienna.

From 1908 to 1918 he was in charge of managing homes for boys in the Austrian capital. In 1918 he was

made responsible for setting up an educational center for delinquent children in an unused refugee camp. Convinced that the suppression then commonly practiced was not the right approach, and disappointed by the kinds of psychological training taught at the university, he introduced unorthodox methods, based on “warm sympathy with the fate of those unfortunates and was correctly guided by an intuitive perception of their mental needs” (Freud, 1925f). His educational success caught the attention of Anna Freud, and it is through her that he discovered psychoanalysis when he was already past forty. He undertook an analysis with Paul Federn and, in 1922, became a member of the Vienna Psychoanalytic Association. When his experiment in reeducation came to an end, Aichhorn created, in 1923, educational centers that focused on psychoanalysis in each of Vienna’s fourteen districts. He worked in the centers, always at his teacher’s salary, until his retirement in 1930.

Along with his responsibilities as a re-educator, he expended tremendous energy in teaching and training. The conferences at which he discussed his original approach to problem adolescents are collected in his book *Wayward Youth* (1925), with a preface by Sigmund Freud. The book was an international success. He was invited to Zurich, Basel, Bern, Prague, Berlin, Stuttgart, and Lausanne. He collaborated in the *Revue de pédagogie psychanalytique* (Review of Psychoanalytic Pedagogy), which he co-edited from 1932 on. Between 1931 and 1932 he directed the small school created by Dorothy Burlingham. After Freud and his followers fled the city, Aichhorn continued to train doctors and psychologists in psychoanalysis and to organize seminars for education and guidance counselors. Made president of the new Vienna Psychoanalytic Association in 1946, he continued his work among educators, whom he exposed to the importance of psychoanalytic training.

Aichhorn opened a new field of activity in psychoanalysis—social work. He radically renewed the approach to “abandoned” youth, showing that asocial phenomena—latent or manifest—had their origin in the severe lack of social and emotional support experienced during childhood. His ideas on how to use transference as a therapeutic tool, on the importance of the individual, both the educator and the delinquent, and on the necessity of giving marginalized youth a sense of responsibility to help reintegrate them socially are still relevant. “Psycho-analysis could teach

him little that was new of a practical kind, but it brought him a clear theoretical insight into the justification of his way of acting and put him in a position to explain its basis to other people” (Freud, 1925f).

## **AIMÉE, CASE OF**

The full title of the doctoral thesis that signaled Jacques Lacan’s entry into psychiatry was *De la psychose paranoïaque dans ses rapports avec la personnalité* (On paranoid psychosis as it relates to the personality). The work was dated September 7, 1932, when Lacan was thirty-one years old.

Readers of the work were uniformly impressed with the breadth of scientific learning that Lacan displayed. To Georges Heuyer, who had doubts about the sheer quantity of bibliographical references, Lacan responded that he had, in fact, read them all. Furthermore, Lacan claimed to have personally evaluated about forty cases. And his familiarity with German texts clearly distinguished his scholarship from the chauvinism characteristic of the two great schools of psychiatry of the time. The French school was his model because of the high quality of its observation and because of its elegance and precision. But the Germans supplied Lacan with the doctrinal authority required by his goal of methodological synthesis.

“Then came Kraepelin” (Lacan, 1932, p. 23). Emil Kraepelin succeeded in imposing differential diagnoses in the field of the psychoses, where previously the category of paranoia had been extended to every kind of delusion and cognitive disorder in a way clearly contradicted by observation, despite the fact that paranoia

was defined very narrowly. Lacan wrote in glowing terms of Johannes Lange, coauthor of the 1927 edition of Kraepelin's *Manual of Psychiatry*, whose study of eighty-one cases noted that classical paranoia was extremely rare, and assigned the curable cases to the category delineated by Kraepelin. As for "genuine paranoia," the question was whether it could be acute, whether remissions were possible. This was a question that Lacan asked from the outset (1932) and that would still preoccupy him twenty-five years later in "On a Question Prior to Any Possible Treatment of Psychosis" (1959/2004). For Lacan, the work of Robert Gaupp supplied an affirmative answer to this question. In short, Lacan endorsed Kraepelin's inclination toward a psychogenetic conception of paranoia, and what Lacan called "psychogeny" became a main theme of his thesis. Hence Lacan's harsh criticism of organicism, the constitutional theory, and the ideology of degeneracy—all then still prevalent in French psychiatry.

To stymie these tendencies, Lacan chose to speak of "personality." To solidify this notion, he drew upon Ernst Kretschmer, Pierre Janet, Karl Jaspers, and, finally, Eugen Bleuler. Bleuler and the Zurich school were Lacan's main route into psychoanalysis from the psychiatric study of the psychoses. Lacan sought to relate mental disturbances to personality, as Janet did, and, like Kretschmer, to explain them in terms of the individual's history and "experience" (*Erlebnis*) (1932, p. 92), with "its social and ethical stresses," rather than by evoking "congenital defects" (1932, p. 243). All this implied a "comprehensive" approach to psychotics consonant with the phenomenology of Jaspers. For this reason, Lacan enlisted the masters of psychiatry and psychopathology in support the open-minded approach to mental illness characteristic of his friends at the journal *L'évolution psychiatrique*.

Lacan argued that pathological manifestations in psychosis were "total vital responses," which, as "functions of the personality," maintained meaningful connections with the human community (1932, p. 247). In short, they were meaningful—a realization that defined the young Lacan's approach and influenced the choice of his inaugural case, that of "Aimée."

Aimée was a thirty-eight-year-old woman who, with "eyes filled with the fires of hate" (1932, p. 153), had tried to stab the celebrated actress Huguette Duflos. As a result of this attempted "magnicide" on April 18, 1931, she was immediately imprisoned.

Lacan began to see her one month later at Sainte-Anne Hospital. He reconstructed "almost the full gamut of paranoid themes" (1932, p. 158): persecution, jealousy, and prejudice for the most part, themes of grandeur centered chiefly on dreams of escape and a reformatory idealism, along with traces of erotomania. Her cognitive functions were unaffected. To this classic picture, which Lacan established by means of thorough biographical inquiry, Lacan added what he considered a decisive consideration: after twenty days of incarceration, the patient's delusional state diminished dramatically. This development Lacan viewed as evidence of the acute nature of her paranoia. Connecting Aimée's criminal act with this remission, he set out to discover the meaning of her pathology, and with this in mind he proposed a new diagnostic category: "self-punishment paranoia."

Aimée also aroused Lacan's curiosity because of her attempts at writing. Lacan had already evinced an interest in the writing of psychotics, and in his thesis (1932) he published selected passages from "Aimée"—the name being that of the heroine of the patient's projected novel. Aimée's writings and the sensational aspects her case brought Lacan's work to the attention of a public well beyond psychiatry. The spirit of the times saw links among art, madness, and psychoanalysis. The dreams related by André Breton in *Communicating Vessels* date from 1931, and his exchange of letters with Freud, which followed the publication of this book, date from 1932. René Crevel, Paul Éluard, Salvador Dalí, Joë Bousquet all echoed Lacan's thesis. In 1933, in the first issue of the Surrealist magazine *Minotaure*, Dalí cited "Jacques Lacan's admirable thesis" and praised the thesis of "the paranoiac mechanism as the force and power acting at the very root of the phenomenon of personality." Lacan took pride in this acknowledgment. In his *Écrits* (1966), he described his thesis as merely an introduction to "paranoiac knowledge" (p. 65), an unmistakable allusion to Dalí's "paranoiac-critical method." He never revised this attitude: as late as December 16, 1975, he declared, "Paranoid psychosis and personality have no relationship because they are one and the same thing."

Left-wing philosophers likewise fell under the spell of Lacan's book. Paul Nizan, a careful reader of Jaspers, published a summary of it the communist daily *L'humanité* for February 10, 1933; Lacan's talk of a "concrete" psychology related to "social reality" sufficed to open that particular door. Jean Bernier, in *La*

*critique social*, a journal to the left of the Communist Party, offered a brilliant reading of Lacan's thesis, despite being marred by misunderstandings of psychoanalysis so common among revolutionary critics.

Lacan's doctoral thesis was significant in another way too: it was his declaration of allegiance to psychoanalysis. He undertook a personal analysis and trained under the auspices of the recently established Société psychanalytique de Paris (Paris Psychoanalytic Society). In his thesis, he hailed "the scientific import of Freudian doctrine," the only theory capable of apprehending the "true nature of pathology," as opposed to other methods, which, despite their "very valuable observational syntheses," failed to clear up uncertainties (1932, p. 255). Lacan's study of the case of Aimée and his overall view of the psychoses were thoroughly imbued with Freudian teachings. Thus he saw the psychogenesis of Aimée's pathology in light of the theory of the development of the libido, as rounded out a few years earlier by Karl Abraham (1924/1927). And he understood delusion as the unconscious offering itself to the understanding of consciousness. "Ça joue au clair," Lacan reiterated in his seminar on the psychoses (1981/1993, session of 25 January 1956).

For Lacan, the notion of personality certainly implied "a conception of oneself" (1932, p. 42), but in his view this conception was based on "ideal" images brought up into consciousness. Under the acknowledged influence of Angelo Hesnard and René Laforgue's report to the Fifth Conference of French-Speaking Psychoanalysts in June 1930, Lacan advanced his hypothesis of psychosis as "self-punishment" under the influence of the superego. He suggested that a nosological distinction be drawn for cases where an element of hate and a "combative attitude" turn back upon the subject in the shape of self-accusation and self-depreciation, and concluded by proposing the category of "psychoses of the super-ego," to include contentious and self-punishing forms of paranoia (1932, p. 338).

The most striking aspect of Lacan's thesis, in the context of the time, was the evidence it offered of his solid Freudian grounding, gleaned in part, no doubt, from his translation into French, in that same year of 1932, of Freud's paper "Some Neurotic Mechanisms in Jealousy, Paranoia, and Homosexuality" (1922b [1921]). What Lacan drew from this important work underlay his assertion that "Aimée's entire delusion"

could "be understood as an increasingly centrifugal displacement of a hate whose direct object she wished to misapprehend" (1932, p. 282). At the beginning of his discussion, Lacan derived a general proposition from the same source: "The developmental distance, according to Freud, that separates the homosexual drive, the cause of traumatic repression, from the point of narcissistic fixation, which reveals a completed regression, is a measure of the seriousness of the psychosis in any given case" (1932, p. 262).

The case of Aimée continued to play a part in Lacan's life. For one, he had good cause to remember it when, years later, Aimée turned out to be the mother of one of his patients, the psychoanalyst Didier Anzieu. Furthermore, the themes explored in *De la psychose paranoïaque* continued to preoccupy him in his later work. Most significantly, his resolutely psychoanalytic approach to the psychoses was confirmed by his defining work of the 1950s (1993, 2004), whose great theoretical import was rivaled only by what he called "fidelity to the formal envelope of the symptom" (1966, p. 66). This remark does far more than endorse the precepts of a grand clinical tradition; it distills certain constants of Lacan's thinking. As he adds in the same passage, the formal envelope of the symptom may stretch to a "limit where it reverses direction and becomes creative." This was a crucial issue for Lacan throughout his life, and in many different ways. The culmination of this concern was his engagement with the work of James Joyce, which informed his seminar of 1975–1976 on the "sinthome" (1976–1977). On the same page of *Écrits* (p. 66), Lacan, reviewing his own past itinerary, described what might be considered the function of the symptom: to keep up, despite the ever-present risk of slipping, with what he called "confronting the abyss." Psychosis exemplified such confrontation, which was why Lacan returned here to how "passing to the act" may serve to "fan the fire" of delusion—an original theme explored in his thesis. How such acts relate to literary creation, the function of the symptom, and passing to the act were thus just so many issues first broached in the case of Aimée.

## AJASE COMPLEX

Heisaku Kosawa visited Sigmund Freud in 1932 and presented this paper on the Ajase complex. The paper was entitled “Two Kinds of Guilt Feelings” and subtitled “The Ajase Complex.”

The Ajase complex is an original theory developed by Kosawa, and subsequently expanded by Keigo Okonogi. Whereas Freud based his Oedipus complex on a Greek tragedy, Kosawa developed his theory on the Ajase complex from stories found in Buddhist scripture. The story of Ajase centers on the Buddhist concept of reincarnation. Well known to the Buddhist world, Ajase's story appears with many variations in the scriptures of ancient India. Kosawa modeled his theory on the version of Ajase story appearing in the *Kanmuryojukyo*, a Buddhist scripture centering on the salvation of the mother.

Ajase was the son of a king in India. His mother, fearing the loss of her youth and beauty, wanted to bear a child so she could retain her status. A prophet

told her that a hermit who lived in the forest would be reborn as the king's son. The queen, however, wanted the child as soon as possible and killed the hermit, who then entered her womb. The child that she bore was named Ajase. Just before being slain, the hermit had told the queen that he would be reborn as her son and curse his father. The queen, fearful of what she had done, tried to abort and kill the baby, but she failed and Ajase survived. When Ajase grew up and learned the secret surrounding his birth, he became angry with the queen and attempted to slay her, but was dissuaded from this act by a minister. At that moment, Ajase was attacked by a severe guilt feeling and became afflicted with a dreadful skin disease characterized by so offensive an odor that no one dared approach him. Only his mother stood by and lovingly nursed him. Despite his mother's devoted care, Ajase did not readily recover. Seeking relief, the queen went to the Buddha and told him of her sufferings. The Buddha's teachings healed her inner conflict, and she returned to continue to care for her Ajase. Eventually, the Prince was cured to become a widely respected ruler.

This is the version of the Ajase story Kosawa wrote in the 1950s, based on the *Kanmuryojukyo*. The themes of the Ajase complex are as follows:

1. A mother's conflict between her wish for a child and an infanticidal wish;
2. Prenatal rancor and matricidal wish in the child, Ajase. According to the parable of reincarnation, Ajase is the reincarnation of a hermit whom his mother had killed. In other words, he hates his mother for having killed him before his birth. Prenatal rancor means hatred for the origin of one's birth. Prenatal rancor led Ajase to try to kill his mother when he learned the origin of his birth;
3. Two kinds of guilt feelings. Ajase was overcome with strong feelings of guilt after attempting to slay his mother, and became afflicted with a terrible, painful skin disease characterized by foul-smelling abscesses. Kosawa called this feeling of guilt “a punitive guilt feeling.” Only his mother's forgiveness and nursing brought him back to health. Kosawa called the feeling of guilt that Ajase experienced “a forgiven guilt feeling.”

## **ALCHEMY (ANALYTICAL PSYCHOLOGY)**

Alchemy is a philosophical and chemical “opus” with roots in ancient times and branches throughout the world’s cultures. It is both an experimental and symbolic practice, a technical research into the nature of matter, and an imaginal exercise on the spirit of matter and its potential for change. It is also a mythopoeic meditation and a projective method, a moving Rorschach for the practitioner.

Using its experiments as metaphors, it has sought an enlivening elixir, a healing panacea, and the transformation of base metal into gold through release from crude impure ores. This occurs through producing a transmuting agent, itself a transformation from the *prima materia* of the common “philosopher’s stone” into the precious “stone of the philosophers” or “lapis.”

Alchemy posits an original unitary energy which separated in space-time into distinct physical elements, “falling apart” and differentiating in the four directions. Perceived as transmutable through shared qualities or correspondences, these elements could one day be reunited in a reconstituted wholeness. The dicta—“Return to chaos is essential to the work,” “Volatize the fixed and fix the volatile,” and “Dissolve and Coagulate”—express a dialectic process between complements and opposites in analysis and synthesis.

The alchemists might quicken this process through their outer intervention in matter and their interior practice of soul and spirit. The *opus* is the work of persons or couples, whose integration or dissociation are operative. While using common references, it values the individual and dynamic over the collective and dogmatic. Through the interior change of the adept and his *soror mystica* (mystical sister) and the chemical changes

in the “well closed vessel” of the retort, the microcosm and macrocosm affect and reflect each other.

The Freudian psychoanalyst Herbert Silberer first observed the analogy to transference in the conjunctions and confrontations among sulphurs, mercuries, and salts, between the “masculine” and “feminine” matter, called king and queen, sun and moon, gold and silver, day and night, male and female.

Jung cited Silberer in his work on the “*coniunctio*” (conjunction) of transference and countertransference. In alchemy, Jung found a precursor of depth psychotherapy’s dyadic and interactional model. He came to understand the psyche, the unconscious, and depth analysis as alchemical process, the “stone” as transformational consciousness, both a means and the goal of individuation. He also noted alchemical images in modern dreams.

## **ALCOHOLISM**

Alcoholism is not a psychoanalytic concept. The most rigorous definition, following from the basic notion of dependence, is the one provided by Pierre Fouquet: “An alcoholic is any man or woman who has lost the ability to do without alcohol.” The word “alcoholism” was introduced by the Swedish physician Magnus Huss (1849) and mentioned in France by M. Gabriel (1866) in his medical dissertation. It appears in Freud’s writings prior to 1900 in association with hysteria and hypnosis, as a form of “subjection,” a “morbid habit,”

falling somewhere “between the organic affections and the disorders of the imagination.” Principal occurrences of the word appear in letters to Wilhelm Fliess (especially that of December 22, 1897), in the attached manuscript (Draft H., 1895), and especially in the key text “Sexuality in the Aetiology of the Neuroses” (1898a). “Habit,” Freud writes, “is a mere form of words, without any explanatory value” and “success will only be an apparent one, so long as the physician contents himself with withdrawing the narcotic substance from his patients, without troubling about the source from which their imperative need for it springs” (p. 276).

It was initially believed (Sigmund Freud, Karl Abraham, Sándor Ferenczi) that alcohol does not create symptoms but only promotes them, removing inhibitions, and destroying sublimation. The theory of alcohol addiction (1905d) is summarized in terms of its predominance among men beginning with the onset of puberty; its relationship to sexuality, and latent homosexuality, already identified as narcissistic and specular by Viktor Tausk (1913) and Lou Andreas-Salomé (1912); oral fixation, and autoerotic behavior. Emphasis later focused on the nature of the defensive process, an immediately effective means, but one that is too accessible, which is why it is so dangerous (1930a [1929]). The economic approach to affects was emphasized next—concepts of alexithymia (McDougall, 1978), instinctual discharge by the body (“resomatization of affects”), and acting out (“dispersion,” “destruction of affects,” “acts-symptoms”), depending on the author—all at the expense of psychic elaboration.

Alcohol plays the role of a unique substitute object and a trap, creating a pseudo-reality; the hallucinations associated with delirium tremens cease with the administration of alcohol. The narcissistic problematic (withdrawal) in fact harbors an autoerotic component and gives rise to defenses, barriers, or narcissistic prostheses, such as an overinvestment in work, children, “friends,” etc., and alcohol. The mechanism of splitting into non-alcoholic (common, neurotic) and alcoholic sectors of the ego has denial as its corollary, but it is a denial that does not involve the perception of an external reality (difference of the sexes, castration) but rather the internal perception of the body itself. There exist silent zones, “matrices of painful, deadly territories that threaten the unity of the ego” (Mijolla and Shentoub, 1973). These are the parts of the body that lie outside symbolization and outside language, as described by Jean Clavreul

(1959). For Paul Schilder and Walter Bromberg (1933), alcoholism is accompanied by a regression from castration that leads to bodily fragmentation. The alcoholic short circuit leaves no room for the establishment of loss, the source of desire, but rather establishes an ensemble of needs and repetitive acts that are without meaning. An analogy can be made with pathological games. Shame or opprobrium are distinguished from guilt. The superego of an alcoholic is demanding but “soluble in alcohol” (Simmel, 1930). There is no strong image with which the subject identifies, but identification can occur with someone hated, which can lead to “self-hatred.” The indulgent and demanding mother who creates insecurity is the object of reverse fantasies (idealization).

The symbolism of alcohol is that of vital fluids (blood, “the blood of the vine,” sperm, milk) or destructive humors (urine, feces), of the breast and the penis, good and/or bad. This symbolism is present in all the myths associated with alcohol, from Dionysus to the Eucharist.

The situation in terms of a psychoanalytic classification is still the subject of controversy. It is a narcissistic disorder, closer to manic-depression and paranoia than to neurosis, psychosis, or perversion. Its issues fall within the framework of addiction.

Intolerance to alcohol can be interpreted as a reaction formation to the excitations that alcohol promotes, or to the frequently negative attitudes toward alcoholics, sometimes as extreme as hatred (Winnicott, D. W., 1947), or even to the most primitive issues of the alcoholic that are awakened in the therapist. From the standpoint of treatment, it is a matter of detoxification or social prohibition (1927c)—“Not all men abandon this toxic supplement with the same facility” (1905c), “the only effective remedy is the resolution that draws its strength from a powerful current of the libido”—as opposed to involvement of the superego (1966b [1932]). The effectiveness of temperance movements appear to be associated with libidinal investments “torn from alcohol” and given expression in exhibitionism, or homosexual and narcissistic masochism.

There is a double risk of using the term “alcoholism”: the risk of turning it into a closed and homogenized entity, or of breaking apart the clinical concept, reductively assimilating it to various diagnostic classifications (neurosis, psychosis, perversion—fetishism,

for example—paranoia, manic-depression, psychopathy, etc.). To compound the problem, concepts such as homosexuality, orality, “disappointment,” and “libidinal viscosity,” risk serving as facile or even completely inappropriate explanations.

Freud himself often superimposed the phenomenology of drunkenness and the psychopathology of alcohol addiction, and even considered the relation of the alcoholic to his poison as nonconflictual, “the purest harmony,” and “an example of a happy marriage” (1912d, p. 188). Blind spots with respect to his own relationship to toxic substances (cocaine, tobacco) led him outside the field of psychoanalysis when he postulated a “toxological theory” in psychopathology, which he did not abandon until the *Outline of Psychoanalysis* (Descombey, 1994).

There are a number of concepts related to alcoholism: addiction, alcoholic intoxication, alcoholic delirium and jealousy, delirium tremens (Viktor Tausk’s delirium of action or occupation), alcohol-associated epilepsy. And it can be asked, as Freud asked about psychosis, if the terms “denial” and “repression” have the same meaning with respect to alcoholism as they do for the psychopathology of the neuroses. The same question could also be asked about the familiar use of the concepts of desire and pleasure when it comes to a clinical practice that is situated “beyond the pleasure principle” or within the register of need.

Post-Freudian authors who have done substantive work on alcoholism include James Glover (1938) and the Kleinians Herbert Rosenfeld (1964) (paranoid-schizoid and depressive positions), Sándor Radó (1933) (pharmacothymia, initial anxiety depression, pharmacogenic orgasm, addiction crisis), and Michael Balint (1977) (basic fault). There has also been renewed interest in the subject in the work of the French psychoanalysts Jean Clavreul (1959), Alain de Mijolla and Salem A. Shentoub (1973); the Lacanians François Perrier (1975), Charles Melman (1976), A. Rigaud (1976), M. Lasselin (1979), and F. Gondolo-Calais (1980); as well as Jacques Ascher (1978), Joyce McDougall (1989), M. Monjauze (1991), and Jean-Paul Descombey (1985–1994).

## **ALEXANDER, FRANZ GABRIEL (1891–1964)**

A doctor and psychoanalyst, Franz Gabriel Alexander was born January 22, 1891, in Budapest, and died March 8, 1964, in Palm Springs, California. The son of Bernard Alexander, a Jewish professor of philosophy, Franz Alexander studied medicine in Göttingen and Budapest, and specialized in research on the physiology of the brain. Following the First World War, he moved to Berlin. It was Sigmund Freud who introduced him to psychoanalysis, but he completed his analytic training with Hanns Sachs in Berlin.

In 1921 he became a member of the German Psychoanalytic Society, an assistant at the Berlin Psychoanalytic Institute, and a training analyst. He undertook a reformulation of the study of neuroses in his *Psychoanalyse der Gesamtpersönlichkeit* (Psychoanalysis of the total personality), which represented the first step

toward a psychology of the psychoanalytic ego. Together with Hugo Staub he published a psychoanalytic study of criminology in 1929, *Der Verbrecher und seine Richter* (*The Criminal, the judge, and the Public: A Psychological Analysis*, 1956). In 1930 he was invited to the United States, where he occupied the first University Chair of psychoanalysis at the University of Chicago. In 1931 he worked at the Judge Baker Institute in Boston on juvenile delinquency and, in 1932, he founded the Chicago Psychoanalytic Institute, where he remained director until 1952. In 1933 he was admitted as a member of the Chicago Psychoanalytic Society and, in 1938, named professor of psychiatry at the University of Illinois. Alexander was one of the best known representatives of medicine seen from the point of view of psychoanalysis.

In 1939, in collaboration with Flanders Dunbar, Stanley Cobb, Carl Binger, and others, he founded the review *Psychosomatic Medicine*. "According to his theory on the specific psychodynamic conflicts associated with certain illnesses, a psychosomatic illness appears whenever there is an encounter between a certain personality type, predisposed to certain illnesses, and a specific conflict situation that lends itself to the formation of specific organic illnesses" (Bonin, 1983).

In 1955 he spent a year at the Center for Advanced Study in Behavioral Science in Palo Alto, California. Following this year, in 1956, he settled in Los Angeles, where he was named head of the Psychiatric Research Department at Mount Sinai Hospital. With support of the Ford Foundation, he organized a research project to study psychotherapeutic process by direct observation of patients and therapists. That same year Alexander became cofounder of the American Academy of Psychoanalysis. He died March 8, 1964, in Palm Springs, California.

Alexander believed that psychoanalysis was a branch of psychiatry, and was also convinced of the efficacy of a shortened course of therapy. Many of his critics considered the new ideas he introduced into analytic theory to be reductive.

## **ALIENATION**

Inscribed in the opposition between the Same and the Other, alienation describes the condition of the subject who no longer recognizes himself, or rather can only recognize himself via the Other. The philosophical background of this concept derives from Hegel and then Marx. Classical psychiatry used the term to classify any mental illness in which the subject no longer knew who he was. Thanks to Jacques Lacan's study of Hegel's master/slave dialectic, the term no longer refers only to mental alienation, but retains the meaning it has in philosophy.

For Lacan, who followed Hegel on this point, human desire is constituted by mediation: "Man's desire finds its meaning in the other's desire, not so much because the other holds the keys to the desired object, but because his first objective is to be recognized by the other" (Lacan, p. 58). Specifically, the objective is to be recognized by the Other as a desiring subject, because the first desire is to have one's desire recognized. The conclusion is Lacan's well-known formula: "Man's desire is the desire of the Other," which doesn't mean that one desires another as object, but that one desires another desire, and wants to have one's own desire recognized by the Other. This is an echo of Hegel's master/slave dialectic (a struggle for pure prestige) where each consciousness wants to be recognized by the Other without recognizing it in turn ("each consciousness seeks the death of the other").

In this fight to the death, the one who accepts death in order to win becomes the Master; the other will become the slave. But the Master is taken in a trap, for he owes his status to the recognition of a slave-consciousness. The slave, however, will be liberated by the Master as his work extracts from things the consciousness of self that was lost in the struggle. The slave will end up, in the Marxist perspective, transforming the world in such a way that there is no place for the Master.

Thus the theme of alienation in Lacan refers to what is called a forced choice, or *vel*, which is the Latin word expressing an alternative where it is impossible to maintain two terms at once. The *vel* is alienating in that it gives a false choice, a forced choice (“your money or your life,” “me or you”). The Master’s freedom, which must pass through death to attain consciousness of self, is no freedom. Lacan derived several consequences from this structure of alternative, particularly in his critique of the Cartesian *cogito*, by indicating that thought and being cannot coincide. Thus, “I am where I do not think” and “it thinks there where I am not.”

Piera Aulagnier also took up the notion of alienation, but even though she borrowed from Lacan the relation of desire to the Other, her view more closely approached Freud’s thinking about collective hypnosis and its relation to the ego ideal. However, she worked in an entirely different context, refusing to make alienation one of the givens of human existence, but instead seeing it as one of the ways the psyche attempts to resolve conflict. First, she defined the notion of alienation by its goal, which is “to strive for a non-conflictual state, to abolish all causes of conflict between the identifying subject and the object of identification, between the I and its ideals” (Aulagnier, 1979). Thus she connects the notion to the aims of Thanatos, as a “desire for non-desire” and it can then be used in fields as diverse as collective psychology, passionate love, gambling, and drug addiction.

Nevertheless, Piera Aulagnier insists that alienation rests on an encounter between the desire for self-alienation, on the one hand, and the desire to alienate, on the other. The process of alienation seeks to erase the tension arising from this difference, whether it involves a subject that seeks to identify himself with the object identified, or a subject that wants to bring together the self image that comes back to him from others and the others themselves. Thus alienation appears to be a pathological modality, like neurosis or psychosis, that attempts to regulate the conflict between identifying

subject and the object identified. Whereas the neurotic differentiates between his self and its idealization and the psychotic posits the latter as realized in a delusion, the alienated subject idealizes an other who provides him with certainty. Unable to make these ideals a spur to progress, alienation produces a short circuit through the mediation of an idealized force. Alienation becomes even more effective when the alienated subject misapprehends “the accident occurring in his or her thought” (Aulagnier, 1979). It is as though this subject, once a prisoner, no longer has the objectivity needed to judge the situation.

In cases where a group feels alienated, not only is a group of subjects oppressed by a group of masters, but oppression infiltrates all relationships within the group. “Thus whatever the position one may occupy at the moment, every subject is both a victim and a potential murderer, given that one could always find oneself in the opposite position a moment later” (Aulagnier, 1979). If Jacques Lacan is indebted to Hegel, Piera Aulagnier leans on Aldous Huxley and George Orwell, both of whom revisit the historical experiences that have left their mark on the twentieth century, the Holocaust and the gulag.

But how does it happen that the subject chooses one outcome of alienation, rather than another? Piera Aulagnier would start from the metapsychological perspective on the conflict between the identifying subject and the object identified. This conflict is inscribed at the heart of a pathological relation to the ideal ego and to the ideal agencies in general. Alienation is characterized (as is psychosis, but in a different way) by an asymmetry between the I and its object, with no reciprocity between what the one recognizes and what the other recognizes. Thus a dominant pole is created (passionate investment in an object, the God-drug, Chance) by means of which the subject’s response will be alienated from the object that is seen as invulnerable; conversely the psychotic, who also recognizes the asymmetry in the relation, is going to try to flee from it and create outside of it a delusional object of identification that others refuse to recognize.

The notion of alienation as Piera Aulagnier conceives of it allowed for a reconsideration the nosographical categories. She particularly opened up a domain for renewed investigations on the question of addictions and on the perversions.

## **ALLENDY-NEL-DUMOUCHEL, YVONNE (1890–1935)**

A French writer and art critic (under the pseudonym of Jacques Poisson), Yvonne Allendy-Nel-Dumouchel was born in Paris on September 3, 1890, and died there on August 23, 1935.

Alice Yvonne Nel-Dumouchel (she later gave up the name Alice) married René Allendy, homeopathic doctor and future founding member of the Paris Psychoanalytic Society, on November 19, 1912. In 1922, together with her husband, she created the Groupe d'études philosophiques et scientifiques pour l'examen des idées nouvelles, at the Sorbonne.

She was coauthor with him of *Capitalisme et Sexualité* (Capitalism and sexuality; 1931), a work whose subject matter touched upon communism and feminism. Claiming that life is an ongoing, and one-way, adaptation guided by our instincts, the authors affirm that capitalism intensifies the conflicts between the instincts of possession and those leading to procreation, that economic concerns increase in importance and are substituted, in the relations between the sexes, for values of a sentimental nature. "Woman experiences economic servitude combined with sexual dependence, her illusory emancipation is added to her responsibilities." Faced with these difficulties, they stipulate a kind of economic

regulatory system, national and international, culminating in the abolition of capitalism. As far as the modern family is concerned, they want to see the State substituted for the father as the economic provider. Their analysis cites both Freud and Engels.

Under the pseudonym of Jacques Poisson, Yvonne Allendy published a number of articles on the relationship between art and psychoanalysis. Speaking of the cinema, she affirmed that her subject must include the new field then of concern to researchers: the unconscious psychic apparatus, which dominates drama. Allendy claimed that only the cinema is capable of clearly reproducing the thought-image in all its dizzying rapidity.

In "Littérature moderne et psychanalyse" (April 1923), she makes use of Freud's methods to clarify literature, painting, and especially the work of the avant-garde. Apollinaire, Jean Cocteau, Philippe Soupault, and Blaise Cendrars were all examined for their Freudian symbolism. She suggested that there would be "more to gain in expanding our knowledge of human nature" if psychoanalysts were to study Dadaist texts "than there would be in having professors of literature explain classical texts."

She died in 1935 and her sister Colette became René Allendy's companion. Colette ran a gallery of modern art after the Second World War.

## **ALLENDY, RENÉ FÉLIX EUGÈNE (1889–1942)**

A French homeopathic doctor and psychoanalyst, René Allendy was one of the founding members of the

Société psychanalytique de Paris. He was born on February 19, 1889, in Paris; his father was a shopkeeper from the Isle of Maurice and his mother was from Picardy. He died in Montpellier on July 12, 1942. When he was three, he contracted bronchial pneumonia from his nurse and during childhood lived through a number of often serious illnesses, including diphtheria complicated by quadriplegia. A student of the Marist brothers at the Collège Saint-Joseph in Paris, he completed his study of the humanities at the Lycée Janson-de-Sailly. He enrolled in the School of Oriental Languages to learn Russian. Later, he received a degree in Swedish from the Scandinavian Language Institute.

After receiving his medical degree from the School of Medicine of Paris on November 12, 1912 (his dissertation was entitled “L’Alchimie et la Médecine” [Alchemy and medicine]), he married Yvonne Nel-Dumouchel, just seven days later. Until her death in 1935, she remained his constant companion and collaborator. In 1936 he married Colette Nel-Dumouchel, Yvonne’s sister.

After being mobilized in 1914, he was gassed in Champagne, later declared tubercular, and given a disability pension. He practiced medicine in Paris at the Léopold-Bellan hospital and at the tuberculosis prevention clinics run by Hygiène Sociale de la Seine and the Saint-Jacques hospital, where he provided homeopathic treatments from 1932 to 1939. With his wife Yvonne he founded, in 1922, the *Groupe d’études philosophiques et scientifiques pour l’examen des idées nouvelles* (Philosophic and scientific study group for the examination of new ideas) at the Sorbonne, where a number of speakers from France and other countries spoke on science, art, and psychoanalysis. He defined the organization’s goals this way: “In order that the great movement of contemporary ideas might lead, without impediment, to practical realizations, it is essential to study the meaning of the future and hasten its spread.”

Analyzed in 1924 by René Laforgue, he practiced medicine, homeopathy, and psychoanalysis, studied esotericism and numerology, and published extensively in all these fields. Aside from his private practice, located at 67, rue de l’Assomption, in Paris, he worked as a psychoanalyst in the department of Professor Claude at Sainte-Anne.

In 1924 he wrote, together with Laforgue, *La Psychoanalyse et les Nevroses* (Psychoanalysis and

neuroses), which appeared with a preface by Professor Claude. The same year, the review *Le Disque vert* published “La Libido” in an issue dedicated to Freud. He wrote more than thirty articles for homeopathy journals and was equally productive in the field of psychoanalysis: *Les Rêves et leur Interprétation psychanalytique* (Dreams and their psychoanalytic interpretation; 1926), *Le Problème de la destinée* (The problem of destiny; 1927), *Orientations des idées médicales* (Orientations of medical ideas; 1928), *La Justice intérieure* (Interior justice; 1931) and *La Psychoanalyse, doctrine et application* (Psychoanalysis: theory and application; 1931). Although he often wrote about unorthodox subjects, his theoretical positions remained fairly orthodox; he was, however, open to many of Jung’s ideas, such as that of the collective unconscious. His book on Paracelsus remains a standard reference for admirers of the “accursed doctor.” With Yvonne he published *Capitalisme et Sexualité* (Capitalism and sexuality) in 1932.

He was a friend of Antonin Artaud, and he was also Artaud’s therapist; other patients included René Crevel and Anaïs Nin, who described Allendy in detail in her *Journal*. With Edouard Pichon, he drafted the first statutes of the Paris Psychoanalytic Society, where he was secretary from 1928 to 1931. In 1942, in Montpellier, he dictated his last thoughts on the illness that would soon take his life. A strange mixture of lucidity and blindness, these were published in 1944 as the *Journal d’un médecin malade* (Journal of a sick doctor).

## ALLERGIC OBJECT RELATIONSHIP

The expression *allergic object relationship* appeared as the title of a talk given by Pierre Marty in 1957, published in the *Revue française de psychanalyse*. Influenced by the work of Maurice Bouvet, it extends the psychosomatic approach found in his work, which remains key for the question of allergies, and entails an asymptomatic model for psychosomatic functioning.

The relationship is characterized by a confusion between the personality of the patient and that of the analyst. A striking, if not total, identification sustains this confusion from the outset. This “communion” (in the sense almost of a transubstantiation) implies both identification and projection. The subject inhabits the object and is inhabited by it. The nature of the object—human, animal, plant, thing—matters little, for it is quickly invested as both host and guest. These patients give the impression and have the feeling of being sponges, possibly endowed with clairvoyance. (Zelig, the hero of Woody Allen’s film, is a striking example.) For Marty, the overlapping of identification and projection implies that such projection must be understood primarily as an extension of the limits of the ego as understood by Paul Federn.

This first step is followed by a lengthier and more nuanced attempt to modify the object, through which the subject tries to obliterate the limits between self and object, always by means of the same two mechanisms: cloaking the object in its own qualities through an act of “projection” and taking on the qualities of the object through identification. However, the qualities of the object must stay close to a certain ideal of the object. So one sees a capacity for object-choice, but the subject can only detach itself from an object by identifying with a new object, which leads to the loss of the previously invested object, but without any pain of loss or consequent work of mourning.

The very idea of a conflict between identifications is avoided in the allergic relation. The oedipal situation is thereby avoided and, when this is impossible, the risk of triggering a somatic crisis becomes manifest. Each of the objects individually can be an object of identification, but conflict (for example, oedipal) results in an interior rift that is avoided by the somatic allergic crisis.

This account, under the heading of “the allergic character,” would lead to a more comprehensive conception of psychosomatics, founded on the work of Pierre Marty, and enabling him to reveal its role in different forms of character splitting. Léon Kreisler (1980) continued this work in his notion of precocious appearance. The role played by the parents in the development of this relationship is more prominent in his conception than in Marty’s, for whom it is almost a given. Michel Fain compared the family dynamics typical of allergics with the constitutional defect discussed in the work of René Spitz: anxiety in the presence of the stranger.

## ALLERGY

Treatment of allergies became a part of psychosomatics, and subsequently psychoanalysis, following the work of the Chicago School, especially Franz Alexander and Thomas M. French in 1941. Alexander and French focused primarily on asthma rather than cutaneous allergic reactions, but later authors approached these initial studies quite differently. Distancing themselves from the idea of hysterical conversion, they established a link between psychic conflict and analogous somatic conflict. With respect to allergy, they looked for the conflicting elements they considered characteristic. For asthma, these conflicts were primarily conflicts between infants’ dependence on their mothers and instinctual demands that threatened this dependence. The crisis itself was associated with an inhibition of emotional expression, especially tears.

Because these factors were not specific, other authors returned to classical methods of analysis. Phyllis Greenacre (1945) insisted that oral sadism can be masked by streams of crocodile tears; here emotional expression assumes renewed importance in an interpretive framework. Jacob Arlow (1955) considered an allergic attack to be a manifestation of transference essentially associated with sadistic fantasies of incorporation. Melitta Sperling (1963) also demonstrated the links between allergies and pregenital factors. Philip C. Wilson (1968) hypothesized that transferential acting may be involved. In the end, the dimension of conversion returned to the foreground. Michel de M'Uzan (1968) insisted on the need to clarify the formation of somatic symptoms, and he turned to the notion of psychosomatic structure.

Pierre Marty reinvigorated the concept of allergies through his description of the allergic character (1976), which followed his account of the allergic object relation fifteen years earlier. He gave the allergic character the following traits: absence or avoidance of aggressiveness, a capacity for identification, absence or avoidance of conflict, considerable merging with the other, and projection as a mode of identification. To describe these traits in turn, absence or avoidance of aggressiveness gives subjects a socially agreeable cast, but is based on a weak capacity for negation, which in turn indicates a weak superego. The capacity for identification was already included in the allergic object relation. Merging with the other (absence of anxiety in the face of the foreign) is also characteristic of certain forms of primary epilepsy and allergic epilepsy, described by Marie-Thérèse Neyraut-Sutterman. Projection, described in 1957, becomes a mode of identification. As a consequence, subjects are unable to project bad objects or to distinguish good from bad.

Only when the allergic child is able, through stranger anxiety, to be afraid do allergic mechanisms begin to diminish. The features above can be found together in a character neurosis (which Pierre Marty referred to as a common allergy bundle), or they can appear as simple, relatively invasive traits that form a more or less split-off component of the personality, manifested only during regression (Pierre Marty referred to these as lateral lines) or deep splitting (parallel lines).

An allergic crisis can be triggered by the overriding of identificatory possibilities, as when the child is presented with two equally invested objects where the

identifications have been kept separate. For Pierre Marty, a somatic manifestation is seen as a way station within a regressive movement and not, as in the psychogenetic approach, as the somatic expression of a traumatic situation. For Michel Fain, the unconscious of the typical allergic is the seat of the mother's desire to have the child regress to a primary narcissistic stage of feelings of unity with her, a desire that keeps an entire portion of the ego of the allergic patient in an embryonic state.

For Marty, these properties and variations result in distinct therapeutic indications. In typical cases, the allergic individual is very adaptable, also in the allergic's relation to the analyst and to analysis. The downside of this is that there is a risk of an outbreak of somatic manifestations at the end of treatment. He therefore recommends psychotherapy as a prophylactic, which can help the patient to recognize unconscious factors and become aware of the danger of certain object relations. Marty believes that medical treatment is indicated for somatic disorders, and that analysis and psychotherapy should not be recommended for allergic manifestations.

This conception of an allergic quasi-structure has led to more recent work by Léon Kreisler (1982), Michel Fain (1969), and Gérard Szvec (1993), who have addressed these problems in children.

## ALLGEMEINE ÄRZTLICHE GESELLSCHAFT FÜR PSYCHOTHERAPIE

The Allgemeine Ärztliche Gesellschaft für Psychotherapie (General Medical Society for Psychotherapy, AÄGP) was an organization of physicians headquartered in Germany dedicated to the promotion of psychotherapeutic theory and practice.

Its membership was comprised primarily of young internists and neurologists concerned with that aspect of a "crisis in medicine" having to do with a "materialist" university psychiatry beholden to abstract research and nosology (classification of diseases) instead of the prevention and treatment of mental disorders. Although there was some diversity of political and ideological opinion within the AÄGP, the membership by and large displayed a conservative medical critique of modern industrial society in general and the democratic Weimar Republic in particular. The AÄGP also sought to differentiate psychotherapy from neighboring disciplines inside and outside medicine; there was significant debate in particular about its relationship to psychiatry.

The AÄGP was founded as an international organization in 1928 with its own journal; its first annual congress had been held in Baden-Baden in 1926. In 1930 the journal was renamed *Zentralblatt für Psychotherapie* and was published in Leipzig until 1944. The society was reorganized in 1934 as a result of the Nazi seizure of power; a new Internationale Ärztliche Gesellschaft für Psychotherapie in Zurich under the presidency of Carl Gustav Jung was created along with the Deutsche Allgemeine Ärztliche Gesellschaft für Psychotherapie under Matthias Heinrich Göring. In 1940 Göring succeeded Jung; the AÄGP was resurrected as a West German entity in 1948 under psychiatrist and former president Ernst Kretschmer.

While some individual psychoanalysts were members of the AÄGP, the German Psychoanalytic Society did not recognize such an organization of "wild analysts." Although—and because—it was one of the purposes of the AÄGP to unify the schools of thought in psychotherapy, criticism within it of psychoanalysis, especially after 1928, was common. The Freudians who were members of the AÄGP tended to be revisionists like Karen Horney, Georg Groddeck, Wilhelm Reich, and Harald Schultz-Hencke, or apostates such as Carl Gustav Jung, Alfred Adler, and Wilhelm Stekel. In this regard, it was ironic that under National Socialism the society, for largely political reasons but still in keeping with Freud's view of the dangers of the medicalization of psychoanalysis, opened its membership to lay practitioners.

## ALMANACH DER PSYCHOANALYSE

The first *Almanach der Psychoanalyse* was published in 1926 by Internationaler Psychoanalytischer Verlag in Vienna. The job of publishing the *Almanach*, a highly effective publicity vehicle, was the first editorial decision made by Adolf Josef Storfer after the departure of Otto Rank as director of the press. Storfer's goal was to supply a kind of budget anthology of psychoanalysis

that would provide an overview of the psychoanalytic literature.

The *Almanach* was published once a year from 1926 until 1938, when the Germans entered Austria. There were thirteen volumes in all, comprising between two and three hundred pages each; nine thousand copies of each octavo volume were printed. Each number contained about twenty short articles written by psychoanalysts, scientists, and writers (including Thomas Mann, Stefan Zweig, and Hermann Hesse), articles that had previously appeared in the psychoanalytic literature, pages from books published by Internationaler Psychoanalytischer Verlag, and, in rare cases, unpublished writing. Freud helped support the *Almanach* by publishing “Humor” and “Fetishism,” two unpublished texts of his, in 1928. Each volume also contained portraits of the various psychoanalysts and critiques of works on psychoanalysis excerpted from newspapers and the trade press, as well as a list of new publications by Internationaler Psychoanalytischer Verlag.

## **ALPHA-ELEMENTS**

Bion used the term “element” first in *Experiences in Groups* (1961), only in very general terms. In *A Theory of Thinking* (1962) Bion describes for the first time (except for an unpublished paper presented at a scientific meeting of the British Psycho-Analytical Society) the use of the concept of alpha-function as a working tool in the analysis of disturbances of thought: “It seemed convenient to suppose an alpha function to convert sense data into alpha-elements and thus provide the psyche with the material for dream thoughts and hence the capacity to wake up or go to sleep, to be conscious or unconscious. According

to this theory consciousness depends on alpha function and it is a logical necessity to suppose that such a function exists if we are to assume that the self is able to be conscious of itself in the sense of knowing itself from experience of itself.”

In this paper he describes how alpha function converts beta-elements (raw sense data) into *alpha-elements*, and he is particularly concerned with the differentiation that is established between the unconscious and the conscious. He considers *alpha-elements* to be elements necessary for consciousness. By “consciousness” he means specifically self-consciousness, since beta-elements in a sense are also conscious as raw perceptions. When the infant’s consciousness is invaded to an unbearable extent by beta-elements, the infant is driven to project these outside. When the beta-elements are transformed into alpha they become consciously apprehended, and a differentiation is established between the conscious and the unconscious. The *alpha-elements* can be consciously experienced, repressed, symbolized, and further worked on.

In *Learning from Experience* (1962), Bion gives the following example:

“If a man has an emotional experience when asleep or awake and is able to convert it into alpha-elements he can either remain unconscious of that emotional experience or become conscious of it. The sleeping man has an emotional experience, converts it into alpha-elements and so becomes capable of dream thoughts. Thus he is free to become conscious (that is wake up) and describe the emotional experience by a narrative usually known as a dream.”

Similarly, a person having a conversation converts the beta-elements into alpha, and thus freed of all the most primitive ways of functioning, he can have a rational conversation while not losing touch with his unconscious. *Alpha-elements* form what Bion calls a contact-barrier, the part of the mind in which beta-elements are transformed into alpha, and this contact-barrier could be seen as a flexible barrier of repression. “Alpha-elements comprise visual images, auditory patterns, olfactory patterns, and are suitable for employment in dream thoughts, unconscious walking, thinking, dreams, contact-barrier, memory.”

Bion developed his thought in a number of later writings, particularly in *Learning from Experience*. Alpha-elements are a product of alpha function. They

can be stored and repressed. They undergo further transformation and abstraction. They are the elements of dream thought, dream, myth, and conscious thought. And they form the contact-barrier between the conscious and the unconscious.

## **ALPHA FUNCTION**

Wilfred Bion's work on the "alpha function" was based on Melanie Klein's concept of projective identification. He added a further dimension by suggesting that projective identification is not only an all-powerful fantasy in the infant's mind, but also its first means of communication.

Bion discussed the alpha function for the first time in an article titled "A Theory of Thinking" (1962), but the idea had already been prefigured in his work. For example, in "On Arrogance" (1958), he described a patient who perceived his analyst as someone who "could not tolerate it" (the "it" not being defined) (1958, p. 146). From this Bion drew the conclusion that the patient's means of communication was preverbal and occurred through projective identification with the primitive id, and that the patient was experiencing the analyst's insistence on verbalization as an attack on his means of communication.

In "Attacks on Linking" (1959), Bion described a patient who as a young child could not contain his fear of death. He dissociated himself from it and at the same time from a part of his personality, and projected it onto his mother: "An understanding mother is able to experience the feeling of dread, that this baby was striving to deal with by projective identification, and yet retain a balanced outlook"

(p. 313). By projecting its terror onto the mother, the infant makes it into *her* experience and communicates to her its own distress. This situation is repeated in analysis. In this study, Bion stressed that projective identification has a realistic aspect that can elicit an appropriate response from the mother. If this response is not forthcoming, the baby's fear of death is reinforced and cannot be processed.

In "A Theory of Thinking," Bion formed the hypothesis of an alpha function exercised by the mother when she processes the baby's projective identification and converts what he calls "nascent sensory data," including emotional data, or beta elements, into alpha elements—the materials of dream thoughts and conscious thoughts:

It seemed convenient to suppose an alpha-function to convert sense data into alpha-elements and thus provide the psyche with the material for dream thoughts, and hence the capacity to wake up or go to sleep, to be conscious or unconscious. According to this theory, consciousness depends on alpha function, and it is a logical necessity to suppose that such a function exists if we are to assume that the self is able to be conscious of itself in the sense of knowing itself from experience of itself (p. 308).

Bion deliberately refrained from giving a definition of the alpha function, since he could only deduce its elements. He let it be understood that further study of it was needed. Instead of giving definitions, he described the process and provided the following model:

the infant, filled with painful lumps of faeces, guilt, fears of impending death, chunks of greed, meanness and urine, evacuates these bad objects into the breast that is not there. As it does so the good object turns the no-breast (mouth) into a breast, the faeces and urine into milk, the fears of impending death and anxiety into vitality and confidence, the greed and meanness into feelings of love and generosity and the infant sucks its bad property, now translated into goodness, back again. As an abstraction to match this model I propose an apparatus, for dealing with these primitive categories of I, that consists of a container and the contained. The mechanism is implicit in the theory of projective identification in which Melanie Klein formulated her discoveries of infant mentality. (1963, p. 31).

The concept of the alpha function led to that of the container/contained relationship. The internalization

of the latter provides the elementary thought-thinking apparatus. The mother's receptivity to the child's projective identification is a central factor in this process. Her receptivity is dependent upon what Bion called the maternal capacity for reverie—a dreamlike state whose contents are love for the child and its father.

Deficiencies in maternal reverie or excessive feelings of omnipotence or envy on the part of the infant can interfere with the alpha function and the container/contained relationship. The alpha function is related to—conjoined with—the shift from the paranoid-schizoid position to the depressive position.

## **ALTER EGO**

The representation of an other complicit in the subject's narcissism, or self-object, the alter ego refers to the narcissistic need of an other similar to the self, a factor in the development of the self. The term appeared in the work of Heinz Kohut in 1971 in the context of alter ego transference, a form of mirror transference. After 1984, given the autonomy of the alter ego transference, it appears as a constituent of the self, along with the grandiose self, the pole of ambitions, and the idealized parental imago, the pole of ideals. Defined as an arc of tension between the two poles, the alter ego takes into account the harmony of

the self, while the mirror affirms the vigor of the self and its idealization and cohesion. The line of development of the alter ego is important throughout the period that extends from the age of four to ten years; friendship, the need for someone like us, sometimes changes into the need for an imaginary companion. The alter ego is associated with humanity and sexual identity through self-identification—the father's true son. The reverse would be a Kafkaesque world of dehumanizing experiences. When this sector is stopped, repressed needs remain fixed and are difficult to verbalize because of the shame they arouse. The alter ego is associated with other needs and narcissistic transferences. Within this context, the concept of identification loses the specificity it has in Freudian metapsychology in terms of the constitution of the ego.

## **ALTHUSSER, LOUIS (1918–1990)**

Louis Althusser, a French philosopher, was born in Birmandreïs, Algeria, on October 16, 1918, and died in Le Mesnil-Saint-Denis, Yvelines, France, on October 22, 1990. Born into a family of practicing Catholics, Althusser's secondary schooling took place at the Lycée Saint-Charles in Marseille. He prepared for the entrance competition to the École Normale Supérieure (ENS) at the Lycée du Parc in Lyon, where he was a student of Jean Guilton, then of Jean Lacroix. He was accepted for admission in 1939 but was mobilized in September and became a prisoner of war. He

didn't begin his studies at the ENS until October 1945. It was in the prison camp that he learned about communism. Meetings at the ENS, primarily with Jean-Toussaint Desanti and Tran Duc Thao, gave him a better understanding of Marxist thought. Althusser taught philosophy at the ENS until 1980. There he met Jacques Lacan during the years when Lacan brought his seminar to the school.

Althusser is known as a chief theoretician of ideology. In *Reading "Capital"* (1979) he introduced a new reading of Marx, a "symptomal" reading, which, through a constructed discourse, is able to redefine the operating concepts and formal structure of his thought. This work led him to postulate a break between the works of the young Marx, where theoretical humanism is still present, and the mature works, which display a "theoretical antihumanism."

He criticized the spontaneous ideology that infiltrated so-called scientific discourse and set forth the foundations of a critical epistemology. One of his most important texts is "Ideology and Ideological State Apparatuses" (2001). In it he demonstrates the doubling of the subject and the specular structure of every ideology. Althusser returned to Ludwig Feuerbach's theory of the specular relation, Hegel's theory of recognition, and a theory of guarantees whose origins can be traced back to Spinoza, but gave them a new interpretation. He also made use of psychoanalytic ideas: the question of identification and the Lacanian themes of the split (or barred) subject and alienation from the Big Other in the specular relation. Althusser used this theoretical approach to address psychoanalysis. In his work he also attempted to articulate psychic and social processes outside the conventional patterns of Freudian and Marxist thought.

In addition, Althusser had direct experience of psychotherapy with a psychoanalyst. Althusser suffered from serious psychiatric problems, which required his hospitalization on several occasions. In 1980, in a moment of dementia, he killed his wife, H el ene. In *The Future Lasts Forever* (1993), most of which was written in 1985, Althusser acknowledges his painful efforts at understanding carried out after this tragic event.

Althusser trained an entire generation of scholars to be rigorous and critical in their reading of philosophy. Throughout the 1970s his influence was considerable and international in scope.

## ALTRUISM

Freud refers to the concept of altruism approximately ten times in his work, most often in a social or cultural context. In "Thoughts for the Times on War and Death" he writes:

Throughout an individual's life there is a constant replacement of external by internal compulsion. The influences of civilization cause an ever-increasing transformation of egoistic trends into altruistic and social ones by an admixture of erotic elements. In the last resort it may be assumed that every internal compulsion which makes itself felt in the development of human beings was originally—that is, in the *history of mankind*—only an external one. Those who are born to-day bring with them as an inherited organization some degree of tendency (disposition) towards the transformation of egoistic into social instincts, and this disposition is easily stimulated into bringing about that result. (1915b, p. 282).

In other cases, Freud uses the term most frequently against a background of what he called, in an exchange with Oskar Pfister, his "joyous pessimism." After pointing out that except when in love, "the opposite of egotism, *altruism*, does not, as a concept, coincide with libidinal object-cathexis" (1916–17a [1915–17], p. 418), he added, rather laconically, in *Civilization and Its Discontents*, "the development of the individual seems to us to be a product of the interaction between

two urges, the urge towards happiness, which we usually call 'egoistic', and the urge towards union with others in the community, which we call 'altruistic'. Neither of these descriptions goes much below the surface. In the process of individual development, as we have said, the main accent falls mostly on the egoistic urge (or the urge towards happiness); while the other urge, which may be described as a 'cultural' one, is usually content with the role of imposing restrictions" (1930a [1929], p. 140).

However, in the third part of *The Ego and the Mechanism of Defence* (1936/1937), Anna Freud provides an example of two types of defense, namely, "identification with the aggressor" and "a form of altruism." And in connection with the mechanism of projection, she conceives of "altruistic surrender" (*altruistische Abtretung*, according to the expression used by Edward Bibring):

The mechanism of projection disturbs our human relations when we project our own jealousy and attribute to other people our own aggressive acts. But it may work in another way as well, enabling us to form valuable positive attachments and so to consolidate our relations with one another. This normal and less conspicuous form of projection might be described as 'altruistic surrender' of our own instinctual impulses in favour of other people (p. 133).

Using a clinical example, Anna Freud analyzes the transference of the subject's own desires to others, a transference that enables the subject to participate in the instinctual satisfaction of another person through projection and identification. In speaking of this process, she refers to Paul Federn's comments concerning identification through sympathy.

The section of the book devoted to the study of two mechanisms of defense is placed between a chapter on the preliminary stages of defense—the avoidance of unpleasure in the face of real dangers (negation through fantasy, negation through acts and words and withdrawal of the ego)—and a chapter on the phenomena of puberty and the defenses arising from fear associated with the intensity of instinctual processes. To Anna Freud, the mechanisms of identification with the aggressor and altruism can be conceived as intermediary stages of defense, centered on the transition from anxieties arising from external dangers to subsequent anxieties arising from internal dangers.

This explains the projection inherent in both types of defense and the role of the superego in the genesis of altruistic surrender: "Analysis of such situations shows that this defensive process has its origin in the infantile conflict with parental authority about some form of instinctual gratification" (p. 141). Other passages in her work support this view: "Her early renunciation of instinct had resulted in the formation of an exceptionally strong super-ego, which made it impossible for her to gratify her own wishes... She projected her prohibited instinctual impulses on to other people, just as the patients did whose cases I quoted in the last chapter... In most cases the substitute has once been the object of envy" (pp. 135-36, 136, 141). She also points out that altruistic surrender is a means for overcoming narcissistic humiliation.

Finally, for Anna Freud, altruism could involve libidinal impulses as well as destructive impulses and, moreover, could affect either the realization of desires or their renunciation. Her analysis of the mechanism of defense finishes with an approach to its connection with the fear of death, by examining the bonds between the hero Cyrano de Bergerac and his friend Christian. Anna Freud provides a concluding note on the similarity between the conditions needed to initiate altruistic surrender and those present during the formation of masculine homosexuality.

Anna Freud's position was subsequently revisited with respect to such concerns as the psychodynamics of anorexic adolescents.

### ALVAREZ DE TOLEDO, LUISA AGUSTA REBECA GAMBIER DE (1915–1990)

An Argentine doctor and psychoanalyst, Luisa Agusta Rebeca Gambier de Alvarez de Toledo was born June 13, 1915, in the 9 de Julio section of Buenos Aires, where she died on September 5, 1990. “Rebe,” as she was known to her friends, expressed an interest in medicine in childhood, which led to her later studies in the capital. She discovered psychoanalysis when still a student, and became a member of the earliest psychoanalytic groups in the country, even before the creation of the Asociación Psicoanalítica Argentina (APA). Her meeting with Matilde and Arnaldo Rascovsky, through whom she became familiar with the field, led to her decision to pursue psychoanalysis as a career. Although she was not a founding member of the APA, she took an active part in the activities of the creators of the Argentine psychoanalytic movement.

She began her training analysis with Celes Cárcamo and was officially supervised by Angel Garma and Enrique Pichon-Rivière. She became a member of the APA in 1945 with the presentation of her study “A Case of Examination Neurosis,” and a fellow in 1950 with the presentation of her “A Contribution to the Understanding of the Symbolic Meaning of the Circle” and “On the Mechanism of Sleep and Dreaming.”

In 1946 she contributed to the creation of the first department of psychoanalytic psychiatry for adolescents at the hospital then known as the Hospicio de las Mercedes, under the direction of Enrique Pichon-Rivière and Arminda Aberastury. Between 1955 and 1958 she made regular trips to Montevideo, where she gave seminars and supervised other psychoanalysts, and in so doing contributed to the formation of the Uruguayan Psychoanalytic Association and helped train its members.

In 1954 she became a training analyst and, on this occasion presented her “Análisis del asociar, del interpretar y de las palabras” (The analysis of associating, interpreting, and words). This study, which became a classic of psychoanalytic literature, was published in the *Revista de psicoanálisis* in 1954 and had long-lasting influence on the evolution of the field. The author saw language as integral to psychoanalysis and showed how “the fact of speaking, as an act and independently of the content of the words, satisfies oral, anal, phallic, and genital libidinal impulses,” and that “by analyzing ‘the fact of associating’ and ‘the fact of interpreting’ in itself, there arises the primitive identity of the act, the image, and the object, which is realized in the act of speaking and listening to the analyst.”

Later she grew interested in the development of psychoanalytic research involving the use of hallucinogenic drugs. It was during this period that she wrote “Ayahuasca” (1960), which addressed the use of LSD in certain communities of Upper Peru. She was forced to interrupt her research when, for reasons beyond her control, the consumption of LSD was made illegal by the then current government.

Within the APA she assumed a number of important roles: secretary of the executive committee (1952–1953), treasurer (1953–1954), and president (1956–1957). She continued to assume positions of responsibility within the organization until 1972. Later in life, she turned her efforts toward providing an analytic space for several of her institutional colleagues.

## AMAE, CONCEPT OF

The concept of *amae* is a concept which derives from a unique Japanese word *amae*, a noun form of *amaeru*, an intransitive verb. It primarily refers to what an infant feels toward the mother when it recognizes and seeks her, hence it is nonverbal to begin with, but it acquires its first-person dimension when a child comes to learn the meaning of *amae*. *Amae* may be applied to an adult in a similar situation involving someone who is supposed to take care of him or her. It is on the basis of these linguistic facts plus the clinical experience that Takeo Doi arrived at the concept of *amae* indicating whatever happens consciously or unconsciously in a person vis-à-vis a possible caretaker.

*Amae* corresponds to what Freud (1912d) calls “the affectionate current,” which should combine with “the sensual current” in love. Also, it should correspond to the process of identification, since Freud (1921c) states that “identification is known to psychoanalysis as the earliest expression of an emotional tie with another person.” What is closest in meaning to *amae* is “primary love or passive object love” defined by Michael Balint (1935/1965). Interestingly, he specifically states that “all European languages...are all so poor that they cannot distinguish between the two kinds of object love, active and passive.” Among the empirical studies of infants, the attachment behavior which John Bowlby focused upon overlap with the behavior of *amae*. It is significant that *amae* is the exact reverse of envy which Melanie Klein emphasized in her thinking of mental life. The self-object needs defined by Heinz Kohut also correspond to *amae*.

*Amae* thus bridges many important concepts in psychoanalysis. Its strength lies in the fact that being a verb-noun it represents something alive, and thus suggests a potential feeling. According to Freud’s earlier formulation of instincts, *amae* can be a representative of the ego instincts.

## AMBIVALENCE

Ambivalence is the simultaneous presence of conflicting feelings and tendencies with respect to an object. During the winter meeting of Swiss psychiatrists in Berne on November 26–27, 1910, Paul Eugen Bleuler described, with respect to schizophrenia, the simultaneous existence of contradictory feelings toward an object or person and, with respect to actions, the insoluble concurrence of two tendencies, such as eating and not eating. In “The Rat Man” (1909d) Freud had already indicated that the opposition between love and hate for the object could explain the particular features of obsessive thought (doubt, compulsion). In *Totem and Taboo* (1912–13a) he adopted the term “ambivalence” proposed by Bleuler in the text of his conference published in 1911 in the *Zentralblatt*.

For Freud the term, in its most general sense, designated the presence in a subject of a pair of opposed impulses of the same intensity; most frequently this involved the opposition between love and hate, which was often expressed in obsessional neuroses and melancholy. In 1915, in his metapsychological writings, he added that it was the loss of the love object that, through regression, caused the conflict of ambivalence to appear. In 1920 Karl Abraham emphasized the intensity of the sadistic fantasy associated with urinary and digestive functions. In 1924 he extended and transformed the Freudian schema of the evolution of

the libido into a complete picture of the development of the relation to the object along two lines: the partial or total nature of the investment in the object, and ambivalence. The precocious oral stage of sucking is preambivalent, neither love nor hate are felt toward the object. There follow four ambivalent phases: the late oral stage, which is cannibalistic and seeks the total incorporation of the object, the precocious anal-sadistic stage, which seeks the expulsion and destruction of the object, the late anal-sadistic stage, which seeks its conservation and domination, and finally the precocious-phallic genital stage. The final genital phase of love towards a complete object is postambivalent.

Freud integrated Abraham's contributions in the thirty-second of his *New Introductory Lectures on Psycho-analysis* (1933a). Within the oedipal conflict ambivalence is resolved as a neurotic symptom, either through a reaction formation or through displacement (1926d). Reformulated in the second theory of instincts, ambivalence becomes part of the fundamental instinctual dualism: life instinct/death instinct.

For Melanie Klein ambivalence was key in formulating a theory of depression. The interplay of introjection and projection, the dialectic of good and bad objects, and depressive anxiety, signaling the fear of destroying the maternal object, are the apparent manifestations of the conflict of ambivalence. Together they constitute the ego and work toward resolving the oedipal conflict.

For Paul-Claude Racamier (1976), while melancholy is hyperambivalent in that it results from an intense struggle between love and hate, schizophrenia must be considered as a fundamentally antiambivalent process, where "contrary impulses ... radically split, fuse separately in a nearly pure state, presenting themselves alternately to the same object or simultaneously to partial objects that are always distinct and divided."

## AMENTIA

Amentia, or confusion, is a state of acute hallucinatory delirium; it was described with this name by Theodor Meynert in *Leçons cliniques de psychiatrie* (1890). Meynert, who had been a professor of psychiatry since 1873 at the University of Vienna, believed in an anatomic-clinical theory of psychiatry and did not

attribute any meaning to the hallucinations that arose during amentia, considering them merely a disorderly flow of “accessory representations” from “cortical exhaustion” and excessive irrigation of subcortical centers, which were considered to be the seat of sensory impressions.

Freud, faithful to his teacher of 1883, also referred to the clinical value of the concept of amentia, in spite of the differences between them (Jones, 1953). He wrote of “a fine daydream” (Freud, 1916–17f) and, as demonstration of this, a “hallucinatory psychosis of desire.”

Although Freud mentioned the concept much earlier (1894a), it is not until his *A Metapsychological Supplement to the Theory of Dreams* (1916–17f) that he would see in amentia an element of comparison, with which to explain the role of belief in the hallucinatory fulfillment of desire in dreams. The regression of the preconscious to mnemonic images of things invested by the unconscious would be unable to explain such belief if, in both cases, the conflict with reality (associated with the functions of consciousness) weren't eliminated. Amentia is unlike the dream state, where it is through the wish to sleep that the subject loses interest in reality. Rather, in the hallucinatory psychosis of desire, the subject denies a reality that is unbearable because of the loss it inflicts, and is thus open to the free play of hallucinatory fantasies.

## **AMERICAN ACADEMY OF PSYCHOANALYSIS**

The two major psychoanalytic organizations in the United States, the American Academy of Psychoanalysis

(Academy) and the American Psychoanalytic Association (American), now share similar theoretical orientations and are working closely together in the Psychoanalytic Consortium. However, this has not always been the case.

The Academy was formed as a reaction against perceived thought control efforts by certain officers of the New York Psychoanalytic Institute, a member of the American, which demanded conformity to a sharply restricted view of the intrapsychic libido theory. The Academy's orientation was that, in addition to intrapsychic dynamics, biological facts, interpersonal relations, the family, and the broader culture were all significant in personality development and pathology. Thus instead of a unitary theory, the Academy accepted that multiple interacting factors were significant. From its very beginning, the Academy established a democratic and scientific organization, where divergence, dialogue, and creative growth in psychoanalysis were strongly encouraged.

The split in American psychoanalysis started in 1941, at a business meeting of the New York Psychoanalytic Society, when Karen Horney was disqualified as a training analyst because she was disturbing the candidates with her ideas about culture. A number of analytic institutes split off from the American, and in 1955 Clara Thompson called a meeting of eminent psychoanalysts. Amongst those present were Franz Alexander, Abram Kardiner, Jules Masserman, and Sándor Radó, who all encouraged the formation of another national psychoanalytic organization where there would be freedom to exchange ideas in psychoanalysis and with other scientific disciplines. Franz Alexander (Alexander and Selesnick, 1966), a former president of the American, stated that the premature standardization and rigidity of teaching in the American was too past-oriented and not sufficiently creative and future-oriented. Psychoanalysis was still a developing field and the exchange of clinical experience as well as input from science and the humanities was crucial. Conformity would only stifle the growth and development of psychoanalysis as a science. Tolerance for uncertainty and ambiguity are a necessary condition for creativity.

The Academy was established in 1956. Under its constitution, the Academy admits individual members and not institutes, so as not to interfere with the freedom of each institute's jointly determined theoretical approach and politics. The first president of the

Academy was a woman, Janet Rioch Bard, and many other eminent medical psychoanalysts, both men and women, have been elected president since then.

It is interesting that the Academy was similar to the Kleinian group in England, since both can trace their origins to Sándor Ferenczi, who maintained the importance of interpersonal relations and the culture. Ferenczi focused more on maternal nurturance during infancy and relationships in childhood. He also stressed the importance of empathic connection in treatment, especially with more difficult patients, so as to undo trauma or deprivation and provide a corrective emotional experience. He also explored the transference/counter-transference relationship between therapist and patient. Both Thompson and Klein were analyzed by Ferenczi, who strongly influenced their approach. Horney (1922) had rejected Freud's explanation of feminine psychology as due to penis envy and the castration complex, and she stressed that femininity was inborn, being shaped by interpersonal relations and the culture.

The members of the Academy have made important contributions not only to individual psychoanalytic treatment and theory, especially with more troubled patients, but also in psychosomatics, and family and group therapy. Current research in ethology and direct infant observation have validated the importance of an attuned attachment to the mother during the pre-oedipal period, and anthropological research has found that the oedipal conflict is not universal but culturally variant.

In later years, the American reversed its rigid adherence to a unitary theory and embraced the inclusive and democratic ideals that were the very foundation of the Academy. Now both the Academy and the American consider divergent theoretical orientations and include findings from anthropology, culture, and group and family therapy.

Freud was an accomplished researcher in the neurosciences and published his laboratory findings. He was aware that memory was stored in the brain cells and transmitted through synapses. Freud did attempt to develop a neurophysiological method in his "Project for a Scientific Psychology" (1950c [1895]), but not having the technology to integrate the mind and the brain, he focused on the mind. Part of the problem in psychoanalysis was that it did not have a hard and firm scientific foundation. In the resulting search for certainty, a unitary theory was embraced by classical analysts to give the illusion of scientific validity. This

contributed to the split in the psychoanalytic movement in the United States, and the division in England. However, Freud himself was aware that his metapsychology was weak, and that psychoanalysis was not the hard science that he had hoped it to become.

Increasingly the technology exists that can allow one to integrate understandings of the mind and the brain, especially with imaging techniques. The new findings of neurobiology will serve to provide a scientific foundation to psychoanalysis, and further help to bring the psychoanalytic movement together. Thus, Freud's hope that psychoanalysis could become a hard science is still alive; work that reduces the mind/body split could yet ensure that theory and therapy become grounded on a firm scientific basis.

Both the American Psychoanalytic Association and the American Academy of Psychoanalysis have now continued with similar theoretical orientations concerning biological, intrapsychic, interpersonal, and cultural factors in personality development and pathology. However, they have diverged in their methods of sustaining membership. The American has included psychologists and social workers besides psychiatrists, but has remained wholly psychoanalytic. The Academy has included psychiatrists with some analytic training or who are analytically oriented, but remained medical. Accordingly, the Academy changed its name to reflect this change to the American Academy of Psychoanalysis and Dynamic Psychiatry. During the presidency of Samuel Slipp, the Academy was established as an official Affiliate of the American Psychiatric Association. Now, only the Academy holds its annual meeting in the same location as the American Psychiatric Association. Both the American and the Academy have remained in the Consortium to further psychoanalysis together, and they continue their friendly and cooperative relationship.

## AMERICAN IMAGO

Thirty years after Sigmund Freud's 1909 lectures at Clark University, the psychoanalytic community in the United States had grown large enough to support a psychoanalytic journal focused on culture. *American Imago* had its European antecedent in the psychoanalytic journal *Imago* that was, as Freud tells us, "concerned with the application of psycho-analysis to non-medical fields of knowledge" (1926f, p. 269–70). In Felix Deutsch's obituary for Hanns Sachs, he writes, "When this journal [*Imago*] was suppressed in Europe in 1938, Sachs brought it to life again here in the States" (1947, p. 5). Freud wrote to Sachs that he was initially not pleased with the idea for the journal but that was primarily because it was difficult to "let the light be extinguished completely in Germany" (Gay, 1988, p. 634).

*American Imago* was first published in Boston, Massachusetts, in November of 1939. Russell Jacoby (1983) tells us that Otto Fenichel "reported in deepest confidence that... Sachs was beginning a new magazine, *American Imago*... charged by Freud to rally the classical, and now embattled, analysts" (p. 126). Sachs writes, "when the plan for this periodical was proposed to Freud he greeted it wholeheartedly and consented to become its editor" (1939, p. 3).

Hanns Sachs (1881–1947) assumed editorial responsibilities as publisher and editor, and continued in that role until close to his death. From 1946 until 1963 George Wilbur (1887–1976) was the publisher and managing editor. Harry Slochower noted that Wilbur "kept the broad and deep channels of applied psychoanalysis open in the country," and praises Wilbur's "unassuming generosity which... saved the very existence of the journal" (1967, p. 287). Harry Slochower (1900–1991) came to the journal in 1964 and continued as Editor in Chief until his death. He arranged for the journal to be published by Wayne State University Press, thus expanding *American Imago's* original base in the psychoanalytic community to a wider academic audience. In 1987 Martin Gliserman took over editorial responsibility for the journal; he proposed a new format for the journal and approached Johns Hopkins University Press which began publishing the journal in 1991.

From the very beginning *American Imago* has been an interdisciplinary journal that has examined many fields of study—anthropology, art, film, history, literature, music, philosophy, psychoanalysis, religion, society, and politics. For its part, psychoanalysis has served as a prism through which to view a whole range of cultural works. Thus articles in the journal's first volume addressed such diverse subjects as the ritualized games of verbal insult known as "the dozens," masochism, a play by Shakespeare, anti-Semitism, and mythical heroes. The journal has been responsive over the years to changes in the intellectual climate, and has broadened its psychoanalytic vision, without ever abandoning its original purpose of understanding culture.

## AMERICAN PSYCHOANALYTIC ASSOCIATION

Despite Sigmund Freud's concern about the fate of psychoanalysis in the United States, it has been the country where psychoanalysis, as theory and as therapeutic enterprise, has been most successful during its first century.

Accompanied by Carl Gustav Jung and Sándor Ferenczi, Freud made his first and only trip to the United States in 1909, visiting Clark University at the invitation of G. Stanley Hall. At that time he received an honorary doctorate in law for his contributions to psychology. This visit came at a time of crisis in sexual

morality following the oppression of Victorian sexuality, a time of change in the structure of American family life with a move towards smaller families, and also at a time of crisis in the treatment of nervous and mental disorders. Facing such pressures, American psychiatrists found the psychoanalytic focus on the emotional relations of love and hate among family members to be revealing and important.

Within ten years of Freud's visit, psychoanalysis was broadly accepted in the United States. At first it was seen as another form of the then-current psychotherapies of suggestion. Its increasing popularity, displacing other therapies, was a result in part of the public's welcome of its optimistic view of mental illness, emphasizing environmental causes and its accessibility to "cure," in contrast to European theories of hereditary degeneration.

The year 1910 was of great importance to the history of psychoanalysis. In his paper "Wild Psycho-Analysis," Freud voiced concern that the use of psychoanalytic notions by those psychoanalytically untrained could be harmful to patients. To protect the public, and the scientific integrity of psychoanalysis, he and his followers founded the International Psychoanalytical Association (IPA), in which membership would be available only to those trained in the psychoanalytic method. Those few Americans who were trained psychoanalysts formed the American Psychoanalytic Association (the American) in 1911. The purpose of the American association, like that of the IPA, was to promote communication and to define what constituted a psychoanalyst in order to protect the public from "wild analysis." Ernest Jones (who would become Freud's first official biographer in the 1950s) had written to Freud that "already in America there are many men exploiting it for financial and other reasons, whose knowledge of the subject is minimal, and who only bring discredit on the work. . . . no one will be elected member of the association unless he has shown some competence in the work."

Freud's continuing concern led, in 1918, to the establishment of an Institute for psychoanalytic education and training in Berlin, with Vienna and London following soon thereafter. These institutes offered a well thought out curriculum that consisted of instruction in the scientific theory of psychoanalysis, supervision in the treatment of patients using psychoanalytic methods, and a personal experience of psychoanalysis. This "tri-partite" form of training came to be the

model throughout the psychoanalytic world: personal analysis, psychoanalysis of patients under supervision, and didactic course work.

That same year also witnessed the publication in the United States of the Flexner report, a startling exposé on the absence of standards in medical education. About half of the existing medical schools were forced to close, and in those remaining, great efforts were made to exorcise charlatans from therapeutic activity and guarantee that a medical degree was the hallmark of proper training and competence. German and Viennese medicine was prestigious at the time, and in attempts to upgrade their standards, Americans looked to them to provide models.

The fields of psychiatry and neurology were also in their formative stages, and since the American conception of medical science was then similar to that of Freud's, that is, a reliance on clinical judgment based on observations made in the individual case, psychoanalysis brought a degree of respectability to psychiatry. On the other hand, the leaders of analysis in New York believed that psychoanalysis gained respectability and prestige from an alliance with medicine and assured it a serious hearing. The American Psychoanalytic Association was eager to retain this respectability, and by 1924, under the influence of the New York Psychoanalytic Society and the concerns secondary to avoiding accusations of quackery, the American had adopted the requirement that members be physicians. Freud and most of the European psychoanalysts protested this change. They believed strongly that psychoanalysis did not belong to medicine. Rather they believed that psychoanalysis was part of a general psychology. The issue of the training of lay analysts was an issue that would persist.

World War I brought prominence to Freud's theories of the irrational and the brutal in human nature. His methods and their derivatives also proved to be the most effective then available for the treatment of "shell shock." Many psychiatrists subsequently became interested in psychoanalysis as a treatment method, and travel to Europe for psychoanalytic education at one of the newly established institutes became popular. On their return, those so trained contributed to the establishment of psychoanalytic societies in several American cities. This began another chapter in American psychoanalysis. Freud maintained that although rigorous training was necessary to become a psychoanalyst, psychoanalytic education and training should be

available to a wider group, not simply to psychiatrists. But the Americans held firm, and among those who had traveled to Europe to train at European institutes, only the psychiatrists were eligible for membership in the American Psychoanalytic Association upon their return. Heated international debate about this policy followed and continued for decades.

By the 1930s, psychoanalytic societies had been established in several cities in the United States. However, it was not until 1931 that the first Institute for Psychoanalytic Education was established. New York's was the first, but Chicago, Boston, and Baltimore-Washington followed shortly thereafter. Once established, these institutes were committed to maintaining the highest possible standards of psychoanalytic education. Thus in 1932, with the reorganization of the American Psychoanalytic Association as a federation of constituent societies, a Council on Professional Training was formed to establish and maintain policies and standards of teaching, so that psychoanalytic education would maintain some consistency as the various institutes were established. In 1938, this council published the "Standards and Principles of Psychoanalytic Education." Although many revisions have taken place, this document remains the definitive statement that guides psychoanalytic education at all constituent Institutes of the American Psychoanalytic Association. The model of education continues to be predominant as the model first established in the first Institute in Berlin. It is a tri-partite model, which includes a personal analysis, psychoanalysis under supervision, and class-work. This has been the core training of all subsequent psychoanalytic Institutes (with a total of twenty-nine by the end of the twentieth century). In 1946 the American Psychoanalytic Association again reorganized. This time two governing bodies were established; a Board on Professional Standards became responsible for all matters of psychoanalytic education, and an Executive Council was established to deal with membership and practice issues.

The years following the World War II again saw increased professional status for psychoanalysts, particularly as derivatives of its methods proved to have the greatest success in treating psychological disturbances brought on by war combat. Furthermore, at a time before psychotropic medications became available, psychoanalysis and its derivative therapies proved among the most successful methods of treating many varieties of mental disturbances. As a result,

psychoanalysis became highly influential in psychiatric education and a large number of university psychiatric residency programs had a psychoanalyst as chairman.

Many have described the years between 1945 and 1965 as the golden years for psychoanalysis in the United States. Psychoanalysis in Europe had barely survived outside of London, and many European analysts had found their way to the United States. This brought a wealth of intellectual energy to American psychoanalysis and interest in the theoretical basis of psychoanalysis enjoyed great popularity. In addition, the patient pool was large, not only because of the dearth of alternative methods, but also because artists and intellectuals felt that engaging in psychoanalytic treatment freed their creative minds. The wealth of clinical experiences led to ever-expanding theories to explain the clinical observations. Nathan Hale points out that during this period the "Popular images of Freud revealed him as a painstaking observer, a tenacious worker, a great healer, a truly original explorer, a paragon of domestic virtue, the discoverer of a source of personal energy and a genius" (1995, p. 289). All of these attributes reflected idealized American cultural values. With such an idealized image of Freud and of psychoanalysis, disillusionment was inevitable. However, one must balance the valid criticisms of the pretensions of psychoanalysis to be a globally explanatory treatment with the attendant and inevitable failure of psychoanalysis to deliver the kinds of idealized expectations that had been established during this "golden age."

An account of psychoanalysis in the United States would not be complete without taking into account the issue that would not go away, that of "lay analysis." Psychoanalytic education in the United States was limited to psychiatrists from the beginning. In 1957 a provision was made whereby psychologists of exceptional research talent could gain access to psychoanalytic education under the proviso that they simply use their psychoanalytic skills to further their research and not attempt to treat patients. However, it was not until 1986 that provisions were made to allow certain non-medical clinicians to gain access to psychoanalytic training. The American Psychoanalytic Association has now reached a point where it is striving to define eligibility for psychoanalytic education on more than the basis of an academic degree.

There were major ramifications to the exclusionary policies of the American Psychoanalytic Association. These policies guaranteed that advancements in the

field of academic psychology would exclude a consideration of psychoanalytic theory because psychologists who might have been interested in the integration of psychology and psychoanalysis were not given access to psychoanalytic education. This meant that psychoanalysis could not benefit from the research methodology available to psychology, and as very little emphasis was given to research in medical education until recent years, psychoanalysis has suffered from the paucity of research which might have offered some validity or reliability to its theoretical positions.

A central event for psychoanalysis in the United States was a class-action anti-trust lawsuit filed in 1985 by four psychologists. This group alleged that the American Psychoanalytic Association, the New York Psychoanalytic Institute, the Columbia University Center for Psychoanalytic Training and Research, and the International Psychoanalytical Association had “restrained and monopolized interstate and international trade and commerce in the training of psychoanalysis and in the delivery of psychoanalytic services to the public” (Schneider and Desmond, p. 322). By 1989, a settlement agreement was approved. The terms of the agreement changed the face of psychoanalysis in the United States: (1) Psychologists and other qualified non-medical clinicians were eligible to train in the institutes of the American. (2) Members of the American were permitted to teach in non-American affiliated institutes. (3) Membership in the IPA was now open to all qualified psychologists and non-medical psychoanalysts. As a result of these changes the American Psychoanalytic Association has become a more inclusive organization. In addition, the American has joined a psychoanalytic consortium with psychoanalytic colleagues in other organizations: Division 39 (Division of psychoanalysis) of the American Psychological Association, the Academy of Psychoanalysis, and the National Membership Committee on Psychoanalysis in Clinical Social Work. This Psychoanalytic Consortium has worked jointly on a variety of social and political issues important to all psychoanalysts, including maintaining the privacy of the psychotherapist-patient relationship, and is working towards the development of a board to accredit institutes from the entire spectrum of psychoanalysis, in order to protect the high quality of psychoanalytic education and psychoanalytic treatment.

One hundred years after the publication of the *Interpretation of Dreams*, and over ninety years since

Freud’s memorable visit to the United States, the American Psychoanalytic Association, in the best Freudian tradition, is once again actively reaching out to psychologists, psychiatrists, mental health professionals, academics, and the lay public. These new endeavors have infused the organization with vitality. With an appreciation of its past, the American Psychoanalytic Association has risen to the challenges of the new century.

## **AMNESIA**

The notion of *amnesia* is of neuropathological origin, but for Freud it was not functional defect in the registering of memories. Rather, he looked upon amnesia as a symptom resulting from repression, as a phenomenon which could be circumscribed but which was not a defense mechanism. He compared infantile amnesia to hysterical amnesia, of which in his view it was the forerunner, both forms being connected with the child’s sexuality and Oedipus complex. Amnesia concealed mnemonic traces of traumatic events and, more generally, contents of the unconscious. (When defined by Freud simply as the normal “fading of memories,” [1893a, p. 9] by contrast, the idea of amnesia belonged to the psychology of consciousness rather than to the metapsychology of the unconscious.)

Amnesia was not a psychoanalytical discovery, but, beginning with his earliest psychoanalytical writings, notably the *Studies on Hysteria* (1895d), Freud interpreted it in terms of repression; in the *Three*

*Essays on the Theory of Sexuality* (1905d), he extended the discussion to infantile amnesia.

In the development of Freud's thought, it was the neuropathological idea of amnesia that showed the way to his formulation of repression, even though, structurally speaking, amnesia was a result of repression. The phenomenon of the absence of a memory prompted Freud to posit the existence of an unconscious mnemonic trace. Since he did not consider amnesia to be a defense mechanism, he sought to account for it in another way, namely by the mechanism of repression. Thus in the *Three Essays*, comparing infantile amnesia to the hysterical amnesia that he felt it foreshadowed, he saw both as the outcome of the repression of sexuality, especially childhood sexuality, which he described as polymorphously perverse ("Neuroses are, so to say, the negative of perversions." [p. 165]).

The patient was "genuinely unable to recollect" the "event which provoked the first occurrence, often many years earlier, of the phenomenon in question," which is why it was necessary "to arouse his memories under hypnosis of the time at which the symptom made its first appearance" (1893a, p. 3). The lifting of amnesia was the precondition of the cathartic abreaction of the affects bound to the trauma, the memory of which had been effaced: this was Freud's first theory of the neuroses, namely the theory of the traumatic causality of hysteria.

Amnesia, however, did not in this view succeed in completely wiping out the memory of the trauma, for patients suffered from obsessions, from hallucinatory visions, from what seemed like foreign bodies within their psyches. So long as no abreaction of affects took place, a struggle continued to rage between amnesia and hysterical obsessions, giving rise to "hypnotic states" of a consciousness riven by conflict. Such states might range, according to the strength of the repression, from "complete recollection to total amnesia" (1893a, p. 12). In this light, amnesia could be seen as the ultimate outcome of that defense by means of the "dissociation of groups of ideas" which until 1900 Freud held to be typical of hysteria, and which later he described as the result of repression (an adumbration of the notion of splitting might also be discerned here).

In *The Interpretation of Dreams*, Freud argued that the forgetting of dreams was not "a special case of the amnesia attached to dissociated mental states," for in all cases "repression ... is the cause both of the

dissociations and the amnesia attaching to their psychological content" (1900a, p. 521). As Freud moved from the theory of traumatic hysteria to the theory of dreams, therefore, his conception of amnesia evolved from dissociative splitting to repression.

It was on the basis of the durability of the impression attached to the trauma (concealed by amnesia but finding expression in symptoms) that Freud hypothesized the existence of an indestructible unconscious mnemonic trace, which helps us understand how, to begin with, he had conceived of the mnemonic trace as a so-called "unconscious memory." The German term "*Erinnerungsspur*," whose literal meaning is "memory trace," covered both the (paradoxical) idea of an unconscious memory, which is to say a memory that has succumbed to amnesia, and the idea of an unconscious mnemonic trace.

In 1900 Freud asserted that mnemonic traces were indestructible; in 1895 he had observed that impressions associated with traumatic seductions preserved their sensory intensity and freshness when amnesia protected them from the wearing-away process that they would have undergone had they not been buried in the unconscious. By thus insisting upon the sensory vividness of what amnesia concealed, Freud depicted a quasi-hallucinatory mode of psychic representation consonant on the one hand with a post-traumatic accentuation of impressions that led in particular to the constitution of "mnemonic symbols," and, on the other hand, with his later theoretical claim that unconscious ideas were necessarily figurative in nature.

The notion of amnesia, though it cleared the way for the psychoanalytical notions of the unconscious and of repression, itself remained a phenomenological idea belonging to descriptive psychopathology and marked by the idea of deficiency even if it went beyond it. While amnesia certainly meant a contraction of conscious memory that was not attributable to any functional deficiency of mnemonic fixation, it nonetheless implied a diminution of the capacities of the ego. The forgetting imposed by amnesia (for it was not intentional) was the effect of a defense mechanism that was itself unconscious, namely repression. Such forgetting was experienced, painfully, as consciousness of a repression either under way or already completed; and amnesia could also be the outcome of defense mechanisms other than repression (projection, splitting, foreclosure).

Since new repressions are always in the making, remembering does not make it possible to lift the amnesia completely. In “Constructions in Analysis” (1937d), Freud used the same terminology as in 1895 or 1900, but his standpoint had changed. He continued to think, to be sure, that the aim of analysis, starting, say, from “fragments of [the patient’s] memories in his dreams” (p. 258), was to induce remembering, to lift amnesia. But he now felt that this procedure could never be total and that it could not even be embarked upon unless repetition—notably the manifestation of affective impulses in the transference—was taken into account. Inasmuch as amnesia continued to obscure entire aspects of the past, it was impossible ever to reconstitute that past in its entirety, and the analyst must be content to (re)construct it on the basis of what took place during analysis. This is not to say that Freud abandoned his fundamental historical perspective and embraced fictions, but simply that he redefined interpretation, independently of amnesia and its removal, as “probable historical truth” (p. 261).

This “probable” truth, as opposed to the whole truth, belongs to the episteme of modern history. How can the correctness of a construction be proved? One aspect of such a proof is connected to the set of problems surrounding amnesia and its lifting: communicating an accurate construction to the analysand may on occasion cause a temporary aggravation of the symptoms and the production of “lively recollections . . . described [by the patient] as ‘ultra-clear’” and involving not “the subject of the construction but details relating to that subject” (p. 266).

Infantile prehistory, when the infant can barely speak, was in Freud’s view affected by amnesia in a very particular way, and amnesias coming into play in later years, including hysterical amnesia, were derived from this primary structural amnesia, the concept of which brought Freud close to the idea of primal repression. What appeared as amnesia was indeed sometimes attributable to primal repression. In “A Child Is Being Beaten” (1919e), analyzing an infantile beating-fantasy, Freud emphasized, apropos of its most important phase (being beaten by the father), that “it has never had a real existence. It is never remembered, it has never succeeded in becoming conscious. It is a construction of analysis, but it is no less a necessity on that account” (p. 185). Here amnesia affects not a forgotten event but rather a fantasy about which there is no necessity to claim that it was at one time conscious.

In such cases the amnesia could be removed only partially, as for example when “an elaborate superstructure of day-dreams” (p. 190) represented the fantasy in an indirect way. Here at last the notion of amnesia was completely absorbed by that of repression.

As noted above, “amnesia” is a term belonging to phenomenological psychopathology rather than to psychoanalysis: it refers to the symptom rather than the cause, and it connotes a lack (a-mnesia), which places it close to ideas of deficit. With respect to the psychology of consciousness, it points up the existence of the unconscious in one of its most spectacular effects. But if it opens the door to the metapsychological ideas of mnemic traces and repression, its affiliation with phenomenological psychopathology and cognitive psychology means that it belongs at once to several disciplines: amnesia is involved with the mnemonic “recalling” of information concerning a traumatic area, but a psychogenic causality does not exclude a cognitive or neurophysiological one.

Finally, since amnesia is centered entirely on a reduction of conscious memory, it is not compatible with the later developments in Freud’s thinking on constructions in analysis, although it is true that the accuracy of a construction may bring about the removal of amnesia—thus tending to confirm that Freud never completely abandoned the theory of traumatic seduction and the amnesia to which such a seduction gave rise. In “Remembering, Repeating and Working-Through” (1914g), Freud argued that the “fabric of the neurosis” itself provided “compelling evidence” for the reality of events experienced by the subject “in very early childhood and . . . not understood at the time” (p. 149); in other words, neither the lifting of amnesia nor even a reconstruction of the past was required—a proposition that amounts to a radical refutation of any “verificationist” epistemology. Psychoanalysis is concerned with historical truth, with infantile and psychic realities lying on a different plane, ontologically speaking, from amnesia and that which amnesia conceals, even if the latter can indeed show us the way to the former.

## AMPHIMIXIA/AMPHIMIXIS

Borrowed from the field of embryology and derived from the Greek (*amphi*: “from both sides”; *mixo*: “mixture”), the term *amphimixia* refers to the fusion of gametes during fertilization and was used by Sándor Ferenczi, beginning in 1924 in *Thalassa: A Theory of Genitality*, as a metaphor for the fusion of erotisms, in order to propose a biology of pleasure.

This elaboration resulted from a method of working by analogies that Ferenczi called “utraquism” (a coinage based on the Latin root *uterque*, meaning “both of them” or “each of them”), or viewing the same thing from two opposite perspectives.

In the language of science, *amphimixia* refers to the fusion of male and female gametes during the process of sexual fertilization, and in *Thalassa* it is extrapolated to describe coitus, the moment of the fusion of erotisms: the mutual identification of the protagonists during foreplay, followed by the dissolving of the limits of the participants’ individual egos; sexual

impotency is described as “genital stuttering” (p. 9); “Everything points to the fact that the urethral (i.e., ejaculatory) tendency is at work from the beginning, throughout the entire frictional process, and that in consequence an unceasing struggle occurs between the evacutory and the inhibitory purpose, between expulsion and retention, in which the urethral element is eventually victorious” (p. 8). Ferenczi continues: “[L]et us term such a synthesis of two or more erotisms in a higher unity the *amphimixis* of erotisms or instinct-components” (p. 9). He describes exchanges in roles, in cases of diarrhea or nervous retention of urine: “[I]n nervous diarrhoea the bowel is inundated by urethrality: while in urinary retention of nervous origin the bladder overdoes the inhibition learned from the bowel” (p. 13n). He points out that “biological science has hitherto taught us nothing about such [displacement] mechanisms as these. As effecting the transition to our assumption of *organic displacement and condensation*, the psychoanalytic investigation of hysteria was of service, in that it demonstrated the displacement of ideational energy upon organic activity and function (conversion) and its retransference back into the psychic sphere (analytic therapy). . . . Each organ possesses a certain ‘individuality’; in each and every organ there is repeated that conflict between ego- and libidinal interests” (p. 82). With regard to female sexuality, the displacement of clitoral eroticism by vaginal eroticism is understood in an analogous way, as a displacement from low to high, as is “the tendency to blushing (the erection of the entire head) on the part of the maiden who represses sexual excitement” (p. 14). In perversion, there is a mixture of oral, anal, cutaneous, and visual erotisms. Further, digressions into the realm of linguistics (the breaks that separate vowels from consonants being compared to certain effects of the sphincter) reveal the ambitious scope of Ferenczi’s project: “to set forth my phylogenetic theory of genitality in the form of a kind of fairy tale” (1936, p. 252), but also as if “sexual intercourse . . . contains a suggestion of mnemonic traces of this catastrophe which overtook both the individual and the species” (p. 254).

*Amphimixia* thus enables Ferenczi, in *Thalassa*, to complement physiopathology with what he terms a “physiology of pleasure” (p. 83), bioanalysis being defined as the “analytic science of life” (p. 93). He emphasizes the significance of regression, noting that the final agonies of death seem to present “regressive trends which might fashion dying in the image of birth and so

render it less agonizing. . . . Death exhibits utero-regressive trends similar to those of sleep and coitus” (p. 95). Finally, he adopts a thoroughly modern viewpoint as he concludes *Thalassa*: “[W]e should . . . conceive the whole inorganic and organic world as a perceptual oscillating between the will to live and the will to die in which an absolute hegemony on the part either of life or of death is never attained” (p. 95).

## **AMPLIFICATION (ANALYTICAL PSYCHOLOGY)**

Amplification is a part of Jung’s method of interpretation of clinical and cultural material, especially dreams. Amplification involves the use of mythic, historical, and cultural parallels in order to clarify, make more ample and, so to speak, turn up the volume on material that may be obscure, thin, and difficult to attend to.

Just as the analyst waits for associations to the dream imagery to reach its personal meanings, so, by amplification, the analyst enables the patient to reach beyond the personal content to the wider implications of her or his material. Thereby, the patient feels less alone and can locate their personal neurosis within humanity’s general suffering and generativity.

Amplification is also a means of demonstrating the validity of the concept of the collective unconscious. Jung’s early understanding of the collective unconscious was that it consisted of primordial images that were, to a large degree, consistent across cultures and historical epochs. As amplification involved the assembly of parallels from diverse sources, it could be regarded as performing this evidential function. Present-day Jungian analysts are far less convinced that universal and eternal images exist.

Amplification is a kind of “natural thinking,” proceeding by way of analogy, parallel and imaginative elaboration. In this sense, it may also be seen as a depth psychological approach to scholarship based on what is claimed to be the natural functioning of the mind, which is not linear and orderly.

Jung first introduced the idea in an essay in a collection edited by Freud in 1908, when he stated that he does not wish the process of interpretation to proceed “entirely subjectively.” In 1935, he spoke of the need to find “the tissue that the word or image is embedded in” (Jung, 1968, p. 84). There he makes the claim that amplification follows a kind of natural “logic.” By 1947, the value of amplification lies in the fact that it can enable us to reach, by inference, the archetypal structures of the unconscious mind which, by definition, are unrepresentable in and of themselves, must be distinguished from their appearance in culture, and which therefore can only be assessed by means of techniques such as amplification (Jung, 1947). Gradually, Jung was coming to see amplification more as a technique to be used in a wide variety of contexts and less as a general principle of mental functioning. Hence, amplification lies behind the immense spreads of cultural and historical material that Jung lays out for his readers.

As the related clinical technique of active imagination was refined, amplification acquired a new significance in Jungian clinical theorizing. If sinking down into the unconscious and recording, often by means of artistic activity, what was encountered therein was not to be merely a self-indulgent, aesthetic process, the role of the ego in amplification was important as a critical agency, not to mention as a bulwark against psychosis.

The clearest statements of the clinical uses of amplification are found in relation to dreams.

Amplification as a concept also had a marked effect on the development of analytical psychology as an institution. If patients were to pursue the parallels to their personal material in terms of cultural material, they needed libraries in which to do this. This was one reason for the creation of analytical psychology “clubs” in urban centers. In the clubs, selected patients and the analysts could relate on more-or-less equal terms, in part united by the need for scholarly resources (Samuels, 1994). The main criticism of amplification has been that it can make analysis into much too intellectual a process and sometimes leads

patients into an inflation whereby they equate their personal situation with something much greater, hence not only avoiding the transference but also gratifying omnipotent fantasies (Fordham, 1978, p. 220).

Amplification needs to be discussed in the context of current debates about interpretation: it is best located as part of a hermeneutical approach rather than a causal-positivist one. Recently, the concept has been extended so as to cover much more of the field of interpretation than Jung intended (Samuels, 1993). The ordinary, everyday analytical procedure of interpreting the patient's material in infantile terms may also be seen as a kind of amplification, neither hermeneutic nor causal-positivist.

## **ANACLISIS/ANACLITIC**

The idea of anaclisis was introduced by Freud to describe the original relationship, in the young child, between the sexual drives and the self-preservative functions. Arising from a specific site in the organism (an erotogenic zone), the sexual drives at first prop themselves on the self-preservative functions, and only later become independent. The self-preservative function thus sometimes offers its own object to the sexual drive; this is what Freud calls “anaclitic object-choice.”

Like the notion of “deferred action” (*Nachträglichkeit*), that of “anaclisis” or “leaning-on” or “propping” (*Anlehnung*) constitutes a major theoretical concept that always remained latent in Freud's own work. Freud devoted no article or complete discussion to it,

and the notion lay undeveloped in psychoanalysis up until the nineteen-sixties (Laplanche & Pontalis, 1967/1973). An important reason for this inattention is doubtless the fact that the *Standard Edition* did not heed the consistent use of the German word nor translate it in a systematic way; its preferred rendering, moreover, was the artificial “anaclisis.” It has to be said that the concept was not identified either, as such, in Freud's texts or in German psychoanalysis. Since the notion was eminently problematical, and since Freud did not set an example by thinking the matter through, things were simply left fallow.

The German substantive *Anlehnung* is derived from the verb *Sich anlehnung*, meaning to “lean on” or “prop oneself on” (Laplanche, 1970/1976, p. 15–16). The term appears regularly in Freud's work, especially prior to 1920. What it describes is the support that sexuality derives, at the beginning, from various functions and bodily zones related to self-preservation: the mouth, the anus, the musculature, and so on. It is thus intimately bound up with the Freudian conception of infantile and adult sexuality as a much-broadened sphere, far more comprehensive than the genital alone, and indeed extending to the entire body.

The notion made its appearance in the first edition of *Three Essays on the Theory of Sexuality* (1905d), and was further explicated in later revisions of that work. It occurs for the very first time as a designation for the way in which anal sexuality is bound to the excretory function. The most explicit account, however, concerns sucking at the breast: “The satisfaction of the erotogenic zone is associated, in the first instance, with the satisfaction of the need for nourishment. To begin with, sexual activity attaches itself to functions serving the purpose of self-preservation and does not become independent of them until later... The need for repeating the sexual satisfaction now becomes detached from the need for taking nourishment” (1905d, pp. 181–82). “At a time at which the first beginnings of sexual satisfaction are still linked with the taking of nourishment, the sexual instinct has a sexual object outside the infant's own body in the shape of his mother's breast. It is only later that the instinct loses that object... As a rule the sexual instinct then becomes auto-erotic” (p. 222).

According to Freud's description of the component instincts, the bodily source, the aim, and the object of an instinct need to be in a particular term-to-term relationship, on the one hand with respect to self-

preservation, and on the other with respect to sexuality. Freud's account is most explicit apropos of the object: self-preservation may show sexuality the way to the "choice of an object," in which case that choice is made on the model of one of the people important for the child's survival—"the woman who feeds" or "the man who protects." This "anaclitic (attachment) type of object-choice" is contrasted, in "On Narcissism: An Introduction," with "narcissistic object-choice," where the object is chosen on the model of the self (1914c, pp. 87–90).

The idea of anaclisis contains the seeds of an interesting theory of the genesis of the sexual drive. It proposes that this drive definitely develops on the basis of an organic factor, namely the self-preservative function, but that it then detaches itself therefrom, so becoming autonomous, and in the first instance autoerotic, bound to sexual fantasy. This incipient theory was never worked out by Freud: it was firmly rooted in his first theory of the drives (which contrasted sexuality and self-preservation), and its integration into the framework of his "second dualism," that between the life and death drives, would have entailed a complete overhaul of that scheme. Its most troublesome aspect, however, lies in the assumption that the self-preservative and the sexual drives can be treated as comparable, as two parallel yet somehow identical processes. For the very idea of *Anlehnung* implies to the contrary that there is an essential disparity here: the sexual drives are assigned their aims and objects by other processes—by bodily functions or needs—and this implies that sexuality is initially indeterminate.

What Freud's introduction, then his abandonment, of the notion of anaclisis encourages us to do, therefore, is revisit the distinction between the notion of drive (*Trieb*) on the one hand, and that of instinct (*Instinkt*) or bodily function on the other. There are three very different ways of approaching such a task.

A first interpretation posits a sort of developmental parallelism between two types of process, equally biological in nature, as for example nourishment and oral sexuality. According to this model, the operation of self-preservation is seen as triggering erotogenic stimulation. This stimulation is then repeated in an endogenous way (what Freud calls "sensual sucking"). This somewhat mechanical model postulates that the sources, the aims, and even the objects of the two kinds of drives are clearly discernible and discrete, even though, to begin with, they operate in parallel.

A second approach looks upon anaclisis as the correlate of a kind of hatching process, with infantile sexuality functioning in two different ways: at a first moment sexuality props itself upon a bodily function (nutrition, say) even to the point of becoming indistinguishable from it; then, in a second mode, it separates and becomes at once autonomous, autoerotic, and of the nature of fantasy. In the course of this complex transformation, the notions of source, aim, and object undergo a kind of mutation and symbolization. In the case of nourishment, for instance, the object of self-preservation is milk, whereas the sexual object is the breast. From this standpoint, it would be inaccurate to speak of a hallucinatory satisfaction, because the shift from the need for milk to the incorporation of the breast is a movement from the order of need to the order of fantasy and desire.

Thirdly and lastly, it may be objected that this second interpretation is inadequate in that the sexual drive could not arise from physiological functions by means, purely and simply, of some mechanism of "mentalization," some kind of endogenous creation. Rather, it is arguable that the intervention of a sexual other—the adult as opposed to the child—is a primordial requirement if symbolization and sexualization is to take place, if the splitting of sexuality, its binding to fantasy and its functional autonomy, are to be achieved. In this view, it is in the context of seduction that the organic source (the lips, the tongue) comes to be defined as erotic, that the object (the mother's erotogenic breast) imposes itself, and that the aim (for example cannibalistic incorporation) is specified—far beyond the simple ingestion of nourishment.

## ANACLITIC DEPRESSION

The term “anaclitic depression” was coined and promoted by René Spitz. Its first significant mention was in Spitz’s article on “Hospitalism” (1945). The kindred concepts of hospitalism and anaclitic depression are described in chapter 14 of *The First Year of Life* (Spitz and Cobliner, 1965) in the context of a discussion of “The Pathology of Object Relations.” Spitz might be said to have opposed both Otto Rank’s thesis of the “trauma of birth” and the Kleinian idea of the “depressive position” in order to emphasize the study of anaclitic depression, weaning, and the development of the ego.

Spitz’s use of the word “anaclitic” in this connection is in fact rooted in the Freudian notion of *Anlehnung*, or “leaning on,” translated in the Standard Edition as “anaclisis.” The etymological origin of “anaclisis” is the Greek *ana-kleinen*, “to support (oneself) on.” The idea underlying Spitz’s “anaclitic” is thus that of a relational object on which the subject can rely for support in the course of self-construction and self-differentiation; the perspective is the same as Freud’s when he said that object-relationships depended anaclitically on the satisfaction of self-preservative needs. It will be recalled, too, that Freud distinguished between two types of object-choice, the anaclitic and the narcissistic: “there are two methods of finding an object. The first . . . is the ‘anaclitic’ or ‘attachment’ one, based on attachment to early infantile prototypes. The second is the narcissistic one, which seeks for the subject’s own ego and finds it again in other people” (1905d, note added in 1915, p. 222n; see also Freud, 1914c, pp. 87–88).

The anaclitic object plays an important part in Spitz’s theoretical model of the genesis of the object, a model taken up in France by such authors as René Diatkine and Serge Lebovici (1960). It may be defined as that object which the young child uses for purchase as he constructs and discovers his ego and as, at the

same time and as part of the same progression, he passes through the three stages described by Spitz: an objectless stage, a pre-objectal stage, and an objectal stage properly so called. To characterize this object as anaclitic is furthermore quite in harmony with the Freudian notion of anaclisis, for it is through the satisfaction of its self-preservative needs that the baby in Spitz’s model discovers the object and the object-relationship, a relationship that obtains not in the world of needs but in the world of wishes.

There can be no doubt that his extremely fruitful theorizing enabled Spitz, in his time, to propose a model of the genesis of mental representations that was at once developmental and metapsychological, and thus sharply distinct from that of John Bowlby, who has indeed been taken to task for somewhat shortcircuiting the issue of mental representations. At all events, two very different theoretical (and clinical) approaches to depression in infants have resulted.

For Spitz, such depressions are attributable to emotional deficiency—a partial deficiency in the case of anaclitic depression (which is reversible), but absolute in the case of hospitalism (irreversible, at least in principle). Mary Ainsworth (1962; see also Spitz, 1965, p. 267) has reiterated that such situations of emotional deficiency may be described as “quantitative” in that they are the outcome of an absence of the anaclitic object in actual historical reality (i.e., the physical separation of mother and child).

When the anaclitic object is missing from the relational environment, the child’s instincts, and notably its aggressive instincts, are turned against the child itself; it has no external object upon which to focus, and at the same time no sufficiently stable and differentiated internal representation of the object yet exists. The danger of anaclitic depression and hospitalism is thus at its most acute between the ages of one and one-and-a-half, or in other words between the objectless stage and the fully objectal one.

Claims to the contrary notwithstanding, such psychopathological situations are by no means rare, and naturally they are very common during times of social disruption (war, displaced populations, natural disasters, etc.). It is interesting to note, historically speaking, that it was roughly at the same moment, in the immediate aftermath of World War II, that two things happened: no sooner had researchers turned their attention for the first time to the unsuspected abilities of babies, than René Spitz, Anna Freud, Dorothy

Burlingham, John Bowlby, and others described depression, and Leo Kanner autism, in early infancy. It was as though according babies the “right” to a mental life of their own immediately entailed the possibility of their experiencing all the difficulties that inevitably attend any real mental activity: pain and suffering in the case of depression, madness in that of autism or early psychoses.

In more recent times the idea of anaclitic conditions has been widely questioned, even dismissed, yet it is still a point of reference for a good many authors, and there is no denying that it has effectively demonstrated the importance of the quality of the infant’s relationship to the primary object in the construction of the ego, in the emergence of a representational capacity, and in the establishment of a psychosomatic equilibrium.

## **ANAGOGICAL INTERPRETATION**

The idea of “anagogical interpretation”—a kind of interpretation which moves, according to the *Robert* dictionary, “from a literal to a mystical

meaning”—derives from theology. An anagoge is a mystical interpretation that implies spiritual elevation, convergence towards a universal symbolic meaning, and an ecstatic feeling. The notion was promoted by Herbert Silberer, author of *Hidden Symbolism of Alchemy and the Occult Arts* (1914/1971).

Anagogical interpretation relates to the “functional phenomenon” that Silberer defined on the basis of his observation of hypnagogic processes. Silberer described three levels of symbolization: somatic, material, and functional. The “functional phenomenon” pertains to the capacity for symbolic generalization: it facilitates the shift from “material” symbolization of the particular contents of thought to a general symbolization, in images, affects, tendencies, intentions, and complexes that reflect the structure of the psyche.

In psychoanalytic treatment, anagogical interpretation aims at strengthening the tendency to form more and more universal symbols, whose ethical value is also reinforced. Silberer claimed that the functional phenomena were bolstered in the course of an analysis.

This idea of interpretation as a generalizing idealization in the here and now is at odds with the Freudian conception based on the personal dimension, the erogenous zones, and deferred action. Freud recognized the utility of Silberer’s hypotheses for explaining the formation of ideas and the dramatic character of dreams, but he criticized his extension of it to the technique of interpretation (as did Ernest Jones, who likened Silberer’s approach to Jung’s). Freud further rebuked Silberer for falling prey to the defense mechanisms of rationalization and reaction-formation.

## ANALITY

The term “anality” may refer to the second stage of libido development, to a feature of the pregenital organization of the libido, to an aspect of sexual life, or to a salient personality trait. In his letter to Wilhelm Fliess of November 14, 1897, Freud indicated that by adulthood the regions of the mouth and throat and of the anus no longer “produce a release of sexuality” (1950a, p. 279). Their appearance and representation no longer excite, but instead provoke the disgust associated with repression. In *Three Essays on the Theory of Sexuality* (1905d), Freud defined anality as sexual activity in the child that is anaclitically dependent on another physiological function: defecation. The erogenous zone, the zone of attachment of the impulse, is in this case the anal region. This is why certain disturbances of a neurotic origin involve a range of digestive disturbances.

In “Character and Anal Eroticism” (1908b, p. 169), Freud discerned some specifically anal character traits: orderliness, parsimony, and obstinacy. These traits, in his view, are the result of the sublimation of anal eroticism. The handling of money, for example, is clearly connected with an interest in excrement.

In a letter to Dr. Friedrich Krauss (1910f), Freud spoke of the universal tendency of people to “dwell with pleasure upon this part of the body [the anus], its performances and indeed the product of its function” (p. 234). In “The Disposition to Obsessional Neurosis” (1913i), Freud distinguishes passivity, fed by anal eroticism, and activity (mastery), which coincides with sadism. Accentuating this eroticism during the stage of pregenital organization will, during the genital stage, leave men with a significant disposition to homosexuality. When he began his fundamental study “Mourning and Melancholia” (1916–1917g [1915]), Freud wrote, “As regards one particular striking feature of melancholia that we have mentioned, the prominence of the fear of becoming poor, it seems plausible to suppose that it is derived from anal erotism which has been torn out of its context and altered in a regressive sense” (p. 252).

In Freud’s correspondence with Karl Abraham (Freud, 1965a [1907–1926]), the study of melancholic depression was a central theme. Abraham (1927), considered object loss to be an anal process. One form of behavior specific to melancholic depression is an impulse for coprophagy (feeding on feces), which is associated with the oral process typical of introjection and central to melancholy. Abraham went on to claim that anal eroticism embodies two diametrically opposed forms of pleasure. The same opposition can be seen in sadistic impulses. His distinction between two anal-sadistic stages—primitive expulsion (a show of hostility toward the object) and late retention (including tendencies to dominate)—therefore seems fundamental. For Abraham, sexual development after the oral phase went through a second, anal-sadistic, phase, reinforcing the ambivalence that arose during the oral-sadistic substage. This phase itself comprises two substages. The first is characterized by destructive tendencies, while in the second the subject seeks to possess and preserve the object. Freud summarized this approach in his *New Introductory Lectures on Psycho-Analysis* (1933a).

Melanie Klein (1940) adopted Freud’s and Abraham’s conception of depression and mourning, and expanded on it. She treated melancholy as associated with loss of the object and theorized that the archaic character of some pathologies is signaled by the mechanisms of projection and splitting. For Klein (1945), fantasies of emptying the breast and penetrating it to steal its milk, or of attacking it to fill it with fecal matter, underlay paranoid anxieties. Klein then describes the mechanism of projective identification, which is based on earlier work of hers (1955). Through this mechanism, parts of the self empty out into various objects. In this connection, anality assumes central importance in pregenitality and the capacity for sublimation.

Donald Meltzer (1966) makes use of the concepts of the false self and the as-if personality, introduced by Donald W. Winnicott and Helene Deutsch, in his investigation of the features of pseudomaturity, which he associates with anality. Meltzer views anality as a defense against a relation to the breast, and later against the total mother-object.

André Green (1973) suggests that anal regression leads to the destructuring of thought. Primary anality provokes, attacks, and discharges until a state of blank psychosis arises. This approach allows Green (1983) to

distinguish two forms of narcissism: a narcissism associated with the life instinct and a narcissism associated with the death instinct (a negative form of narcissism).

## ANAL-SADISTIC STAGE

The anal-sadistic stage, the second type of organization of libidinal cathexes, instates the anal zone as the predominant erotogenic zone during the second year of life. The relation to the object during this period is shot through with meanings relating to the function of defecation (expulsion or retention) and to the symbolic value of feces (given or refused).

Freud saw the conflicts of this stage as defining for the sadomasochistic object-relationship and its three characteristic dichotomies: activity/passivity, domination/submission, and retention/expulsion.

The anal-sadistic stage takes form during the second year of life, which is devoted to the mastery of the object and the development of the “drive for mastery.” Anal erotism, anaclitically attached to the retention or evacuation of feces, becomes conflicted during this stage.

The erotogenic zone involved is not confined exclusively to the anal orifice, but extends to the whole ano-recto-sigmoidal mucosae and even to the digestive system as a whole and to the musculature responsible for retention and evacuation. The instinctual object cannot be reduced solely to feces to be retained within the body or expelled into the outside world, for during this time the mother and people around her also function as partial objects to be mastered and manipulated.

The instinctual aims of this period are twofold: to gain erotic pleasure linked to the erotogenic zone and mediated by stools and to explore ways to manipulate and master the mother, who is now beginning to be differentiated. “The child looks upon its stools as a part of itself that it may either expel or retain (a gradual differentiation between inside and outside) and

that thus becomes a medium of exchange between itself and the adult” (Golse, 1992).

Freud placed special emphasis on the symbolic meanings of giving and withholding attached to the activity of defecation. He showed how anal erotism, which is linked to both destructive expulsion and conservative retention, assigns to feces the role of a part-object that the child can use either to please or to challenge the mother. “Defaecation affords the first occasion on which the child must decide between a narcissistic attitude and an object-loving attitude. He either parts obediently with his faeces, ‘sacrifices’ them to his love, or else retains them for purposes of auto-erotic satisfaction and later as a means of asserting his own will” (Freud, 1917c, p. 130). Freud went on to stress the symbolic equivalence of feces, gifts, and money. This equivalence was further extended with the notion of a “little, detachable part of the body” (excrement, the penis, and the baby) that can stimulate a mucosal passage by entering and leaving it. These parts, as detachable parts of the body, are symbolically interchangeable. It is worth noting that even before describing the anal-sadistic pregenital organization, Freud had earlier made a connection between certain character traits in adults (love of order, avarice, and obstinacy) and the child’s anal erotism (1908b).

Following Freud’s lead, Karl Abraham (1927, pp. 422–433) proposed to divide the anal-sadistic stage into two phases on the basis of two contrasting kinds of behavior with respect to the object. In a first, expulsive phase, dependent on the musculature, auto-erotism is associated with evacuation. This period is sadistic in the sense that the expulsion of the destroyed object also acquires the meaning of an act of defiance toward an adult. A second, retentive phase is passive and masochistic in character. The instinctual aim here is mastery of the object, which implies its preservation. This phase is masochistic in that it involves an active search for pleasure through painful retention and dilation of the mucous membranes and anal canal.

The anal stage is thus a time of ambivalence par excellence, when the same fecal object may be either preserved or expelled, and may thus underpin two quite different types of pleasure and assume the qualities by turns of a good or bad object.

For Abraham (1924/1927, p. 433), the dividing line between the first and second phases of the anal stage correspond to the boundary between psychosis and neurosis. In his view, in the psychoses the object is

expelled and lost, whereas in obsessional neurosis it is withheld and preserved. In the neuroses, preservation of the object implies that retention wins out over expulsion and that ambivalence is resolved, with the result that there are fewer splits of various kinds. This underscores the role of an obsessional organization in maintaining the link to the object.

In *The psycho-analysis of children* (1932/1975, pp. 144–146), Melanie Klein described anal-sadistic fantasies in which objects (and the subject too, by way of the law of talion [an eye for an eye]) are attacked by poisoned or explosive fecal matter.

## ANALYSAND

During the earliest days of psychoanalytic practice, Freud and his students, excited by their discoveries, put great emphasis on the active role of the psychoanalyst. Even though he showed himself to be less of an inquisitor than in the *Studies on Hysteria*, it was the analyst who intervened, interpreted, “analyzed,” and the patient was, at least in theory, the person on whom some form of therapeutic activity was practiced. The patient was the “analysand” of a psychoanalyst, who possessed the necessary theoretical knowledge from having first “undergone” the initiatory experience of psychoanalysis himself.

British authors were the first to use the gerundive form “analysand” to refer to the patient in analysis. The term is found as early as 1925 in the *International Journal of Psycho-Analysis* and was regularly used by English authors before the Second World War. As psychoanalysis developed and spread, and as increasing emphasis was placed on the transference and countertransference in the dynamics of therapy, the patient turned out to be at least as, and sometimes more, active than the analyst. In 1972 Joyce McDougall created the term “anti-analysand.”

### **“ANALYSIS OF A PHOBIA IN A FIVE-YEAR-OLD BOY” (LITTLE HANS)**

This important publication of 1909 was the first case study in which clinical material, derived directly from the treatment of a child, was presented as evidence in support of Sigmund Freud's theories of infantile sexuality. The somewhat unorthodox treatment was carried out by the child's father under the “supervision,” mainly by way of letters, of Freud himself.

This case study played a significant role for Freud in consolidating his new theories concerning infantile sexuality. While his major findings about the existence of the Oedipus and castration complexes, and the sexual life and theories of children, had originally been derived from the analysis of adults, the case of “Little Hans” (as it has come to be called in the psychoanalytic literature) provided the independent “proof” Freud needed, using clinical material obtained from a child. The case of Little Hans delivered compelling clinical examples which confirmed many of the theoretical statements made in the *Three Essays*

*on the Theory of Sexuality*, which Freud had published in 1905, and which were, at that time, regarded as scandalous.

Little Hans, whose father had been sending Freud reports about his son's interest in sexual matters and his curiosity about his body and the bodies of others—an interest centered especially upon the anatomical differences between the sexes—suddenly developed a phobia (an infantile neurosis). He refused to leave the house and go into the street for fear of being bitten by a horse. The paper “The Analysis of a Phobia in a Five-Year-Old Boy” is the account of the development, the interpretation, the working through, and partial dissolution of the neurotic conflicts from which the phobic symptom originated. This first “child analysis” was conducted, with “supervision” from Freud, by Max Graf, Hans's father, an early follower of Freud's. His wife, Hans's mother, had been in analysis with Freud, while Graf was a participant in the Society's Wednesday meetings.

Freud had Hans and his father in to see him, and realized that the details of the appearance of the horse that so frightened the boy stood in fact for the eye-glasses and moustache of the father. Freud's revelations prompted Hans to ask his father, “Does the Professor talk to God, as he can tell all that beforehand?” (p. 42–43) Freud indeed played the *éminence grise* in this story, and the father reported several times to Freud that Hans had requested him to convey this or that fantasy to him, apparently secure in the feeling that “the Professor” would know how to interpret them.

What the case of Little Hans documented were the now well-known elements of the phallic-oedipal phase of sexual development. Evident were the high esteem in which the penis is held by the child as a source of pleasure; the love of the parent of the opposite sex and the rivalry with the (otherwise loved) same sex parent; the pleasures of looking and being looked at; persistent thoughts about the parents' sexual activities, about pregnancy and birth; and jealousy, death wishes, and castration anxiety.

The case study cannot however be seen simply as a description of a specific clinical syndrome or as the extension of analytic technique to children. It also made clear for the first time, as Anna Freud (1980) pointed out, the complexity of the child's emotions and thinking, and graphically illustrated how inner conflicts arise through the mutually contradictory demands of the drives, the developing ego and

superego structures, and the external world, and how this process can be accompanied by compromise formations in the form of neurotic symptoms. The paper documents the arduous task for the still immature ego of finding compromise solutions to these conflicts. The publication is also considered to be an important step in closing the gap between pathology and normality, between psychic health and psychic illness.

The case study of “Little Hans” proved to be the forerunner of the development of child analysis (in the work of Anna Freud in Vienna and London and Melanie Klein in Berlin and London) and the direct observation of children.

Freud’s explanation of the outbreak of Little Hans’s phobia is as follows: the phobic symptom, that a horse might bite him or fall down, was a compromise formation which was developed in an attempt to solve the oedipal conflict, with which he was struggling. Hans’s sexually excited attachment to his mother and his ambivalent feelings towards his father, whom he loved deeply, but who stood in his way as a rival for the reciprocation of love from his mother, gave rise to castration anxiety and the fear of being punished, as well as to guilt feelings and to repression. The birth of his sister heightened the conflict as she too was seen by Hans to be a rival for his mother’s attention and affection. Hans was able quite openly to express his death wishes towards his sister—but the repression of his aggressive impulses towards his father strengthened his castration anxiety and forced him—through the mechanisms of displacement and externalization—to create a phobic object which could be avoided. In this way Hans’s inner conflict was converted into an external danger, which he could escape through flight. He was thus able to ward off an even greater anxiety, that of castration. The development of the phobic symptom fulfilled the function of helping to maintain Little Hans’s psychic balance.

## “ANALYSIS TERMINABLE AND INTERMINABLE”

In response to Rank’s proposal of providing shorter cures, Freud, using the example of the Wolf Man, makes the central theme of this article the duration of the treatment and “the part of the transference which had not been resolved” (p. 218). The problem of the slow progress of an analysis “leads us to another, more deeply interesting question: is there such a thing as a natural end to an analysis?” (p. 219). A terminated analysis supposes that two conditions are fulfilled: first, the patient must be relieved of symptoms, inhibitions, and anxieties, and second, enough of the repressed must be made conscious and elucidated, and enough of the resistance conquered, so as to banish the risk of repetition.

Three factors affect the length of a treatment: “the constitutional strength of the drive,” “traumas,” and the “alteration of the ego” (pp. 220–221). Freud indicated that if the traumatic factor is preponderant, the situation favors progress towards a “definitively terminated” analysis (p. 220). Two factors are responsible for interminable analyses: “the constitutional strength of the drive” and “an unfavorable alteration of the ego acquired in the defensive struggle” (pp. 220–221) that results in a kind of dissociation or restriction of the ego.

To follow dialectical reasoning by opposing a “terminated analysis” to an “interminable” one might not be of use for theoretical research on the end of analysis. Too much stubbornness on this point could reinforce a somewhat ideological position consisting, as Freud wrote in “Remembering, Repeating and Working-Through,” “in resolving every one of the patient’s repressions” and “in filling all the gaps in his memory” (1914g, p. 220). A failure to achieve this end could result from the constitutional strength of the drive being rooted in biology.

In 1937, the metapsychological model explained most closely the economic and dynamic aspects of clinical experience, aspects that had previously eluded explanations using the notion of opposition of forces. Thus the end of analysis was described by means of a much more complex psychic apparatus involving both the first and second topographies, as well as two classes of drives that place the “psychic conflict” at the center of mental functioning.

When drive is mentioned in this late work, it must be understood in the context of a two-drive model, whether in its relation to the object or to the ego. The pressure of the drives is countered by the ego, which sets up a resistance using various defenses, some of which, as “reaction-formations,” constitute the louder aspects of neurosis. Though Freud used the term “transference-love,” Eros is not the only component in the dynamics of the transference. Various obstacles face the analysis, with the risk of a negative therapeutic reaction always on the horizon. These negative developments might be moderate during the analysis only to flare up at full intensity after its termination.

On the basis of two examples, Freud implicitly introduced two essential ideas regarding the end of the treatment. The first concerns what would now be called the counter-transference in relation to a young female homosexual. The second idea involves the time of exploration necessary for the numerous returns of negative currents.

This article implicitly links the themes of psychic conflict, failure to achieve completion, the negative, and counter-transference. Resistance to the loss of the object and to the constitution of masculine and feminine identifications is grounded in the dynamics of the binding of the two drives, itself influenced by the transference and the analyst’s interpretations.

In this work, Freud did not directly raise the issue of the analysand’s desire to become an analyst, although he very probably was referring to Sándor Ferenczi when he mentions the belated disclosure of the negative transference. The remnant of negative transference that is the desire to become an analyst was made the subject of a study by Jean-Paul Valabrega concerning analytic training (1994).

The negative current is one working perspective outlined by Freud in this late text. Several subsequent authors, each in their own way, revisited the question of the negative. As different as their works might be, one common point becomes clear, namely that an analysis,

even in the favorable case of a transference neurosis, confronts the protagonists with the play of binding and unbinding of the drives and with inevitable negative phenomena. The length of treatment, which has increased over time, is due, in large part to a wish to analyze the negative currents, particularly in the transference.

## ANALYTIC PSYCHODRAMA

There is a distinction to be made between psychodrama, a method of investigating psychic processes by dramatizing improvised scenes staged and acted by a group of participants, and “analytic psychodrama,” a form of analytic psychotherapy that uses a play and its dramatization as a means of elucidating unconscious phenomena. In analytic psychodrama the emphasis is on the interpretative function of the play: a play leader analyzes transference and resistances. The drama

presented in the play is an invitation to engage in symbolizing, which is often fragile in the kind of patient for whom this therapy is intended.

Psychoanalysis is indebted primarily to Jacob Levy Moreno (1889–1974) for the remarkable insight of deploying theatrical improvisation and its dramatization in plays in the service of psychoanalysis. He continually combined his psychiatric training with his training as an actor to open up new modes of expression that used lively dialogue and developed a rediscovered spontaneity. He anticipated that such a catharsis would lead to an emotional release, facilitated by body language. Later he moved on to a more specific study of interpersonal group relations, which subsequently formed the basis for his theory of roles and interaction (sociometry).

After the Second World War, interest in theories about groups and group methods developed rapidly and found a particularly favorable reception in France. In the wake of the work of Georges Heuyer in child psychoanalysis and Mireille Monod in psychodrama, Serge Lebovici undertook the first analytic psychodramas with children. He based his practice on psychoanalytic findings and thereby instigated the gradual process by which psychodrama, founded on Moreno's theories, became established. Informed by a wealth of observations, the field of psychodrama then grew and was extended to adult psychotherapy.

In Great Britain, the Tavistock Clinic was the source of group therapies, which benefited from Wilfred R. Bion's remarkable contribution. In the United States, group therapy and psychodrama became particularly fashionable, with the American Society for Group Psychotherapy and Psychodrama in New York as its starting base. In Argentina, following the years of repression under the military dictatorship, psychodrama underwent a new expansion. In particular, an association for psychodrama and group psychotherapy was founded there in 1963. Psychodrama also began to emerge in Russia, Czechoslovakia, and Vietnam, where it remains strongly characterized by Moreno's influence.

In practice, an analytic psychodrama is centered around a theme suggested by a patient, which is acted out by him and the other participants. Instead of the free associations used in classical treatment, the patient is invited to act out and stage everything that comes to mind with the help of the other actors. Anything can be acted out, though it has to remain in the realm of the play. Through the reaction that it

produces, the play resuscitates what is often a deficient psychic dynamic. The drama enacts and accomplishes the following:

- The dramatization of conflicts. Affect is connected with words and gestures, which allows the drives to be based in the body.
- Access to representability. The drama enacted by the actors and the interpretation provided by the play leader facilitate the formulation of otherwise inexpressible anxieties and thereby suggest representations often containing affects that are painful to the patient's ego.
- Mediation through the play. By reducing the influence of censorship, the fiction created by the play lifts certain inhibitions and facilitates access to unconscious conflicts. The enjoyment of the play reinforces the subject's narcissism and his confidence.

There are many varieties of psychodrama, which bears witness that the practice is evolving, creative, and receptive. There is the form of group psychodrama in which the theme is one shared by the whole group and is interpreted accordingly. There are also two main varieties of psychodrama with individual themes: individual psychodrama and group psychodrama. In these latter two types of psychodrama, a patient or group of patients meets with a team of therapists. In either case, the theme is always individual, as is the resulting interpretation. There are three types of participant in psychodrama: the patient, who chooses the scene, a character to play, and the roles to be assigned to the other actors; the other actors, who act out the suggested scene (their acting has a primarily interpretative purpose, being closest to the unconscious impulses expressed by the patient); and the play leader, who does not act but interprets and makes connections between the meaning of the different scenes. The play leader also assists in the staging and reinforces the setting. To the play leader falls the task of interpreting the transference.

Whether the use of analytic psychodrama is indicated depends more on the patient's mode of functioning than on nosographic categories. Psychodrama is more often recommended for patients who suffer from sensory deprivation or rigid defensive procedures, who are deficient in their ability to fantasize, or who harbor dominant psychotic fears. Furthermore, since psychodrama was first used in treating child and

adolescent pathologies, it continues to be the treatment of choice for young patients.

## **ANALYTICAL PSYCHOLOGY**

Founded by Carl Gustav Jung, the field of analytical psychology is the descendent of the “Zürich School” of psychoanalysis which Jung spearheaded while still the heir apparent to Freud and the first president of the International Psychoanalytic Association (1910–1914).

The first written occurrence of the name “analytical psychology” is in a lecture delivered by Jung to the Psycho-Medical Society in London on August 5, 1913 (“General Aspects of Psychoanalysis”). Conceived by Jung as a general (depth) psychology, the field grew in size and developed in complexity both during Jung’s lifetime and after his death in 1961. By 1997 it had come to embrace some two thousand professional analysts on five continents.

In the years 1907–20 Jung worked out the main outlines of his theory, which set the course for analytical

psychology. By the end of this period, the theory included psychological types, the theory of complexes and archetypes, the notions of persona, shadow, and anima/animus, and the individuation process.

Among the factors that have distinguished analytical psychology are: (a) a synthetic/symbolic component in analytic treatment; (b) a view of libido that includes a broad range of instinct groups, as well as a theory of culture that sees it based not on sublimation of sexuality but on symbolic transformation processes native to the psyche; (c) a notion of the unconscious that includes strivings toward growth and development, intelligent purpose, and orientation to meaning rather than narrowly limited to a pleasure orientation and a drive to tension release; (d) minimization of the psychosexual stages of development in childhood in favor of lifelong psychological development.

Technique also contributes important distinguishing features to analytical psychology: (a) while retaining a strong sense of the importance of transference and regression, Jung placed patients in a chair vis-à-vis the analyst and asked them to interact and maintain a dialogue; (b) frequency of sessions is variable from twice to five times per week, depending on the need; (c) the personality of the analyst as well as the analyst’s associations (“amplifications”) to dreams and other unconscious material come into play in a more open and explicit fashion, and the analyst seeks to be somewhat transparent and self-disclosing of emotional reactions.

Already when Jung broke with Freud at the end of 1912 he enjoyed an international reputation and quickly attracted his own students from many parts of Europe and the United States. These men and women typically returned to their countries of origin and began Analytical Psychology Clubs or similar study groups in their home cities: London (1922), Paris (1926), New York (1936), San Francisco (1939), Los Angeles (1942), Tel Aviv (1958). Interest in Jung’s ideas was strong also in Berlin, but since many of the physicians drawn to him were Jewish (Gerhard Adler, Ernst Bernhardt, Werner Engel, Jean Kirsch, Ernst Neumann) and fled to the United States, England, Italy, and Israel during the 1930s, and because of the Nazi rise to power and the outbreak of World War II, the founding of a Jungian organization in Germany was delayed until 1962.

Gradually these Analytical Psychology Clubs fostered professional analyst societies which, after the

Second World War, began sponsoring training institutes. The Society of Analytical Psychology, London (1945) led by Gerhard Adler, Michael Fordham, and Edward A. Bennett founded the first training program. Next came the Carl Gustav Jung Institute/Zürich (1948) with Carl A. Meier as President. In the 1960s, training institutes appeared in many parts of the world: Italy (1961), New York (1962), Germany (1962), San Francisco (1964), Los Angeles (1967), and France (1969). In the following decades, professional societies and training institutes also developed in Austria, Australia/New Zealand, Brazil, Israel, South Africa, and many urban centers in the United States. By 1996 there were twenty-three training institutes in existence worldwide.

The International Association for Analytical Psychology (IAAP), founded in 1955 to serve as an international umbrella organization for all professional analyst groups within the field of analytical psychology, provides a network of communication and collegiality for Jungian analysts throughout the world. There are presently thirty-two member groups of IAAP. Every three years the IAAP sponsors a Congress and publishes the papers presented. The Zürich Congress of 1995 was the thirteenth to be held.

As the field of analytical psychology developed, it experienced a vigorous display of diversity and polarization. The issue that has most divided it is the same one that originally caused the rupture between Jung and Freud: a symbolic, prospective approach to interpretation and clinical practice vs. a reductive one. Within analytical psychology this has been referred to variously as the Zurich vs. London, the classical vs. developmental, or the symbolic vs. clinical tension. In every version of this debate, the questions revolve around whether to give more prominence to working synthetically and symbolically with dreams and other direct manifestations of the unconscious or to devote one's efforts exclusively toward technique and the analysis of personal issues involving early childhood and developmental traumas, resistance, and transference. The classical school bases itself centrally on the writings of Jung and his close followers such as Marie Louise von Franz, Carl A. Meier, and Edward Edinger, while the developmental school incorporates many ideas from modern psychoanalysis, particularly object relations theory. The leading figure of the latter movement was Michael Fordham. The most recent generation of analysts has attempted to synthesize these two

opposing trends and to find a balanced approach. Some have carried out investigations of the character disorders, dissociative states, and the interactive field (transference-countertransference). There have also been movements in recent decades to apply analytical psychology to the analysis of children and adolescents, society and politics, art and popular culture, small groups and large corporate organizations, and marriage and family dynamics.

Scientific studies testing the hypotheses of analytical psychology continue in many universities and institutes throughout the world. Journals of analytical psychology appear regularly in English, French, German, Italian, Japanese, Korean, and Portuguese. The most important of these are: *The Journal of Analytical Psychology* (London, est. 1955), *the Cahiers Jungiens de Psychanalyse* (Paris, est. 1974), and *the Zeitschrift für Analytische Psychologie* (Berlin and Zürich, est. 1969).

## ANALYZABILITY

The concept of “analyzability” appeared late in the psychoanalytic literature and has two different meanings: One was the classical designation, following the medical model, concerning “indications and contraindications” of the psychoanalytic treatment; the other referred to the realization of a limit to interpretation, that is, the recognition that there is an “analyzable” element and an “unanalyzable” element in what the psyche produces. It was the abandonment of the strict medical model and the attempt to take into account purely psychoanalytic factors that led to the emphasis, when discussing the progress of an analysis, on the concept of analyzability. Preliminary interviews are intended to estimate and, depending on the psychopathology of the patient and his capacity for insight, orient the choice of therapy toward a conventional treatment or psychotherapeutic treatment. Some authors, like Elisabeth Zetzel (1968), have, for example, classified hysterical patients into four categories based on their “analyzability.” Other authors, especially when discussing borderline patients, have tried to define precise criteria for prognosis. These include Otto Kernberg, who feels that the ability to experience guilt is “a good prognostic sign in the evaluation of the ‘narcissistic personality’s’ analyzability” (1970). The majority of authors, however, although they do not recommend the use of trial treatments as Heinz Kohut did (1971), following Freud, recognize that the only way to judge a patient’s receptivity to analysis is through the process of analysis itself.

The other meaning refers to the limitations of what can be analyzed. Early in his career Freud put forth the idea that not everything was subject to interpretation and that we had to acknowledge the unknown element in the psychic material studied, even if clinical and theoretical efforts were intended to reduce the impenetrability: “The best-interpreted dreams often have a passage that has to be left in the dark, because we notice in the course of interpretation that a knot of dream-thoughts shows itself just there, refusing to be unraveled, but also making no further contribution to the dream-content.

This is the dream’s navel, and the place beneath which lies the Unknown” (1900a, chap. 7).

To this constraint on the “interpretative frenzy” (as Sándor Ferenczi described it) of some psychoanalysts was later added a discussion and evaluation of the limits of the effectiveness of psychoanalysis. In “Analysis Terminable and Interminable,” aside even from the limits imposed by the resistance of the id, the “viscosity of the libido,” or negative therapeutic reactions, Freud concluded, “We often have the impression, in the case of penis envy and masculine protest, of having opened a passage through the psychological strata to ‘bedrock,’ and to have thereby completed our work. Yet it cannot be otherwise, since for the psychic, the biological indeed plays the role of the underlying bedrock” (1937c).

## ANDERSSON, OLA (1919–1990)

A Swedish psychologist and psychoanalyst, Ola Andersson was born on June 8, 1919, in Luleå, in

northern Sweden, where his paternal grandparents were landowners; he died in Stockholm on May 15, 1990. Andersson wrote two important works that have served as key references in the literature: his dissertation and an article in which he describes the historical and social context in which Freud's patient Emmy von N. lived.

In 1948 he began an analysis with René de Monchy, recently emigrated from the Netherlands. When Monchy left Sweden in 1952, Ola Andersson continued his psychoanalytic training with the Hungarian psychoanalyst Lajos Székely, who was then living in Stockholm, at a time when the Swedish Psychoanalytic Society was riven by internal conflicts. He devoted himself to research on the history of psychoanalysis and the translation of psychoanalytic texts. His first translation was a work by the English psychoanalyst Charles Berg, *Deep Analysis, the Clinical Study of an Individual Case*, which was followed by translations of Freud over a period of more than thirty years. He again devoted himself to translation when he contracted cancer at the end of the 1980s.

In December 1962, Andersson defended his doctoral dissertation, "Studies in the Prehistory of Psychoanalysis: The Etiology of Psychoneuroses and some Related Themes in Sigmund Freud's Scientific Writings and Letters, 1886-1896," at the University of Uppsala. The dissertation covered the period between Freud's return to Vienna after his stay in Paris and meeting with Jean Martin Charcot, and the first appearance of the word "psychoanalysis."

Andersson insists on the fact that he focused on studying the origins of Freudianism to avoid interpreting them in the light of future discoveries in psychoanalysis. He noted that he did not take into account biographical or psychological information about Freud. His dissertation was written from within the field of psychoanalysis and treats the evolution of psychoanalytic theory as continuous. He shows how Freud, in his attempt to explain clinical observation, formulated ideas that, for the most part, recalled the Herbartian *Vorstellungsmechanik*, a dynamic interaction of ideas. Freud himself never overtly acknowledged the influence of Johann Friedrich Herbart. Before Ola Andersson, researchers like Louise von Karpinska (1914), Maria Dorer (1932), and Ernest Jones (1953) had pointed out the similarities between Herbart's psychology and psychoanalysis, but he was the first to show that Herbart's ideas served as the

dominant psychological tendency in the academic milieu in which Freud worked when he was developing his theory. This dissertation is one of the first attempts to analyze the historical sources of Freud's theories and the circumstances surrounding the birth of psychoanalysis.

In 1960 Andersson was asked by the Sigmund Freud Archives in New York to investigate the case of Emmy von N. and locate any new biographical information about her. The results of his research appeared in an article that was presented in a talk given to the International Psychoanalytic Congress in Amsterdam in 1965, but was not published until 1979 in the *Scandinavian Psychoanalytical Review* (1979, 2, 5). In the article Andersson refers to the existing biographies of those close to Freud's patients, as well as to interviews with his children and family members, and personal documents. Because of the belated publication of the article, the historian Karl Schib was able to reveal the name of Emmy von N. for the first time in 1970. She was Fanny Moser, the widow of a successful manufacturer from Schaffhausen, Switzerland.

Andersson trained with the Swedish Psychoanalytic Society (Svenska Psykoanalytiska Förening), but his professional life was for the most part conducted outside the organization. He was never responsible for training other analysts, even though he was one of the rare Swedish psychoanalysts to have conducted original research, and his clinical activity appears to have been limited. During a period when society was concentrating its efforts on the clinical training of psychoanalysts, Andersson was the only one in Sweden involved in historical research on the origins of psychoanalysis.

Throughout his life he remained in close contact with the university, although he played no official role in the academic training of researchers. His interest later turned to matters of philosophy, psychology, and religion as they related to psychoanalysis. Between 1947 and 1980 he worked in a religious institution, the Stora Sköndal, as a professor of literature, then of psychology. He participated in the activities of another Swedish psychotherapeutic institution with a strongly Protestant tradition.

In an article published in 1990 in English by a member of the Swedish Psychoanalytic Society on the history of psychoanalysis in Sweden, Andersson was not mentioned. Nor is he listed in the Swedish Encyclopedia (1989-1996). His son no longer uses his name

and there is no tombstone to mark the place where he was buried. His obituary, which appeared on May 20, 1990, in the largest daily in the region, the *Dagens Nyheter*, was written by a Swedish psychoanalyst influenced by the Christian psychotherapeutic tradition that impregnated Swedish thought throughout the entire twentieth century.

## ANDREAS-SALOMÉ, LOUISE (LOU) (1861–1937)

A Russian writer and essayist, Louise Andreas-Salomé was one of the first practicing psychoanalysts. She was born on February 12, 1861, in St. Petersburg, Russia and died February 5, 1937, in Göttingen, Germany. Louise's father, Gustav von Salomé (57 years old at the time of her birth), of German-French origin, was a general in the service of the tsar. Her mother, Luise Wilm (38 years old at the time of Louise's birth), was from a family of Protestant merchants from Hamburg. Louise, the youngest of four children (she had three older brothers) was raised under feudal family conditions and turned out to be a very willful child. She took refuge in an imaginary world peopled with its own god and threw off the constraints imposed by her family. She refused confirmation and, at the time of her father's death in 1879, turned her back on religion. She shared her existential concerns with her first spiritual teacher, Hendrik Gillot (1836–1916), a fascinating preacher in the Dutch community. It was Gillot who

gave Louise the diminutive "Lou." Together they read authors like Baruch Spinoza, whose philosophy helped structure her research in psychoanalysis. However, Gillot's proposal of marriage destroyed their relationship. Her break with Gillot was unequivocal. Lou von Salomé left for Zurich in 1880, where she studied philosophy, history, art, and theology. She outlined her approach to God in her *Essays*.

When she was 21 she met the philosophers Paul Rée and Friedrich Nietzsche in Rome, at the salon of Malwida von Meysenbug. They wanted to formalize their reciprocal fascination in a working and living community. She replied to Gillot's exhortations, "I am certainly going to shape my own life the way I see it, come what may. . . ." This belief led her to take up psychoanalysis at the age of fifty, after an extremely turbulent life.

Lou Andreas-Salomé's first foray into psychoanalysis was the *Neue Quellen*; she found new answers to old questions in her own life, which she had approached especially through literature, for there are a number of autobiographical traces in her writings. Shortly after participating in the 1911 International Psychoanalytic Congress in Weimar, she went to Vienna to become a student of Freud's. In her journal, *In der Schule bei Freud* (1912–1913), keen observations of social life and critical opinions and personal hypotheses on psychoanalysis appeared side by side. Aside from Freud she was very impressed by Sándor Ferenczi and Viktor Tausk. It was through Tausk that she was able to make her first practical observations at the clinic for nervous disorders in Vienna.

After Vienna, Lou Andreas-Salomé continued to write to Freud on a regular basis and appears to have accepted only Freud as the supervisor of her own cures. After her visit with Freud's family in 1912, she became close with Anna Freud, the focal points of their relationship being Freud the psychoanalyst and Freud the man. They worked together on a subject of common interest, the *Tagtraum-Traumdichtung* (daydream-dream poem). Anna Freud's presentation to the Vienna Psychoanalytic Society for her admission to membership at the society, entitled "Schlagenphantasie und Tagtraum" ("Beating Fantasies and Daydreams"; 1922), was the result of their efforts together and also contributed to Andreas-Salomé's admission to the society. She died on February 5, 1937, in her home in Göttingen, Loufried, where she had lived since 1903 with the Oriental scholar Friedrich Carl Andreas.

Psychoanalysis marked a turning point in the life of Andreas-Salomé, who was immersed in contemporary philosophy, the philosophy of Spinoza, and deeply affected by the theory of the psychoanalytic unconscious and the libido theory. She devoted herself to the insoluble conflict of body and soul, the soma and the psyche, sexuality and the ego, masculine and feminine—subjects that appeared in all her psychoanalytic writing between 1911 and 1931. Her style, as exemplified in *Narzissmus als Doppelrichtung* (1921), was individualistic—capricious, expressive, and poetic. With her representation of a narcissism that was “happy to develop” as a “companion of life that renews being,” she completed her work on primary narcissism as a developmental phase and narcissism as a pathological form of self-love. She emphasized the concept of “double direction” that was present in Freud’s concept of the libido but which he had not developed further. The libido is in the service of the ego instinct and the “beyond-ego” (the death instinct). In this sense she was ahead of her time. *Zum Typus Weib* (On the Feminine Type; 1914) regroups her most important ideas on femininity and psychoanalysis. She introduced the feminine point of view into psychoanalytic discourse and focused her interest on the difference between the sexes, a difference that must be considered beyond individual differences. She emphasized the complementarity of relationships. For Andreas-Salomé an androgynous image signified a loss rather than a gain for both sexes. In her essay on femininity she introduced a utopia of feminine culture.

## ANIMAL MAGNETISM

“Animal magnetism” is a term popularized by the Viennese doctor Franz Mesmer. In *Mémoire sur la découverte du magnétisme animal* (Propositions concerning animal magnetism; 1779) he defined it as the “property of the animal body that makes it susceptible to the influence of celestial bodies and the reciprocal action of those around it, made manifest by its analogy with the magnet.” He believed that a cosmic fluid attracted animate beings to one another. He considered poor receptivity to the fluid to be pathogenic, and the cure consisted in transmission of the fluid.

In Paris, Mesmer enjoyed enormous success. Faced with a crush of clients, he installed a “tub,” a round device around which patients sat in a group, and that was designed to concentrate and redistribute the fluid, resulting in beneficial convulsions. Mesmerism claimed to be a scientific discovery as well as a secret associated with initiation into a group of adepts.

In 1784 two committees appointed by the Académies Royales des Sciences et de Médecine (Royal Academies of Science and Medicine) drafted a report for the king on Mesmer’s “discovery.” The astronomer Jean Sylvain Bailly, reporter of the first committee, concluded that the fluid likely did not exist, and he sketched out an explanation in terms of “imagination” and “imitation.” In a secret report, released after the French Revolution, he noted the sexual nature of the convulsions, which he compared to orgasm.

That same year Armand de Puységur, a disciple of Mesmer, discovered (or rediscovered) that one can provoke calm crises that resemble the natural somnambulism of certain sleepers. He referred to this as artificial or induced somnambulism. From this point onward, magnetized subjects were no longer “convulsives,” but “somnambulists,” as in Puységur’s model. The somnambulists appeared changed: they uttered prophecies, showed signs of split personalities, and, under the influence of the fluid, which was supposed

to be transmitted by the “passes” of the magnetizer, exhibited extraordinary signs of “lucidity.” Puységur and his followers developed a standard form of treatment that differed considerably from what was often suggested by medical authorities. The magnetized patient directed the treatment; the magnetizer questioned the patient and let her talk (almost all patients were female). It was assumed that in a somnambulistic state the person had self-healing capacities. Magnetism became a social and cultural phenomenon of considerable importance.

In 1813, in his public lectures, Abbé José Custodio de Faria claimed that there was no need of a fluid to induce sleep, since by a simple command, a state of “lucid sleep” could be brought about in a subject. In 1823 and 1826 the physician Alexandre Bertrand returned to Bailly’s work on imagination and imitation. He connected Mesmeric phenomena to a traditional psychology of ecstasy, currently understood as a trance. An opposition was thus established, before the term “hypnotism” became popular, between orthodox fluidic Mesmeric magnetism and a heterodox psychological movement represented in France by Faria, Bertrand, and Joseph Noizet.

In Mesmeric terminology, the “relationship” refers primarily to the relation between the magnetized patient and the magnetizer. The literature in the field mentioned the sexual aspect of the relationship only rarely and with reticence. Yet love between a magnetizer and a somnambulist did become a distinct theme in fiction. Animal magnetism even became a kind of platitude, if we are to believe the article “Magnetism” in Gustave Flaubert’s *Dictionary of Accepted Ideas*: “An agreeable subject of conversation that can also be used to ‘impress women.’”

## **ANIMISTIC THOUGHT**

Freud drew the concept of animism from anthropologists such as Herbert Spencer, James George Frazer, Andrew Lang, Edward Burnett Tyler, and Wilhelm Wundt, who used it to refer to the tendency, thought to belong to people in primitive cultures and children, of attributing a soul to things and thus ascribing an intentionality to phenomena that would otherwise be understood in mechanistic causal terms. In psychoanalysis, the concept of animism is inextricably connected with projective mechanisms.

The connection between animistic thought and the mechanism of projection appears in 1912 in relation to some details concerning the relation between taboo and danger. This is a psychic danger because in the consistently applied animistic view of the universe of a person in a primitive culture, “every danger springs from the hostile intention of some being with a soul like himself, and this is as much the case with dangers which threaten him from some natural force as it is from other human beings or animals” (Freud, 1918 [1917], p. 200). Freud continued: “But on the other hand he is accustomed to project his own internal impulses of hostility on to the external world” (p. 200).

The concept of animism is further developed in *Totem and Taboo* (1912–1913a), in which it is related to magic and the omnipotence of thoughts. Here Freud attributes a world-view to animism, as an intellectual system, in which it is conceived as a vast whole that starts from a specific point. This first conception of the universe held by humanity is a mythological conception that gives way first to the religious and then to the scientific world-view. Its particular interest for psychoanalysis lies in its psychological aspect,

which is associated with the representation of souls that populate the universe and which, being separable from their original material ties, can be transposed into others. This led Freud on to the common ground that gave rise to superstition, as well as the belief in the existence of unconscious determinations or the negation of chance at an individual psychic level. Far from shying away from this kind of connection, Freud used it in 1915 as the basis for his justification of the hypothesis of the unconscious by recalling that consciousness can only ever be attributed to another person by analogy, just as animism confers a similar consciousness to that of the human being on things, plants or animals. This process of inference, which Freud designates here by the concept of identification, also justifies, with reference to the subject himself, making “the assumption of another, second consciousness which is united in one’s self with the consciousness one knows” (1915e, p. 170). The need to go beyond animism in order to be able to believe in the role of chance in external events—that is, in order not to succumb to superstition—recurs on several occasions in Freud’s work (1933a [1932]), particularly in relation to the inability to conceive of death as anything other than the result of a murder, whether this is through incompetence or negligence in the case of a doctor (Mijolla-Mellor, 1995).

The concept of animism seems to be inextricably linked with Freud’s philosophical reflection on the different forms of world-view *Weltanschauung* in particular the religious form that animism precedes and from which it differs, particularly through its connection with magic based on the belief in the omnipotence of thoughts, a belief that is also found in obsessional neurosis.

Finally, Freud found in animism a foundation not only for suggestion as a therapeutic technique but for the form in which it persists in the conduct of the analytic treatment. In this case it concerns a form of animism without a magical act, which is entirely based on “the overevaluation of the magic of words and the belief that the real events in the world take the course which our thinking seeks to impose on them” (1933a [1932], p. 166).

## **ANIMUS-ANIMA (ANALYTICAL PSYCHOLOGY)**

Anima and animus are gender specific archetypal structures in the collective unconscious that are compensatory to conscious gender identity. Thus, animus images primarily depict the unconscious masculine in a woman, and anima images primarily depict the unconscious feminine in a man.

The notion first appears in print in Carl Gustav Jung’s *Psychological Types*, in 1921.

One of the most complex and least understood features of his theory, the idea of a contrasexual archetype, developed out of Jung’s desire to conceptualize the important complementary poles in human psychological functioning. From his experiences of the emotional power of projection in his patients and in himself, he conceived first of the anima as a numinous figure in a man’s unconscious. Originally, Jung associated anima with mother and animus with father, but he soon began to identify their roots and effects in a broader spectrum. By 1925 he considered these concepts the two most comprehensive foundation stones of the psyche. Anima and animus, Jung says, are inborn as “virtual images” that acquire form “in the encounter with empirical facts which touch the unconscious aptitude and quicken it to life” (Jung, 1928, p. 300). The initial contrasexual content is introjected from the infant’s relationship with the parental figures.

Developmentally, then, separation from parental figures as primary objects is followed by the idealizing identification of anima and animus with figures in the environment, usually, but not necessarily, persons of the opposite sex. Subsequently, projections can be withdrawn from their objects and the apperception of anima/animus as intrapsychic objects made conscious. At that point anima and animus can act as the ego's interface to the collective unconscious. In most clinical instances, anima and animus figures personify the struggle between the culture-bound, collective images of masculine and feminine and the developmental urge to liberate one's individuality from collective norms.

The concept includes the potential in women and men to develop both masculine and feminine elements in themselves. The contrasexual archetypes fuel the Oedipal predicament. Differentiation between the parental imagoes and anima and animus projections leads out of the Oedipal fixation. A narcissistic identification with the contrasexual figure may result in positive or negative inflation or, alternatively, deteriorate into a state of flooding of the ego by unconscious contents.

Critics fault Jung for his confusion of outer life realities of women and men and the inner world of anima and animus images; for example, his repeated assignment of relatedness (Eros) both to anima and to women, and rationality (Logos) both to animus and to men. This confusion can lead to the false equation of culturally acquired elements with inborn male and female characteristics.

### **ANNA O., CASE OF**

Anna O. was the first case described by Joseph Breuer in his *Studies on Hysteria* (1895d). Her real name, Bertha Pappenheim, was revealed by Ernest Jones in his 1953 biography of Freud, shocking his contemporaries. When Breuer saw her for the first time toward the end of November 1880, Bertha Pappenheim, a friend of Martha Bernays (Freud's future wife), was about 22 years old. Her problems had been triggered when her father, whom she loved deeply, fell seriously ill. Her symptom was a "nervous cough," which Breuer quickly diagnosed as being of hysterical origin. She soon suffered from other symptoms as well: squinting, partial paralysis, visual disturbances, and a lack of feeling in her right arm. She also exhibited alternating states of consciousness, which drew Breuer's attention as a sign of a self-hypnotic condition that he would gradually use for therapeutic purposes.

These symptoms were followed by speech disturbances (she could only speak English, then became mute), which led Breuer to conclude that she was hiding something and must be made to speak. This therapeutic insight was followed by an improvement in her condition, but the death of her father in April 1881 caused a relapse. It was at this time that she began recounting lengthy stories in a highly dramatic

tone of voice during her self-induced hypnotic states in the evening. These were accompanied by violent affects that highlighted their significance. She referred to this initial “catharsis” as the *talking cure* and sometimes as *chimney sweeping*.

It was most likely during the summer of 1881, probably in mid-August (although Henri Frédéric Ellenberger says it occurred during the first months of 1882), that an incident occurred that was to have profound significance on the future of Breuer’s method. Anna refused to drink liquids, but in her hypnotic state revealed that she had been disgusted to discover her lady companion’s dog drinking out of her glass. When awakened she asked for a glass of water. The etiological function of the “cathartic method” was born and Breuer had her identify, for each of her symptoms, the memory of the “primitive scene” from which they originated but which had apparently been forgotten.

Between December 1881 and June 1882, a new symptom appeared, which led to a renewal of what she had experienced a year earlier, as indicated by Breuer’s notes at the time. This “talking out” (1895d, p. 36), as Breuer referred to it, was not simple, however: “The work of remembering was not always an easy matter and sometimes the patient had to make great efforts. On one occasion our whole progress was obstructed for some time because a recollection refused to emerge” (p. 37). Freud was later to draw significant conclusions about this “resistance” on the part of the patient.

In 1882, however, Breuer had little understanding of “transference,” and this continued as late as 1895, when he completed his description of this intelligent, intuitive, and kind woman: “The element of sexuality was astonishingly undeveloped in her. The patient, whose life became known to me to an extent to which one person’s life is seldom known to another, had never been in love; and in all the enormous number of hallucinations which occurred during her illness that element of mental life never emerged” (1895d, p. 21–22).

In the wake of Breuer’s colorless narrative, a number of mysteries and legends have grown up around the circumstances of the rupture of such a strong affective relationship. In fact, Breuer was apparently called to her bedside the very evening they said goodbye to one another after the conclusion of the treatment. She was in the midst of a hysterical crisis

and pretended to be giving birth “to Doctor Breuer’s child.” Ernest Jones writes that Breuer was “fled the house in a cold sweat. The next day he and his wife left for Venice to spend a second honeymoon, which resulted in the conception of a daughter; the girl born in these curious circumstances was nearly sixty years later to commit suicide in New York” (Jones, 1953, Vol. 1, p. 148).

In fact, historical research has shown that this story is false. Anna O. was hospitalized in the clinic of Kreuzlingen in July 1882 at Breuer’s request. She was suffering from neuralgic pains of the trigeminal nerve, which had led Breuer to administer increasingly strong doses of morphine, from which she eventually had to be weaned. We know that Bertha Pappenheim, even though Breuer was no longer her physician, was gradually healed and devoted her life and her writing after 1895 to helping young Jewish girls, single mothers, and orphans. She was one of the first “social workers” and her work earned her the admiration of everyone who knew her until her death on May 28, 1936.

As for Breuer, that summer he and his wife he did not escape to Venice but spent their vacation in Gmunden, near the Traunsee in Austria. Their daughter Dora was born on March 11, 1882, three months before the end of Anna O.’s treatment. But such legends die hard and the detractors of Freud and psychoanalysis continue to make use of them.

Breuer continued to care for “nervous” patients and described his method of treatment to his young protégé Freud on November 18, 1882, and again in July 1883. This was the point of departure for the etiological research that Freud, somewhat disillusioned by Jean Martin Charcot’s lack of interest in the story, was unable to begin until nearly ten years later.

In his “On the History of the Psycho-analytic Movement” (1914d), Freud, who always reported that the origins of psychoanalysis lay in “J. Breuer’s cathartic method,” (in 1910a, for example), spoke of the transference aspect that, until then, had been neglected: “Now I have strong reasons for suspecting that after all her symptoms had been relieved Breuer must have discovered from further indications the sexual motivation of this transference, but that the universal nature of this unexpected phenomenon escaped him, with the result that, as though confronted by an ‘untoward even,’ he broke off all further investigation” (1914d, 12).

On June 2, 1932, in a letter to Stefan Zweig, Freud gave further details about the end of Anna O.'s treatment while reminiscing about Breuer: "Asked what was wrong with her, she replied: 'Now Dr. B.'s child is coming!' At this moment he held in his hand the key that would have opened the 'doors to the Mothers,' but he let it drop. With all his great intellectual gifts there was nothing Faustian in his nature. Seized by conventional horror he took flight and abandoned the patient to a colleague."

The story of Anna O. has always been a source of contention. In 1895 it was published, primarily to demonstrate that the cathartic method, dating from 1881–1882, preceded the research published by Pierre Janet. In 1953 it was used by Jones to demonstrate Freud's courage and scientific creativity compared to Breuer's presumed cowardice. Following the research of Henri Frédéric Ellenberger and Albrecht Hirschmüller, the real history is better known, and while the romanticized presentation of therapy can no longer escape the notice of the psychoanalytic community, it still contains traces of Freud's later thinking. In any event, the distortions of writing do not justify believing, as the detractors of psychoanalysis such as Mikkel Borch-Jacobsen would have us do, that Breuer and Freud were charlatans and Bertha Pappenheim was simply a "fraud."

### ANNÉE PSYCHOLOGIQUE, L'

*L'Année psychologique* (AP) is the leading French review of scientific psychology. It was founded in 1894 by Henri Beaunis and Alfred Binet to publish the research activities conducted in the Sorbonne's psychology laboratory. Henri Beaunis was a physiologist and a representative of the School of Nancy. Alfred Binet was a psychologist and worked for seven years with Dr. Féré under Jean Martin Charcot (on animal magnetism, fetishism, and hysteria). He soon succeeded Beaunis as the head of the laboratory and the review.

The review went through three main periods: 1894–1911 (the date of Binet's death); 1912 to the end of the Second World War, when it was under the direction of Henri Piéron; and from the liberation of Paris until today, under the direction of Paul Fraise. It was only during the first period, under Binet's editorship, that psychoanalysis featured prominently in the review, at a time when references to the subject were practically nonexistent in France. The principal center of interest then shifted to experimental psychology. The review consists of three sections: original papers, comments and reviews, and bibliographies.

Alfred Binet, a friend of Édouard Claparède and J Languier des Bancelles, both Swiss, became interested in psychoanalysis early in his career through his relation to psychopathology and forensic psychology. But he didn't read German. In 1908, he commissioned Carl Gustav Jung to write an article on psychoanalysis, "L'analyse des rêves" (The analysis of dreams), which appeared in the 1909 issue of the AP. However, in a letter to Freud, Jung qualified the article as an "insignificant, superficial thing." In 1912 there appeared an article by Alphonse Maeder entitled "Sur le mouvement psychoanalytique" (On the psychoanalytic movement). This much longer article acknowledged the development of a Freudian school that had renewed psychiatry and psychoanalysis.

In the AP under Pieron's direction, after 1912, psychoanalysis played a minor role, and was relegated to reviews of publications by Freud and Jung, written by Pieron. The tone is generally critical. As for the young French psychoanalytic movement, it was ignored by the AP. Following the liberation, Paul Fraise replaced Henri Pieron as the editor-in-chief, reinforcing its experimental bias. After 1949 the term "psychoanalysis" simply disappeared from the bibliographic entries listed in the publication.

## **ANNIHILATION ANXIETIES**

In annihilation anxieties, the basic danger involves a threat to psychic survival, experienced as a present menace or as an anticipation of an imminent catastrophe. The experience entails fantasies and/or feelings of helplessness in the face of inner and/or outer dangers against which the person feels he can take no protective or constructive action.

The construct derives from Freud's 1926 view of a traumatic situation where the person is faced with a quantity of stimulation that he/she cannot discharge or master, a failure of self-regulation. The experience of overwhelmed helplessness has much in common with Jones' aphanisis, Klein's psychotic anxiety, Schur's primary anxiety, Winnicott's unthinkable anxiety, Bion's nameless dread, Stern's biotrauma, Frosch's basic anxiety, Little's annihilation anxiety, and Kohut's disintegration anxiety. Derivatives of underlying annihilation anxieties are fears of being overwhelmed, destroyed, abandoned, mortified, mutilated, suffocated

or drowned, of intolerable feeling states, losing mental, physical or bodily control, of going insane, dissolving, being absorbed, invaded, or shattered, of exploding, melting, leaking out, evaporating or fading away.

Annihilation experiences and anxieties are universal in early childhood, where psychic dangers are regularly experienced as traumatic. Eight related ideational contents are seen to comprise the major dimensions of annihilation anxieties: fears of being overwhelmed, of merger, of disintegration, of impingement, of loss of needed support, of inability to cope, of concern over survival, and of responding with a catastrophic mentality. Pathological annihilation anxieties are a consequence and correlate of psychic trauma, ego weakness, object loss, and pathology of the self. They can be consequential for the process of psychoanalytic therapy and may influence resistance, transference, and countertransference in a given treatment. Symptoms, thought patterns, affect states, and behaviors are especially resistant to change when they are defending against such anxieties.

The concept is especially relevant to psychoses, borderline and narcissistic character pathology, psychic trauma, nightmares, anxiety states and phobias. Annihilation anxieties under various names are mentioned widely in the psychoanalytic literature, but there has been insufficient systematic exploration of interrelationships with psychic trauma, ego weakness and deficit, regression, hostility, depression, transference, and countertransference.

## ANOREXIA NERVOSA

The term “anorexia nervosa” was coined by William Gull in 1873. Although the term has existed for little more than a century, the clinical description of the syndrome is much older. Among other works, we can find a description in Avicenna in the eleventh century, and we have no difficulty recognizing it in Richard Morton’s 1694 account of “nervous consumption.” The first complete description in terms identical to those of Gull can be found in an article written by Dr. Louis Victor Marcé in 1860.

The classic clinical picture of anorexia brings together three factors: weight loss of more than 10 percent, amenorrhea, and the absence of a manifest melancholic or delusional mental disturbance. But the emphasis has changed from these classic symptoms to more specific symptoms, such as a confused body image, denial of being thin, desperate desire to be thin, and fear of putting on weight. Also, two major types of anorexia nervosa have been distinguished: purely restrictive forms and forms associated with bulimic episodes accompanied by weight monitoring, self-induced vomiting, and excessive use of laxatives and diuretics. Anorexia nervosa frequently occurs during adolescence, especially among females (ten girls for every one boy). It affects between 1 and 2 percent of the female adolescent population.

Without ever dealing specifically with eating disorders, Freud did in fact establish all of the perspectives—hysteria, melancholia, and “actual” neurosis—around which the pathological manifestations of anorexia can be understood metapsychologically. As a hysteria, anorexia involves a double polarity: oral fixations of the libido serve as a point of regression, and sexual fantasies become oral and are then repressed. As a melancholia, anorexia involves melancholy over the issue of object loss and a loss of instinctual needs. Freud speaks of an anesthesia that leads to melancholic thinking, which opens up a research path related to the next perspective. As an “actual” neurosis, anorexia poses a threefold question about the importance of the current situation, of somatic and infrarepresentational factors, and of the inadequacy of the ego and capacities for working matters out.

Melanie Klein and her students have stressed the importance of archaic fantasies of sadistic devouring, destruction, and poisoning in anorexia. Psychoanalysts dealing specifically with eating disorders initially considered them to be primarily a symptom and took

little interest in the organization of the personality. But because of the complexity of cases and the frequent severity of the evolution of the disorder, the pathology of the personality assumed a growing importance in their work. The Göttingen symposium, organized by J. E. Meyer and H. Feldmann (1965), recognized anorexia nervosa as having a specific structure and viewed it not so much as an attempt toward compromise formation but rather as an attempt to deal with psychotic failures in the organization of the ego by reestablishing the mother-child unit.

Evelyne Kestenberg et al. (1974) have provided a remarkable description of the specific modes of the regression and instinctual organization in anorexia. This organization is characterized by recourse to a primary erogenous masochism in which pleasure is linked directly to a refusal to satisfy a need. Pleasure does not accompany the feeling of having something inside oneself; rather, anorexia eroticizes not satisfying a vital need. Similarly, relationships become dominated by pleasure in their being not satisfied. The hedonization of refusal becomes the guardian of the feeling of being or existing in one’s own right, corporeal activity and the body being thus liberated from all external holds. The most complete form of this hedonization of refusal is “hunger orgasm.”

Different studies stress the importance of the dependence/autonomy conflict and the fundamental vulnerability of anorexics. This vulnerability is associated with powerful passive desires and, as a consequence, a constant fear of intrusion, particularly an invasion of the body by the object on which these desires depend. To pose the problem in terms that highlight the paradox of anorexia: anorexics destroy themselves to prove their own existence. The destructive effect is not sought after for its own sake, and in this respect anorexia is not a suicidal behavior, although it can be seen as the result of unleashing aggression and turning against the self an incorporation fantasy of an object experienced as destructive for the self. Anorexia is the consequence of using a physiological need indispensable for survival to preserve a feeling of autonomy. In doing so—and this is the second paradox—anorexics find themselves in fact more dependent on an environment from which they sought to free themselves. By making refusal the instrument of their liberation, they alienate themselves from the object of the refusal, which they can neither lose nor interiorize.

The anorexia-bulimia tandem leads to questions about whether a problem of dependence underlies other behaviors grouped under the label “addictive behaviors”: drug addiction, alcoholism, pathological gambling, and shopping, as well as abuse of psychotropic drugs and kleptomania. The fragile narcissistic bases of such addicts makes their object relations difficult to manage, because these object relations become too exciting and too dangerous. Addiction to products or behavioral practices offers addicts a need-satisfying relational substitute that is always accessible and which they believe they can control, while in fact they fall into its grip.

The eating disorder represents a substitute for the object whose loss could plunge these patients into a collapse. This attempt to find a substitute object in addictive behavior represents a perverse organization of a relationship to the object in which the object is not recognized as having its own desires and differences, but is acknowledged only for purposes of narcissistic reassurance. An analogy exists among these patients’ relationship with food, their relationship with their own bodies, and their object relations, as well as their modes of emotional investment in general.

Family-therapy approaches illustrate the sensitivity of these patients to the influences of their environment. These eating disorders can be seen as existing at an intersection between individual psychology, family interactions, the body in its most biological aspect, and society in general. An essentially mental disorder may thus have grave somatic consequences, and these consequences may in turn affect the anorexic’s psychic state and thus contribute to maintaining the disorder.

Addictive behaviors raise questions about the type of society in which we live, particularly with the increase in the frequency of these disorders accompanying the increase in consumerism in our societies.

## **ANTHROPOLOGY AND PSYCHOANALYSIS**

Anthropology, a term common to the European languages, has several meanings, ranging from the theological—the expression of divine things in human terms—to the modern—the study of humanity as a unit, including an examination of its biological, psychic, and social nature, as well as mankind’s historical and prehistorical development. During Freud’s lifetime, the term acquired new connotations through the expansion of anthropological research, by both Anglo-American and European researchers.

The word “anthropology” was not part of Freud’s vocabulary any more than “sociology,” which Freud integrated (*Sozial-, oder Massenpsychologie*) with psychoanalysis. His avoidance of the terms is significant. In the case of anthropology he used the German *Geisteswissenschaften*, literally the “sciences of mind,” and enumerated the domains in which psychoanalysis was pertinent: the explanation of the “major cultural

institutions,” exogamy, the construction of the state, law, the social order, art, morality and moral awareness, religion. He also refers to research on myths, tales, and legends, cultural history and development, linguistics and ethnology, the history of the development of the human species—in fact, the principal subjects of anthropology.

Freud’s justification of the relevance of psychoanalysis to these fields was systematized after the publication of *Totem and Taboo* (1912–13a). In “The Claims of Psycho-analysis to Scientific Interest” (1913j), there is a lengthy explanation of this, an idea that was further developed by Freud in his later writings (1914d, 1923a, 1924f, 1925d, 1926e, 1933a). Initially a medical specialization concerned with neurotic symptoms, the status of psychoanalysis changed with the publication of *The Interpretation of Dreams* (1900a). “The analysis of dreams gave us an insight into the unconscious processes of the mind and showed us that the mechanisms which produce pathological symptoms are also operative in the normal mind. Thus psychoanalysis became a depth-psychology and capable as such of being applied to the mental sciences” (1923a, p. 253). Moreover, psychoanalysis, which is the science of the genesis of psychic formations, is the basis for all psychology, “since nothing that men make or do is understandable without the co-operation of psychology, the applications of psychoanalysis to numerous fields of knowledge, in particular to those of the mental sciences, came about of their own accord” (1933a, p. 145).

In 1907 Freud found a resemblance between *compulsive activities and religious practices* (1907b) and compared the phenomenology of rituals with a shared etiology of conflict. In 1913 he postulated the identity of the “dynamic source” that generated “the psychic behavior of isolated individuals and societies” (1913j). In *Group Psychology and the Analysis of the Ego* (1921c) and later in *Civilization and Its Discontents* (1930a [1929]), Freud showed how the instinctual dynamic of groups is the same as that of individuals, and excluded any “herd instinct.” This identity enabled psychoanalysis to be applied to (or implied in) the explanation of cultural formations and allowed researchers to exploit the profound analogy between individual psychic formations and cultural formations.

The fundamental analogy is that of the “two wishes which combine to form the Oedipus complex coincide precisely with the two principal prohibitions imposed

by totemism (not to kill the tribal ancestor and not to marry any woman belonging to one’s clan)” (1923a, p. 253). Here Freud’s research makes a direct reference to anthropology.

All the central concepts of psychoanalysis are related to anthropology and to group psychology because of their intrinsic relation to individual psychology, the family being the intermediate term. Aside from the Oedipus complex and ritual, the ego, ego ideal, and superego are derived from this, as are identification and defensive formations, which are associated with education and culture, especially inhibition and sublimation.

The study of myth, religion, and society extended Freud’s work, primarily through the writings of Otto Rank, Theodor Reik, and Géza Róheim. Later, American cultural anthropology made use of the psychoanalytic point of view, although in diluted form. As anthropology evolved and became more interdisciplinary, psychoanalysis became one of its key referents. In France, authors such Georges Devereux, Roger Bastide, and Bernard Juillerat are examples of this interrelation. In *Tristes Tropiques* (1955), Claude Lévi-Strauss insisted on the decisive role played by the discovery of Freud’s theories in his training as an ethnologist.

According to Freud, psychoanalysis discovered universal psychic processes; moreover, it possesses explanatory and not purely descriptive capability. Critics of the relevance of psychoanalysis for anthropology have attacked both aspects of its explanatory powers. In fact the articulation of knowledge through field studies is as complicated as it is in the case of metapsychology and therapeutic methods. However, Freud provided us with a way to move forward in *Moses and Monotheism* (1939a [1934–38]), his masterful analysis of Jewish and Christian monotheistic cultures.

## ANTICATHEXIS

Counter-investment—translated as anticathexis in the *Standard Edition*—is a particular mode of investment used by the ego for defensive purposes. The term is used to designate the dynamic defensive role of certain cathexes and to take into account the economic dimension of repression.

The term first appeared in *The Interpretation of Dreams*: “There then follows a defensive struggle—for the *Pcs.* in turn reinforces its opposition to the repressed thoughts (i.e., produces an ‘anticathexis’)” (1900a, p. 605). The counter-cathexed elements are the “repressed thoughts” mentioned in the letter to

William Fliess of February 19, 1899. Thus Freud’s conception of repression includes the idea that a counter-position, an investment against, must be set up to keep the undesirable idea in the unconscious. The material that is cathected in order to support repression may consist of an idea linked to the repressed idea, which has thus remained relatively easily accessible to the association of ideas, or it may consist of more remote mental or motor elements. The latter case involves “reaction formations” such as those observed in the character neuroses.

The mental energy deployed in the anticathexis is libido that has been reclaimed by a withdrawal of cathexis from other psychic formations; the pleasure that the realization of a repressed desire might provide is rendered impossible, but the preservation of equilibrium between forces limits the quantity of free energy and implies a form of pleasure that favors the maintenance of the defensive system. Meanwhile, the restrictions on the libido that are involved in anticathexis have a mental cost since they restrict the subject’s thoughts or activities.

Gradually, Freud granted the role of organizing counter-cathexes to the ego: “[When] certain ideas . . . [are] cut off from consciousness, we must, on the psycho-analytic view, assume that these ideas have come into opposition to other, more powerful ones, for which we use the collective concept of the ‘ego’” (1910i, p. 213). He also pointed out the role of “setting up an ideal” as one of the ego’s conditions for repression (1914c).

The theory of anticathexis was taken up again in Freud’s metapsychology and in *Inhibitions, Symptoms, and Anxiety* (1926d [1925]). There he emphasized that the constant pressure of the drives necessitated a continuous counter-pressure. In “The Unconscious” (1915e), he assigned to anticathexis not only the role of maintaining this counter-pressure, but also the task of organizing the permanent point of reference that is the prerequisite of all repression (i.e., “primal repression”): “Anticathexis is the sole mechanism of primal repression. . . . It is very possible that it is precisely the cathexis which is withdrawn from the idea that is used for anticathexis” (1915e, p. 181).

## **ANTICIPATORY IDEAS**

The term *Erwartungsvorstellungen* is generally translated as “anticipatory ideas,” although this term does not reflect “*Erwartung*”’s connotations of waiting, expectancy, or hope. It refers to the hypotheses that the analyst communicates to the patient to incite him or her to pursue in greater depth the interpretation of unconscious content; in this sense, the term is sometimes accompanied by the qualifying adjective *conscious*.

In 1901, in his analysis of the dream-work, Freud invoked this notion when he proposed that secondary revision operates upon the contents of a dream just as it does upon any other content, by apprehending it via anticipatory ideas. But in 1909, this idea assumed its proper place in interpretive analytic work and refuted the accusation of *suggestion* that was beginning to be made about the method. In “Analysis of a Phobia in a Five-Year-Old Boy,” Freud wrote: “In a psycho-analysis the physician always gives his patient (sometimes to a greater and sometimes to a lesser extent) the conscious anticipatory ideas by the help of which he is put in a position to recognize and to grasp the unconscious material. For there are some patients who need more of such assistance and some who need less; but there are none who get through without some of it” (1909b, p. 104).

The following year, in “The Future Prospects of Psycho-Analytic Therapy,” Freud further explained: “The mechanism of our assistance is easy to understand: we give the patient the conscious anticipatory idea [the idea of what he may expect to find] and he

then finds the repressed unconscious idea in himself on the basis of its similarity to the anticipatory one. This is the intellectual help which makes it easier for him to overcome the resistances between conscious and unconscious” (1910d, pp. 141–142). In “The Dynamics of Transference,” Freud emphasized the hope that characterizes anticipation or waiting: “If someone’s need for love is not entirely satisfied by reality, he is bound to approach every new person whom he meets with libidinal anticipatory ideas... th[e] transference has precisely been set up not only by the *conscious* anticipatory ideas but also by those that have been held back or are unconscious” (1912b, p. 100).

Freud’s last mention of this notion is found in two passages of his *Introductory Lectures on Psycho-Analysis* (1916–1917a [1915–1917]). First, in the lecture “Transference,” where he emphasized the participation of intelligence in the process of becoming aware, Freud wrote: “There is no doubt that it is easier for the patient’s intelligence to recognize the resistance and to find the translation corresponding to what is repressed if we have previously given him the appropriate anticipatory ideas. If I say to you: ‘Look up at the sky! There’s a balloon there!’ you will discover it much more easily than if I simply tell you to look up. . . . In the same way, a student who is looking through a microscope for the first time is instructed by his teacher as to what he will see; otherwise he does not see it at all, though it is there and visible” (p. 437). Thus, the mechanism of suggestion is clearly involved in guiding patients. However, in the next lecture, “Analytic Therapy,” Freud emphasized the difference between this technique and suggestion: “After all, his conflicts will only be successfully solved and his resistances overcome if the anticipatory ideas he is given tally with what is real in him. Whatever in the doctor’s conjectures is inaccurate drops out in the course of the analysis; it has to be withdrawn and replaced by something more correct” (p. 452).

The necessity for anticipatory ideas to be appropriate to the patient’s reality was underscored by Ferenczi in his paper “On Forced Phantasies” (1924): “When we interpret the patient’s free associations, and that we do countless times in every analytical hour, we continually deflect his associations and rouse in him expected ideas, we smooth the way so that the connections between his thoughts so far as their content is concerned are, therefore, to a high degree active. . . . The difference between this and the ordinary suggestion

simply consists in this, that we do not deem the interpretations we offer to be irrefutable utterances, but regard their validity to be dependednt on whether they can be verified by material brought forward from memory or by means of repetition of earlier situations” (pp. 71-72).

Although the notion of anticipatory ideas did not reappear in Freud’s later writings, the idea of *constructions* was closely dependent upon it. In “Constructions in Analysis,” he wrote: “The analyst finishes a piece of construction and communicates it to the subject of the analysis so that it may work upon him; he then constructs a further piece out of the fresh material pouring in upon him [and] deals with it [sic] in the same way” (1937d, p. 260), adding, “We do not pretend that an individual construction is anything more than a conjecture which awaits examination, confirmation or rejection” (p. 265).

Thus, there were many safeguards against the excesses of analysts who were overly sure of the absolute accuracy of their interpretations. The dynamic relationship between analyst and patient that Freud highlighted here is that of a jointly undertaken search that, to be sure, presupposes a “historical truth” to be discovered, but with the reminder that this investigation is based on approximations whose limits are sometimes impossible to go beyond and must thus be accepted. It is this idea that Serge Viderman carried to its logical conclusion in his work on the “construction of the analytic space” (1970).

## **ANTILIBIDINAL EGO/INTERNAL SABOTEUR**

Fairbairn’s thinking on psychic structure began in 1929, with a critical study of Freud’s ideas about the superego (Fairbairn, 1929/1994b), and developed into his mature object-relations theory (1954), modifying the Freudian model. In Fairbairn’s revision (1952/1994a) of Freud’s concepts of endopsychic structure (1923), the term “antilibidinal ego” refers to the split-off and repressed ego-structure related to the rejecting object. In his earlier work it developed from his ideas about the superego and was termed the “internal saboteur.”

According to Fairbairn, the early unitary ego, rather than seeking pleasure, seeks relationships (intimacy) with the external object. Actual environmental failure (which in ideal circumstances maintains integration of the ego) leads to compensatory internalization of the object. The object is then defensively split into three objects. The unrepressed (central) ego, partly conscious and attached to the ideal object, represses the other two objects, the exciting (libidinal) object and rejecting (antilibidinal) object, together with the aspects of the ego related to them (the libidinal ego and antilibidinal ego, known as subsidiary egos). These repressed objects are termed “bad objects” and are unavailable for real object relations.

Fairbairn named the resulting situation the “basic schizoid position,” a term later taken up by Melanie Klein (1946/1952). The antilibidinal ego, attached to the rejecting object and unrelentingly hostile to the libidinal ego, reinforces the central ego in its repression of the libidinal ego. The degree of psychopathology depends on these splits, the amount and strength of central ego remaining, and the many possible patterns of internal relationships. Fairbairn saw disturbance as being due to the return of repressed bad-object experience to consciousness. Fairbairn’s dynamic structure, which differs from that of Freud, is wholly object-related. The concept of the schizoid position is fundamental to his thinking about the many possible variants of psychopathology. The elaboration of the

antilibidinal ego as differing from the superego, together with the theory of a psychic structure made up of many conflicted ego-object relationships, allows a flexible technical approach.

This thinking has been influential in Britain, most notably on the Independent Group, and on self-psychologists and intersubjective theorists in the United States.

## ANTINARCISSISM

The concept of *antinarcissism* was proposed by Francis Pasche in 1964. The context was a theoretical debate seeking initially to define narcissism and then to describe its role in psychic development.

The difficulties, complexities, and, for some, the aporias of narcissism led to two antithetical choices. Some abandoned the notion of primary narcissism, giving a fundamental role to the primary object-relation (this was true of the English school, Michael Balint, and John Bowlby). Others, like Paul Federn and Béla Grunberger, were led to separate narcissism

from the libido. This, it seemed to them, was necessary in order to account for the ubiquity of narcissism in mental life. But this was not the opinion of Francis Pasche, who chose to reintroduce a duality, or even a dialectic, into the concept of narcissism itself (1965).

Both narcissism and antinarcissism were characterized for Pasche by an object and a direction. The object was the same for both: the ego. The direction, however, was not the same: centripetal for narcissism, centrifugal for antinarcissism. Antinarcissism could be thought of as a centrifugal investment, in which the subject tends to be divested of the self, to give up their own substance and reserves of love, and to do this independently of any economic factors. In this sense, antinarcissism is actually a manifestation of Thanatos, that is, of unbinding separation and dispersion, but not of aggressiveness.

There is a striking convergence between Francis Pasche's conception of antinarcissism and what Sándor Ferenczi called, in his final writings, the "altruistic drive" (1949, fragment dated 24 August 1930).

André Green's work on narcissism is also germane here. Even if Green's negative narcissism does not correspond precisely to Pasche's antinarcissism, the two notions are akin.

## ANTI-OEDIPUS: CAPITALISM AND SCHIZOPHRENIA

Gilles Deleuze and Félix Guattari's *Anti-Oedipus: Capitalism and Schizophrenia*, was originally intended to be the first volume of a two-volume work. The second volume, which was supposed to be entitled *Schizo-analysis*, never appeared under that title but was instead "replaced" by *A Thousand Plateaus*.

At the time of its publication in 1972, *Anti-Oedipus* had an explosive impact. In a state of high excitement, and still shaken by the events of May 1968, the French intelligentsia greeted this work by a renowned philosopher and an antiestablishment psychoanalyst as a revolutionary brick through the window of psychoanalysis. Deleuze said of his collaboration with Guattari, “We don’t work together, we work between the two of us”.

The Oedipus complex, which psychoanalysts describe as a fundamental and unavoidable step in the psychic structuring of the healthy child, was denounced by the authors as an “impasse.” The unconscious was a production, a fabrication, a flow. Accordingly, there was no such thing as a desiring subject, but rather flows of desire that are independent of and that traverse the subject. These points of traversal of desire, this flow, exists in opposition to lack, to the Law. “Lack (manque) is created, planned, and organized through social production.” Being essentially revolutionary, desire is the enemy of capitalist society, which psychoanalysis defends and protects.

The family is the first source of the work of repression operating in the flow of desire: “The family is thus introduced into the production of desire, and from earliest childhood it will effect a displacement of desire, an unheard-of repression.” All of capitalism’s efforts—and those of psychoanalysis—will go toward trying to maintain these flows of desire and “re-territorializing” them by imposing limits; on the interior, Oedipus, on the outside, as “the absolute limit of every society” (p. 266), schizophrenia: “The Oedipal triangle is the personal and private territoriality that corresponds to all of capitalism’s efforts at social reterritorialization” (p. 266).

The “schizo-analysis” invented by the authors is defined as “a whole scouring of the unconscious, a complete curettage” (p. 311). The thesis of schizo-analysis proposes that desire is a machine, in fact, interconnected machines—“desiring-machines.” This assemblage of machines represents the real and constitutes the production of desire. Psychoanalysis is described as a belief in a structural ensemble of the symbolic and the imaginary that Deleuze and Guattari characterize as a mythical belief. They radically challenge the Oedipus complex and accuse psychoanalysis of “beating down all the connections, the entire arrangement” because it “hates desire, hates politics.” The two authors reject the idea of any psychic reality: “There is only desire and the social, and nothing else.”

Schizo-analysis, with its schizophrenic process, a “political and social psychoanalysis” proposes to “undo the expressive oedipal unconscious, which is always artificial, repressive and repressed, and mediated by the family, to gain access to the immediate productive unconscious.”

The authors are careful to distinguish between schizophrenia as a structure and the schizophrenic as an entity. The latter is sick from the oedipalization that society attempts to impose upon him, but he represents the emblematic figure of the revolutionary, who is in a position to say, “Oedipus? Never heard of it” (p. 366). The schizophrenic process is revolutionary; its goal is to “show the existence of an unconscious libidinal investment of socio-historical production.” Here, schizo-analytic production is the opposite of psychoanalytic expression.

Proponents of antipsychiatry, in particular Ronald D. Laing, proved to be valuable allies to Deleuze and Guattari. In effect, madness is described not so much as a collapse but rather as a breakthrough. The goal of schizo-analysis is to enable the flows, to “tirelessly undo/defeat the egos and their assumptions.” and it “makes no distinction in nature between political economy and libidinal economy.”

In taking as their model the schizophrenic process and contrasting it with the oedipalized neurotic process, the authors constructed a seductive theory that was in keeping with its era. Marxist and structuralist elements are discernible. What are now referred to as “the events of May ’68” had not yet been entered into the history textbooks and the collective memory. The metaphor of schizophrenia, stretched to the limit by Deleuze and Guattari, was resonant in the context of a breakdown in the political order and the family. The disillusionments that followed are well known.

It is somewhat surprising to note that in the very extensive index of proper names in *Anti-Oedipus*, Sophocles is not mentioned once. This is of course indicative of the authors’ genuine intent to separate Oedipus as a psychic structure from Oedipus as a dramatic myth. It is the former, structural aspect of Oedipus that is fundamental to all civilizations. It is this Oedipus that is targeted by the authors, and not the dramatic figure of antiquity.

Indeed, *Anti-Oedipus* today appears as an anti-dramatic text, to be read as a comedy deriding capitalism and glorifying a schizophrenia invented and

amplified through the joint writing of a philosopher and a psychoanalyst engaged in critical reflection designed to challenge the bourgeois ideology of their era.

## ANXIETY

Anxiety is an unpleasurable affect in which the individual experiences a feeling of danger whose cause is unconscious. Freud had already begun considering the problem of anxiety in his correspondence with Wilhelm Fliess at the very start of his psychoanalytic work (1950a [1887–1902]). His subsequent efforts were more and more systematic as he developed two successive theories of anxiety.

In both of Freud's theories of anxiety a fundamental role is played by an absence of discharge, and hence of instinctual satisfaction. In his first account, the sexual instinct, undischarged, was described as being transformed explicitly into anxiety by a seemingly biological mechanism (1895b [1894]). Somatic sexual

excitation with the help of sexual ideas thus could not develop into psychic libido. However, sexual representations could be repressed, and their attendant excitation either diverted toward somatic outlets, so giving rise to hysterical conversion symptoms or, alternatively, redirected into the substitute representations typical of anxiety hysteria or phobic neurosis.

In Freud's second theory of anxiety, set forth in *Inhibitions, Symptoms, and Anxiety* (1926d [1925]), unsatisfied instincts were not explicitly evoked. In this account, anxiety as a signal is developed by the ego as a defensive measure against automatic anxiety. The infant's biological and mental immaturity does not enable it to confront the increase in tension arising from the enormous amounts of instinctual excitation that it cannot discharge and satisfy. This generates a state of distress that is traumatic for the newborn, triggering automatic anxiety. The infant gradually comes to understand that the maternal object can put an end to this state of affairs. It is then that the loss of the mother is experienced as a danger, and this experience constitutes anxiety as a signal.

When the newborn begins to perceive its mother, it is unable to distinguish temporary absence from enduring loss; thus from the moment the mother is lost sight of, the baby behaves as if it is never going to see her again. Repeated experiences of satisfaction have created this object, the mother, which, as need arises, is intensely cathected in a way that might be described as nostalgic. From this moment on, in Freud's view, object-loss provokes psychic pain, while anxiety is the reaction to the danger associated with that loss. Sadness arises whenever reality-testing forces an acknowledgment that the object has been lost. In its various forms, object-loss becomes the prototype of later anxieties, which Freud lists as: anxiety at the loss of the love of the object, castration anxiety, and anxiety at the loss of the love of the superego.

The novelty of this theorization derives, on the one hand, from the genetic notion according to which anxiety is tied to the fear of re-experiencing very early human states of distress, and on the other hand, from the fact that these states are associated during early infancy with various fantasies about the maternal object, and later with fantasies concerning other objects, including the father (castration anxiety or anxiety at the loss of the love of the superego). The close connection thus posited between anxiety

and ideation is radically at odds with Freud's first theory of anxiety.

Anxiety always occupied a central place in the work of Melanie Klein, first of all with respect to technique, and secondly in terms of theory. She stated repeatedly that her chief technical principle was that interpretation must focus on the point of maximum anxiety. Equilibrium between the life instincts and the death instincts was fundamental to Klein's understanding of the different forms of anxiety and the fantasies that expressed them. In her earliest writings, she associated anxiety and its related inhibitions with sexual conflicts of childhood bound up with the Oedipus complex. At the same time, however, she was struck by the scope of aggressive fantasies in young children, especially during what she called the phase of maximal sadism. She gradually came to view the child's aggressiveness towards the mother's body and its fantasy contents (penis, baby, feces, etc.) as responsible for an anxiety based on the fear of the reciprocal aggression it could provoke. The danger intrinsic to anxiety was thus seen as the result of the subject's excessive aggressiveness.

Although to begin with Klein's theory leaned heavily on Freud's *Inhibitions, Symptoms, and Anxiety*, from 1935 on, and especially after 1940, with the gradual working out of the concept of the "depressive position," she assigned object-loss a central role. This implied a change in the conceptualization of anxiety, which acquired a depressive character: anxiety was now seen as expressing "pain," which for Klein included both suffering and sadness in Freud's sense. Anxiety states were engendered by lived experiences of object-loss that were more or less definitive and irreversible.

Since experiences of loss were closely associated with the damage wreaked in fantasy by aggressive impulses, painful feelings were accompanied by feelings of conscious or unconscious guilt. This guilt generally tended to remain unconscious because of the great importance it assumed for the subject, who attributed an all-powerful destructiveness to his own aggression. The ego would then turn to radical (psychotic, manic, or depressive) defenses, which also made it difficult for painful feelings to gain access to consciousness. On the other hand, the more real the guilt, the more vigorously it would be supported by the ego, clearing a path to consciousness by way of feelings of sadness. A basic exception to this rule were the strong guilt feelings manifested by melancholics, whose self-reproach masked an

attempt by the ego to overwhelm the introjected and attacked object with guilt.

After introducing the "paranoid-schizoid position" (1946), which she contrasted with the depressive position as a type of psychic functioning, Melanie Klein was able to develop a systematic theory of anxiety and guilt (1948). The theory relied primarily on Freud's concept of the death instinct, which Klein had adopted. In this view, anxiety was provoked by the danger with which the death instinct threatened the organism. Klein spoke of anxiety about "annihilation" and "fragmentation" with reference to very primitive terrors triggered by the inner working of the death instinct and with reference to the paranoid anxiety generated by persecutory objects or by the primitive superego. In this sense fragmentation anxiety may be considered a very archaic precursor of castration anxiety.

In the face of maternal frustration, Klein contended, the sense of an internal threat created by the death instinct reinforces the projection of destructive impulses by the primitive ego of the paranoid-schizoid position. As a consequence the breast as "bad" part-object becomes the source of "paranoid" or persecutory anxiety. Another portion of the death instinct is used by the ego in the form of aggression to attack the persecutory object. Introjection of both the persecutory breast and the persecutory penis is the foundation of the primitive superego, which is at first difficult to distinguish from internal persecutory objects since it provokes very intense persecutory anxiety (fear of fragmentation). This very early superego, in spite of its aggressiveness, strives to protect the libidinal bonds that the ego is meanwhile forming with good or idealized objects, which are experienced as the source of life.

As progress is made, with the help of libidinal instincts, toward the successful integration of aggression, fantasies arise, characteristic of the early stages of the Oedipus complex, involving part-objects in the process of being made whole: the mother's stomach and its fantasized contents (penis, baby, feces, etc.). If such objects provoke psychotic persecutory anxieties, these will manifest themselves clinically as the outcome of a defensive transformation of intolerable depressive anxieties produced under pressure from an overly aggressive primitive superego. In fact, as Klein indicated in her last writings, the paranoid-schizoid and depressive positions act simultaneously, whether in the service of defense or of integration. In clinical work, this is reflected in the coexistence of paranoid

and depressive anxieties; one or the other will prevail, depending on which position is predominant in the patient.

During the various steps in the integration of the depressive position, a whole range of depressive anxieties is encountered, as distinguished by the particular fantasies that attend the loss of the libidinally cathected object in each type of case (Palacio Espasa, 1993). Thus whenever fantasies of catastrophic destruction come to the fore and the damage is experienced by the subject as irreparable because of the great force of his aggression, as he perceives it, the intensity of the ensuing guilt makes the pain and sadness hard to bear. The ego can only resort to psychotic defenses that transform these disastrous depressive anxieties into persecutory anxieties.

Where fantasies of destruction are less significant, and the subject's aggressiveness is experienced as less destructive, fantasies of the death of libidinally cathected objects may be prevalent. The ego can then use its store of libido, which it experiences as limited, as a massive barrier to any manifestation of aggression. This arouses intense feelings of guilt, and hence of responsibility for fears of death or of object-loss. The ego tends to defend itself against such painful depressive affects either in manic fashion, through identification with idealized and intact objects, or else by melancholic means, such as identification with the dead or destroyed aspects of objects.

When fantasies of loss of the object's love predominate, they center on rejection or abandonment by the object. Death fantasies are less intense and are experienced as more easily reversible because of the greater libidinal capacity available to the ego of subjects in this category. Under these circumstances the ego has a whole panoply of neurotic defenses at its disposal. These include the retroactive denial of the ill consequences of the subject's aggression and reaction-formations against aggression of a typically obsessive-neurotic kind. By means of phobic displacement and symbolization, a predominance of libidinal impulses facilitates the transformation of the conflict provoked by the loss of the object's love into a triangular conflict in which fantasies of exclusion become more prominent. Given well-integrated instinctual relationships with two highly cathected parental imagos, the experienced object-loss may be reduced to that of the loss of the incestuous object's exclusive love. On the other hand, the dangerous aggressiveness deemed

responsible for the loss of the object's love may be projected onto the other parent, who then becomes a rival. An oedipal situation is thus created, along with the various conflicts, directly or indirectly expressed, that characterize the Oedipus complex.

In short, as the intensity of depressive anxieties decreases, the Oedipus complex comes to the fore thanks to the transformation of depressive conflict into a variety of neurotic conflicts that generate castration anxiety. In neurosis, however, along with castration anxiety intense depressive anxieties (especially guilt) may continue to exist with respect to the oedipal parents—more complete objects, often neglected in the literature on neurosis. Such anxieties may indeed occasion significant regression back toward depressive conflict.

In psychoanalytic theory castration anxiety is closely bound up with the Oedipus complex. For Freud castration is one of the primal fantasies. In his view of childhood sexuality, the Oedipus complex makes its appearance during the stage of phallic primacy, which means that castration anxiety is rather similar in the two sexes. Because of the overvaluation of the phallus, the child does not recognize the female sex as such and considers it to be the result of castration. In *Inhibitions, Symptoms, and Anxiety* Freud sees castration as one loss, on the level of genital sexuality, in a series of object-losses: the loss of the mother's breast, the loss of the contents of the intestines, and so on.

For Melanie Klein castration anxiety develops as a fear of reprisal for the child's oedipal rivalry with the parent of the same sex. In boys this becomes an anxiety about the loss of the penis at the hands of a vengeful father; in girls it becomes an anxiety about attacks against her own belly by the persecuting maternal object. From this theoretical standpoint, castration anxiety appears as a form of punishment for the manic and narcissistic fantasies constructed by the young child as protection against its feelings of exclusion from the sexual and genital relations of the parents, to which it does not have access because of its biological immaturity. The infant then takes possession in fantasy of the idealized sexual attributes of the parent of the same sex, who thus becomes a rival, and imagines it is the exclusive recipient of the love of the parent of the opposite sex. Such a fantasy position can only generate castration anxiety, if for no other reason than that it derives from the infant's apprehension of its own biological immaturity as a mutilation.

Separation anxiety appears when the subject experiences separation as a more or less irreversible object-loss. In the descriptions given by Margaret Mahler, the very young infant manifests separation anxieties after the fifth or sixth month, and they become especially significant between 15 and 18 months of age, during the *rapprochement* subphase of the separation-individuation (Mahler et al.). During this time the baby experiences real despair, feelings close to the nascent melancholy that Klein describes as occurring at the height of the depressive position. The presence of the external mother is essential, for her internal image is experienced as very much under threat from the child's aggressive fantasies, perceived by the child as massive and highly destructive. Only after the age of two or three, during the phase of object constancy, does the child become able little by little to overcome separation anxiety; by then it can retain an inner mental representation of the mother that is cathected for the most part by libidinal impulses.

Anxiety in the presence of actual danger, or "realistic anxiety," is a somewhat paradoxical concept employed by Freud in *Inhibitions, Symptoms, and Anxiety*, where (as we have seen) he views anxiety as arising from a felt danger from within occasioned by object-loss. Freud himself resolves the ambiguity when he asserts, in discussing apparently external dangers such as the loss of the object's love, or castration anxiety, that "the loved person would not care to love us nor should we be threatened with castration if we did not entertain certain feelings and intentions within us. Thus such instinctual impulses are determinants of external dangers and so become dangerous in themselves" (p. 145). In other words, all realistic anxiety is also anxiety *tout court*, and not simply fear of an external danger, for it always arouses an internal threat. This idea is crucial, of course, to the Kleinian concept of the depressive position, where every outside loss is accompanied by an experience of the loss of internal objects. Primitive experiences of loss are reactivated by the real loss, so that the working-through of such early internal losses is a prerequisite if objects lost in the outside world are to be successfully mourned.

### ANXIETY DREAM

A dream may be so charged with anxiety that the dreamer can escape only through waking. Sometimes the dreamer is then amazed by the disparity between the intensity of emotion and the apparent banality of the dream itself. This is the classic "anxiety dream." Freud offered a detailed analysis of such a dream in his case history of the "Wolf Man" (1918b [1914]).

Freud often returned to the problem of anxiety dreams, because, as he wrote in *The Interpretation of Dreams*, “It does in fact look as though [they] make it impossible to assert as a general proposition . . . that dreams are wish fulfillment; indeed they seem to stamp any such proposition as an absurdity” (1900a, p. 135). Freud’s answer to the puzzle about anxiety dreams holds fast to the basic principle of dream-formation: that even when the content of the dream is clearly distressing, its latent content involves fulfillment of a wish.

From this point of view, Freud analyzed one of Dora’s dreams (1905e [1901]), a dream of Norbert Hanold in *Delusions and Dreams in Jensen’s “Gradiva”* (1907a [1906]), a dream of “Little Hans” (1909b), and most noteworthy, the wolf dream of Sergeï Pankejeff, the “Wolf Man” (1918b [1914]). Freud returned at length to this thesis in the chapter on wish fulfillment in *Introductory Lectures on Psycho-Analysis* (1916–1917a [1915–1917]).

With respect to recurrent anxiety dreams in cases of traumatic neuroses, Freud altered his views somewhat in “Revision of Dream Theory,” chapter 29 of *New Introductory Lectures on Psycho-Analysis* (1933a [1932]), where he asserted, “A dream is an attempt at the fulfillment of a wish. . . . In certain circumstances a dream is only able to put its intention into effect very incompletely, or must abandon it entirely. . . . While the sleeper is obliged to dream, because the relaxation of repression at night allows the upward pressure of the traumatic fixation to become active, there is a failure in the functioning of his dream work, which would like to transform the memory-traces of the traumatic event into the fulfillment of a wish” (p. 29). Although Freud did not highlight the change in this text, the fundamental revision to his theory of dreams perhaps came earlier, in *Beyond the Pleasure Principle* (1920g [1914]).

## **ANZIEU, DIDIER (1923–1999)**

French psychoanalyst and professor of psychology Didier Anzieu was born July 8, 1923, in Melun and died on November 25, 1999, in Paris.

His parents, who worked for the post office, met in Melun, where Didier Anzieu spent his childhood and part of his adolescence. A younger sister died at birth. His parents’ intense investment in Didier, especially on the part of his mother, Marguerite, who became seriously depressed after the stillbirth of her daughter (she herself was a “survivor,” her sister having died when she was a child), led to alternations between “superimposed layers of care” and feelings of

abandonment that would mark Anzieu's life and work. His mother's illness and subsequent treatment in a psychiatric hospital further distanced him from her; he was raised by his maternal aunt, who later moved in with her brother-in-law.

His close, secure, and warm relationship to his father sustained him throughout his childhood and entrance into adult life. He began his secondary school studies in Melun, followed by Paris, where he met Zacharie Tourneur, with whom he edited Pascal's *Pensées*. After the *École Normale Supérieure* and his studies in philosophy, he turned to psychology, which he taught, along with Daniel Lagache, at the Sorbonne, before continuing his academic career in Strasbourg (1955–1964) and Paris (1964–1983). In 1957 he completed his oral defense for the doctoral degree, the subject being Freud's self-analysis and its role in the invention of psychoanalysis.

Before he became a psychoanalyst Didier Anzieu worked as a clinical psychologist. His involvement in psychology led him through several fields of study: psychodrama, dermatology, projective methods, and Rorschach methods, in which he specialized. He made use of the dynamics of Lewinian groups in creating, in 1962, an association—CEFFRAP, the *Centre d'études françaises pour la formation et la recherche active en psychologie*—through which he set up the first French experiments in group psychoanalysis and group psychodrama. Anzieu's various activities supported a brilliant academic career alongside his work as an editor and creative writer (short stories, essays, drama).

As a psychoanalyst, Anzieu's life intersected his personal history, his psychoanalytic history, and the history of the French psychoanalytic movement. His mother, Marguerite Anzieu, had been treated by Jacques Lacan, who had used her treatment as the basis for his medical dissertation *De la psychose paranoïaque dans ses rapports avec la personnalité* (*On Paranoid Psychosis in Its Relations with the Personality*), published in 1932, in which she is known simply as "Aimée." Didier Anzieu began psychoanalysis with Lacan in 1949. After four years of fruitful work, their relationship became problematic when Lacan asked him to remain silent about how therapy was being conducted. Anzieu continued his training (1953) with Daniel Lagache, Juliette Boutonier, and Georges Favez. He participated in the foundation of the French Psychoanalytic Association when it was formed in 1964 following the break with Lacan, and assumed a num-

ber of responsibilities within the association (he was its vice-president).

Anzieu's psychoanalytic writing can't be separated from his other writing, his activity as a psychoanalyst, or his interests. It is both varied and indivisible, always informed by the uncertainties of psychology, literature, and the psychoanalysis of intersubjective bonds.

In his psychoanalytic practice, Anzieu always claimed to be an orthodox analyst, but he was also careful to modulate the mechanism and technique of interpretation according to the treatment needs of the individual patient. As he refined his theoretical understanding through clinical activity, he highlighted the transformations needed in the object of interpretation (the "archaic") and in the handling of a reliable and flexible framework that harmonized with the specific transferences generated by the pathologies of the primal. He gave increasing attention to these areas of practice, which were supported by his contacts with the Anglo-American school (Melanie Klein, Wilfred R. Bion, Donald W. Winnicott, Esther Bick). He was also interested in the unconscious formations and processes involved in group bonds and the work of creation. A statement written in 1975 expresses his fundamental position: "The question is not to repeat what Freud found when faced with the crises of the Victorian era, but to find a psychoanalytic response to mankind's malaise in the civilization in which we live. Work such as that of psychoanalysis needs to be done wherever the unconscious arises, standing, seated or lying down; individually, in a group or in a family, wherever a subject can allow his anxieties and fantasies to speak out to someone who is supposed to listen to them and is likely to help him understand them."

Anzieu's worldwide recognition is largely due to his scrupulous approach to clinical and theoretical work and his intellectual freedom in searching for innovative tools. He renewed the understanding of self-analysis and dream interpretation, primordial models for what he would later theorize as the work of creation and processes of thought.

He introduced new concepts into psychoanalytic theory. With the important concept of the "skin ego" (1985/1989), he referred to "a figuration the child's ego makes use of during the precocious phases of its development to represent itself as an ego containing psychic contents based on its experience of the surface of his body." This concept inaugurated several research projects on psychic interfaces and envelopes,

on the dual prohibition of touching, on formal signifiers and their normal and pathological transformations. These investigations gave rise to a theory of thought processes and a conception of the work in which the dual polarity of creation and destruction is affirmed.

Didier Anzieu made use not only of clinical psychoanalysis but literature (Pascal, Julien Gracq, Alain Robbe-Grillet, Samuel Beckett) and the visual arts as well (Francis Bacon) to bring to light the traces of the body in writing, drama, and painting. Finally, through his work on individual and group psychoanalytic psychodrama, he enriched the instruments derived from psychoanalysis by proposing a new outlook on the operation of the unconscious in groups.

## **APHANISIS**

The term “aphanisis” merits an entry in Laplanche and Pontalis's *The Language of Psychoanalysis*, where

its principal definition is as follows: “Term introduced by Ernest Jones: the disappearance of sexual desire. According to Jones aphanisis is the object, in both sexes, of a fear more profound than the fear of castration.”

It was in 1927 that Ernest Jones called upon this concept in his work on the precocious development of feminine sexuality. Etymologically the term comes from the Greek *aphanisis*, which refers to an absence of brilliance in the astronomical sense, to disappearance or becoming invisible (of a star for example).

Jones applied this concept in a psychoanalytic sense in seeking to account for the disappearance of sexual desire in light of the castration complex; at the same time, he stressed that in his view there was no strict correlation between castration and the disappearance of sexuality: “many men wish to be castrated for, among others, erotic reasons, so that their sexuality certainly does not disappear with the surrender of the penis.” (1927, p. 439–440)

In other words, the concept of aphanisis, according to Jones, was much broader than that of castration, and if the two notions sometimes appeared to merge, it was only because the figure of castration was in some way emblematic of the suppression of sexual desire, for which it supplied a concrete (but in fact inaccurate) representation.

Laplanche and Pontalis (1967) observe that in women the fear of aphanisis is discernible beneath the fear of separation from the loved object, which is consistent with the fact that Jones introduced the notion apropos of feminine sexuality.

While Sigmund Freud described the psychosexual development of the boy along phallogocentric lines, Jones, for his part, tried to describe the sexuality of the young girl not by exclusive reference to penis envy (*Penisneid*), but as a sexuality having direct aims and modalities of its own. And it is precisely aphanisis, prior to the castration complex, that can furnish a kind of common basis for the sexual development of both sexes.

About thirty years after Jones introduced it, in 1963, John Bowlby took up the concept of aphanisis again in his critical review of separation anxiety. He made aphanisis one of the possible bases for understanding this developmental phenomenon. The disappearance of the object in fact confronts the infant

with the fear of no longer being able to focus its instinctual impulsive movements, and thus with the risk of losing the very possibility of the pleasure of desire as well.

Today the concept of aphanisis as such is little used in the context of metapsychological work; it has doubtless been relegated to the background by the redoubtable expansion of the theory of attachment.

## **APHASIA**

Aphasia, a word proposed by Armand Trousseau to replace the term “aphemia,” created by Paul Broca, refers to language disturbances that arise from specific cerebral lesions, most often in the cortex. Between 1861 and 1865, when the dispute ended concerning the question of determining whether the cerebral cortex operated as a unit or as a collection of separate elements, Paul Broca showed, through a series of anatomical and clinical observations, that the destruction of the left side of the base of the third circumvolution of the frontal lobe in a right-handed subject who until then was able to speak normally led to the loss of articulate language. The subject was unable to express himself using a sequence of words or phrases.

In 1874 Carl Wernicke extended the field of research by describing two other types of aphasia, all caused by a lesion in the left hemisphere: sensory aphasia from damage to the posterior areas of the second and third circumvolution of the cortex, and conduction aphasia, arising from the disconnection of

the bundles connecting this region to the base of the third circumvolution of the frontal lobe. Afterwards, the disturbance identified by Broca would be known as “motor aphasia.” Later Wernicke identified two other types of aphasia: “motor transcortical aphasia” and “sensory transcortical aphasia.”

By the end of the nineteenth century, three separate approaches to the problem had been developed. Some researchers, such as Jean Martin Charcot and Joseph Grasset, increased the number of types of aphasia; others, like Alfred Vulpian, and later Pierre Marie, renewed the “unitarian” position; the third group, following the important work by Jules Déjerine, demonstrated through the use of clinical and anatomical arguments that the nature of the aphasia would change with the nature and location of the lesion. For example, frontal lesions seemed to primarily affect speech production, posterior lesions seemed to affect speech recognition, and the destruction of the cortex resulted in disturbances of internal language, which affected the subject’s autonomy.

Sigmund Freud’s work on aphasia, published in 1891, accepts the work of Paul Broca but questions Wernicke’s research, which Freud criticizes for being excessively schematic and lacking in clinical observations. Freud did not question the relationship of language function with the brain but was cautious about hastily assigning specific locations to specific functions. Although he accepts that certain clinically based forms of aphasia—“verbal aphasia,” “asymbolic aphasia,” “agnosic aphasia”—can be used to localize the cortical lesion with certainty (which was later confirmed by neurosurgery during the First World War), he refused to extrapolate from pathology to physiology and deduced a cerebral concept of the normal operation of language, with a critical position that was far removed from the scientism that is often attributed to him in this field. In the descriptive sections of his work, Freud distinguished between the representation of words and the representation of things, and their links with auditory images, visual images, and the motor images at work in these phenomena.

## APPLIED PSYCHOANALYSIS AND THE INTERACTIONS OF PSYCHOANALYSIS

Aside from being a theory of the unconscious, psychoanalysis as a method is used as an investigative tool in a wide variety of fields, the treatment of neuroses being only one among many. The term *applied psychoanalysis* is often used to refer to fields other than psychoanalysis or psychotherapy, particularly literature, art and culture. The term is therefore likely to have a range of accepted meanings that is either very broad, as in the case of collective phenomena, or narrowly restricted, as in the case of individual works of art.

The idea of *application*, to the extent that it presupposes use outside a field of origin, has often been criticized for introducing the risk that psychoanalysis will be used abstractly or mechanistically. This was certainly not the opinion of Sigmund Freud, who felt that most psychoanalytic concepts were buttressed by the great myths and works of literature, such as Sophocles's *Oedipus the King*, Michelangelo's *Moses*, and Shakespeare's *Hamlet*, which he mentioned in his letter to Wilhelm Fliess on October 15, 1897. Freud's later writings made use of the work of Wilhelm Jensen, Dostoevsky, and others. There are also numerous references to Goethe woven into the fabric of his thought. In this context we cannot really speak of application but, rather, of different modes of expression for the investi-

gation of what it means to be human. This proximity of culture and psychoanalysis also has the effect of mitigating the field's association with medicine, which was indeed one of Freud's objectives.

Freud's writings are interspersed with texts that are not specifically about psychopathology but contribute to its development indirectly. *Jokes and their Relation to the Unconscious* (1905c), "Psycho-Analysis and the Establishment of the Facts in Legal Proceedings" (1906c), *Delusions and Dreams in Jensen's "Gradiva"* (1907a [1906]), "Obsessive Actions and Religious Practices" (1907b), all written over a period of two years, reveal the variety of fields to which Freud applied the psychoanalytic method. More generally, psychoanalysis appears to embrace the fields of both individual therapy and collective phenomena, although we cannot speak of applied psychoanalysis in the latter case. Examples include *Totem and Taboo* (1912–1913a), *Group Psychology and the Analysis of the Ego* (1921c), "The Acquisition and Control of Fire" (1932a[1931]), and *Moses and Monotheism* (1939a [1937–1939]). Given the importance of these texts and their theoretical richness, "applied psychoanalysis" in the broad sense loses its meaning.

An especially rich and frequently examined field is the psychoanalysis of works of literature and the plastic arts. When it turns its attention to the artist or author, the psychoanalytic approach is not really far removed from its psychotherapeutic role. Freud himself emphasized the proximity between the case study and the novel, asserting that his case studies could be read as novels (1895d) and that novelists knew more about the unconscious than psychoanalysts.

Yet, the matter is not quite as simple as it appears. Although studying an author's biography is relevant for understanding his or her writing, such an examination should not be reduced to a form of pathography. Isidor Sadger was referred to as a *bungler* (Nunberg and Federn, 1962–75) and Max Graf, supported by Freud, pointed out that an author's neurosis does not explain his work. In "Creative Writers and Day-dreaming" (1908e [1907]), Freud shifted his focus to the question of the author's creativity with the hypothesis of a relation between the daydream and the themes of literary creation. He also questioned the nature of the reader's pleasure.

In 1912 the review *Imago*, published by Freud with the help of Otto Rank and Hans Sachs, printed articles on psychoanalysis applied to works of art, but even

earlier, in 1910, Freud's study of Leonardo da Vinci (1910c) had shown the protean nature of this type of psychoanalytic investigation. This was a study of a "childhood memory" of da Vinci's, and the earliest impressions of his life; it also provided an occasion to develop the theory of sublimation in its various versions, along with a new approach to male homosexuality.

Freud's paper on da Vinci is a good example of the impossibility, when referring to research devoted to a work of art (*The Virgin, Infant Jesus, and Saint Ann*) and its author, of limiting oneself to a single "application" of the psychoanalytic method. This, with all the risks it entails (mistaking the kite for a vulture), is creative because it directs toward the analysis of the work of art hypotheses and intuitions that could have come into being elsewhere or differently, blending episodes of therapy with a self-analytic approach (Freud's fantasy relationship with Leonardo).

Conversely, Freud's study of Michelangelo's Moses (1914b) ignored the facts of the artist's life. The interpretation is based on the feelings of the viewer, Freud in this case, and his understanding of the Bible. He explicates the work using the same method used for dreams, teasing out what is hidden or secret by means of details that are barely visible. Freud does not sharply distinguish between interpretation of the work of art and reconstruction of the author's fantasies, and when he turns to Jensen's *Gradiva* (1907a [1906]), it is only as an afterthought that he questions the author about the actual existence of a young girl with a club foot whom the author was supposed to have known in childhood.

The term "applied psychoanalysis" does not seem to be appropriate when we consider that for Freud—as for many psychoanalysts like Karl Abraham, Otto Rank, Wilhelm Stekel, Max Graf, Theodor Reik, and Fritz Wittels—it was not a question of demonstrating that the psychoanalytic method could be used outside the context of therapy (Laplanche proposed the expression, "extramural psychoanalysis"), but of developing hypotheses concerning this method within a field of research other than therapy.

Aside from the psychoanalysis of works of art, Freud highlighted the interest of psychoanalysis (1913j) not only for psychology but for the other sciences. By "interest" he meant the implications—being in (*inter-esse*)—of psychoanalysis for the other sciences, which can make use of psychoanalysis as a means of self-enrichment and even self-analysis. Thus

linguistics could draw on dreams and symbols for the study of language, philosophy could make use of the psychography of philosophers, and biology could borrow the opposition between ego instinct and sexual instinct to identify the opposition between an immortal germ plasma and isolated individuals. Similarly, the history of civilization could make use of the psychoanalytic approach to myth to help explain religion.

Nearly fifteen years later, in *The Question of Lay Analysis*, Freud wrote, "As a 'depth psychology,' a theory of the mental unconscious, it can become indispensable to all the sciences which are concerned with the evolution of human civilization and its major institutions such as art, religion, and the social order. It has already, in my opinion, afforded these sciences considerable help in solving their problems. But these are only small contributions compared with what might be achieved if historians of civilization, psychologists of religion, philologists and so on would agree themselves to handle the new instrument of research which is at their service. The use of analysis for the treatment of the neuroses is only one of its applications; the future will perhaps show that it is not the most important one" (1926e, p. 248).

Of course it is not necessarily the case that the benefit of psychoanalysis for the sciences is a one-way process. Just as the "application" of psychoanalysis outside therapy leads to discoveries that affect therapy through a deepening of theory and method, it benefits psychoanalysis to be questioned by the sciences with which it interacts. The "interactions of psychoanalysis" (Mijolla-Mellor, S. de) highlight the fact that it is impossible to focus psychoanalysis on a specific domain without the validity of its own methodology being questioned in turn. Such interactions assume the pursuit of a renewed epistemological investigation of the value of the psychoanalytic method and its ability to encounter other logics. This not only provides new insight into the field of application but also helps clarify the essential nature and potential for growth of psychoanalysis itself. The principal reason for this fecundity lies in the ability of psychoanalysis to allow itself to be questioned, and enriched, by, the fields of inquiry toward which it is directed.

Here, the cultural object or scientific discourse itself may exhibit a certain resistance (much like a patient) because they function according to their own logic and presuppositions, which in principle acknowledge no unconscious dimension. To introduce this dimension

into other domains means that the psychoanalyst must become newly aware of this object suspending the work of interpretation and, above all, questioning its ability not only to account for the facts in question but also for the way in which they are viewed and cathected.

The multidisciplinary interactions of psychoanalysis thus require an ongoing epistemological investigation of major importance, and which risks being undermined if psychoanalysts limit their inquiry to the therapeutic situation alone. This perspective is epistemological first and foremost, opening up the possibility of borrowing other models and allowing for conceptual fusion; but it also shows up the abiding (at times) specificity of fields of knowledge, and even their impermeability—and hence the limits of these interactions.

The common goal of research in the field of “interactions with psychoanalysis” is an awareness not only of the impact of Freud’s discovery of the unconscious on the humanities (*Geisteswissenschaften*) but also of the effects of models specific to those domains on psychoanalysis itself, as theory and as method, whenever it attempts to “interact.”

## APPRENTI-HISTORIEN ET LE MAÎTRE-SORCIER (L'-) [THE APPRENTICE HISTORIAN AND THE MASTER SORCERER]

This book's title and subtitle indicate its essential argument. The *I* is the apprentice historian, the psychological space in which identifications or delusional statements are worked out. According to Aulagnier, two questions have inspired her writings, including this book: the function of the *I* as the builder of its own libidinal history; and the relationship between this *I* and the analytic approach, where the concept of "the repressed" is of central importance.

The master sorcerer is another name for the id, for the psychological place where primal and primary processes write a story without words. In some cases, the subject may experience the "telescoping" of an event, a fantasy, and an identification in such a way that the subject is "stuck with" an identification which he is unable to assume, and yet finds it impossible to repress the fantasy. The task of analysis is to seek out the event that marked the infantile psyche, to bring to light how the irruption of affect contributed to fixing the identification in the subject's mind and worked to impede repression. The *I* can then replace this lived/lost moment with a history of the identification that makes sense of the subject's present life and makes an investment in his future possible.

The first part of Aulagnier's book presents the cases of Philippe and Odette, focusing on their relationships to time. Philippe is a young, delusional, psychotic patient who was treated by Aulagnier, initially during his hospitalization and later in her home, with the idea of undertaking an analytic treatment. Odette is a woman of about forty who elected to undergo analysis (which lasted five years) to help her in her struggle against what she called "dehumanization crises."

Aulagnier presents four versions of Philippe's history: that of Philippe himself, which embodies a delusional causality that brings about "temporal

indifferentiation" and seeks to exculpate his parents; that of the parents, who deny the role they have played in Philippe's life; the version that Aulagnier develops based on the preceding two histories, and on her own suspended theoretical attention; and, finally, the history that evolves within the therapeutic relationship.

Behind the claim of Philippe and his mother, that he "had a wonderful childhood," the analyst clearly discerns the annihilation of a birth. When the therapist suggests that the future is not decided in advance, Philippe responds: "I can't tell the difference between the past and the future. I just don't understand all these dichotomies: past/present, life/death, present/future." Aulagnier believes that in trying decathect her child, the mother has "roboticized" her relationship with him. This is reflected in the leitmotiv of Philippe's delusions: "We are all robots." He has been forbidden, he says, to see his birth. This evokes the prohibition against conceptualizing the mother's desire with regard to that birth. "My father has always been a brother to me," says Philippe. In other words, the paternal function has always been a blank in his history.

The act of eating a San Pedro cactus (*Trichocereus pachanoi*), which marks Philippe's entry into a delusional episode, causes him to meet "the unspeakable." His fantasy is to incorporate "a power close to that of God," but this idea opens the way to a characteristic primal metabolization. He acts out a pictogram: He incorporates and "autolyzes" the stone maternal breast, giver of indistinguishable "life-death"; "his bones and his thoughts" disintegrate, and he self-destructs and destroys the forbidden core that is the cactus/breast. The autolysis actualizes the decathexis that will satisfy both his mother's desire, and his own.

Odette, for her part, substitutes "bodily perceptions" for what she should have borrowed from her mother's discourse to construct the first paragraphs of her history. For lack of an ear capable of hearing her mother's words, her *I* was unable to metabolize into ideational representations those representatives of the suffering body that the psyche then metabolized instead into pictograms and fantasies. Her delusional causality is an attempt to fill the void created by the discourse of the spokesperson. To reconstruct her history and account for the events that have marked her, Odette invokes a single causal factor, "the abjection of the father"—a father whose powers of maleficent desire she idealizes. She then constructs an analytic

theory for herself, apparently “the equivalent of a split-up delusional theory” that is compatible with the discourse of her environment.

In the second part of her book, Aulagnier proposes a theoretical outline of the process of identification. She expands and refines the concept of potentiality as elaborated in her earlier works. While psychotic potentiality is characterized by the conflict between the “Identifying *I*” and the “Identified *I*,” neurotic potentiality involves the relationship between the *I* and its ideals; polymorphous potentiality, when it becomes manifest, leads to symptoms such as love relations or alienating relations, certain forms of somatization, and the like. In this theoretical scheme, T0 corresponds to the birth of the infant, T1 to the emergence of the *I*, and T2 to the conclusive moment when the *I* makes a compromise with reality; this compromise determines the type of potentiality. Potentiality is thus a specific organization that under certain circumstances moves from the potential to the manifest.

Faced by an idea that is “unthinkable and impossible to take on,” and that is evoked by a particular book, Philippe eats the cactus and plunges into a delusional state. Similarly, the revelation of “the magic of analytic knowledge about desire” confronts Odette with an unbearable discovery, the analyst becoming for her an idealized, all-powerful mother. Aulagnier uses the expression “encounter effect” to refer to this type of catalyzing cause that prompts a conflict of identification to pass from the potential to the manifest state.

By way of conclusion, Aulagnier shows how George Orwell’s fictional world in *1984* prefigures her theories of repression and of the process of identification. What Orwell calls “doublethink” is meant to produce a kind of repression within the subject that destroys ideas, consuming them utterly. The objective is to strip the *I* of all confidence in its own thinking. The subject is alienated, for he has internalized the mechanism of repression, but it is Big Brother who decides what the repressed object is. This mutilation serves to provide an idealized figure for repression in the psychotic patient: its function is to prevent the revealing of non-repressed elements active in the mother’s psyche. It thus serves an entity that is external to the subject, whereas in neurosis repression is imposed by the *I*s own thinking. The neurotic forbids him- or herself to desire the forbidden, but the psychotic suffers an external prohibition on the thinking of non-repressed

thoughts. The *I*s power of thinking is inhibited in neurosis, whereas in psychosis it is damaged.

In short, Aulagnier’s hypothesis of a ternary system of representational activity, and the notion of potentiality, profoundly transform and reinvigorate the Freudian understanding of possible mental organizations.

## ARCHAIC

Archaic is the term used in psychoanalysis to refer to an aspect of the psyche that was organized in the distant past and which contrasts with a new or more evolved organization. The term is used in two specific senses. For Freud the term served essentially to refer to a phylogenetic heritage that involved a way of thinking (1933a [1932]), the requirement of a superego (1923b), or an anxiety associated directly with a prehistoric reality. Freud’s theoretical advances did not affect the nature of the archaic understood in this sense. For Melanie Klein the archaic increasingly refers to that which is not reworked by the development of the depressive position, becoming a synonym of sorts for the pregenital.

These two meanings of the archaic do not always intersect. Freud saw in our phylogenetic heritage something underlying the id, a kind of strata of the psyche whose influence on the remainder of the psyche

was only partial or nonexistent. Through the superego, the ego draws on the experiences of the past stored in the id (1923b). But as far as the magical functions of thinking were concerned, Freud considered the resurgence of an ancient mode of communication such as telepathy, which operated in communities of insects and which can still be actualized in crowds (1933a [1932]). One form of “archaic” thinking, Freud claimed, can still be found in dreams, specifically their symbolism. He also associated a number of infantile desires, including oedipal desires, with a “phylogenetic heritage.” In 1925 Freud noted that the horror of incest and the reality of castration imposed by a leader on his rivals date back to prehistoric times (1925j).

This concept of the archaic is not found in Melanie Klein, for whom the term was far more important than it was for Freud. For Klein the term is always associated with ontogenesis. As Klein’s work reached its maturity, the term came to refer to the anxieties and defenses that crystallized during the formation of the paranoid–schizoid position (1946). The archaic is therefore contrasted with what it is not: the binding associated with the constitution of the depressive position.

What place can be given to the archaic within a conception of psychic life in which everything is a reworking of something else? Doesn’t the activity of deferred action bar access to those so-called archaic strata of the psyche? This brings up the question of the association between the archaic and the actual or present. André Green (1982) situates the problem of the observation of the archaic within this context. This observation can only be illusory because the archaic always appears to us in a transformed state. Whether or not this involves regression, “what is brought to the surface is not the faithful record of a prehistory,” wrote Green. Putting aside the wish to lift the veil on certain occasions, as Freud suggested with his metaphor of archeological excavations that would allow us to discover buried strata of psychic life, wouldn’t it be possible to assign to the archaic an influence ranging from what is most proximate to what is untouchable by definition, for in order to reach it we would have to return to the zero point of time and space, to what is most distant? This would revitalize the interest in direct observation of the infant, which is currently burdened with the reputation of being an observation of the archaic.

Jean-Michel Petot (1982), in his study of the archaic in the work of Melanie Klein, warns of the confusion between the “deep” and the archaic. For regressing to an archaic state that would otherwise need to be addressed in actuality is equivalent to creating a field of psychic depth that only the work of mourning associated with the depressive position can be used to bind and, consequently, put in perspective. In this sense the archaic could be said to be contemporaneous with temporal creation itself.

## ARCHAIC MOTHER

In the Kleinian constellation over which she presides, the archaic mother is the fantasy mother of the first few months of the infant’s life—the paranoid-schizoid phase. Omnipotent and phallic, she fulfills and frustrates in equally radical measure. She is the key figure in the early stages of the Oedipus complex, and her breast, an object split into a good, nourishing breast and a bad persecutory one, is her generic attribute. It is the target of the ambivalent libidinal and sadistic oral drives of the infant in search of unlimited satisfaction, a satisfaction that, inevitably, will never be achieved.

Beyond such epistemological considerations, the idea of the archaic mother points up a persistent psychoanalytical paradox: the fact that we mourn for origins that are inaccessible yet somehow open to retroactive attempts to reveal them. This figure embodies an archaism with the extraordinary ability to “conjure up the beginning while simultaneously revealing its absence” (Assoun, 1982). The primal mother escapes our grasp yet holds us in thrall.

The notion of the archaic is a semantic point of convergence for several Freudian concepts. It is closely related, for one thing, to the “primal”—to all those terms in Freud’s writings that begin with the prefix “ur-”: *Urszene* (the primal scene), *Urphantasien* (primal fantasy), *Urverdrängung* (primal repression), *Urvater* (primal father). And it is akin to the stratigraphical and archaeological metaphors of which Freud was so fond.

Melanie Klein used the adjective “archaic” only once, but made frequent use of “früh” or “early” (Petot, 1982). The idea of the archaic mother was introduced in connection with Klein’s theses on the early stages of the Oedipus complex in boys and girls (1928). Apropos of the early oral stage of the oedipal conflict, Klein described a “paranoid-schizoid position” characterized by the relationship to part-objects, by the splitting of the ego (an ego lacking in maturity) and of the object, by persecutory anxiety, and by schizoid mechanisms. The breast of the archaic mother was a structuring factor here. Frustrated in their attempts to attain that breast, both girls and boys were prompted to abandon the quest and embrace the wish for oral satisfaction by means of the father’s penis. Introjection of the good and bad breast of the good and bad mother was thus replaced by introjection of the good and bad penis of the good and bad father. The parents became the first models not only for internal protective and helpful figures but also for internal vengeful and persecutory ones; these first identifications by the ego constituted the foundations of the superego. Some of the superego’s most important traits, both its loving/protective and its destructive/devouring sides, were derived from the earliest identifications with the mother.

Klein’s followers developed these ideas, notably that of projective identification in infants (Bion, 1962; Meltzer, 1992); their exploration of childhood psychoses

went in the same direction (Tustin, 1972; Meltzer, 1975).

The archaic mother is part of a long mythological tradition stemming from the fecund and savage Earth Mother of ancient Greek cosmogony. In psychoanalysis the theme is discernible, for example, in the sea “abandoned in primeval times” of Ferenczi’s *Thalassa* (1924, p. 52), in Freud’s phylogenetic explanation of primal fantasies (1915f, p. 269 and n.), or in the “biological bedrock” of the “repudiation of femininity” (Freud, 1937c, pp. 250–52).

If the “archaic” is forever generating meaning in the unconscious without ever manifesting itself as a perceptible cause, it is the task of metapsychological speculation to offer an account of this phenomenon. The aforementioned psychoanalytical “mythologies” may indeed be said to respond to an “epistemic imperative” (Assoun, 1982). At the same time, however, any psychoanalytical view of the archaic, which is inseparable from the discussion of “deferred action” (q.v.), can achieve legitimacy only by eschewing the naïvety of the Freudian archaeological metaphor: the “archaic mother” of an excavated past does not amount to a restoration of the original.

Recently the analysis of borderline conditions has highlighted the notion of an analyst who does not *represent* the mother but instead *is* the omnipotent mother. This figure is the object of a transference that is “both archaic and a defense against the archaic” (Green, 1982).

At present, clinical work on the psychoanalysis of origins has an important part to play in the study of parenthood. In the contexts of infertility, perinatal psychopathology, or transgenerational mental transmission, the consideration of the structural outcome of parental conflict with the archaic (grand-) mother has given this concept a new lease on life (Bydlowski, 1997).

## ARCHEOLOGY, THE METAPHOR OF

Archeology, the study of artifacts from the past, is relevant to psychoanalysis in the sense that an analogy can be established between the search for a collective past and the search for an individual past. Freud himself uses the metaphor of archeology in his *Delusions and Dreams in Jensen's "Gradiva"* (1907a). His description of the structure of hysteria as a building of several dimensions, containing at least three strata ("The Psychotherapy of Hysteria" in *Studies on Hysteria*, 1895d), even though it refers to an archival case, also evokes the work of the archeologist: The order of discovery is reversed, with the most primal matter being the most deeply buried ("Saxa loquuntur," 1896c).

Freud was very interested in archeological research (Schliemann's excavation of Troy, for example) and

the collected artifacts, many of which decorated his office and which he frequently showed to his patients (*The Rat Man*, 1909d) as signs of the preservation of traces of a past that had become unconscious. More profoundly, we find that the methods of the archeological dig and those of psychoanalytical investigation have followed a similar evolution, consisting in shifting the focus of interest from a privileged object that will be excavated to a gradual discovery of the terrain (stratigraphic method), through which it is possible to trace the thread of history back to its origins step by step. Interest in these vestiges, which constitute "a history without a text" (André Leroi-Gourhan), intersects the work of reconstruction that takes place during analysis (Freud, 1937c). Similarly, the interest in a missing element (doubt in the dream, foreclosed elements in psychosis) evokes this preservation-through-absence that archeologists experience in what they call "ghost sites" (Mijolla-Mellor, 1993).

The archeological metaphor is present throughout Freud's work (1911f) and underlines the similarity with the work of therapy as well as the differences, especially since the working conditions of the psychoanalyst, and his or her ability to bring back old emotions through transference, are better than those of the archeologist.

## ARCHETYPE (ANALYTICAL PSYCHOLOGY)

The scientific hypothesis of the archetype was proposed by Jung as an innate formal element that structures the psyche at its most basic levels. In itself psychoid and therefore anchored in reality beyond the psyche (in “spirit” or nous, the non-biological mind), the archetype is responsible for coordinating and organizing the psyche’s homeostatic balance and its programs for development and maturation. Essentially there is one master archetype, the self, which defines the skeletal form of human wholeness.

The archetype itself is not available directly to experience—only its images and created patterns can become manifest and subject to experience by the psyche. These archetypal images are potentially unlimited in number and variety. They are embedded in the universal patterns of myth, in religious symbols and ideas, and in numinous experiences; they are also often represented in symbolic dreams and in altered states of consciousness. Within the psyche, archetypal images are linked to the (five) instinct groups, giving them direction and potential meaning. Like the archetype, the instincts are psychoid and rooted in reality beyond the psyche itself (in the physiological base of the psyche, the body). Archetypal images and instinctual impulses, united within the psyche, together make up the collective unconscious, the primordial psychosomatic basis of all psychic functioning.

Jung first used the term “archetype” in 1919. This was preceded by several years of speculation on primordial images and impersonal dominants. The implications of the archetypal hypothesis were developed by Jung himself and by his many students over subsequent decades in numerous case studies and investigations of myth, religion, and esoteric practices, especially alchemy. As the field of analytical psychology has grown and developed, the notion of the archetype and the role of archetypal images in psychological functioning and development have assumed a central role and have become the most distinctive feature of this school of psychoanalysis. Archetypal psychology, led by James Hillman, is a later offshoot of analytical psychology.

Jung himself found important connections between archetypal theory and the work of such ethologists as Konrad Lorenz who studied innate patterns of animal behavior and discovered innate releasing mechanisms. There are also parallels to be drawn between archetypal

patterns and the innate mental schemas described in cognitive psychology. Recent findings of innate human patterns in neuropsychiatry and sociobiology also suggest confirmation of the hypothesis of the archetype. Some leading thinkers in analytical psychology have found close similarities between the theory of archetypal images and Kleinian notions of unconscious phantasy.

Criticisms of the archetypal hypothesis have come from many quarters. As an essentialist position, it has drawn fire from social constructionists who argue that human nature is infinitely malleable and defined more importantly by social and material conditions than by innate propensities. It has also drawn criticism from clinicians for whom the personal conflicts and traumas inflicted in childhood define the universe of therapeutic concern. For Jung and his adherents, however, the archetype has been seen as the source of healing and as the guide to potential wholeness of the individual.

## ARCHIVES DE PSYCHOLOGIE, LES

*Les archives de psychologie* was founded in 1902 by Théodore Flournoy and Édouard Claparède. Though the review was eclectic and devoted itself to all aspects of psychology, principal areas of interest were psychic phenomena, the psychology of normal and abnormal children, and psychopathology.

Théodore Flournoy was then a professor of experimental psychology in the Department of Science at the University of Geneva. He was interested in obscure phenomena disdained by official science: genius, mysticism, metapsychic phenomena. Édouard Claparède, his assistant, had an interest in psychopedagogics.

From the beginning of the century until World War I, the review played a pioneering role in spreading an awareness of psychoanalysis throughout French-speaking countries. Psychoanalytic publications in German were regularly printed and analyzed. Many original articles were directly related to Freudian theory, including the work of Alphonse Maeder, Paul Menzerath, Pierre Bovet (then codirector of the Institut Jean-Jacques Rousseau), Paul Ladame, and Carl Gustav Jung. After Freud and Jung split in 1913, the review refused to take a stance between the two camps.

Upon the death of Théodore Flournoy in 1920, the review obtained the help of Jean Piaget, who reinforced the focus on child psychology and applied psychology. After 1930 the review devoted almost no space to psychoanalysis.

## **ARGENTINA**

Argentina is unlike other Latin American countries in that its population is in large part the result of the massive European immigration that took place beginning in the late nineteenth century. Between the last decades of that century and with the global economic crisis of 1930, the country experienced increased prosperity. During that interval, the cultural climate was infused with a number of avant-garde intellectual currents.

Psychoanalysis in Argentina can be broken down into five periods: 1) the pre-institutional period, 2) the pioneer period, 3) the institutional period, 4) the crisis of the seventies, and 5) the present.

After 1922, and during the pre-institutional period, Spanish translations of the first volumes of Freud's complete works began to appear in Argentina, although translations in other languages were known. As early as 1910, however, Freud's ideas about infantile sexuality, free association, and psychoanalysis had been presented in Buenos Aires by the Chilean doctor Germán Greve (quoted by Freud in *The History of the Psychoanalytic Movement*) during the International Congress of Medicine and Hygiene, and the Peruvian Honorio Delgado had published articles on psychoanalysis in several prestigious medical journals.

In 1922 Enrique Mouchet, who had been professor of experimental psychology and physiology for two decades in the Department of Philosophy and Literature at the University of Buenos Aires, made psychoanalysis part of his syllabus, although he was critical of it. In 1923 the Spanish doctor Gonzalo Lafora gave a number of talks on psychoanalysis at the school of medicine. In February 1930, two recognized psychiatrists left for Vienna to visit Freud: Gregorio Bermann and Nerio Rojas, who would later publish a report of his meeting in the widely circulated daily *La Nación*. During the thirties, inexpensive editions of Stefan Zweig's biography of Freud were printed, as well as a ten-volume series of popularizations of Freud entitled, *Freud Made Easy*, carelessly edited (pseudonymously) and containing long passages from the Spanish translation of Freud's works.

The journal *Critica* regularly published a column on psychoanalysis devoted to the interpretation of dreams. In 1936 one of the most serious literary reviews in the country, *Sur*, paid homage to Freud; the review *Psicoterapia* also devoted an issue to the founder of psychoanalysis. A group of writers invited Freud to move to Argentina. Jorge Thenon, a self-taught psychoanalyst, received a letter from Freud, to whom he had sent his thesis, "Psicoterapia comparada y psicogénesis" [Comparative Psychotherapy and Psychogenesis], in which Freud encouraged him to continue his work for future publication in an international psychoanalytic review. The letter appeared in *La Semana médica* in 1933.

In 1938 the arrival of the Hungarian psychologist Béla Székely in Argentina helped to spread psychoanalytic

ideas along with the use of tests, especially Rorschach tests. During that same decade, Enrique Pichon-Rivière and Arnaldo Rascovsky discovered Freud's work; they devoted themselves to its study and its clinical application. Pichon-Rivière formed a working group with Arminda and Frederico Aberastury; Rascovsky, with his wife Matilde Wencelblat, Luisa Gambier (later Luisa Alvarez de Toledo), Simon Wencelblat, Teodoro Shlossberg, Flora Scolni, Alberto Tallaferro, and Guillermo Ferrari Hardoy.

In 1939, two psychoanalysts from Europe, the Argentine Celes Cárcamo, member of the Paris Psychoanalytic Society, and the Spaniard Angel Garma, member of the German Psychoanalytic Association, joined Rascovsky's and Pichon-Rivière's groups. Celes Cárcamo had been a friend of Pichon-Rivière for years. Angel Garma, who had wanted to leave Spain for Argentina, had met Cárcamo in Paris. A decision was made to found a psychoanalytic association as soon as a sufficient number of analysts could be brought together. Luisa Alvarez de Toledo, Luis Rascovsky, Guillermo Ferrari Hardoy, and Alberto Tallaferro began analysis with Cárcamo, while Arnaldo Rascovsky, Enrique Pichon-Rivière, and Arminda Aberastury started with Garma. The patients who were analyzed by Cárcamo were supervised by Garma and vice versa.

On December 15, 1942, Cárcamo, Garma, Ferrari Hardoy, Pichon-Rivière, Rascovsky, and Marie Langer founded the Asociación Psicoanalítica Argentina (APA), which marked the debut of the institutional period. Marie Glas de Langer, who had sought refuge in Uruguay in 1938, settled in Buenos Aires in 1942. Analyzed by Richard Sterba, she had been trained at the Vienna Institute of Psychoanalysis but, to complete her clinical work, she underwent a control analysis with Celes Cárcamo. Shortly after it was founded, the association received the provisional approval of Ernest Jones, then president of the International Psychoanalytic Association (IPA). The APA was recognized as a member society of the IPA at the Zurich Congress, in August 1949.

In July 1943, the first issue of the *Revista de psicoanálisis* appeared, and that same year the publisher Biblioteca de Psicoanálisis went into operation. This began a process of rapid expansion of the discipline both inside and outside Argentina. Therapists from throughout Latin America arrived eager for training, there were many foreign visitors, and Argentinian analysts traveled to present their work in other

countries throughout the Americas and Europe. In 1953, the association had more than 68 members in all categories.

Angel Garma, who was analyzed by Theodor Reik and undertook his control analysis with Otto Fenichel, had an interest in a number of fields and in all of them he left his personal mark. He discussed Freud's theory of hallucinations in 1931, generalized the hypothesis of the traumatic genesis of dreams, and promoted psychoanalytic research and treatment in the field of psychosomatic disturbances. Celes Cárcamo was analyzed by Paul Schiff and had his control analysis with Rudolph Loewenstein and Charles Odier. He was interested in philosophy, religion, art, and especially therapy, and through his personal prestige and integrity helped introduce psychoanalysis to different social and professional milieus. During his early years, his writings primarily focused on psychoanalytic technique and psychosomatics.

The analysis of psychosis became a focus of interest through the impetus of Enrique Pichon-Rivière, along with Arnaldo Rascovsky's research on mania. Pichon-Rivière emphasized the "single illness" theory and proposed a psychopathology that centered on a central pathogenic kernel or "fundamental depressive situation." Rascovsky, in his work on fetal psychism, introduced the hypothesis of a prenatal maniacal position, prior to the introduction of the paranoid-schizoid position by Melanie Klein.

Arminda Aberastury and Elisabeth Goode de Garma specialized in the psychoanalysis of children and adolescents, basing their work on the theoretical contributions of Melanie Klein. Increasing demand and theoretical interest in this type of therapy helped stimulate the growth of group psychoanalysis. The work of Marie Langer, León Grinberg, and Emilio Rodrigué stands out in this field. The personality and the ideas of these pioneers affected the tenor of their theoretical work. There was a strong Freudian influence, of course, but Otto Fenichel, Hermann Nunberg, Wilhelm Reich, Paul Federn, and Melanie Klein were read as well.

Other important work was done by Marie Langer on femininity and by Luisa Alvarez de Toledo in her research on "association" and "interpretation," which contributed to the interest in language, a subject later taken up by David Liberman. Heinrich Racker made significant contributions to the study of the

instrumental value of countertransference (concomitant with the work of Paula Heimann in Great Britain).

The tentative return to democracy in 1958, which coincided with one of the most brilliant moments in the contemporary history of the University of Buenos Aires, provided a favorable framework for the activity of new generations of psychoanalysts. It was during this period that there arose the personalities and ideas that would, to a large extent, define the identity of what came to be known as the “Argentinian school.” Alongside the work of Rascovsky, Garma, Pichon-Rivière, and Racker, the names of León and Rebeca Grinberg, Willy and Madeleine Baranger, Jorge Mom, Jorge García Badaracco, Mauricio Abadi, Edgardo Rolla, Fidias Cesio, José Bleger, David Liberman, Joel Zac, Horacio Etchegoyen, Salomón Resnik, Luis Chiozza, Isidoro Berenstein, and many others gained local and international recognition.

The dominant theoretical trends revolved around English authors, primarily Melanie Klein and her closest collaborators: Paula Heimann, Hanna Segal, Susan Isaacs, and later Donald Meltzer, Wilfred Bion, and Herbert Rosenfeld. When Klein’s influence reached its peak, there were four dominant trends: dogmatic Kleinians, critical Kleinians (Baranger), those who deepened and extended her work (Grinberg, Bleger, Liberman, Etchegoyen, Zac), and those who responded to her theories with a refreshing (non-Lacanian) return to Freud.

During this period, the first non-IPA schools of psychoanalysis appeared, founded by members of the APA, to meet the growing demand for training and the limited opportunities for admission provided by the Association. Another important event that occurred at this time was the introduction of psychoanalysis in hospitals throughout Argentina. Also, during this ten-year period, a school of psychology was created in Buenos Aires. Psychoanalysis played a major role in the curriculum and a number of qualified psychoanalysts were on the staff. The school produced a large number of clinical psychologists. After 1986 they were able to join the APA once it removed the restriction that required practitioners of psychotherapy to be medical doctors.

The seventies were a period of increased tension. Changes around the world had repercussions in the country generally and on the psychoanalytic movement in particular. Passionate debates within the psychoanalytic community prevented any kind of consistent intellectual progress. During this confused

period, a number of well-known analysts (Marie Langer, Diego and Gilou García Reynoso, among others) left the APA and founded the Plataforma and Documento movements. Other forms of psychotherapy competed for the market of available patients, whose numbers continued to increase rapidly. This was somewhat muted by the economic inflation and the increasing social and individual malaise. Antagonisms among psychoanalysts concerning institutional attitudes and psychoanalytic training grew steadily, culminating in the schism that would divide the Argentine Psychoanalytic Association and give birth, in 1977, to the Asociación Psicoanalítica de Buenos Aires (APDEBA), officially recognized the same year by the IPA during its Congress in Jerusalem.

It was at this time that Jacques Lacan’s ideas entered the sphere of Argentinian psychoanalysis. These ideas rallied legions of partisans, not only because of their inherent interest but because of the anti-institutional orientation that Lacan embodied within the range of the then current warring ideological positions. Lacan’s followers were soon clamoring for positions in hospitals, universities, and on the pages of the leading reviews. The particular language used by Lacanians made it difficult to confront them or even exchange ideas on the basis of an alternate terminology, which effectively curtailed the traditional intellectual pluralism that had been the norm within psychoanalytic organizations.

At the time there were five psychoanalytic institutions affiliated with the IPA: two in Buenos Aires (APA and APDEBA) and three in the cities of Mendoza, Córdoba, and Rosario. Unlike the previous periods, psychoanalysis now had to struggle for its identity and avoid being diluted in a complex and confusing “world of psych.” A number of non-IPA teaching facilities were established, but the level of teaching was inconsistent. In spite of the changing, and unfavorable, cultural context, which contrasted sharply with the climate of the previous periods, the output of the majority of psychoanalysts was considerable, the local associations remained consistently productive, with an abundance of publications of high quality, and Lacanian organizations were highly active, demonstrating the persistent vitality of the discipline in the country.

Psychoanalysis in Argentina was influenced by global trends. Willy Baranger, initially influenced by the ideas of Enrique Pichon-Rivière, engaged in a critical examination of key concepts in psychoanalysis, from Melanie

Klein to Jacques Lacan. Because of the lucidity of his approach, Baranger's work became a key focus of psychoanalytic thought in Argentina, and has remained valid for the second generation of practitioners.

An indigenous line of thought focused on method soon developed in Argentina. It was based on the technical work of Heinrich Racker and its greatest representative was Horacio Etchegoyen, who perfected it through his many innovative contributions to the theory of psychoanalytic technique and his marked interest in the epistemological aspects of the discipline. Another local current came into prominence during the eighties and favored a diversification of practice in the psychoanalytic approach to group, family, and couples therapy. There was considerable interest in the social aspects of psychoanalysis, which led to the development of more committed positions among psychoanalysts and a psychoanalytic approach to social phenomena of violence. Developments in the field of psychosis, the diversification of applied psychoanalysis, and work in the field of psychosomatics reflect the range of contributions of contemporary psychoanalysis in Argentina.

### **ARLOW, JACOB (1912–2004)**

Jacob A. Arlow, American psychiatrist and psychoanalyst, was born September 3, 1912 in New York, where he died May 21, 2004.

The youngest of three children, he was raised in modest circumstances in Brooklyn, New York. Subject to frequent childhood illnesses, he spent much time in reading and reflection. With his encyclopedic knowledge and superb intellectual endowment, he found his way to Freud's writings in his adolescence. Graduating from New York University at the age of twenty, he then earned his M.D., also from NYU. While in the United States Public Health Service, training in psychiatry, he planned his study of psychoanalysis at the New York Psychoanalytic Institute. He was appointed a training and supervising analyst soon after his graduation in 1947. In 1960 he was elected president of the American Psychoanalytic Association and was elected Chairman of its Board of Professional Standards from 1967–1969. From 1963 to 1967 he served as treasurer of the International Psychoanalytic Association.

Jacob Arlow's teaching, presentations, lectures, seminars, and writing illuminated the different areas of psychoanalytic theory, technique, and applied analysis. His teaching was known for its clarity, consistency, and the force of his ideas. Emphasizing methodology and the importance of evidence, he advocated the objective marshaling and organizing of data after careful listening and contemplation. Arlow emphasized the close correlation of observation and inference with critical evaluation. His analytic ideas were lucidly expressed with attention to sound and silence, with apt metaphor. He regarded metaphor as central to clinical psychoanalysis. Arlow had an intense interest in the arts and humanities, and published many relevant psychoanalytic papers. Well versed in Jewish history, he was fluent in biblical Hebrew, a student of the Bible and its psychoanalytic interpretation.

The scope and depth Arlow achieved in his work are remarkable. He was the author of more than two hundred papers and a classic volume on structural theory, co-authored with Dr. Charles Brenner. He is regarded as one of the architects of American ego psychology, extending the concept of ego functions far beyond defense as originally formulated. Affects and moods were not simple drive derivatives, but had important regulatory functions, already indicated by Freud in the concept of signal anxiety.

In his later work he demonstrated a growing interest in psychoanalytic developmental theory. He contributed importantly to the psychoanalytic concept of unconscious fantasy and its clinical application. For Arlow unconscious fantasy was a compromise

formation, which encompassed elements of both the internal world and external reality, including identifications with external objects. Unconscious fantasies could undergo alteration during different developmental phases, which would then effect changes in symptoms and character. Transference and countertransference could best be understood in terms of their underlying unconscious fantasies. Arlow's papers included significant expositions of myth and the interrelationship of myth and culture. Myth was described as not only related to infantile unconscious fantasy, but also as a facilitator of the child's fitting into the particular cultural society in which he was reared.

Arlow's original contributions have left a permanent influence and in many respects transformed North American psychoanalytic theory and technique.

## **ARMAND TROUSSEAU CHILDREN'S HOSPITAL**

The Armand Trousseau Children's Hospital is a symbolic landmark in the treatment of suffering children, whether from physical or psychical problems. Since the late 1960s, Trousseau has witnessed the birth and development of a massive movement to humanize hospital treatment for children. It is arguable that the necessity for parental presence close to hospitalized

children was first recognized in the wake of the events of May 1968. We must not forget that prior to this time, young children were systematically strapped into their beds except for very limited visiting hours for the family. Generally speaking, very little attention was paid to the consequences of physical suffering, separation from the family, and the illness itself. The work of the pediatricians, psychologists and psychiatrists in Trousseau hospital—accompanied by important though less global actions in other French hospitals—introduced radical reforms in the way children were received, the quality of their stay and most of all in terms of consideration for hospitalized children.

It was indeed in this hospital that the humanization of pediatrics first blossomed and flourished, before being given concrete form in official decrees (*Bulletin officiel*, 1983, "Child hospitalization, Ministry for Social Affairs and National Solidarity, decree no. 83–24 of August 1, 1983", special issue no. 83/89b). Actions such as no longer strapping children into their beds, opening hospital sections up to parents, designating the first rooms for mothers, training maternity staff to inform and support parents after the birth of a handicapped child, the prevention of maltreatment, and the creation of a school inside the hospital all served to transform treatment.

Simultaneously, this collaboration between pediatricians, psychologists and psychiatrists gave rise to the notion of liaison psychiatry and thus the presence in almost every pediatrics department of psychologists and child psychiatrists. The metapsychological markers introduced by psychoanalysts contributed in a specific and important manner to defining this clinical field.

It is no accident that Françoise Marelle Dolto conducted a psychotherapy consultation unit for trainee analysts at Trousseau from 1940 to 1978. Her presence left a deep and lasting mark, although we must bear in mind—and this is by no means the least of the paradoxes—that this consultation unit was never a part of the psychiatric department: the premises were simply lent to her and she was never paid by the hospital. All of the movements initiated at Trousseau to improve the conditions governing child hospitalization and treatment link up, at least symbolically, with her combat for the recognition of children as subjects in their own existence.

### ARROGANCE

In the course of psychoanalyzing psychotic patients, Bion came across a series of invariant clinical phenomena that seemed to characterize the psychotic personality. In 1958, he presented the paper “On Arrogance,” in which he noted that the psychotic patients he was analyzing seemed to demonstrate a constantly conjoined yet mysteriously dispersed triad of phenomena: *arrogance*, *curiosity*, and *stupidity*. Bion was able to formulate that the root cause of this syndromic cluster of phenomena was ultimately due to a failure on the part of the psychotic patient to have had at his disposal as an infant a mother who was able or willing to tolerate his projective identifications into her. This theme of the unavailability of a receptive mother to tolerate her infant's projective identifications was to be carried through in two successive papers, “Attacks on Linking” and “A Theory of Thinking.” Ultimately, it became the pivotal alteration of Klein's concept of intrapsychic projective identification into intersubjective projective identification and the foundation for Bion's later theories of alpha function and container/contained.

Bion found that, in these patients, the triad of curiosity, stupidity, and arrogance was initiated clinically by the revival in the analysis of the presence of an *obstructive object*, which represented the psychotic infant's projection-rejecting (part-object) mother in addition to her hostility *and* the infant's hostility. As

an internalized hybrid, it becomes a formidable, archaic superego, which attacks the infant's normal curiosity; is arrogant (because of the projective identification of omnipotence); and conveys stupidity because of its hatred of curiosity. Bion states that where the life instincts predominate, pride becomes self-respect, whereas when the death instinct predominates, pride becomes arrogance.

The fact that the triad is mysteriously dispersed, and therefore unsuspected as belonging together, is evidence, according to Bion, that a psychotic disaster had taken place. The analytic process itself, which seeks to learn more, constitutes the stimulus for curiosity. Bion states, “The very act of analyzing the patient makes the analyst an accessory in precipitating regression and turning the analysis itself into a piece of acting out” (Bion, 1967, p. 87). The features that characterize the transference are references to the appearance of the analyst and the analysand's identification with him in terms of being “blind, stupid, suicidal, curious, and arrogant.” (Bion, p. 88). What takes place is a hateful attack by this obstructive superego against the ego, either in the analysand or, by projective identification, in the analyst. Thus, either the analyst and or the analysand are targets of the obstructive object's hateful attacks.

Since the aim of analysis is the pursuit of truth (curiosity), the truth-pursuing analyst is considered to have a capacity to contain the discarded, split-off portions of the analysand's psychotic self, including the obstructive object and its destructive effects. This capacity becomes the target for envious and hateful attacks. In short, as Bion summarizes:

What it was that the object could not stand became clearer . . . where it appeared that in so far as I, as analyst, was insisting on verbal communication . . . I was felt to be directly attacking the patient's methods of communication [i.e., projective identification].

Bion further summarizes that in some patients the denial to the patient of a normal employment of projective identification precipitates a disaster through the destruction of an important link. Inherent in this disaster is the establishment of a primitive superego which denies the use of projective identification.

## AS IF PERSONALITY

In 1934, and again in 1942, Helene Deutsch described what she called the “as if” (*als ob*) personality type. She was referring to individuals who leave other people with an impression of inauthenticity, even though they seem to enjoy “normal” relations with those around them and even though they complain of no disorder. They appear perfectly well adjusted, and are even capable of a certain warmth, but in a number of circumstances they betray a lack of emotional depth.

This phenomenon does not correspond to a type of repression but rather to a “real loss of object cathexis. The apparently normal relationship to the world corresponds to a child’s imitativeness and is the expression of identification with the environment, a mimicry which results in an ostensibly good adaptation to the world of reality despite the absence of object cathexis” (1942, p. 304). Their creations are, on observation, “a spasmodic, if skilled, repetition of a prototype without the slightest trace of originality” (p. 303). “Another characteristic of the ‘as if’ personality is that aggressive tendencies are almost completely masked by passivity, lending an air of negative goodness, of mild amiability which, however, is readily convertible to evil” (p. 305).

In the course of psychoanalytic treatment their behavior may seem to indicate excellent cooperation and a certain progress, until the analyst realizes that nothing is actually happening, that the patients have changed nothing in their lives. Although “a strong identification with the analyst can be used as an active and constructive influence” (*ibid.*), these patients often develop a “vocation” to become psychoanalysts themselves.

Deutsch classified such personalities as “depersonalized” and associated them with schizoid-type behavior, insisting that there was a schizoid psychotic core behind their pseudo-normality. They were later classed as “borderline states” presenting “narcissistic disorders” or, according to Heinz Kohut, “disorders of the Self.” Links have also been established between “as if” personalities and the notion of a “false Self” developed by Donald W. Winnicott (1962/1965), or Phyllis Greenacre’s studies of “the imposter” (1958). Masud Khan related the etiology of “as if” personalities to the

failure of the superego or the absence of a personal ideal ego, suggesting that although these subjects give the impression of being psychopathic or immoral “they have a very highly organized ego-ideal and all their attempts are to approximate to its demands” (1960, p. 435).

In any event, Deutsch’s initial description corresponds to a reality that continues to be confirmed in clinical experience as in everyday life.

## ASSOCIATION PSYCHANALYTIQUE DE FRANCE

The Association psychanalytique de France (APF) was created in 1964 as a result of dissension within the Société française de psychanalyse (SFP) over the training of future psychoanalysts and the recognition of the APF by the International Psychoanalytic Association. Two factions evolved within the association. One of them, which became a majority in the SFP in November 1963, was led by Daniel Lagache, Juliette and Georges Favez, Wladimir Granoff, Didier Anzieu, and René Pujol, along with the five sponsors of the July 1963 motion (Jean-Louis Lang, Jean Laplanche, Jean-Bertrand Pontalis, Victor Smirnoff,

and Daniel Widlöcher). The group was recognized by the International Psychoanalytic Association (IPA) as the only “French Study Group.” On June 9, 1964, the association filed its bylaws, and was, after the dissolution of the SFP in January 1965, recognized as a member society of the IPA. It then had ten accredited members, 18 associates, and about 30 students. In December 1999, in addition to a guest member and eleven honorary members, there were 34 accredited members, 27 members, and more than 180 trainee analysts, including ten who would soon be eligible for membership.

The association’s general orientation was described in two talks given by Daniel Lagache in 1964 and 1965, and again by Victor Smirnoff in 1977. The association’s objectives can be found in the policy statements published each year in *Documents et Débats*, the association’s journal. These can be summarized as: freedom of expression in scientific discourse without concern for any narrowly construed form of orthodoxy, a rejection of dogmatism or any “overarching” authority; a heterodox approach to theoretical sources, leading to the coexistence of several trends in clinical psychology, dynamic psychology, Lacanian thought (exclusive of training), philosophy, and the work of Freud; the periodic revision of “classical” positions in psychoanalysis, even those not deeply rooted in psychoanalysis, especially through a rereading of Freud in the light of current understanding; an openness toward other disciplines and especially toward the various branches of the humanities; and periodic consideration of the relations of the institution to its various categories of members, including trainee analysts.

APF training is one of the most important features of the association. The reasons for the split were obviously not restricted to the questionable practices of certain members or a leadership dispute, and fundamental modifications concerning recruitment and training turned out to be essential. These issues have been an ongoing element within the APF since its inception and were concretized in the reforms of 1969–1971, which were finally completed in 1978. They can be summarized as follows: elimination of the training analyst under institutional control and elimination of the group of training analysts, and complete separation between institutional bodies and personal analysis. Regardless of where the original analysis occurred, this separation was appreciated by the members of the training committee before whom candidates for admission appeared as trainee analysts; once

accepted, they were allowed to participate from the outset in scientific and teaching activities. The approval of controlled analyses was a joint effort of the members of the training committee, since they alone were authorized to do so, acceptance into the program (including participation in classes) being the responsibility of the members’ council. The candidate was then asked to present a paper before being accepted as a member, which was submitted to a vote by the members.

This system, which did not comply with the customary practices issued by the IPA (in the “French” system, members alone are responsible for training), has always been a topic of discussion and is currently oriented toward the conditions of supervision and the paper. It should also be pointed out that trainee analysts participate at every level of the life of the institution and are represented, separately and independently of the training committee, on all the committees, and even participate in the association’s administrative affairs. There is also a welcoming and study group for new candidates.

Teaching, which is under the supervision of an ad hoc committee, is not separate from the association’s scientific and research activities. It consists primarily in conferences and discussions, group activities, periodic meetings to discuss clinical issues or technique, and research groups. It is not mandatory and is not subject to individual control. Members can participate in these activities as soon as they are accepted into the program. In 1999 there were 32 groups or seminars open to trainee analysts; a number of full members were participants as well.

Scientific activities, also under committee control, consist (in addition to the research groups mentioned above) in monthly meetings often focused on an annual topic, two annual colloquia (the “Entretiens,” formerly the “Entretiens de Vaucresson”), and two annual days reserved for active members and also involving a specific subject. There are also a number of Open Sessions, such as the current “Soirées de l’APF” (three per year), and APF participation in a number of French, European, and International colloquia, two of which, the Congress of French Languages and the Journées Occitanes, are organized with the assistance of the APF.

Five issues of the *Bulletin intérieur de l’A.P.F.* were published between 1964 and 1969. This was followed

by *Documents et Débats*, which ran from October 1970 to December 1999, that is, 52 issues. A periodical newsletter and annual report on the activities of the association are also published. The APF has no journal of its own but its members are active participants in the publication of several specialized journals: the *Nouvelle revue de psychanalyse*, created in 1970 by Jean-Bertrand Pontalis, *Psychanalyse à l'université*, created in 1975 by Jean Laplanche, *L'Écrit du temps*, and *L'Inactuel* by Marie Moscovici, *Le fait de l'analyste* by Michel Gribinski. In addition to reprinting Jean Laplanche and Jean-Bertrand Pontalis's *The Language of Psycho-Analysis*, the association supervised the translation of the complete works of Sigmund Freud, published by Presses Universitaires de France (PUF) under the direction of Jean Laplanche and André Bourguignon, with the collaboration of Pierre Cotet and François Robert (in progress; the final work will comprise 21 volumes). Member publications appear in collections edited by a member of the APF in the following series: Bibliothèque de Psychanalyse, published by PUF under the direction of Jean Laplanche; Connaissance de l'Inconscient, published by Gallimard under the direction of Jean-Bertrand Pontalis; and Psychismes and Inconscient et Culture, published by Dunod under the direction of Didier Anzieu.

Although relatively small in size and with little desire for expansion or control, the APF remains ambitious in its goals and open to new ideas. Its headquarters and secretariat are located at 24 Place Dauphine in Paris. It is here that the association's councils and committees meet and where the association's library, containing some four thousand volumes and documents, is housed.

## ASTHMA

Due to its frequent association with psychoaffective symptoms, asthma is considered a classic psychosomatic disorder. The Hungarian-American analyst Franz Alexander was an early proponent of psychosomatic medicine, and during the 1940s he and Thomas French applied the “specific emotion theory” to try to establish a link between the onset of asthmatic attacks and emotional conflicts. Their research suggested that pregenital instinctual desires, experienced as threatening to the dependent mother-child dyad, could give rise to bronchial symptoms, noting that breathing is the first independent post-natal physiological function. It is possible to view the infant's double separation from the mother—biological and psychoaffective—as reviving the Freud-Rank birth trauma debate. A generation later in 1963, research by Peter Hobart Knapp suggested that allergic diathesis was a necessary precondition to developing symptoms, and offered as possible triggering mechanisms either hysterical conversion or conflicts of oral incorporation expressed through the respiratory apparatus.

In France, Pierre Marty, one of the founders of the *Ecole de Psychosomatique de Paris*, theorized that asthma, like other allergic manifestations, arises from a specific type of object relationship that involves a form of profound and almost instantaneous mimetic identification that includes a projective movement identifying object with subject. The difficulty of maintaining such a state of confused fusion either produces some accommodation or, in the case of an intractable object, creates a distance from the object that may be considered at once symbolic and real. The separation from the object whose own characteristics are too distant from, or independent of, the subject, occurs without the work of mourning. The asthmatic attack breaks out during conflict between two objects, both equally invested but themselves in conflict. The asthmatic attack externalizes and diverts internal psychological destruction.

## ASTHMA IN CONTEMPORARY MEDICINE AND PSYCHOANALYSIS

A fairly uncommon disease in 1900, a century later asthma represented a growing international health problem. Although the early psychosomatic models proposed by Alexander, Fenichel, and other first and second generation analysts were eventually supplanted, numerous research efforts in a variety of disciplines have failed to develop a comprehensive understanding of the disorder. Although asthma is treatable as a chronic condition, it remains poorly understood.

The original psychoanalytic research into asthma in American medicine represents a historical point of reference in subsequent reviews of the literature. But from a medical point of view, its specific hypotheses could not be easily refined for further research, while typology of the disorder itself changed considerably. In the mid-twentieth century Hans Selye's holistic concept of stress created grounds for a macrocosmic explanation that ultimately proved valuable, if unquantifiable. At the same time, investigations into the physiology, immunology, and genetics of asthma all yielded significant, though sometimes conflicting, results. Although this research helped create a pharmacological armamentarium for palliative treatment, studies in all these areas only reinforced the hypothesis that psychological factors play significant roles in asthma, which continues to qualify as a psychosomatic disorder. In this context, psychoanalysis remains a plausible treatment for reducing symptomatic attacks and alleviating frequently comorbid conditions, such as anxiety and depression, as do other modalities, including relaxation therapy, hypnosis, and other types of psychotherapy.

More recent psychoanalytic conceptualizations of asthma include work by Judith Mitrani (1993) from a

post-Kleinian perspective; she describes asthma as one of a number of disorders that in some cases may be viewed as arising from persistent primitive mental states in the context of what Esther Bick terms "adhesive identification."

## ATTACHMENT

The term *attachment* is used in contemporary scientific literature in four distinct senses: a form of behavior whose goal is to maintain proximity to the other person (smiles, vocalization, tears, approach behavior); the bonds of attachment that are related to the affiliation between parents and children; the system of attachment, in which the child's goal is to seek proximity with the attachment figure and obtain an internal feeling of security; and, finally, relationships that involve the offer of attention, emotional availability, and the search for comfort in parent-child relations.

Attachment is a behavioral control system of biological origin, which involves the use of the attachment figure by the child as a "secure base" from which it can explore the environment. In John Bowlby's theory, the form assumed by the child's attachment is based on its actual interactive experiences with its attachment figures and not with the fantasies they arouse. These feelings of security or insecurity (anxious attachment, resistant attachment, avoidance attachment, disorganized attachment) about the parental figures are organized during the first year of life in the form of an "internal model of work" that will give rise to stable forms of reaction in the face of distress and novelty.

From the start of the twentieth century, the medical literature was cognizant of the effects of the lack of maternal care of infants (Chapin, 1916; Spitz, R., 1945). In 1951 Bowlby wrote a monograph on maternal care and mental health. In 1959 Harlow, working with primates, provided experimental proof of the independence of attachment and the satisfaction of physiological needs. This led Bowlby to propose, in 1969, the concept of “attachment behavior” and to emphasize its importance for normal development. Bowlby’s student Mary Ainsworth proposed the experimental paradigm of the “strange situation,” which could be used, in the laboratory or at home, to study the reactions of infants over a year old to the presence of a stranger, followed by a short separation and reunion. It was used to classify attachment behavior with either of the parents into types: secure attachment (type B) against various insecure attachments (anxious-avoidant, or type A; anxious-resistant, or type C; and disorganized, or type D). The work of Mary Main focused on describing parents’ speech about their children and in classifying it into coherent, avoidant, involved, or disorganized types. Longitudinal studies show a clear correlation between the speech category of the parent most directly involved with the child and the type of attachment formed by the child. The relation appears clearly during experiences of absence and abuse and the phenomenon of disorganized attachment.

Attachment is not a psychoanalytic concept; it is part of ethology. However, the concept was developed and applied within the context of psychopathology and the study of infant development by a psychoanalyst, a leading member of the British Society of Psychoanalysis, who had been responsible for training for many years. To the great regret of its inventor, the concept of attachment, although it underwent considerable development in the field of developmental research, was not extensively used in clinical practice, at least, not until recently. Of course, the concept of attachment clashes with the classical theory of anaclisis. It is also true that from the point of view of attachment theory, infantile sexuality is of little importance and the emphasis is on the real and repeated experiences of early childhood. However, contemporary psychoanalysts would be wrong to neglect this essential dimension of human relations, important because of its development in the first year of life, the formation of the different styles of attachment described by Main and observable after the first year of infancy in Ainsworth’s “strange situation,” as well as the persistence of attachment in adolescent and adult life. Attachment

theory clarifies the development of early parent-infant relations and the modes of organizing representations.

Finally, there is remarkable convergence between the concept of attachment and psychoanalytic theory in the work of John Bowlby and Mary Main on the transgenerational transmission of styles of attachment through the consistency of parents’ speech concerning their own infancy. Starting from the “secure base” represented by the analyst, the patient can explore the disturbances in his earliest relationships and eliminate their continuation in his interpersonal relations and their transmission to his own children through the expression, in narrative form, of his emotional experience, which is re-expressed in the transference. The concept of attachment assumes its place in psychopathology as a tool for analyzing early development and exploring its structure in the psychoanalytic experience.

---

## **ATTENTION**

The word “attention” comes from the Latin *attention*, itself derived from *attendere*, which means “to turn

one's mind towards"—to turn one's mind or perhaps one's senses. In any case, the term is currently very ambiguous, and all the more so since it is used in different senses by researchers and clinicians referring to quite varied epistemological horizons.

In France, Didier Houzel has made the most careful study of the concept in recent years, notably in relation to infant observation. According to this author, if the function of attention is only rarely mentioned in the psychoanalytic literature, it is in part due to the ambiguity it evokes and also in part because attention is traditionally linked to consciousness without there ever existing any clear definition of a possible unconscious attention.

Freud mentions attention for the first time in his book *On Aphasia* (1891b), where he discusses divided attention (*geteilte Aufmerksamkeit*): "When I read proofs with the intention of paying special attention to the letters and other symbols, the meaning of what I am reading escapes me to such a degree that I require a second perusal for the purpose of correcting the style. If, on the other hand, I read a novel, which holds my interest, I overlook all misprints and it may happen that I retain nothing of the names of the persons figuring in the book except for some meaningless feature or perhaps the recollection that they were long or short, and that they contained an unusual letter such as x or z. Again, when I have to recite, whereby I have to pay special attention to the sound impressions of my words and to the intervals between them, I am in danger of caring too little about the meaning, and as soon as fatigue sets in I am reading in such a way that the listener can still understand, but I myself no longer know what I have been reading. These are phenomena of divided attention which are of particular importance here" (pp. 75–76).

Freud thus attributed to attention an ability to forge links between different components of the sensory data constitutive of the word, distancing himself from localizationist theories of aphasia. In this linking function of attention, one can see the precursor of what would later come to be called "suspended attention" of the analyst and its crucial characteristic of non-selectivity, which is an important component of technique.

It was in the *Project for a Scientific Psychology* (1950c [1895]) that Freud proposed an actual theory of attention. Having distinguished between  $\Psi$  neurons sensitive to quantities of excitation and x neurons sensitive to qualities of excitation, he defined attention as a hypercathexis of the indications of quality that are

perceived by the x neurons but as hypercathected by an energy issuing from the  $\Psi$  neurons. He made attention capable of expectation in that it was responsible for apprehending indications of quality from perception and thus anticipating cathexis by wishes.

Thus Freud distinguished "ordinary thought," directed toward the search for an object of satisfaction, and "observing thought" (1950c [1895], p. 363) which is turned more towards the internal world than the external and is supported by the function of attention. According to him, attention has one valence directed toward the interior, or the intrapsychic world, and it is this centripetal attention that allows neuronal facilitations that would be impossible with only centrifugal attention.

In *The Interpretation of Dreams* (1900a), he assigned attention the task of transmitting psychic material from the preconscious system to the conscious system, thus giving a certain primacy to continuous attention. In 1911, he specified the dynamic character of attention in his article, "Formulations on the Two Principles of Mental Functioning": "A special function was instituted which had periodically to search the external world in order that its data might be familiar already if an urgent internal need should arise—the function of *attention*. Its activity meets the sense-impressions half way, instead of awaiting their appearance" (1911b, p. 220). He was here underscoring the active aspect of the function of attention.

Freud returned to the question of attention yet again in "Recommendations to Physicians Practising Psycho-Analysis" (1912e), where he defined "evenly-suspended attention" as the desirable attitude of the analyst during the session. This attitude, which certainly puts less strain on the analyst, is justified mainly on the grounds that non-selectivity toward clinical material, as the counterpart for the analyst of the rule of free association for the patient, promotes a more direct contact between the ideational worlds of the two participants.

Wilfred Bion extended the concept of attention beyond sensory reality and applied it to psychic reality, a direction that Freud had indicated in *An Outline of Psycho-Analysis*. This theme is central to Bion's book *Attention and Interpretation* (1970), in which he described attention as the matrix within which the diverse elements of mental life come to be united and combined. Thus the Bionian perspective is highly dynamic.

Moreover, on the interpersonal level, Bion described the "mother's capacity for reverie" (Bion, 1967, p. 116),

referring to the “function” by which, thanks to her processes of attention, capacity, and transformation, the mother helps the child to render his or her environment thinkable so that the child will be progressively able to integrate it into its own “apparatus for dealing with thoughts” (Bion, 1962, p. 83). What is fundamentally involved is a work of detoxification that makes it possible for the child to metabolize (on the digestive model of the psyche) protopsychic materials that are at first unusable by the child alone.

Maternal attention represents a first step towards and an essential precondition for the work of transformation that Bion referred to as equally important to his experimental paradigm, which was that of analytic treatment, and especially the treatment of psychotic adults. He recommended that analysts be without “memory and desire” (1970, p. 31), which is certainly not to be taken literally, but aims to create in the analyst a particular state of attention and perhaps, according to Houzel, an unconscious state of attention.

The most recent work in the field of early childhood analysis, especially that of the post-Kleinians, places more and more emphasis on attention as the cornerstone of the therapeutic process.

## **AUBRY WEISS, JENNY (1903–1987)**

Jenny Aubry Weiss, a physician in the Hospitals of Paris and French psychoanalyst, was born on October 8, 1903, in Paris, where she died on January 28, 1987. She was born into an upper-middle-class family; her mother was Jewish and her father Protestant. She studied medicine and interned with Clovis Vincent, was an assistant with Georges Heuyer, and, in 1939, was the second woman to be appointed as a physician in the Hospitals of Paris. In 1928 she married Alexandre Roudinesco, a pediatrician, with whom she had three children. She later divorced Roudinesco and married Pierre Aubry in 1952.

In 1939 she became a physician at an institute for gifted children (the first in France). She accepted a number of Jewish children and hired a number of Jewish personnel, saving them from the concentration camps. She prepared certificates of tuberculosis for young men likely to be sent to the forced labor camps in Germany. In 1944 she received the Medal of the Resistance. She was head of the pediatrics department of the Ambroise Paré Hospital in 1946, of the polyclinic on the Boulevard Ney in 1952, and of the pediatrics department of the Hôpital des Enfants Malades from 1956 to 1968. She met Anna Freud in 1948 and began psychoanalysis with Michel Cénac, Sacha Nacht, and Jacques Lacan, whose loyal supporter she remained during the sectarian battles of 1953 and 1963.

An excellent clinician, she realized quite early in her professional life that psychoanalytic insight can help to understand the development of children and their illnesses. Convinced of the importance of interactions between mother and child, mother and father, and parents and children, and of the key role played by the mother-child-father relationship, she was able to verbalize children’s suffering and help their parents make sense of their physical and psychic disturbances. The publications, films, and papers she produced bear witness to this, as do her many innovations in the hospital, where she managed to create a pleasant and friendly environment within a recreational framework. She persevered in her efforts to create positions for kindergarten teachers and educators, and she included psychoanalysts on her staff.

In 1948 she appointed a teacher for her young patients and studied dyslexia. She brought psychoanalysts to the school for gifted children. She initiated a research program on the lack of maternal care with John Bowlby, and she formed a team with Myriam David to observe and establish analytic cures for children assigned to her department (Dépôt d'enfants de parents de Rosan). In 1950 she created a specialized family-placement service so that children under her care could benefit from a family environment and analysis.

Through the World Health Organization, she helped found, in July 1950, the first Guidance Center for Children in Soissons, France. In 1952, together with Odile Lévy-Bruhl and Raymonde Bargues, she studied children in the hospital day-care center and their entry into a preschool setting. In 1954 she was asked by the World Health Organization to study abandonment and child development in Africa. At the Hôpital des enfants malades, with Raymonde Bargues, Ginette Raimbault, Anne-Lise Stern, and René Tostain, she trained pediatricians and nurses to be sensitive to the needs of children and parents, and established a psychoanalytic practice. From the hospital administration she obtained approval for parents to visit from noon to 8:00 p.m.

After her retirement to Aix-en-Provence in 1968, she helped promote psychoanalysis in southeast France. In 1971 she organized and introduced the meeting of the École freudienne de Paris (Freudian School of Paris). After the death of Pierre Aubry in 1972, she returned to Paris, where she resumed her psychoanalytic practice, served as a training analyst, and remained an active participant in the École freudienne de Paris until its dissolution in 1980.

## **AULAGNIER-SPAIRANI, PIERA (1923–1990)**

A physician, psychiatrist, and psychoanalyst, Piera Aulagnier-Spairani (formerly Castoriadis-Aulagnier) was born on November 19, 1923, in Milan, Italy, and died on March 31, 1990, in Paris.

She studied medicine in Rome, her early medical calling marked by her sustained focus on clinical practice. In 1950 she moved to France, where she completed her studies in psychiatry.

She trained in psychoanalysis with Jacques Lacan from 1955 to 1961. As his student, she joined ranks with him when he was expelled from the Société française de psychanalyse (French Society of Psychoanalysis) in 1963, and she was among the psychoanalysts who first formed the École freudienne de Paris (Freudian School of Paris) in 1964. True to her personal standards of rigor, she later resigned from that organization when she found herself in disagreement with Lacan's positions on the training of psychoanalysts.

In 1969, immediately after her break with Lacan, along with François Perrier, Jean–Paul Valabrega, and other analysts, she founded the Fourth Group of the O.P.L.F. (Organisation psychanalytique de langue française [French-language psychoanalytic organization]) in which she remained a central figure, although it was never her wish to impose a hierarchical structure within the group.

Throughout these tumultuous years, she was known for her independent-mindedness and the calm in debates that led her to abstain from participating in vain polemics. However, her reserve was never synonymous with indifference. Her concern about the risk of conformity that threatens psychoanalytic and indeed other societies led her to denounce that tendency in 1969, when she wrote, “the audacity and genius needed to transgress accepted wisdom do not guarantee that the transgressors will be able to pass on to their heirs the ability to dismantle the barrier that has been broken through.”

This spirit was reflected in her activity in the two she successively founded at the Presses Universitaires de France: *L'Inconscient*, with Jean Clavreul and Con-

rad Stein in 1967–1968, and then *Topique*, beginning in 1969. In both publications, pluralism and respect for the authors' thought always won out over issues of institutional affiliation.

Daily clinical practice and the ongoing pursuit of her writing were intimately linked for Aulagnier. In 1975, while she was married to Cornelius Castoriadis, her first book, *The Violence of Interpretation: From Pictogram to Statement* (under the name Piera Castoriadis-Aulagnier) was published by the Presses Universitaires de France. This work became an obligatory reference for those who felt the need, based on the clinical treatment of psychosis, to reexamine Freudian metapsychology. Two other books, published under the name Piera Aulagnier, followed: *Les Destins du plaisir. Aliénation, amour, passion* (1979; The destiny of pleasure: Alienation, love, passion) and *L'Apprenti-historien et le maître sorcier. Du discours identifiant au discours délirant* (1984; The apprentice historian and the master sorcerer: From the discourse of identification to the discourse of delusion); these books also found a broad readership. The long series of articles written beginning in 1961, most of them published in *Topique*, the revue she headed from its founding in 1969, were collected and reprinted in *Un interprète un quête de sens* (An interpreter in search of meaning; 1986).

All are indebted to Aulagnier for a new approach not only to psychosis, but also a new theory of representation that considers the psychotic's relationship to discourse. Beyond this, she established an entirely new theorization of the *I* and the conditions in which it comes into being. Her conceptual inventions emerged in close connection with clinical practice and under strict critical self-scrutiny, leaving those who knew her with lasting impressions of her tireless and passionate interest in the fundamental issues not just of psychoanalysis, but of human experience.

## **AUSTRALIA**

Sigmund Freud wrote his short paper "On Psychoanalysis" in response to an invitation from Andrew Davidson, the Secretary of the Section of Psychological Medicine and Neurology for the Australasian Medical Congress in Sydney in September 1911. Papers by Carl Jung and Havelock Ellis were also presented. Ernest Jones was another distinguished early contributor, for he personally read a paper at the Australasian Medical Congress in 1914 entitled "Some Practical Aspects of Psychoanalytic Treatment."

Two notable Australian figures who accepted Freud's challenge to develop the study of psychoanalysis were Paul Greig Dane and Roy Coupland Winn, who practiced between the two world wars. Before the World War I (1914–1918) a Presbyterian clergyman, Donald Fraser, had lectured on psychoanalysis in Sydney, but Dane appears to have been the first physician to become a wholehearted and consistent exponent of Freud's early theories in the careful use of catharsis and abreaction after the war. Paul Dane's interest in psychological methods of treatment was stimulated by the work of earlier pioneers such as John William Springthorpe and Clarence Godfrey. Dane was one of the first in Australia to use hypnosis and abreactive techniques. He also introduced group therapy for returned soldiers. His interest stemmed from contact with Joan Riviere in England. Dane, although not an analyst himself, was the first chairman of the Melbourne Institute for Psychoanalysis and was intimately associated with its foundation and early history. Dane died in 1950.

Siegfried Fink, an associate member of both the Swiss and the British Psycho-Analytical Societies, worked in Sydney until his death in the 1960s. Fink was thus a contemporary of both Dane and Winn. He was one of the founding councilors of the Sydney Institute for Psychoanalysis.

Roy Coupland Winn, after serving with great distinction in World War I, returned to the medical staff of Sydney Hospital and after several years went to London to continue medical and psychiatric training, becoming an associate member of the British Psycho-Analytical Society and later a full member. Back in Sydney, for several years he was Honorary Physician at Sydney Hospital but in 1931 he resigned and went into full-time psychoanalytic practice.

Winn was thus the first full-time analyst in Australia. Later, when Clara Lazar-Geroe came to Australia from

Hungary and began to train analysts at the Melbourne Institute, Winn was very supportive. He joined the Board of Directors of the institute, a position that he held until his death in 1961. In 1951 he had made a generous endowment in founding the second training institute in this country, the Sydney Institute of Psychoanalysis, with Andrew Peto, also from Hungary, as training analyst (Graham, 1965).

Clara Lazar Geroe, the first Australian training analyst, arrived in Melbourne on March 14, 1940. She received her training in medicine in Prague. Her psychoanalytic training in Budapest naturally was in the school of Sandor Ferenczi, her training analyst being Michael Balint.

At the International Psychoanalytical Congress in Paris in 1938, Ernest Jones suggested that Hungarian analysts seeking emigration might consider New Zealand and Australia. Negotiations regarding New Zealand failed. "However, in Melbourne and Sydney some influential people, among them Bishop Burgman, Paul Dane, M. D. Silberberg, Reginald S. Ellery, and Roy Coupland Winn, reacted positively to the idea of an analyst coming to Australia. Their enthusiasm, and the enterprise of Paul Dane particularly, carried the day. After much negotiation, Geroe, with her family, settled in Melbourne to become Australia's first training analyst working at the newly formed Melbourne Institute for Psychoanalysis. She had been appointed as a training analyst by the British Psycho-Analytical Society of which she was a member" (Graham, 1980).

The founding of the first institute was made possible by a generous gift from Lorna Traill. The first meeting was held in the home of Hal Maudsley, a central figure in the history of psychiatry in Australia. The institute was opened at 111 Collins Street, Melbourne, by Judge Foster on the birthday of its benefactor, Lorna Traill, on October 10, 1940. The first Board of Directors included Paul Dane, Norman Albiston, Reginald S. Ellery, P. Guy Reynolds, and A.R. Phillips. There were two psychoanalysts on the Board, Ernest Jones of London and Roy Coupland Winn from Sydney. Geroe started her work with the institute and in private practice early in 1941. She conducted a large seminar for twenty to twenty-five doctors, psychiatrists, psychologists, educationists, probation officers, and others.

The traditional small seminar method was followed for candidates in training, both medical and non-medical. Geroe also organized many other seminars for groups of teachers, kindergartens, and parents for

discussion of their special problems with infants and children. The Institute Clinic catered to patients who could not afford private analytical fees; Geroe's Child Guidance Clinic developed a close liaison with the Children's Court clinic. Geroe lectured for many years in the Psychology Department of the University of Melbourne and to students taking the Diploma of Psychological Medicine. She was appointed Honorary Psychoanalyst at Royal Melbourne Hospital—certainly the first appointment of this type in Australia.

The first medical student to go into training in Australia was Frank Graham, who started with Winn in 1939, then began training with Geroe in 1941. The first psychiatrist or medico to train was A.R. Phillips and the first lay analyst Janet Nield.

Early on, psychoanalysts qualified or in practice in Australia were all members or associate members of the British Psychoanalytical Society. They formed "The Australian Society of Psychoanalysts," a sort of unofficial branch of the British Society but having no independent status. Harry Southwood and Frank Graham were the first to graduate in Australia in this way as associate members of the British Psycho-Analytical Society.

In 1966 the British Society suggested that this interim arrangement should be formalized by an Australian application to the International Psychoanalytical Association for Study Group status. At the IPA Congress at Copenhagen in 1967, with the support of the British Society, the Australian Study Group was established under the direction of an international Sponsoring Committee. At this stage, there were twelve Australian psychoanalysts, members of the Study Group, who were appointed direct members of the IPA. They were: O.H.D. Blomfield, R.A. Brookes, Clara Lazar Geroe, Frank W. Graham, I.H. Martin, R. Martin, J. Nield, D. O'Brien, V. Roboz, Rose Rothfield, H.M. Southwood, and I. Waterhouse.

Of the seven members of the IPA Sponsoring Committee, Fanny Wride (chair), Adam Limentani, Ilse Hellman, Lois Munro, and Leo Rangell all visited Australia at various times and helped with clinical and structural development. The other members of the Sponsoring Committee were Maria Montessori and M. Mitscherlich-Nielson.

In Vienna, in July 1971, the IPA at its business meeting accepted the recommendation of the Sponsoring Committee and raised the status of the Study Group to that of Provisional Society. After the requisite two years as a Provisional Society, the Australian Psycho-

analytical Society was admitted as a Component Society of the International Psychoanalytical Association at the IPA Congress in Paris in 1973. The constitution of the third Institute in Adelaide in 1979 represented the fruition of many years of dedicated and determined work by Harry Southwood. Assistance by the IPA was required in relation to the coordination of training in the three centers. The IPA appointed two Site Visiting Committees. The first in 1980 (Drs. Joseph, McLaughlin, Moses) and the second in 1987 (Dr. Cooper, Prof. Sandler.)

Over the years, Australian analysts have been encouraged and stimulated by working visits by distinguished colleagues—the outstanding ones in the sixties being Michael Balint and Enid Balint. Other influential invited visitors included Betty Joseph, Edna O'Shaughnessy, Sydney Klein, and Anne-Marie Sandler.

Apart from these visits, the isolation of the Australian Society has been mitigated by the fact that many members completed their initial training with the British Society or have spent long periods in London for further analysis, supervision, or seminar work. Non-medical analysts have played an important part in the growth and development of psychoanalysis. From the beginning psychoanalysis has been viewed as a separate discipline in its own right.

Psychoanalysis has had a marked influence in many areas, most particularly in child psychiatry and social work. Following the lead of Paul Dane in the treatment of ex-servicemen in the Commonwealth Repatriation Department, Frank Graham introduced psychoanalytically oriented group therapy at the Royal Melbourne Hospital in 1950 and later inspired the formation of the Australian Association of Group Psychotherapists.

In the academic world, some departments of psychology have psychoanalysts on the staff or maintain a working contact with psychoanalysts, as do several departments of philosophy, sociology, and politics; the law has been less influenced. The first publicly advertised senior position on the medical staff of a major teaching hospital for a psychoanalyst was established largely through the efforts of William Orchard at Prince Henry's Hospital Melbourne, in about 1970. Frank Graham was the first appointee. Another appointment of this kind was Janet Nield as Honorary Psychotherapist (1953–71) at The Royal Alexandra Hospital for Children in Sydney.

In the 1990s, a widening of the field of activity of the Australian Psychoanalytical Society has involved contributions by the society or its members to university teaching (at MA and PhD levels) and open seminars. There is a growing list of publications and public lectures by members. The Freudian School of Melbourne and The Australian Centre for Psychoanalysis in the Freudian Field are devoted to the Lacanian approach in Melbourne. There is an active school of Self-Psychology (Heinz Kohut) based in Sydney. Graduates of the American Academy of Psychoanalysis (Karen Horney) have played an active role in developing psychoanalytic psychotherapy in the Psychotherapy Association of Australia.

### **AUSTRIA**

The history of psychoanalysis in Austria is practically indistinguishable from that of the Vienna Psychoanalytic Society until the end of the Second World War. The group known as the Wednesday Psychological Society, which met regularly after 1902 in Freud's apartment, later renamed itself the Wiener psychoanalytische Vereinigung (Vienna Psychoanalytic Society) and was admitted as a regional group into the International Psychoanalytical Association, which had just been founded. In 1911, following the defection of its first president, Alfred Adler, Freud assumed the presidency. When Carl Gustav Jung and the members of the Zurich society left the

psychoanalytic movement, Vienna became the sole center of influence.

After a period of inactivity caused by the First World War, the society resumed its activities and, with its youngest members playing an important role, quickly established a treatment facility in 1922 and a training institute in 1924. Only in 1936, after years of migration, was the Vienna society able to take possession of the premises at Berggasse 7, where it was housed along with its training institute, treatment facility, and publishing house.

Between 1934 and 1938 Austria developed politically into an authoritarian Catholic state. Although most members of the society had shown themselves to be sympathetic to the Social-Democrats, its administration made a conscious decision to abstain from politics. On March 14, 1938, the day after German troops entered Austria and after a number of analysts had already left the country, the Vienna Psychoanalytic Society held its last meeting. Members unanimously decided that those who felt threatened should leave Austria, and that the society's headquarters would be transferred to wherever Freud happened to be. With the exception of Alfred Winterstein and August Aichhorn, the 68 active and honorary members and approximately 36 candidates left the city. Freud left with his family on June 4, 1938. Between 1938 and 1945 a branch of the Deutsches Reichsinstitut für psychologische Forschung und Psychotherapie (State Institute for Research in Psychology and Psychotherapy), directed first by Aichhorn and then by Beggattel, was established in Vienna. Under Aichhorn's presidency a group of analysts and psychologists attempted to free themselves of the command of the Reichsinstitut. In 1944 this secret group had 14 training candidates, 7 of whom later became psychoanalysts.

Following the fall of National Socialism and the end of the Second World War, Austrian analysts did two things during the period of reconstruction: first, they reconstructed the Vienna Psychoanalytic Society and got it readmitted to the International Psychoanalytical Association, and second, they attempted to bring into the fold analysts and organizations that, under the title of depth psychology, held orientations considered marginal or unorthodox.

The inauguration of the new Vienna Psychoanalytic Society took place in 1946, with August Aichhorn as

president. With assistance from Anna Freud, international recognition followed shortly, although it would take decades before the Vienna Psychoanalytic Society made any significant contact with the world psychoanalytic movement. After Aichhorn's death in 1949, Alfred Winterstein became the new president, a post he held until 1957. Under the direction of Wilhelm Solms-Rödelheim, the society continued to grow. The 1971 International Psychoanalytic Congress, held in Vienna, helped solidify the society's renewed links to international psychoanalysis.

Meanwhile, the Austrian and international student movement grew, and there was renewed interest in psychoanalysis generally. The Sigmund Freud Gesellschaft (Sigmund Freud Society), founded in 1968, together with the sociopsychiatrist Hans Strotzka and the cofounder of the Sigmund Freud Society Harald Leupold-Löwenthal, did much to make psychoanalysis better known to the population at large. Hans Hoff, professor of psychiatry, also helped establish this receptive climate.

Between 1972 and 1974 the presidents of the Vienna Psychoanalytic Society included Alois Becker, Harald Leupold-Löwenthal, Peter Schuster, Wolfgang Berner, and Wilhelm Burian. Krista Placheta became president in 1998. As of 2005, Christine Diercks was president of the society.

In 1986 the society moved to new offices at Gonzagagasse 11. As of 1988 the society had seventy members and approximately a hundred candidates, more than the number of members in the former Vienna society. With the post-1968 generation of psychoanalysts came a relaxation of the older, authoritarian climate of discussion and a broader range of issues. Two central themes for the society in the 1980s were anti-Semitism inside and outside the field of psychoanalysis and its history during and after the war. In addition, the society held debates on the relation between psychoanalysis and psychotherapy. These discussions led to a training seminar on psychoanalytic psychotherapy, which became an integral part of the general training program.

In 1989, at the annual meeting of the Vienna society, the assembled members voted, by a margin of one vote, to join the Dachverband für Psychotherapie (a supervisory organization), and later it voted to join the Psychotherapiebeirat (Psychotherapy Advisory Committee). In 1993 the Vienna Psychoanalytic Society was legally recognized as a training organization for psychotherapy and was a leader in this field.

From 1945 Igor Caruso, an important representative of the various groups associated with psychoanalysis, worked to make psychotherapy more accessible to a greater portion of the population. During the years following the war, he and the discussion circle of which he was a member succeeded in creating a psychoanalytic organization that remained in operation for a number of decades. Known as the *Österreichische Arbeitskreise für Tiefenpsychologie* (Austrian Working Group on Depth Psychology) and later renamed the *Österreichische Arbeitskreise für Psychoanalyse* (Austrian Working Group on Psychoanalysis), it initiated throughout the country a series of teaching and clinical initiatives that were Freudian in orientation.

In 1947 Caruso created the *Wiener Arbeitskreise für Tiefenpsychologie* (Vienna Working Group on Depth Psychology), an autonomous scientific community composed primarily of physicians, psychiatrists, psychologists, and theologians, most of whom were close in age. The first candidates were trained privately and without any specific professional requirements, since the group defined itself primarily as a venue for scientific discussion. For this reason an increasing number of members of the Vienna Psychoanalytic Society participated in these discussions, although some of them found the intellectual climate overly imbued with Catholicism. Because of the working group's unorthodox approach, the Vienna Psychoanalytic Society was forced to define strict boundaries between the two organizations at the start of the 1950s. These boundaries may have led to the Vienna working group, whose training guidelines were largely those used by psychoanalytic societies having a strictly Freudian orientation, to introduce a more formal and systematic structure for itself. The Vienna working group and the Vienna Psychoanalytic Society differed in ideological orientation. In place of psychological analysis, the Vienna working group aimed at an existential synthesis in the form of a universal humanity, blended different trends in depth psychology, and harked to Jung rather than Freud.

With the 1952 publication of Caruso's book *Psychoanalyse und Synthese der Existenz (Existential Psychology: From Analysis to Synthesis, 1964)*, the working group's program became more focused. After 1953 there were no explicit references to Jung's depth psychology and increasingly specific references to psychoanalysis. "Psychoanalysis" was initially understood in its techni-

cal sense, and the human aspect inherent in Freudian theory and its offshoots was enlarged in the direction of a personal psychoanalysis.

Caruso's book was translated into six languages, and thus served to spread his ideas internationally, especially in South America, where his ideas were well received. In fact, a number of South American candidates received their training in Vienna. Another example of cross-border activity is the 1954 Brussels symposium on the "Psychology of the Individual," attended by some forty psychoanalysts from several European countries. Presenters included Jacques Lacan, who gave a talk on the internal dialectics of the person in the theory and technique of psychoanalysis. As a result of his talk, Lacan became a corresponding member of the Vienna Working Group on Depth Psychology, a status he maintained until his death.

Theoretically, the working group focused on the concept of symbols and attempted to find a connection between Freudian ego psychology and personal philosophical concepts. There were increasing interdisciplinary attempts to bridge psychiatry, ethology, sociology, group dynamics (especially that of Raoul Schindler), and psychoanalysis. This expansion resulted in the founding, in Innsbruck in 1958, of the International Secretariat of the Working Groups on Depth Psychology, which was replaced in 1966 by the *Internationale Föderation der Arbeitskreise für Tiefenpsychologie* (International Federation of Working Groups on Depth Psychology) because of the growing number of participant associations.

During the 1960s different attempts to found a second world association, independent of the orthodox International Psychoanalytical Association, were made at the instigation of the German Psychoanalytic Association. Caruso and his working groups rebuffed these attempts in spite of the number of exchanges and conferences within the *Internationale Arbeitsgemeinschaft psychoanalytischer Gesellschaften* (International Working Group of Psychoanalytic Societies), founded in 1962 in Amsterdam. At this time the theoretical orientation of the working groups moved further and further away from fundamental theological concepts of Catholicism. There were increasing references to the Freudian foundations of psychoanalysis and greater emphasis on the psychosociological aspects of the field, which resulted from a growing interest in thinkers like G. W. F. Hegel, Karl Marx, and Herbert Marcuse. In 1972, when Caruso

obtained the psychology chair at the University of Salzburg, a number of circles and working groups were formed outside Vienna, and these helped spread awareness of psychoanalysis throughout Austria. In addition to the Linz Circle, created in 1958, these included groups for the study of depth psychology launched in Graz and Linz in 1973 and in Salzburg in 1974, followed by the foundation of the Austrian Society for the Study of Child Psychoanalysis in Salzburg in 1976.

This gathering trend toward orthodoxy found concrete expression when the Vienna Working Group on Depth Psychology renamed itself the Vienna Working Group on Psychoanalysis in 1988. Shortly thereafter all the other depth psychology groups followed its example. Until 1992 these groups were all governed by the Directorate of Austrian Working Groups, which was replaced in 1992 by the *Wissenschaftliche Gesellschaft der Arbeitskreise für Psychoanalyse in Österreich* (Scientific Society of Working Groups for Psychoanalysis in Austria). This society produced the journal *Texte: Psychoanalyse, Ästhetik, Kulturkritik*, the only (quarterly) Austrian journal on psychoanalysis, edited by E. List, Johannes Ranefeld, G. F. Zeilinger, and August Ruhs. Because the society met IPA standards, which the working groups had followed since 1970, it asked to be admitted to the International Psychoanalytical Association in 1997, with Ranefeld as president. A commission of inquiry was established in October 1998.

Between 1985 and 1990 an interdisciplinary group of Viennese scientists, in collaboration with the Institut culturel français, organized a two-year international seminar entitled "Psychoanalysis and Structuralism: Freud and Lacan," which included some of the best known representatives of the Lacan school. This resulted in the formation of the *Neue wiener Gruppe/Lacan-Schule*, composed of an "aesthetic" section (under the direction of Walter Seitter) and a "clinical" section (under the direction of August Ruhs). It organized regular interdisciplinary conferences, usually followed by one or more publications.

In 1984 a group of students founded the *Werkstatt für Psychoanalyse und Gesellschaftskritik* (Workshop on Psychoanalysis and Social Criticism) in Salzburg. Until 1996 the organization refused to accept any form of orthodoxy or dogmatism and insisted on maintaining a political focus. The *Werkblatt*, the organization's publication, is still published, although the organization itself no longer exists.

In 1967 Eric Pakesch, a student of Caruso, created a chair of medical psychology and psychotherapy in the Karl-Franzens-Universität Graz. At the suggestion of Hans Strotzka, a popular psychoanalyst and sociopsychiatrist, the Institute of Depth Psychology and Psychotherapy was founded in 1971 within the School of Medicine of the University of Vienna. It was intended to house psychoanalysis along with the other generally recognized schools of psychotherapy in a single facility. Eventually, psychoanalysis became its primary focus, and in the current university depth psychology clinic, run by Marianne Springer-Kremser, all practitioners use psychoanalysis or depth psychology, with the exception of one practitioner who uses systemic family therapy. A psychoanalytic focus can also be found at the university institutes of medical psychology (and psychotherapy) in the universities of Graz, Innsbruck, and Vienna (directed by W. Pieringer, G. Schüssler, and G. Sonneck, respectively). The Psychology Institute of the University of Klagenfurt, under the direction of Professor J. Menschik-Bendele, also has a strong psychoanalytic orientation.

Legislation on psychoanalysis instituted in 1992 had important repercussions for the field of psychoanalysis in Austria, for it drastically reduced the autonomy of psychoanalytic societies in their training activities and therapeutic practices. Psychoanalysis became recognized as equivalent to other therapeutic practices, so it had to comply with the general training program for psychotherapists. Before becoming a psychoanalyst, candidates had to complete a two-year program required for all forms of psychotherapy. Since health insurance recognized only some psychoanalytic treatments and reimbursement was partial, the five principal Viennese psychoanalytic and depth-psychology associations decided to create a parent organization in 1997 to make special agreements with insurers for long-term psychoanalytic treatment. For the first time in the history of psychoanalysis in Austria, member and nonmember associations of the International Psychoanalytical Association worked together in an organization to promote their mutual interest. Thanks to the concerted efforts of these societies, the Viennese municipal health service began to offer analyses for fifty citizens, without restriction as to duration or the frequency of treatment. Sixty years after Vienna's *Ambulatorium* shut down under Nazi administration, this treatment center reopened in 1999 and represented another sign of reawakened interest in psychoanalysis. Finally, plans for the *Wiener Arbeitskreis*

für Psychoanalyse to join the IPA moved forward when it was granted study group status in 2003.

Another important parent organization for psychoanalysis is the Sigmund Freud Society and Sigmund Freud Museum at Berggasse 19 in Vienna. The society, founded in November 1968 with the help of Anna Freud, succeeded in creating a museum where Freud had his consulting room. In addition to supporting research into the history of psychoanalysis and its founders, the society holds discussions on important contemporary clinical, sociocultural, and therapeutic issues in a spirit of interdisciplinary cooperation. Harold Leupold-Löwentahal, president of the Society from 1976 to 1998, was succeeded by Johannes Schüle, who presided until 2003, and Dieter Bogner. The library, with 25,000 volumes, represents one of the major collections of its kind in Europe and includes archives with over 50,000 records of all kind. Since 1997, at the instigation of American artist Josef Kosuth and Austrian art dealer Peter Pakesch, the Sigmund Freud Society has acquired a collection that demonstrates the influence of psychoanalysis on contemporary art. In 2003, under director Inge Scholz-Strasser—albeit against the wishes of many Viennese psychoanalysts—the museum turned into a private foundation. This event led to a noticeable coolness between the administration and the city's psychoanalytic societies.

## **AUTISM**

Autism has had two meanings. The first, historically associated with schizophrenia, refers to the investment of a person's psychic energy in his or her own delusions, which prevents the person from investing in the outside world. The second refers to an absence of

development of communication with others beginning in earliest infancy.

The word was introduced into the psychiatric vocabulary by Eugen Bleuler in 1911 in his description of schizophrenia. However, a hint of it could be detected as early as 1907 in the correspondence between Freud and Jung: “Bleuler still misses a clear definition of autoerotism and its specifically psychological effects. He has, however, accepted the concept for his Dem[entia] pr[aecox] contribution to Aschaffenburg's Handbook. He doesn't want to say autoerotism (for reasons we all know), but prefers ‘autism’ or ‘ipsism’” (Freud and Jung, p. 44–45).

Bleuler, who very early on took an interest in Freud's work, did not accept his libido theory, and this was the reason for the amputation that produced the word *autism* from *autoerotism*: to distance it from the libidinal significations of the latter term, while keeping the former's Greek root, *auto*, meaning “self.” For Bleuler, the autism of schizophrenia is a shutting-in of the subject in an impenetrable, incommunicable world, closed in on itself, made up of unorganized delusional elements to which all the subject's disposable mental energy is attached.

In 1943, Leo Kanner adopted the term to describe “early infantile autism,” a syndrome associated with problems of communication and social behavior, as well as serious developmental disturbances of mental functioning, most notably of imagination

Psychoanalytic research bearing upon infantile autism led to significant advances in the understanding of the beginnings of psychic life. From the genetic point of view, for example, infantile autism corresponds to a stage of psychical development to which the child regresses or remains fixated. In research with normal infants after her initial studies of autistic children, Margaret Mahler placed autism on a developmental axis that progresses from birth to “separation-individuation.” Donald Winnicott attributed the genesis of autism to maternal care, particularly the ability to protect the infant from inconceivable anxieties: a feeling of disintegration, being unable to stop falling, lacking relation to its own body, and having no orientation. Bruno Bettelheim defined the “extreme situation” that set the baby on the path to becoming autistic as a feeling that it could not act in a manner favorable to itself, but that every action on its own part could only be unfavorable because of a “mutuality” between the child and its mother.

From the structural point of view, autism is governed by a structure that establishes mental functioning. The students of Jacques Lacan developed the concept in this direction by relating it sometimes to the concept of “foreclosure” (Piera Aulagnier and Maud Mannoni), sometimes to “jouissance” (Éric Laurent), and sometimes to the “topology of the subject” (Rosine and Robert Lefort).

From a dynamic point of view, it was possible to explore infantile autism in terms of the transference and counter-transference. In 1975, Donald Meltzer proposed a model articulated around three concepts: “the dismantling of the ego,” “the bidimensionality of the object relation,” and “the adhesive identification.” Dismantling is a splitting of the ego along the lines of articulation of the different sensorial modalities, so the autistic child never concentrates feelings on the same object, and stimuli received is never synthesized. The world, perceived in this way, is without depth or volume and is reduced to a juxtaposition of sensations. Bidimensionality is a mode of relation to a libidinal object, established in a world without depth. It is a relation of surface to surface, a binding with an object not experienced as having an interior. Adhesive identification is the result of bidimensionality: the self identifies itself with the object on the surface, owing to no more interior space than the object itself. This prevents mental communication necessary to the development of thought.

Later, Meltzer proposed a model based on the theory of “aesthetic conflict.” He suggested that the fetus, at the end of pregnancy, is eager to exercise its senses but receives only the most filtered stimuli *in utero*. Birth would be experienced as liberation and as something marvelous because of the abundance of sensorial stimulation. The impact would be experienced as an intense aesthetic experience that would at the same time be a source of anxiety because of the vivid contrast between the infant’s overabundant awareness of the qualities of the object’s surface and complete misrecognition of the object’s interior. Occasionally, the impact of the aesthetic object would be so intense as to force the infant to withdraw into infantile autism.

Frances Tustin has emphasized a fantasy of discontinuity, which the autistic infant experiences physically as the tearing away of a part of its own substance. So long as it lacks the experience that makes possible symbolization, an infant would seem to require the illusion of continuity between its body and the object upon

which its drives are satisfied. The autistic infant imagines a catastrophic rupture in this continuity that takes the form of a fantasy of mouth-tongue-nipple-breast, experiencing a damaged breast and torn-off nipple that leaves the mouth a black hole inhabited by tormenting objects. To protect itself from the pain caused by this black hole, the autistic infant constructs the delusion of merging with the environment that abolishes any separation or space, any difference or alterity. To maintain these delusionary autistic objects, concrete objects are not manipulated for use value or symbolic value, but solely for the surface sensations that they offer, giving the illusion of continuity between body and environment. By means of his or her own secretions (tears, saliva, urine, feces) and autistic objects, the subject creates what Tustin called “autistic forms,” which are cutaneous or mucous with nebulous, unstable contours. The autistic subject procures these as a salve to minimize pain and as protection from the exterior world. But these autistic forms cannot be shared with others or identified with objects in the external world. The autistic child uses sensitivity to stimuli to protect himself or herself from the external world; Frances Tustin calls this “perverse self-sensuality.”

**AUTISTIC CAPSULE/NUCLEUS**

The term “autistic capsule” (or “autistic nucleus”) was proposed by Frances Tustin to describe a split part of the personality that has encapsulated archaic depressive anxieties such as the fear of collapse, liquefaction, falling, a black hole, or amputation of a body part, within a system of autistic-like defenses. Sensation objects and sensation forms, experienced as part of the subject’s own body, serve to blot out bodily anxieties.

The notion of an autistic capsule appeared in Frances Tustin’s first book, *Autism and Childhood* (1972), in the chapter entitled “Systems of Pathological Autism,” where she refers to an “isolated pocket . . . of encapsulation” (p. 85). This construct enabled her to follow the development of a number of children who appeared normal but suffered from neurosis and later showed a variety of disorders: “phobias, sleeping difficulties, *anorexia nervosa*, elective mutism, some skin troubles, some psycho-somatic disorders, some learning difficulties, some speech disorders, and some forms of delinquency” (p. 85). She also argued that the autistic capsule exists “in the character structure of some relatively normal individuals,” as revealed by rigid splits, superficial identifications, and an exaggerated need for control (p. 85). The superficial aspect of autistic encapsulation, also developed by Donald Meltzer (1975) and related to the notion of adhesive identity described by Esther Bick (1986), has comparable aspects in the “as if” personality described by Helene Deutsch (1942) and the “false self” personalities described by Donald Winnicott (1965). Tustin thought that ultimately such autistic capsules exist in minimal form in all individuals and that they are responsible for regressive tendencies toward inertia,

similar to the regression toward an inanimate state associated with the death instinct in Freud’s theory. The “de-encapsulation” process, Tustin emphasized, is likely to give rise to manic-depressive swings.

In *Autistic Barriers in Neurotic Patients* (1986) and *The Protective Shell in Children and Adults* (1990), Tustin described the autistic capsule in neurotic adult patients in greater detail, using her own case histories, notably that of an anorexic adolescent girl. Her description of motifs of vampirism and a system of communicating vases is congruent with the findings of the French investigators Evelyne Kestemberg, Jean Kestemberg, and Simone Decobert in *La faim et le corps: une étude psychanalytique de l’anorexie mentale* (Hunger and the body: a psychoanalytic study of anorexia nervosa; 1972). This book also contains contributions from other psychoanalysts, notably Sydney Klein and David Rosenfeld, who developed the theme of autistic phenomena in their own work. Sydney Klein (1980) emphasized how autistic phenomena in neurotic patients lead to thinness and superficiality. Rosenfeld (1993) studied how certain types of drug dependency and psychosomatic illnesses have some autistic aspects.

## AUTISTIC DEFENSES

The term “defense” is not generally associated with autistic states. However, manifestations of the “body ego” (Freud) that have as their function the avoidance of anxiety are “autistic defenses.” They give rise not only to “autistic phenomena” (“objects,” “gestures,” “languages,” etc.) that are inseparable from the sensations that they cause, but also to a devitalization of the outside world.

Leo Kanner (1943) is credited with the discovery of early childhood autism. Without explicitly using the term “defense,” he described a certain number of primary manifestations (sameness, self-sufficiency, self-absorption, and inaccessibility) that could be said to have a defensive function. In lieu of the term “autistic defense” (which implies a relatively organized ego), Margaret Mahler (1968) proposed the term “maintenance mechanism”; Frances Tustin, (1972, 1981) “autistic maneuvers”; and Fraiberg (1982) “defense reactions.” The autistic “defenses” are thought to result from the self-induced sensuality of the autist and his or her exclusive focus on bodily sensations and rhythms (Tustin). Frances Tustin spoke of “autistic objects,” “autistic contours,” and “encapsulation.” Donald Meltzer referred to “dismantling,” and Fraiberg to “avoidance” and to “freezing.”

The analysis of autistic “defenses” leads to that of the psychic function of the body ego on the border between somatic and mental.

## “AUTOBIOGRAPHICAL STUDY, AN”

Freud’s autobiography appeared in *Die Medizin der Gegenwart in Selbstdarstellungen* (Today’s medicine: autobiographies), published in Leipzig in 1925. In the introduction Freud recalls that in 1909 he had outlined the development of psychoanalysis at Clark University in Massachusetts and in 1914 published a history of the psychoanalytic movement (1914d). Realizing that his life history is part of the origins of psychoanalysis, Freud wrote, “I will have to try to find a new way of blending subjective and objective exposition, somewhere between biography and history.”

After a brief reference to his childhood, he directs his attention to a discussion of his teachers: Ernst Wilhelm von Brücke, Theodor Meynert, and especially Jean Martin Charcot. Considerable space is given to Josef Breuer and hypnosis, relatively little to Wilhelm Fliess.

The major discoveries—the concept of psychic reality, infantile sexuality, resistance, repression, dream interpretation—are described and condensed so he can focus on a discussion of psychoanalysis's relationship with other fields and, therefore, the history of the psychoanalytic movement and its conflicts (including his with Carl Gustav Jung). The end of the book is devoted to the applications of psychoanalysis: religion, ethnology, mythology, pedagogy, and so on, illustrating the importance Freud gave to this aspect of his theory.

The identification of Freud with psychoanalysis limits the field of historical investigation in terms of both Freud's biography and the history of psychoanalysis. However, this method of personal exposition is familiar to him and is, in the majority of his works, an intrinsic part of the theoretical exposition, if not an apodictic strategy. Following his break with Wilhelm Fliess, Freud was cautious about the charge of plagiarism and priority of discovery. It is possible to conclude that this point of view limits an understanding of the dialectics of influence, the recognition of cryptomnesia, and more generally the reliance on another's hypotheses to advance one's own.

The truth, as Freud wrote, is fragmentary, and historical narrative is more like a legend than a "family romance."

## AUTOBIOGRAPHY

As a literary genre, autobiography, narrating the story of one's own life, is a variation of biography, a form of

writing that describes the life of a particular individual. From the point of view of psychoanalysis, autobiography is of interest as the story told by the patient to the analyst and to himself.

Autobiography in the modern sense began as a form of confession (Saint Augustine), even though there are memoirs in classical literature (Xenophon's *Anabasis*, Julius Caesar's *Gallic wars*). Such introspective works can be considered attempts at self-analysis before the psychoanalytic discovery of the unconscious. In 1925 Freud wrote *An Autobiographical Study*, in which the story of his own life merges with that of the creation of psychoanalysis. According to Freud, biographical truth does not exist, since the author must rely on lies, secrets, and hypocrisy (letter to Arnold Zweig dated May 31, 1939). The same is true of autobiography. From this point of view, it is interesting that Freud framed his theoretical victory and the birth of psychoanalysis in terms of a psychological novel.

The function of autobiography is to use scattered bits of memory to create the illusion of a sense of continuity that can hide the anxiety of the ephemeral, or even of the absence of the meaning of existence, from a purely narcissistic point of view. This story constitutes a narrative identity (Ricoeur, 1984–1988) but is self-contained. In contrast, the job of analysis is to modify, indeed to deconstruct, this identity through interpretation. Because the analyst reveals repressed content, he is always a potential spoiler of the patient's autobiographical story (Mijolla-Mellor, 1988).

Although autobiography has been of greater interest to literature (Lejeune, 1975) than to psychoanalysis, a number of psychoanalysts (Wilfred Bion and Marie Bonaparte, among others) have written autobiographies, thus confirming the link between the analyst's pursuit of self-analysis and autobiographical reflection.

## AUTOEROTICISM

The term “autoeroticism” refers to behaviors designed to obtain sexual satisfaction without the intervention of another person (the most obvious example being masturbation). However, the term is often understood more broadly, given the Freudian conception of psychosexuality, according to which many different physical pleasures take on the value of sexual satisfaction. Genitals are not necessarily involved. By extension, the same can be said of certain psychic activities (reading, according to popular wisdom, is a “solitary vice”). “Alloeroticism,” a less common term, refers by contrast to sexual satisfaction obtained with the help of another person.

Sigmund Freud, who took the terms from Havelock Ellis, appears to have used them for the first time in a letter to Wilhelm Fliess, dated December 9, 1899: “The lowest sexual stratum is auto-erotism, which does without any psychosexual aim and demands only local feelings of satisfaction. It is succeeded by allo-erotism (homo- and hetero-erotism) but it certainly also continues to exist as a separate current” (Freud, 1950a, p. 280).

According to this initial definition, autoeroticism would appear first but would never disappear. Freud clarified his thought in *Three Essays on the Theory of Sexuality* (1905d) and then in later footnotes. He considered sucking to be a fundamental activity: “The child’s lips, in our view, behave like an erotogenic zone, and no doubt stimulation by the warm flow of milk is the cause of the pleasurable sensation. The satisfaction of the erotogenic zone is associated, in the first instance, with the satisfaction of the need for nourishment” (p. 182). In 1915 Freud added: “To begin with, sexual activity attaches itself to functions serving the purpose of self-preservation and does not become independent of them until later . . . The child does not make use of an extraneous body for his sucking, but prefers a part of his own skin because it is more convenient, because it makes him independent of the external world, which he is not yet able to control” (1905d, p. 182). This is one of Freud’s most

important claims—infantile sexuality develops by making use of a function essential for life, from which it later detaches itself.

This autoerotic satisfaction is not required for every object cathexis, however, since, through this detachment, the child frees itself from its first object, the breast, which is the vehicle of a hallucinatory satisfaction and the subsequent disappointment that leads to the birth of the first representations.

“On Narcissism; An Introduction” (1914c) enabled Freud to take this a step further. When the child constitutes itself as an “object” for its own satisfaction, it is no longer a question of drive satisfaction, as in autoerotic activity, located in a given erotogenic zone, but rather of the beginning of the unification of drive and object: “the hitherto dissociated sexual instincts come together into a single unity and cathect the ego as an object” (1912–13a, p. 89). This unifying movement then acts on another person during the initial “object choices” that will govern all later sexual life. Freud would later refine these views and provide an overview of the process in a 1923 article on infantile genital organization (1923e).

Autoeroticism, therefore, characterizes an early phase of psychosexual development. However, as Freud acknowledged in his 1899 letter to Fliess cited above, it continues to “subsist,” as many common clinical findings demonstrate. It also plays a major role in a number of disorders; in psychoses it can appear invasive (Gillibert, Jean, 1977), as shown in the case of Daniel Paul Schreber (Schreber, 1903/1988; Freud, 1911c), or deficient (Botella, César, and Sára, 1982). In this area as in so many others, the diagnostic dimension and the psychogenetic dimension are complementary.

## AUTOHISTORIZATION

The *I* is constituted by the discourse it builds about itself, its self-assigned task being to transform the fragmentary elements of its past, whether they come from itself or from other people, into a historical construction. The difference between memory and history involves the sequencing of facts to meet two requirements: first of all, that of imparting a feeling of temporal continuity, and in addition, simultaneously, endowing this historical construction with a power of causal explanation with regard to the future (Mijolla-Mellor, Sophie de, 1998). The *I* thus figures, according to the title of Piera Aulagnier's *L'Apprenti historien et le maître sorcier* (The apprentice historian and the master sorcerer; 1984), as an "apprentice historian" faced with the "master sorcerer" constituted by the id.

Autohistorization is the only way the subject can grasp the notion of time, which can only make sense to the subject in relation to his or her own desires and self-perceptions: "The process of identification is the hidden side of the work of historicization that transforms the unfathomable entity of physical time into human time, that replaces irrevocably lost time with a time that speaks it," writes Aulagnier.

This history is that of the *I*'s relationship to its objects: a libidinal history, and a history that can only target the *I* indirectly, through the Other. From temporality to memory to history there occurs an unfolding movement, the construction that the *I* must effect in order for its existence to make sense.

In Aulagnier's view, we are "historians whose quest always founders on an 'already-there' about ourselves or others that resists our efforts to elucidate it." This human inevitability forces the *I* to take possession of this preexisting "elsewhere" and to include it within itself; to do this, the *I* must rely on the accounts of other people who provide it with an affirmation that what it is and what it was are identical, and at the same time give elements of information on this issue. This gives rise to the question of what happens when others fail to transmit to the subject the "first paragraphs" of an individual's personal history and prehistory.

In *L'Apprenti-historien et le maître sorcier*, Aulagnier develops the notion of "nonhistory" in the schizophrenic. In these cases, the mother exerts on the infant's psyche an action of repression so powerful that it will render impossible even the revealing of non-repressed material (and, as it happens, inculcate a desire for death as well) that is present and active within the mother's own psyche. Hence the attempted delusional reconstruction that would enable the subject to do without this contribution from the mother: "The fantasy of self-engenderment that is present in certain forms of psychosis can most often be decoded, on close inspection, as a fantasy that gives the subject the power to engender not just his or her own past, but all past, not just his or her own origins, but all origins."

Aulagnier's entire theory on psychosis, contrary to monolithic interpretations (such as foreclosure in the Name of the Father, double bind, and so on) reflects, as did Sigmund Freud's work, a perspective that is essentially historical, focusing on singular events. What she demonstrates here concerns the consequences of prohibition on memory, and thus the work of autohistorization without which the *I* cannot come into being.

## AUTOMATISM

Properly speaking, "automatism" is not a concept, but rather a term that, like the adjective "automatic" or the adverb "automatically," has several definitions. It can mean "mental operations or activities without the involvement of the will, activities rendered automatic by habit, regularity in the completion of certain acts, or a set of involuntary activities or impulses" (Lantéri-Laura, 1992).

The term "automatism" refers to an activity carried out without the participation of the will. Once the

activity is triggered, it becomes a mechanism that functions by itself. This notion of automatism, derived from the philosophic and medical traditions, provided the eighteenth century with a model, though reductionist, for global and hegemonic knowledge of the physical and biological worlds and, in the biological world, for human behavior. (La Mettrie published *Man a Machine* in 1746.) Later, because of advances in chemistry that revealed very different levels of organization in the two worlds, the model of automatism seemed on the contrary to control only vegetative life, corresponding to the autonomic nervous system, and involved only one part of the life functions, that of muscular mechanics. In this era, a simultaneously morphological and functional opposition was conceived between a less automatic superior level and a more automatic inferior level.

From John Huglings Jackson's work on epilepsy in the nineteenth century emerged a highly elaborated representation of the function and dysfunction of the central nervous system and the discovery of a specific attack—related to lesions—on the automatisms in question. Thus a disorganization of a hierarchical structure suppressed a function and freed what the suppressed function had previously controlled—one automatism disappeared and the other remained uncontrolled.

This notion of an automatism proper to the functioning of the central nervous system found several examples in the field of psychiatry, for instance, the work of Valentin Magnan and his notion of impulse, that of Jules Seglas defining the relation between verbal hallucinations and aphasias, the psychological automatism of Pierre Janet, and finally the mental automatism of Georges de Clérambault and the work of Henri Ey, which was greatly influenced by John H. Jackson.

What is involved is a definition of automatism that situates it as mechanism that is “under control.” It becomes pathogenic and pathological as soon as such control ceases. Meanwhile, there emerges another definition of automatism that situates it instead on the side of the creative force, of a more lively and original inspiration.

The word *automatisch* appeared very rarely in Freud. In one of its earliest occurrences (the case of Dora, 1905e [1901]), it is apparent that he is borrowing vocabulary that is not his own: “I give the name of symptomatic acts to those acts which people perform, as we say, automatically, unconsciously, without attending to them, or as if in a moment of distraction” (p. 76). Then, in the metapsychological texts, the word

is used in three limited senses: a) the regulation of (unconscious) automatic processes by the pleasure principle (*Beyond the Pleasure Principle*, 1920g); b) so-called “automatic” anxiety when it is a question of the origin or the “automatic” appearance of anxiety (*Inhibitions, Symptoms, and Anxiety*, 1926d); and occasionally, c) the process of repression (1926d).

The noun *Automatismus*, “automatism,” is also very rarely found in Freud's works. When Freud refers to it in *Inhibition, Symptoms, and Anxiety* in relation to the process of repression, he prefers the term “compulsion to repeat”: “The new impulse will run its course under an automatic influence—or, as I should prefer to say, under the influence of the compulsion to repeat. It will follow the same path as the earlier repressed impulse, as if the danger-situation that had been overcome still existed” (p. 153). In the *New Introductory Lectures* (1933a [1932]), the term is directly connected to the principle of pleasure-unpleasure, in a sense essentially based on the (automatic) mode of regulation of unconscious processes, but that merges with anxiety and repression.

The term was used more frequently by Jacques Lacan, specifically starting in the fifties, when, under the influence of cybernetics, the question of automata was on his mind. And so pure automatism became an essentially psychotic phenomenon.

Today the term, still being enriched by new mathematical models, could clarify for us a certain mode of the functioning of mental processes.

## AUTOPLASTIC

The terms “autoplastic” and “alloplastic” serve to distinguish changes internal to the subject from work carried out on the external world. Sándor Ferenczi proposed the word “autoplastic” in an article on hysterical materialization (1919/1926). Citing Freud’s description of hysteria as a caricature of art, Ferenczi added, “Hysterical ‘materializations’ . . . show us the organism in its entire plasticity, indeed in its preparedness for art. . . . The purely ‘autoplastic’ tricks of the hysteric [may well be] prototypes, not only for the bodily performances of ‘artists’ and actors, but also for the work of those creative artists who no longer manipulate their own bodies but material from the external world” (p. 104).

Freud adopted these terms when clarifying the similarities and the differences between neurosis and psychosis (1924e). “Expedient, normal” behavior, he wrote, combines features of both disorders, for it “disavows the reality as little as does a neurosis, but . . . then exerts itself, as does a psychosis, to effect an alteration of that reality.” But it “does not stop, as in psychosis, at effecting internal changes. It is no longer *autoplastic* or *alloplastic*” (p. 185).

These seldom used notions might arguably serve a useful purpose in describing the analytic process: in their asymmetrical way, the two protagonists in treatment are engaged in an unending struggle between changing the other and effecting internal change.

## AUTOSUGGESTION

Autosuggestion was popularized by the French “Nancy school.” By the first half of the nineteenth century, methods of self-medication and self-healing known as

“automagnetization” had reinforced (or supplanted) various forms of “magnetism.”

At the end of the century, a theoretical and practical debate ensued that both galvanized and divided the various schools of hypnotism. What was the real agent in the process of suggestion: the hypnotist, or the subject, who often relinquishes power to him without realizing it? For those who believed the latter, the effectiveness of the suggestion was thought to depend on a self-suggestibility associated with hysterical tendencies (Jean Martin Charcot, Pierre Janet), or the “will” of the subject (a position put forward by Joseph Delboeuf [1831–1896], an independent disciple of Hippolyte Bernheim). In 1888–1889, basing his theory on the work of Charcot, Freud showed that some suggestive experiences could be interpreted in terms of an “encouragement to autosuggestion.” In 1892–93, he proposed the notion of a “counter-will.” In 1895 Joseph Breuer insisted that self-hypnotic states were a symptom of hysteria and a process of self-medication and self-healing carried out in the presence of the therapist. The cathartic *talking cure* occurred during these states of self-hypnosis.

Following in the tradition of Nancy school, the pharmacist Émile Coué (1857–1926) popularized the use of autosuggestion to govern one’s own behavior. His disciple Charles Baudouin suggested that a synthesis be attempted between Coué’s theories and psychoanalysis.

## **BACHELARD, GASTON (1884–1962)**

Gaston Bachelard, a French philosopher, was born on June 27, 1884, in Bar-sur-Aube and died in Paris on October 16, 1962. He held a Ph.D. in philosophy and was a member of the Académie des Sciences Morales et Politiques. His career was far from ordinary. He was born into a family of modest means and began his professional life as a temporary employee in the postal service. In 1919 he became a teacher of physics and chemistry at the Bar-sur-Aube grammar school and prepared for his degree in philosophy, which he obtained in 1922. In 1927 he defended his doctoral dissertation and was appointed a professor of philosophy in 1930 at the University of Dijon and later at the Sorbonne (1940–1955). He received the Grand Prix National des Lettres in 1961.

His work is divided between considerations of the scientific mind, rationalism and the need for truth, and reflections on the imagination, daydreams, and poetry. Psychoanalysis, as Bachelard understood it, could serve as a link between these two approaches and, at times, there are echoes of a Jungian approach in his work.

In 1938 he produced *La Formation de l'esprit scientifique: Contribution à une psychanalyse de la connaissance objective* and *The Psychoanalysis of Fire*. The word psychoanalysis was pivotal; the study of fire paved the way for a discussion of the epistemological problem of heat and thermodynamics. Bachelard introduced a powerful and disturbing poetics. For him the scientific mind's idea of the unconscious could be understood not on the basis of dreams but of reverie, that is, fantasies organized into complexes. By grasping the link between electrical fire and sexual fire,

he develops the idea that dream-like values are an obstacle to true understanding and that it is necessary to engage in repression, a voluntary intellectual act of inhibition, which brings with it resistance, defense, and rupture. Psychoanalysis serves as a source of inspiration, it enables us to understand the formation of the scientific mind as an activity that is always subject to revision, not by a purely logical subject but by a superego animated by a rationalist tension that makes sublimation a positive and necessary factor and, in contrast to Freud, one that is also a joyful activity.

In working to frame Freudian concepts within a dialectic structure, Bachelard attempted to substitute a fecund surveillance of the mind for a repetitive and neurotic censorship. He was thus led to distinguish two types of knowledge: common knowledge and scientific knowledge, which consists in the repression of the former. For Bachelard, psychic conflict and resistance were ideas that could be used to conceive of truth as an error that has been rectified.

Bachelard's work found an echo in both the philosophy of the sciences and in literary criticism. But it is to Jacques Lacan that we must turn to fully assess what Bachelard attempted to introduce: the idea of a science whose subject is science.

## BAGINSKY, ADOLF (1843–1918)

Adolf Baginsky, a German pediatrician, was born May 22, 1843, in Ratibor (formerly in Upper Silesia, modern-day Poland) and died May 15, 1918, in Berlin. Baginsky came from a large family of Jewish shopkeepers. He studied medicine in Berlin and Vienna, and obtained his diploma in Berlin on May 7, 1866. His dissertation was on the risks of cesarean birth. He specialized in pediatrics and, in 1872, settled in Berlin as director of a free clinic for children, the Johannisstrasse. In 1877 he founded the *Central-Zeitung für Kinderheilkunde* (Central Journal of Pediatrics), which, in 1879, became the *Archiv für Kinderheilkunde* (Archives of Pediatrics).

He was assigned to a teaching position in 1882 after publishing a work on pediatrics as an autonomous specialization, but, outside of a few courses on pediatrics given during his vacations, his university position was precarious. Cofounder and, after 1890, director of the Kaiser- und Kaiserin-Friedrich-Kinderkrankenhaus (The Emperor and Emperess Friedrich Pediatric Hospital) in Berlin-Wedding, which he ran until April 1, 1898, he was named associate professor in 1892, then held the chair in 1907.

Following a period of study in Paris, Sigmund Freud spent the month of March 1886 at the Baginsky clinic, where he acquired a good understanding of children's diseases in order to prepare for his work as "sector head" in the first public institution for childhood diseases in Vienna.

Baginsky's work is extremely varied, ranging from medical care for sick children to initiatives for socio-medical prevention (including open air schools, educational medicine, and milk distribution). His work bears the mark of a profound humanitarian ideal. Although his religious beliefs became an obstacle to his academic career, he remained actively engaged in the Jewish community. His research reflects all the

richness of his various activities; as an editor he was especially attentive to the psychic disturbances of childhood.

## BAK, ROBERT C. (1908–1974)

Robert C. Bak was a psychiatrist and psychoanalyst, born in Budapest, October 14, 1908, and died in New York, September 15, 1974. Bak was the third son of a rich Jewish family. His father was a farm manager. After graduation in a high school of science, Bak enrolled in the medical university, and received his degree in 1933.

He was trained in psychoanalysis by Imre Hermann. Following his emigration from Budapest to New York in 1941, he worked as a psychiatrist and psychoanalyst. In 1947 he became a training analyst and soon after a leading figure of the New York Psychoanalytical Institute. He conducted courses and seminars.

In 1959 he became president of the Study Committee. He was president of the New York Psychoanalytical Society from 1957 to 1959, and guest-professor at the Albert Einstein Medical University. He conducted lecture tours in Italy, Denmark, and Switzerland for several years.

His early publications fuse psychoanalytical theory with the contemporary concept of psychiatry. He treated the great Hungarian poet Attila József for schizophrenia. The afterlife of the communist poet and of the young psychiatrist who had emigrated to the United States became closely intertwined in the ensuing fifty years of Hungarian psychoanalysis, in which Bak played a salient role, not exempt from ideological

distortions. He wrote several articles on the poet's pathology. In his last paper (1973) he again analyzed the poet's suicide from the point of view of his "progressive withdrawal from the object and repeated attempts to reestablish and recathect objects by being in love."

He maintained professional contact with Imre Hermann until his death, but he was also influenced by Heinz Hartmann's theory, and worked together with Phyllis Greenacre, Edith Jacobson, and Margaret Mahler. From the beginning he was engrossed in an in-depth exploration of the psyche through the phenomenology of psychopathology and the reality distortions manifest in psychoses and perversions. He pointed out the significance of early heat-orientation in schizophrenic symptom-formation. In addition to sadomasochistic libido, he also showed the presence of an overt and neutralized form of the aggression instinct in paranoia and perversions (1956). He traced the common origin of perversion fantasies back to phallic mother-image, and, in addition to the destabilization of reality, assigned an important role to the giant mother-image that Hermann had assumed for him (1968). He wrote about 25 studies in Hungarian, German, and English.

His work continues to exert a profound influence on the study of psychoses and perversion, and represents the traditions of the Hungarian school.

## BALINT GROUP

The Balint group is a group method of training doctors, generalists or specialists, in the doctor-patient relationship. This method was developed by Michael Balint and Enid Albu starting in 1945.

A dozen practitioners are brought together once a week for two hours under the direction of one or two analysts who receive honoraria and ensure the rules under which the group functions. A doctor reports, as spontaneously as possible, a case from his practice that poses a problem. Participants and leaders then help the presenter, by means associations, questions, and interpretations, to elucidate the difficulties in the presenter's relation with the patient.

The aim is to sensitize the doctor to transference and counter-transference in the "retroactive action" of the consultation, to give the doctor psychotherapeutic qualities, and thus to achieve a "considerable though limited change in the doctor's personality" to enable the doctor to better understand and help patients (Balint, 1957, p. 121).

Between 1949 and 1954 Balint and Albu elaborated and tested the method, by trial and error and by reminiscences, at the Tavistock Clinic in London, after Balint took up the Family Discussion Bureau seminar directed by Enid Albu (whom he would later marry). This seminar of case discussions trained social workers treating cases of marital problems. To define the link between client and social worker, Balint modified the case presentations, doing away with written and read reports in favor of oral presentations without notes, in order to maximize the conditions for counter-transference. This method, applying the fundamental rule, but always referred to a third party (the patient), was similar to Hungarian supervised analysis, centered on counter-transference.

The results were so impressive that when the National Health Service wanted to give doctors training in psychology, Michael Balint proposed the "Tavistock Method." Tested from 1950 to 1953, with volunteers recruited by *The Lancet*, it became a training and research method. French analysts who went to London to be trained soon renamed it the "Balint group."

The Balint movement, launched in the 1960s, is organized on the institutional level. Several national associations have been created: The Balint Medical Society of France (1967), The Balint Society of Great

Britain (1969), and others in over twenty countries, including Italy (1974), Germany, Belgium, and Russia (1994). On the international level, the European Council recognized the Balint Federation as a nongovernmental agency. As of 2004, the work of the Balints continued, with training in Balint groups, colloquia, and national and international conferences.

## **BALINT, MICHAEL (BÁLINT [BERGSMANN], MIHÁLY) (1896–1970)**

Hungarian physician and analyst Michael Balint was born in Budapest on December 3, 1896, and died in London on December 31, 1970.

He was the son of a Jewish general practitioner (Dr. Bergsmann) from a Budapest suburb. In the course of his brilliant university career (he earned qualifications in neuropsychiatry, philosophy, chemistry, physics, and biology), he met Alice Székely-Kovács, an anthropology student, who became his wife in 1924.

After World War I, he held various positions in Budapest, and then in 1921, left for Berlin to undergo analysis with Hanns Sachs at the same time as Alice. He occupied various positions in the Psychoanalytic Institute, the Institute for Organic Chemistry of the Royal Academy of Berlin, as well as the Charité Hospital medical clinic. It was towards the end of his twenties, with the aim of better integrating in society, that he changed his name from the Jewish-sounding

Bergsmann to the more “Hungarian” Balint, just as Sándor Ferenczi’s father (born Fraenkel) had done.

Dissatisfied with their analyses with Hanns Sachs, the Bálints returned to Budapest to finish with Sándor Ferenczi. Michael Balint subsequently became Ferenczi’s student, friend, and successor, as well as his literary executor. In 1931, he was made deputy director of the Psychoanalytic Polyclinic in Budapest under Ferenczi, becoming its director after Ferenczi’s death.

In January 1939, under the pressure of anti-Semitism, the Bálints emigrated to Manchester, England. Six months after their arrival, Alice Balint died. During World War II, Bálint taught medicine and science and began a private practice in psychoanalysis. From 1942–1945, he directed the Centers for Child Guidance in North East Lancaster and Preston. From 1942–1945, he was an honorary psychiatry consultant at Manchester Northern Hospital, and in 1945, psychiatrist at the Center for Child Guidance in Chiselhurst, Kent.

That same year, he set himself up in London as an analyst. There he again took up his project of placing psychoanalysis in the service of general practitioners, this time in collaboration with Enid Albu (herself an analyst), whom he married in 1950. From 1950–1953, he was the scientific secretary of the British Psychoanalytic Society. An admired teacher and supervising analyst, he employed the Hungarian method of training, that is, he himself supervised the first case of candidates he had analyzed. From 1950–1961, he was a psychiatric consultant at the Tavistock Clinic, and from 1957, a visiting professor of psychiatry at the University College of Cincinnati in the United States. From 1961–1965, he was honorary assistant to the department of psychological medicine at the University College Hospital in London where he directed post-graduate training seminars. In 1968, he was elected president of the British Psychoanalytic Society.

Balint’s psychoanalytic writings possess a remarkable coherence. He progressively developed his ideas from 1924 until they reached their ultimate form in his last work *The Basic Fault* (1968). In addition to the notion of the basic fault, Balint also introduced the concepts of primary love (1930–1935) in *Primary Love and Psychoanalytic Technique* (1952), and of benign and malignant regression in *Thrills and Regressions* (1959). He questioned the existence of primary narcissism and emphasized the contradictions in Freud’s

elaborations on it (“Critical Notes on the Theory of the Preenatal Organization of the Libido,” 1935). He coined the term “ocnophile” to describe personalities that feel the need to cling to objects and the term “philobatism” to characterize those who dread obstacles and seek out open spaces that are free of them (1959). He distinguished three mental zones: the oedipal zone, involving three persons, where conventional language holds sway; the zone of the basic fault, involving two persons, where conventional language is no longer current; and the zone of creation, where the subject is alone and creates only out of the self (1968).

Balint’s other major effort was his educational training work with general practitioners. His first article dealing with this subject dates from 1926: “On the Psychotherapies, for the Practicing Physician” (*Therapia* 5, Budapest). His major work in this area is *The Doctor, His Patient and the Illness* (1955).

The theoretical work of Michael Balint stands in direct relation to the clinic and constitutes a remarkable tool for psychoanalytic practitioners. The technique that he elaborated for use by general practitioners resulted in the creation of “Balint Groups” and “Balint Societies” that utilize this mode of training.

Finally, Balint is responsible for the preservation and promotion of the work of Sándor Ferenczi, for whom he was literary executor. It was Balint who transcribed Ferenczi’s Clinical Diary, which he then translated into English, and who also made the first transcription, during the 1950s, of Ferenczi’s correspondence with Freud.

Michael Balint published ten books (of which five were coauthored) and 165 articles. The Balint Archives are housed in the department of psychiatry in the University of Geneva.

## **BALINT-SZÉKELY-KOVÁCS, ALICE (1898–1939)**

Hungarian psychoanalyst and anthropologist Alice Balint-Székely-Kovács was born in Budapest on June 16, 1898, and died in Manchester on August 19, 1939.

She was the eldest daughter of Vilma Kovács, herself an analyst and student of Sándor Ferenczi. Both Alice and Michael Balint were also his students. Alice Balint had a brilliant career as a student in Budapest. One of her classmates was Margrit Schönberger, who became well known under the name of Margaret Mahler. Then she pursued university studies in mathematics and anthropology.

From 1921 to 1924, she resided in Berlin with Michael Balint, her future husband. Both were in analysis with Hanns Sachs and participated in the activities of the Psychoanalytic Association of Berlin. Dissatisfied with their analyses, they returned to Budapest and finished their training with Sándor Ferenczi.

Alice Balint was very active in the Psychoanalytic Association of Budapest. A child analyst at the Psychoanalytic Polyclinic of Budapest, she also maintained a private practice of children and adults. She gave lectures for parents that later appeared in the pedagogy journal *Gyermeknevelés* (Child Education). In 1939 the Balint family emigrated to Great Britain and established themselves in Manchester. Alice Balint died there suddenly at the end of August 1939.

Her work comprises a series of articles and one book. Her articles deal with ethno-psychoanalysis (“Mexican War Hieroglyphs,” “The Father of the Family”), psychoanalytic theory (“Love for the Mother and Mother Love,” “On Repression”) and pedagogy. Her book, called *A Gyermekszoba pszichológiája* (The Psychoanalysis of the Nursery), was translated into several languages.

Alice Balint died too young, leaving behind a body of work qualitatively modest, but of great originality, that still waits to be better known and used.

## **BARANGER, WILLY (1922–1994)**

A psychoanalyst with a degree in philosophy, Willy Baranger was born on August 13, 1922, in Bône, Algeria, and died on October 29, 1994, in Buenos Aires.

He spent his childhood in Paris, where he continued his studies until he obtained his baccalaureate diploma in 1939. After moving to Toulouse because of the war, he completed his education with the PCB and received a degree in philosophy. He married Madeleine Coldefy and prepared for his doctorate in philosophy, which he received in 1945.

After teaching in France for a year, he left for Buenos Aires as a professor of philosophy at the Institut Français d'Études Supérieures. He began his psychoanalysis with Enrique Pichon-Rivière and soon completed his theoretical and practical training. In December 1954 a group of Uruguayan doctors and psychologists asked him to assume responsibility for training analysis and teaching in Montevideo. The Asociación Psicoanalítica del Uruguay was officially formed on September 27, 1955. It was recognized as a study group at the international congress held in Paris in 1957 and as an affiliate of the International Psychoanalytic Association at the congress of Edinburgh in 1961.

The *Revista uruguaya de psicoanálisis*, which is still in print, published its first issue in May 1956. Willy Baranger was a constant presence at the Latin

American congresses of psychoanalysis since their inception in Buenos Aires in 1956 and, in 1960, at the congress held in Santiago, Chile, he worked with his colleagues to create COPAL, the Coordinating Committee for Latin American Psychoanalytic Organizations, of which he was president in 1975–1976. In 1966 Baranger returned to Buenos Aires, where he resumed his teaching activities. He was part of the sponsorship committee of the Peruvian group that, once recognized as an affiliate of the International Psychoanalytic Association, named him an honorary member. In December 1993 he received the Mary S. Sigourney prize.

Baranger published four books: *Problemas del campo psicoanalítico*, with Madeleine Baranger (1969), *Posición y objeto en la obra de Melanie Klein* (1971), *Aportaciones al concepto de objeto en psicoanálisis* (1980), and *Artesanías psicoanalíticas* (1994).

Some of his many articles touch upon literature and philosophy. His work on epistemology defends the idea that psychoanalysis must formulate its own criteria of validation, different from those used by the exact sciences. He also studied the problem of ideology and its relation to idealized objects. His emphasis on the object is expressed in his *Posición y objeto en la obra de Melanie Klein*. This “objectology” depends on the willingness to structure any theoretical elaboration of the psychoanalytic situation as a fundamental given. The concept of the psychoanalytic situation as a “dynamic field” leads to an unconscious bipersonal fantasy of the session, in which transference and countertransference are extracted from a situation that possesses its own dynamism and outcomes, aside from the specific contributions of the analyst and analysand. For example, a “bastion” is a resistance produced in the psychoanalytic field by the unconscious collusion of the analyst and the analysand, which immobilizes the process.

Willy Baranger’s work is generally well known and recognized in Latin America, but much less so in Europe, with the exception of Italy, where a selection of his work was published in 1990 as *La situazione psicoanalitica come campo bipersonale* (The Psychoanalytic Situation as a Bipersonal Field).

### BASIC ASSUMPTION

Wilfred R. Bion (1961) uses the term *basic assumption* to designate that which, fundamentally, the individual must assume in order to be part of a group. Basic assumptions come into play at the unconscious, pathic, and affective levels.

Competing with the model of the work (*W*) group, which is focused on a task and puts into effect the secondary processes of rational thought and “reality-testing,” group activity is based on three basic assumptions that are discernible in the affective tone of the relations of group members among themselves and with their leader. The basic assumption of dependency (*baD*) lends cohesion to the group by means of supporting the assumption that nourishment, protection, knowledge, and life can come only from the wisdom of a leader who is omnipotent and omniscient, akin to a magician. The basic assumption of fight/flight (*baF*) brings individuals together around the violent, excitation-saturated feeling that the salvation of the group and its individual members depends on the fact that their leader will enable them to identify, and then successfully fight or flee, a specific enemy either within or outside the group. The basic assumption of pairing (*baP*) enables the group to come together as such through the members’ sharing of an implicit, mysterious hope, sparked by the assumption that a couple will give birth to a messiah, a new guide, a new idea, or a new theory or ideology.

These basic assumptions are states of mind—all of them sexual in the final analysis—associated with the characters in the oedipal situation (including the Sphinx); they emerge as secondary formations from an extremely primitive scene that is played out at the level of part-objects, and which is associated with psychotic anxieties and with the mechanisms of splitting and projective identification inherent in the

schizoid-paranoid and depressive positions posited by Melanie Klein.

### BASIC FAULT

The term *basic fault* refers to the structural deficiency in the personality of subjects who during their early stages of development formed certain types of object relations—which later become compulsions—to cope with a considerable initial “lack of adjustment” between their psychobiological needs and the care provided by a “faulty” environment devoid of understanding. The effects of the basic fault on a person’s character structure and “psychobiological dispositions” (which may predispose that person to certain illnesses) are only partially reversible.

Michael Balint developed this concept in *The Doctor, the Patient, and the Illness* (1957), as a result of his research with physicians in the area of psychosomatic disorders. Additionally, in “The Three Areas of the Mind” (1958), Balint developed the notion of the “basic fault zone” to situate therapeutic processes relating to states of regression in certain patients. This became the source for his metapsychological theorization, in *The Basic Fault: Therapeutic Aspects of Regression* (1968), of “zones of the psychic apparatus,” which included a critique of Sigmund Freud’s notion of “primary narcissism” and new considerations on the handling of regression.

Certain patients (those with schizoid personalities, narcissistic states, or addictions, for example) are unable to tolerate the frustrations of classical treatment and are largely inaccessible to interpretation. The therapeutic relationship thus requires modifications in technique to open up to analysis the interpersonal psychic processes inherent in the “basic fault zone.”

This “zone” of the human psyche (which may be the ego) is unquestionably more primitive than both the “area of the Oedipus conflict” (Balint, 1968, p. 28) (prevalent in classical treatment) and the “area of creation” (p. 29). The processes that take place there are characterized by:

1. An exclusively “two-person” relationship, where only the patient’s needs count;
2. A dynamic force other than conflict (proper to the oedipal zone): that of an anxiety that drives the patient to perpetuate old models of object relations that now indicate maladjustment, such as behaviors that are “ocnophilic” (desperately clinging to objects) or “philobatic” (attempts at self-sufficiency by keeping well away from supposedly dangerous objects); this dynamic also drives the patient to establish a harmonious relationship with his or her environment (“primary love”);
3. The prevalence of nonverbal processes or language usage that is nontypical of adults.

A kind of “psychological mothering” makes it possible to avoid reproducing the traumatic situation in treatment; object relations, rather than interpretation, provide the therapeutic leverage. Regression, which is in part linked to the analyst’s responses, can be therapeutic (“benign”) if it is aimed at producing recognition of previously unacknowledged needs rather than satisfying them. Certain soothing forms of satisfaction (libidinal and physical contact) help sustain the therapeutic relationship. Reestablishing the primary love relationship allows the basic fault, once it has been recognized, to heal. It is said to be “neutralized” when the patient can let go of his or her compulsive object relations.

This theoretical model is especially relevant to the treatment of borderline cases; it is used in the framework of focal therapies and in situations addressing combined psychological, medical, and social considerations (psychotherapeutic aspects of medical treatment,

family planning consultations, and other such contexts). It sustains the fundamental metapsychological and clinical issues.

Inseparable from a conception of the psyche as a product of interpersonal relations—in particular, the ego as a “corporeal entity” (Freud)—and from a theory of treatment that makes use of regression, the “basic fault” has been subject to the criticisms that are usually made against any approach that aims at partial reparation: the risk of erotization, the risk of nondissolution of the transference, and so on. Balint viewed such criticisms as manifestations of anxiety on the part of analysts. Subsequent work has indicated that this conception of an early distortion in the ego should also take into account the pathogenic processes stemming from the patient’s family and cultural contexts. Focus on the nonverbal should not allow the underestimation of the crucial role that language and signifiers (just as much as their deficiencies or dysfunctions) play in the constitution of the ego.

## **BASIC NEUROSIS, THE—ORAL REGRESSION AND PSYCHIC MASOCHISM**

“A most original thinker and prolific writer,” in this book Bergler compiled the results from his 130 published papers and 6 books based on 22 years of clinical experience. Renowned for his research on oral neurosis, he discovered there is but one “basic neurosis”—repressed masochistic attachment to the fantasied ear-

liest “bad mother”; later neuroses “reformulating” oral masochistic material represent “rescue stations”; psychic masochism (PM), the unconscious pursuit of “pleasure in displeasure,” forms the core of oral regression. Thus, neurotic equals psychic masochist. Neurotics cling to and repeat misery, in itself indicating PM. PM unconsciously “sugarcoats” and “neutralizes” pain; but consciously pain remains, felt in symptoms and personality distortions.

To Freud’s “genetic picture” of PM (megalomania unavoidably offended by perceived frustration of libido; fury; helpless aggression rebounding; libidization of guilt), Bergler worked out and added the “clinical picture.” He named it the “mechanism of orality”:

1. Unconscious provocation or misuse of “refusal”; casting others as “bad, refusing mother.”
2. Retaliation for the alleged “injustice” by pseudoaggressively fighting in righteous indignation.
3. Self-pity then unconsciously enjoyed.

With this base, every clinical entity incorporates a unique “specific additional factor”; 27 clinical pictures with case illustrations substantiate this. Psychic masochists unconsciously want refusal, rejection, humiliation, defeat. The genuine “wish to get” of infancy is now a defense. They believe they want normal pleasure, but a person “who unconsciously runs after disappointment cannot be consciously happy.” All neurotic aggression is “pseudoaggression,” promoting self-damage. Neurotics shift the blame outside, mostly to parents; this Bergler named the “basic fallacy” which must be shown to be a fallacy.

Applying these ideas, Bergler advocated new clinical solutions, such as talking at length to patients to counteract their projection of “bad refusing mother” (facilitating analysis), and more active analyzing, to unearth and interpret all repressed masochistic data and repetitions. He added theory regarding transference/love, creativity, working through, masturbation, money-neurosis, fashion, gambling, homosexuality, and humor. Bergler deduced mechanisms of cynicism, hypocrisy, criminosis; described and/or named alysis, middle-age revolt, confusionism, 22 visual neuroses, writer’s block, psychogenic aspermia, counterfeit-sex, and “pseudo-moral connotation of neurotic symptoms” (ironization of teachings to prop up each symptom). He identified the superego (SE) (“torture

for torture’s sake”) as the “real master of the personality,” requiring constant appeasement. Daimonion (the punitive part of SE) uses the ego ideal to torture the ego; also that punishment is masochized. Psychic masochism is disguised from the superego by two defensive alibis (in the five-layer structure of neurotic symptoms and traits). In the normal, the fifth layer is antimasochistic; in neurosis, the final layer “smuggles in” masochism in self-damaging symptoms. Hence, neurotics cannot be helped unless their PM is analyzed. Eighteen further books detail his later discoveries. Growing numbers of adherents are confirming the accuracy and clinical value of his work.

## BASIC PROBLEMS OF ETHNOPSYCHIATRY

Dedicated to Marcel Mauss and with a preface by Roger Bastide, the essays in *Basic Problems of Ethnopsychiatry* were published between 1940 and 1967 in American anthropology, psychiatry, criminology, and

psychoanalysis reviews (*American Anthropologist*, *Bulletin of the Menninger Clinic*, *Journal of Criminal Psychopathology*). The author provided additional commentary for some of the texts at the time of their publication.

In spite of the diversity of the topics, the collection provides insight into the sources of Devereux's thought, his experiences as an ethnologist among the Mohave Indians of California and the Sedangs Moi of Vietnam, as well as his research on sociology and mythology. These included the definition of ethnopsychiatry as a reference frame for clinical work and research in psychiatry; the qualification of the concepts of ethnic personality and its disorders (sacred, typical, idiosyncratic); the status of culture in psychological disturbances such as psychosis, neurosis, somatic disturbance, deviance; and the additional possibilities of functional and cultural disturbances. For example, in "A Sociological Theory of Schizophrenia" Devereux analyzes the effects of modern societies on the disorientation and dysphoria of its members.

The author draws the attention of psychiatrists, psychoanalysts, and anthropologists to the reciprocity of oedipal conflicts between adult and child and to the presence in some societies of models of conventional misconduct that can be used directly in private and "negativist" fantasies. Devereux also reiterates the importance of diagnosing any antisocial "warning symptoms" in disturbed individuals, even those who are least obvious, not as a function of existing norms but as a function of their singularity and distance from culture and the materials it offered them.

For Georges Devereux culture was an interior experience and a way of "living experience." Through his methodology, based on the complementarity of psychological and sociological data, and his theoretical opposition to any form of cultural relativism in the explanation of mental disorders—he believed in the mental unity of human beings—the role of psychoanalysis in ethnological research has been established. Through its coherence and scholarship, Devereux's work provides unique support for the use of ethnopsychiatry in the investigation of culture.

## BAUDOIN, CHARLES (1893–1963)

Charles Baudouin was born July 26, 1893, in Nancy, France, and died on August 25, 1963, in Geneva, Switzerland

During his career, he was a Swiss psychoanalyst and Privatdocent at the University of Geneva (1920), founder of the International Institute of Psychagogy and Psychotherapy (1924), director of the review *Action et Pensée* (Action and Thought) (1931), Chevalier of the Legion of Honor in Paris (1950), and associate professor at the University of Geneva (1962).

His father had a career in the French military as a non-commissioned officer in the public health service, and his mother came from a family of middle-class shopkeepers in the German-speaking area of Lorraine. Baudouin studied philosophy in Nancy, where he received his degree in 1912. He was a professor of philosophy at the school of Neufchâteau in the Vosges. In 1915 he traveled to Geneva, attracted by the success of the Jean-Jacques Rousseau Institute, where he taught. He wrote his doctoral dissertation, entitled *Suggestion et Autosuggestion*, at the University of Geneva in 1920.

Baudouin underwent three different analyses: One in 1917 with Dr. Carl Picht, a Jungian analyst, another, a training analysis, with Charles Odier, between 1925 and 1926, and a third with another Jungian, Tina Keller. Fluent in both French and German, Baudouin read the work of Freud and the first psychoanalysts early in his career. He met Freud in Vienna in 1926. In 1929 Baudouin applied for membership in the Société Psychanalytique de Paris, but his request was rejected because of pressure from Henri Flournoy, who insisted that he would join the organization only upon condition that Baudouin not be admitted.

Baudouin spent much of his career trying to reconcile the work of Jung, Freud, and Adler. His earliest work was devoted to suggestion and hypnosis. He later

developed an interest in literature and the relation between psychoanalysis and education. Baudouin's literary output throughout his career was considerable. He wrote a *Carnet de route* in sixteen volumes (1910–1939), only some of which were published. These notebooks provide valuable commentary concerning the psychoanalytic atmosphere prevalent at the time. *Carnet VI* (October 1918–December 1921) is entitled, "When the Child Appears." His first book was *Suggestion and Autosuggestion* (1920). His most important publications include *Études de psychanalyse* (1922), *Qu'est ce que la suggestion?* (1924), *Le Symbole chez Verhaeren* (1924), *Psychanalyse de l'art* (1929), *La Mobilisation de l'énergie* (1931), *L'Âme enfantine et la psychanalyse* (1931), *La Psychanalyse* (1939), *Psychanalyse et Victor Hugo* (1943), *L'Âme et l'Action* (1944), *De l'instinct à l'Esprit* (1950), *Y a-t-il une science de l'âme?* (1957), *Psychanalyse du symbole religieux* (1957). He also wrote a novel, *Christophe le passeur* (1964).

Baudouin's work merits greater attention from modern historians and psychoanalysts. His concerns and fields of interest are often directly relevant to contemporary psychoanalysis. He is a precursor in a number of fields (art, education, suggestion, and hypnosis). Baudouin did not adhere to orthodox Freudianism and turned to Jung and Adler for the theoretical elements that he felt were relevant for clinical work.

### **BAUER, IDA (1882–1945)**

Ida Bauer, alias Dora, is the subject of Freud's famous case history on an adolescent (Freud, 1905).

Her father, Philip Bauer, who became a rich textile industrialist, was born in 1853 in Pollerskirchen. Her mother, Katherina or Käthe (née Gerber), was born in 1862 in Königinhof, a village that, like her husband's birthplace, was located in the eastern part of Bohemia. Shortly after marriage, the Bauers had their only two children, both born in Vienna: Otto, born on September 5, 1881; and Dora, November 1, 1882. Contrary to his sister, whose reputation stemmed solely from her patienthood, Otto achieved eminence as the parliamentary leader and foreign minister of the First Austrian Republic, as its chief Marxist theorist, and as secretary to the Austrian Social Democratic Worker's Party.

After contracting tuberculosis, the wealthy Philip moved with his family in 1888 from Vienna to B—, Freud's designation for Merano, a Tyrolean resort town that is presently in Italy and situated four hundred kilometers to the southwest of Vienna. In Merano the Bauers befriended another resident couple, designated by Freud as Herr and Frau K, the letter pronounced in German the same way as the last syllable of their real married name, Zellenka. Hans Zellenka and his wife Peppina (née Heumann) had two young children, Otto and the congenitally ill Klara, both born in 1891. Although afflicted herself with bouts of *tussis nervosa* and aphonia, Dora would care for both her sick father and the Zellenka children.

In 1894 Philip became even more sick. Nursed by Peppina, Philip then started a long liaison with her. Dora's conflicts were aggravated by that liaison and also by two traumata that she suffered at the hands of Hans. Although she consulted Freud once in 1898, Dora did not go into treatment with him until the earlier part of October 1900; she abruptly terminated treatment nearly three months later, on the last day of the year. In 1903 she married Ernst Adler, who, not succeeding as a musician, went to work for her father. Summoned by Dora's physician, Felix Deutch visited the bedridden patient in 1923; reportedly she suffered from almost paranoid behavior and found all men

detestable. (Dora's one son, Kurt Herbert, won fame as the director of the San Francisco Opera Company.)

In a fateful twist of history, Dora and Peppina later became friends; both were partners as bridge masters during the 1930s when the card game was the craze in Vienna. Because of her brother Otto's Marxist affiliation, the Nazis sought Dora in the late 1930s, and she hid in Peppina's home. Dora emigrated to Paris, and then to New York where she died.

### **BEIRNAERT, LOUIS (1906–1985)**

Louis Beirnaert, a French Jesuit and psychoanalyst, was born on April 2, 1906, in Ascq and died on April 30, 1985, in Paris. Beirnaert became a Jesuit in 1923. An almoner for law students during the Second World War, he took part in a resistance network and went underground. After the war he became a professor of dogmatic theology (1947–1951). He began his analysis with Daniel Lagache and became an analyst himself.

In 1953 he founded, together with Father Charles Durand (Geneva), Doctor Charles Nodet (Société psychanalytique de Paris [Paris Psychoanalytic

Society]), and Father Bruno de Jésus–Marie (Carmelite studies), the Association Internationale d'Études Médico-Psychologiques et Religieuses (International Association of Medico-Psychological and Religious Studies) to promote the understanding of psychoanalysis within the Catholic church. During the early sixties, he created in France, together with Andrée Lehmann, Abby Marc Oraison, and Father Albert Plé (Dominican, director of the Supplément), the Association Médico-Psychologique d'Aide aux Religieux [Medico-Psychological Association for Assistance to the Clergy], which provided members of the clergy with access to psychoanalysis and a better understanding of its possibilities.

He was a member of the Société Française de Psychanalyse (French Psychoanalytic Society), the École Freudienne de Paris (Freudian School of Paris), and was close to Jacques Lacan. Throughout this period he was also the editor of the Jesuit publication *Études*, for issues of morality, psychology, and psychoanalysis. Through his writing and numerous personal associations, Beirnaert exercised considerable influence on improving relations between psychoanalysis and the Catholic church. He wrote a number of articles on psychoanalysis, ethics, and the interrelation of psychoanalysis and Christianity.

### **BELGIUM**

There were signs of interest in Belgium for Freud and Breuer's research on hysteria as early as 1894. References can be found in Dallemagne's *Dégénérés et déséquilibrés* (Degeneracy and Mental Imbalance), but this appears to be an isolated case (Berdondini, N., 1987). During the twenties, a few attempts were made to introduce young psychiatrists to psychoanalytic concepts, but there was vehement opposition from the old guard. In literature a special issue of *Disque vert* appeared in 1924, entirely devoted to Freud. The

Belgian authors included Georges Dwelshauwers, André Ombredane, and Henri Michaux. In his later writing, Franz Hellens, director of the publication, was also sympathetic to the work of Carl Gustav Jung. At the University of Louvain, following the initiative of the future cardinal Mercier, several professors took an interest in Freudian theory and established individual critical positions because of the emphasis placed on sexuality. The Jesuit J. Maréchal was also influential in promoting early acceptance of psychoanalysis.

In the midst of these still limited signs of interest, there emerged the figure of an educator from Gand, Julien Varendonck (1879–1924), who had the good fortune to meet Freud and become one of his students. He underwent a training analysis with Theodor Reik and spent 1923 in Vienna to continue his education. Upon his return to Gand, he opened his own office and was made a member of the Dutch Society of Psychoanalysis shortly before his premature death on June 11, 1924. In 1921 he published an important monograph entitled *La psychologie des rêves éveillés* (The Psychology of Daydreams), with a preface by Freud. Anna Freud translated the first part of the book. Unfortunately, because he was unable to find any students or an analysand with whom he could continue his research, his initiative remained stillborn.

The foundations of psychoanalytic practice were established by two Belgian pioneers, Maurice Dugautiez (1893–1960) and Fernand Lechat (1895–1959). The beginnings of psychoanalysis in Belgium reflect Freud's own solitary struggle during the first decade of the twentieth century. A closed and poorly informed medical establishment—the organic approach dominated psychiatry at the time—and a public opinion that remained hostile because of sectarian prejudices, explain why Freud's work had to wait for the arrival of two idealists who remained far outside the conventional sphere of training before psychoanalysis could take hold in the country. Both men were self-taught, curious and passionate individuals, who first met in 1933. Their encounter was the prelude to years of fruitful collaboration that enabled a psychoanalytic organization to gain a foothold in Belgium.

In spite of the dramatic context in which it occurred, another fortuitous event took place in 1933 or thereabouts. A Viennese Jew, Dr. Ernst Hoffman, a disciple of Freud and a brilliant student of Sándor Ferenczi, settled in Anvers to escape Nazi persecution. Dugautiez and Lechat, together with Mrs. Lechat, who

was primarily interested in working with children, took advantage of Hoffman's providential appearance and began a training analysis with him. Unfortunately, Hoffman was arrested in 1942 and sent to a concentration camp. He never returned, and the nascent Belgian psychoanalytic movement suddenly lost its leader.

Beginning in 1936 Dugautiez and Lechat began undergoing supervised analyses under the supervision of Dr. Leuba and Marie Bonaparte. They were authorized to practice on their own in 1939; Mrs. Lechat began working with children at this time. After the war ended, both of them applied for membership in the Paris Psychoanalytic Society and were authorized, in 1946, to conduct training analyses and supervise their own students' first analyses.

On December 24, 1946, they founded the Association des Psychanalystes de Belgique (Association of Belgian Psychoanalysts) with Dr. Leuba as honorary president. They were sponsored by the Psychoanalytic Society of Paris. Doctor Ernest Jones, president of the International Psychoanalytic Association (IPA), had encouraged this initiative. In 1947 the association, with the sponsorship of Marie Bonaparte, was accepted for membership in the IPA. The standing of the young organization was made more secure in 1948 with the organization, in Brussels, of the eleventh Conférence des Psychanalystes de Langue Française [(Conference of French-speaking Psychoanalysts)]. During the twelfth conference, in 1954, Fernand Lechat presented a report on "The Principle of Security." There were three further meetings in Brussels: in 1958, in 1972 (when a report was given by Danièle Flagey, entitled "Intellectual Inhibition"), and in Liege, in 1986, with a report by Andrée Bauduin, "On the Preconscious."

In 1953, Dr. Thérèse Jacobs Van Merlen, who had returned from her training in Paris with Sacha Nacht, Serge Lebovici, and René Diatkine, joined Dugautiez and Lechat. A stream of new members joined the association: Flagey, Bourdon, Vannypelseer, Drappier, Luminet, Pierloot, Labbé, Darmstaedter, Duyckaerts, and later, Watillon and Godfrind. The association has continued to grow since then. In 1960 the name was changed to the Société Belge de Psychanalyse (Belgian Psychoanalytic Society), also known as the Belgische Vereniging voor Psychoanalyse.

The society continued to grow, with the addition of a teaching committee, an enlarged administrative

office, and an ethics committee. In addition to bimonthly meetings and working groups, the entire society met every two years for a colloquium. The *Revue belge de psychanalyse*, with Haber as its first director, was founded in 1982. The review made the society's ideas accessible to a much broader public. There was also a members' *Bulletin*, created in 1977.

Some twenty years after the creation of the current Belgian Psychoanalytic Society, various activities were established by psychoanalysts who had returned home from abroad and who were, for the most part, associated with the University of Louvain. These individuals either could not, or would not, become a part of the existing society. Most of them had met in Paris between 1955–1960, where they followed the activities of the French Psychoanalytic Society, which was then run by Daniel Lagache and Jacques Lacan, with the assistance of Juliette Boutonier, Françoise Dolto, and Georges Favez. Following a break in 1953 with the Paris Psychoanalytic Society, in 1964 the French Psychoanalytic Society experienced new upheavals with the departure of Lacan and the creation of the École Freudienne. Although some activities of the new Belgian group began in 1964, the official foundation of the École Belge de Psychanalyse (Belgische School voor Psychoanalyse) did not take place until 1969, under the impetus of Professors Jacques Schotte and Antoine Vergote.

Lacan's influence was decisive within the school, to the extent that its establishment can be considered an implicit extension of the situation in France. This allegiance to Lacanian positions, at least on the part of some, became problematic when the dissolution of the École Freudienne by Lacan led to divisions that subsequently gave rise to numerous offshoots, including Questionnement Psychanalytique (Psychoanalytic Questioning) and the Association Freudienne de Belgique (The Freudian Association of Belgium). These various groups are the result of the differences encountered concerning the importance of Lacanian ideas, in terms of setting and training, and more generally in terms of the theoretical corpus. Unlike the Belgian Psychoanalytic Society, these associations were not part of the IPA, some even took pride in their separatist stance. In 1984 the École Belge de Psychanalyse began publishing a bilingual review, *Psychoanalyse*.

There were also Jungian psychoanalysts working in Belgium. The Société Belge de Psychologie Analytique

(Belgian Society of Analytic Psychology), or SBPA, was founded in 1975. The majority of its members had been analyzed by Gilberte Aigrisse (1911–1995), who was trained in Geneva by Charles Baudouin. In 1994 some members of the SBPA left the organization to found a new group known as the École Belge de Psychanalyse Jungienne (Belgian School of Jungian Psychoanalysis), or EBPJ.

## **BELIEF**

Belief is the condition of holding a thing to be true or probable, giving credit to a person or an idea, giving credence to or having faith in a story. In this last sense belief is related to theology and economy. The believer is situated in a religious system in which he adopts a certain number of convictions, accepts a series of dogmas and makes this credo a guideline for living. Belief may have to do with clinging to a truth or belonging to a church or a party. The believer is also indebted to the person or persons, parents or teachers or others, who provide the material for belief, and possess a capital of confidence and a stock of responses, encouraging or obliging the believer to borrow from them models of reasoning and types of solutions.

The theme of belief is directly addressed by Sigmund Freud in a note accompanying a letter to Wilhelm Fliess dated May 31, 1897. There, belief is described as a phenomenon belonging entirely to the ego system (consciousness), without any unconscious equivalent. The topic had already been addressed indirectly in chapter 12 of the *Studies on Hysteria* (1895d), belief there being associated with superstition (p. 250).

It may seem paradoxical to speak of belief in the context of psychoanalysis. Freud described himself as nonbeliever and made no secret of his atheism. But precisely this external position with respect to unproven truth made him see belief as an anomaly that needed to be explained. Influenced by the positivism and scientism of his time, he considered belief to be a relic of childhood. He thus placed himself within the tradition of Auguste Comte, who believed that the individual and humanity as a whole both went through a childish stage with theological and military characteristics. He considered that the church and the army were the two social institutions responsible for perpetuating this stage. The reference to childhood here is bound up with the role of the father: God is the father of believers, who are all brothers; likewise the commander-in-chief is the father of soldiers, who are all comrades. The belief in salvation or victory is thus vital for maintaining the sense of family.

For Freud the concept of belief is inseparable from childhood theories of sexuality that continue to be held by the individual or by society. The little boy believes that women (and therefore his mother) have a penis. Society believes that the child has no sexuality. Belief is always associated with a disavowal of reality. The renunciation of belief is then an educational task and a psychological struggle, both liable to encounter much resistance. Psychoanalytic treatment cannot itself dispense with belief, for the transference, which reactivates infantile processes, demands that the patient lend credence to the analyst's words even though these do not belong to the realm of demonstrable truth. The better to remove the need for belief, therefore, psychoanalysis is obliged temporarily to replace one belief by another.

Differing attitudes regarding belief broadly coincide with the major splits in psychoanalysis and the schisms that have marked its history. In the early days, there was a "left" psychoanalysis, centered around Alfred Adler and the Social Democrats, which believed in popular revolution and the possibility, within a new political system, of eliminating alienation in both the social and the psychiatric senses of the word. A "right" tendency, meanwhile, epitomized by Carl Gustav Jung, believed in a metamorphosis of the soul and an internal unification of man that could heal all dislocations of being and all fissures in the ego. Freud was suspicious of all such beliefs, and his clinical experience tended to make him pessimistic about the possibility

of separating belief from illusion. He saw the need to believe as a powerful means of mobilizing the instincts and manipulating the unconscious: so loath were man and society to consent to what Max Weber called the disenchantment of the world that they continually felt the need to believe in the unbelievable, to hope against all hope in some distant paradise or in glorious tomorrows.

Skepticism did not in Freud's view mean a refusal of values. Values were indeed necessary for the progress of culture and its corollary, the renunciation of the immediate satisfaction of instinctual impulses. The values of civilization called nonetheless for a truly critical scrutiny that held fast to one most important principle: to fear no truth no matter how painful it might be.

### **BENEDEK, THERESE (1892–1977)**

Therese Benedek, a Hungarian psychoanalyst, was born in Budapest on November 8, 1892, and died in Chicago on October 27, 1977. She received her medical diploma from the University of Budapest in 1915. She underwent five months of analysis with Sándor Ferenczi, then in 1918 settled, along with her husband Tibor, in Leipzig. From 1920–1923 she completed her analytic training at the newly established Berlin Institute, where she attended seminars and conducted analyses under the supervision of Karl Abraham and Max Eitingon. A partisan of "developmental psychoanalysis," Benedek followed Ferenczi's recommendation for flexibility during therapy.

In 1933 she emigrated with her husband and their two children to the United States. In 1936 Franz Alexander offered her an administrative position at the Chicago Institute of Psychoanalysis, where he was the director. Here she participated actively in research on psychosomatic medicine for effective coordination of somatic and psychotherapeutic therapies, and published an article on the functions of the sexual apparatus and their disturbances. This study investigated the interaction between organic (hormonal) factors and the psychosexual economy in sexual disturbances by showing their close interdependence.

In 1949 she was one of the first psychoanalysts to speak of the mother-child dyad in terms of emotional symbiosis, insisting on a transgenerational reading of interaction during infancy. Ten years later, in *Parenthood as a Developmental Phase*, she referred to the interpersonal process that formed the basis of the mother-child interaction as a “transactional spiral,” which took place through the reciprocal identifications and introjections between mother and child.

## **BENIGN/MALIGNANT REGRESSION**

The notion of benign versus malignant regression comes from Michael Balint’s book *Thrills and Regressions* (1959); he distinguished two types of regression that can appear during analysis. The benign form is minor, temporary, and reversible; the other, malignant form is major, serious, lasting, or even irreversible. The former brings with it beneficial, therapeutic effects; the latter is pathogenic and can potentially

result in insurmountable problems for the patient and the analysis.

Regression, discovered very early on by Sigmund Freud in its topographical, temporal, and formal aspects as a defense mechanism and therapeutic support, suddenly appeared as a threat to the patient and to treatment. Generations of analysts thus came to dread it. Balint took up this issue at the point at which Freud and then Sándor Ferenczi had left off, and between 1932 and 1960 he created this notion, which aimed to change analysts’ attitude toward this phenomenon.

Balint no doubt used the terms *benign* and *malignant* with reference to the work of Otto Warburg, his former boss at the Berlin Charity Hospital, on tumors, for which Warburg won the Nobel Prize in 1931. The analogy is found in surgical techniques. This clinical distinction goes beyond the theoretical positions and techniques of Freud and Ferenczi. Freud recommended that regression be overlooked in analytic technique and saw it as a therapeutic support, but he advised analysts to maintain a degree of distance. Ferenczi used it and even provoked it (trance states) for therapeutic ends, and, during the 1930s, carried away by theoretical fervor, he conducted his “great experiment.” He devoted himself completely to his patients and responded to their impassioned demands with small gratifications; he also gave the patients extra sessions on demand, day or night, including during vacations.

The experiment elicited Freud’s “massive condemnation” (Freud, Letter to Ferenczi, December 13, 1931), which Balint called “unfair and not very productive” (1968). Balint reassessed Ferenczi’s approach during his continuation, after 1933, of Ferenczi’s unfinished analyses; this enabled him to understand his predecessor’s errors. The question arose as to whether he should return to the former techniques with these patients or rather, as he had begun to, derive a new evaluation of their object relations and make a prognosis of the transference (massive or non-massive) in order to adapt the treatment accordingly.

He then elaborated a differential diagnostic between two syndromes he called “Cluster A and Cluster B” (1968) with their respective constant characteristics: mutual trust or its absence, demands that were either moderate or insatiable, the inclusion of addictive states or none, and so on. To avoid “the appearance of a

malignant form of regression,” he advocated the development of adapted analytic techniques: The “discreet” (not omnipotent or needlessly intrusive) analyst must create the secure, permissive atmosphere that the patient needs, as well as the time needed for regression and what he called a “new beginning.” This notion, linked to his theory of the “basic fault,” is unquestionably the one that in Balint’s corpus has had the greatest influence among analysts.

## **BERGE, ANDRÉ (1902–1995)**

A French physician and psychoanalyst, André Berge was born on May 24, 1902, in Paris and died on October 27, 1995, in Neuilly-sur-Seine.

Although Berge did not know him, President Félix Faure was his maternal grandfather and there is little doubt that this played a role in Berge’s choices later in life. He grew up with two brothers in a free-thinking, upper-middle class, Catholic family with extensive social connections. His mother, Antoinette Félix-Faure, was a childhood friend of Marcel Proust. His father, René Berge, was a mining engineer, his uncle a perpetual secretary of the French Academy, his aunt a founding member of the “Ligue Fraternelle des Enfants” and a student of Maria Montessori. His secondary education took place at the Lycée Janson-de-Sailly, where he primarily studied literature. He published novels before founding, with his brother François, *Les Cahiers du mois*, in 1924, the year of his marriage to Geneviève Fourcade, with whom he had six children. A book of memoirs, *Réminiscences* (1977), described the events of the first half of his life.

In 1930 Berge participated in the foundation of the *École des Parents*, where he remained vice-president practically for the remainder of his life. He subsequently became interested in psychoanalysis. In 1939 he decided to undergo therapy with René Laforgue and, after joining the “Club des Piqués” consisting of Laforgue’s analysts, became close with Juliette Favez-Boutonier, Françoise Marette (later Françoise Dolto), and Georges Mauco. He decided to study medicine, which he continued during the Occupation, and focused on child psychiatry with an emphasis on psychoanalysis with Professor Georges Heuyer. Berge earned an M.D. in 1946, he became an associate member of the *Société Psychanalytique de Paris* (Paris Psychoanalytic Society) that same year. He was named a full member in 1948.

In 1946 Berge joined the staff of the newly created Centre Psychopédagogique Claude-Bernard, founded by Georges Mauco. He became head of the medical section the following year, remaining director for twenty-six years, until 1973. In 1965 he founded the Association pour la Réadaptation des Infirmes Mentaux (APRIM) [Association for the Rehabilitation of the Mentally Disabled], was president of the Fédération Internationale pour l’Éducation des Parents et des Éducateurs [International Federation for the Education of Parents and Educators] (1973–1979), president of the Montessori Association of France, and a teacher at the Institut de Psychologie from 1961 to 1971. His many activities in international and national organizations, and his many articles assured him a place among the leading educators in the field of child psychoanalysis.

It was in this capacity that, between 1950 and 1952, he became involved in the trial of Margaret Clark-Williams—a psychologist who had been accused of practicing medicine without a license—defending her right to practice psychoanalysis. His subsequent participation in the French psychoanalytic movement was somewhat unique. Even after the 1953 split, for several years he remained a member of the two rival societies, the *Société psychanalytique de Paris* (Paris Psychoanalytic Society) and the *Société française de Psychanalyse* (French Society for Psychoanalysis), founded by Daniel Lagache, Françoise Dolto, and Jacques Lacan, his former analyst. Berge was at the time an editor of the review *Psyché*, founded by Maryse Choisy in 1947, several of whose contributors were also members of the French Society for Psychoanalysis.

While efforts were being undertaken to integrate the French Society for Psychoanalysis within the International Psychoanalytic Association, he became a victim of an error on the part of the negotiators and was named, along with Jacques Lacan and Françoise Dolto, as one of those whom the international authorities wanted to exclude from the list of educators. After the mistake was rectified, he joined the non-Lacanian and created the Association Psychanalytique de France (Psychoanalytic Association of France). Berge was president from 1969–1970 but, faithful to his unique status of “dual membership,” was, in 1965, also elected an associate member of the Paris Psychoanalytic Society, which he had been forced to quit shortly before.

Aside from *Les Psychothérapies* (1968), Berge is the author of a number of articles, talks, and books on psychopedagogy, of which he was one of the leading promoters in France. These were anthologized in *André Berge: écrivain, psychanalyste, éducateur* (1995). In 1936 his book *L'Éducation familiale* was recognized by the Académie des Sciences Morales et Politiques. Other books followed, including *Le Métier des parents* (1956), *L'Enfant au caractère difficile* (1970), and *La Sexualité d'aujourd'hui* (1970). Berge outlined the course of his life in a series of interviews with Michel Mathieu in 1988; in spite of blindness, he remained lucid and active until his death.

Didier Anzieu, in his preface to *André Berge: écrivain, psychanalyste, éducateur*, referred to his work as “protean” and praised the “flexible, open-minded, and rigorous approach that varied with the individual and the context of the exchange. This provided him with direct, rapid insights and the ability to transcribe them with simplicity in clear and convincing language, with less dependence on theory.”

## BERGGASSE 19, WIEN IX

In September 1891 Sigmund Freud, with his wife Martha and his children Mathilde, Martin, and Oliver, moved into a newly constructed building, Berggasse 19, in Vienna's ninth district. Built according to plans by Alexander Stierlin, the building was perfectly suited to its surroundings, consistent with the architecture of the Gründerzeit (founders) style, which changed the face of Berlin, Vienna, and Paris. There were fourteen apartments in the building, all of them sumptuous.

Freud's family occupied the first floor, and it was there that Ernst, Sophie, and Anna were born. In 1896, because of a lack of space, Freud rented an office on the floor below since the apartment opposite his was occupied by his sister Rosa Graf and her children. It wasn't until 1908, when Rosa and her family moved out, that Freud moved into the apartment where he saw patients and received his friends, and which was later catalogued by the photographer Edmund Engelman. He left the apartment in 1938, bringing with him his furniture, his collection of antique objects, and his personal belongings.

After 1908, Freud's family occupied the entire first floor. During the 1930s, Dorothy Burlingham, born Dorothy Tiffany, moved into the second floor while her children were undergoing analysis with Anna Freud. She became friends with Anna and later her close collaborator.

In 1902 a small group, known as the Wednesday Society, began meeting in the apartment at Berggasse 19; it was the first psychoanalytic discussion group. It was there as well that Freud met with his colleagues—many of whom he considered friends—including Sándor Ferenczi, Max Eitingon, and Ernest Jones, along with writers and intellectuals. It was in his office there that Freud wrote the majority of his work.

Since the turn of the century, Freud had surrounded himself with his collection of antique objects, continuously enriched, initially by the purchases he himself made during his trips to Italy and then by those of his

friends and colleagues, especially Emanuel Loewy, a professor of archeology. At the end of his life, Freud's collection contained some two thousand, five hundred objects. He got great enjoyment out of the collection, especially when his cancer prevented him from traveling. When he and his family were forced to flee the country, the apartment was rented and all traces of his presence in it disappeared.

The building has housed the Sigmund Freud museum since its opening in 1971, in the presence of Anna Freud, operated by the Sigmund Freud Society. The museum occupies the entire first floor of the building that remained the Freud family residence for nearly fifty years. But it was only with the opening of the museum that the building, which receives nearly forty thousand visitors a year, has assumed its rightful place in the cultural life of Europe.

## **BERGLER, EDMUND (1899–1962)**

Edmund Bergler, a major Freudian theoretician and clinician, was born in Austria on July 20, 1899, and died in New York City on February 6, 1962. Bergler received his medical degree from the University of Vienna in 1926, and married Marianne Blumberger in 1929. He served on the staff of Freud's clinic in Vienna from 1927–1933, and was an assistant director there from 1933–1938, when he moved to the United States. A prolific speaker and writer, he published nearly three hundred papers and twenty-four books, as well as lecturing and giving interviews.

Bergler's contribution to psychoanalytic thought was remarkable. He extended and made clinically usable several of Freud's later concepts, including superego

cruelty, unconscious masochism, and the importance of the pre-oedipal oral mother-attachment. Hitschmann spoke of his "extraordinary talent for the specialty of psychoanalysis . . . his command of the entire subject matter, his scientific acumen and literary erudition." Considered "one of the few original minds among the followers of Freud," Bergler presented his main ideas in *The Basic Neurosis*, in which he summarized his massive original contribution to the field.

Throughout his considerable body of written work, lucid case summaries in each book reveal clinical brilliance and a highly effective analytic technique. His own writing, as well as productive collaborations with Jekels, Eidelberg, Winterstein, and Hitschmann, included works on theory and technique. The Edmund and Marianne Bergler Psychiatric Foundation, in New York City, was established by Mrs. Bergler to preserve and perpetuate his work. It holds title to his working correspondence, many more articles, another two dozen complete books in English or German, as well as hundreds of drafts of papers and books, and will be a lasting resource.

**BERLIN PSYCHOANALYTIC INSTITUTE.** *See*  
**Berliner Psychoanalytisches Institut**

**BERLIN PSYCHOANALYTIC POLYCLINIC.** *See*  
**Berliner Psychoanalytische Poliklinik**

### **BERLINER PSYCHOANALYTISCHE POLIKLINIK**

When the Berlin Psychoanalytic Institute opened the first psychoanalytic polyclinic on February 14, 1920, it became the institutional model for bringing together the functions of therapy, research and training in one unit.

The Berlin Psychoanalytic Polyclinic fulfilled one of the functions of the Berlin Psychoanalytic Institute (polyclinic, teaching, course commission, treasury, and subsidies). The polyclinic committee consisted of Max Eitingon (reception of patients and treatment indications), Ernst Simmel (experience treating war neuroses) and Karl Abraham (President of the Berlin Association). Situated since 1928 at Wichmannstrasse 10 (with five consultation rooms and a library), the polyclinic was the property of Max Eitingon. In 1928 five assistants were treating between ten and twelve patients.

The antinomy creating tensions between therapy (continuing analysis in difficult cases) and teaching (giving “easy cases” to trainee analysts) led to the development of controlled analyses and technical seminars (no more than six participants and constant personal contact with the training analyst). Training analyses were not paid for. Members of the German Psychoanalytic Society (DPG) had to treat at least one case from the polyclinic. Fees: the patient’s own maximum; about two thirds of the patients were economically challenged and were treated free of charge. Sometimes health insurance funds paid part of the costs (psychologists: three Reichsmarks, physicians: five Reichsmarks). The average duration of treatment was about two hundred hours (in four or five weekly sessions of forty-five minutes).

In spite of the pressure from patients on the polyclinic’s waiting list, “short therapies” were rejected as

“failures.” What Freud had prophesied in Budapest that “the large-scale application of our therapy will compel us to alloy the pure gold of psychoanalysis,” did not apply, according to Eitingon “because we have no other metal to make such an alloy.” In eight and a half years there were 1,600 demands for cures, 640 of which were implemented. An average of 72 cases were treated per year at the polyclinic between 1920 and 1930 by 94 therapists, 60 of whom were API members. In spite of growing recognition from public authorities, the reaction from professional psychiatrists and psychologists was one of distrust because of the question of “lay analysis.”

In 1929 there were polyclinics in Vienna, London, Budapest and Paris. Following the forced elimination of Max Eitingon by the Nazis, Felix Boehm became President of the DPG in 1933 and director of the polyclinic. In 1935 the name of the polyclinic had to be changed by official order to “Ambulatorium.” The demand for treatment nevertheless remained constant. Following the forced expulsion of Jewish psychoanalysts from the DPG (December 1935) and their emigration, many courses of treatment were interrupted. The seventeen remaining “Aryan” analysts (February 1937) were still conducting forty-two analyses. With the creation of the *Deutsches Institut für Psychologische Forschung und Psychotherapie* (Göringinstitut) in May 1936, other methods of treatment were introduced and the organization was divided into four departments (diagnostics, training support, criminal psychology, assessment and catamnesis). Financing was provided by the *Deutsche Arbeitsfront* (DAF; the German Work Front), the *Reichsforschungsrat* (RFR; the Reich’s Research Council), the city of Berlin, the *Reichsluftfahrtministerium* (the Reich’s Ministry for Aviation) and health insurance funds. The goals pursued before the Nazis took over: “to enable psychoanalysis to penetrate the working classes” with the specific aim of effecting a profound change in people, were replaced at the Göring Institute by “the capacity to work.”

After the war Harald Schultz-Henecke and Werner Kemper founded the *Zentralinstitut für psychogene Erkrankungen* on March 1, 1946, with the support of individual insurance companies and pension schemes (VAB), offering a therapy financed by the state with psychoanalysts who were employed full-time, whether physicians or non-physicians. With the reorganization

of health insurance funds in 1958 it became the *Institut für psychogene Erkrankungen* (“Institute for Psychogenic Affections” for the Berlin general health insurance fund [AOK]). The trend toward short therapies and the separation from analytic training institutes meant there was no longer any functional continuity with the polyclinic. Both the DPG and the DPV instituted schools for transmitting psychoanalysis and psychotherapy without monthly wage-earning collaborators.

## **BERLINER PSYCHOANALYTISCHES INSTITUT**

The Berliner Psychoanalytisches Institut (Berlin Psychoanalytic Institute, or BPI), so named on February 20, 1922, included a polyclinic, a training institute (with lectures, case study seminars, and training and control analyses), a curriculum committee, and a treasury and finance office.

As early as 1919 Max Eitingon and Ernst Simmel proposed that the Berlin Psychoanalytic Society

establish a clinic offering free analytic treatment to those otherwise unable to afford it. This was a desideratum for Freud (1919a), and by the next year a training institute for such a clinic opened, with Simmel as director and Eitingon as owner, funded by an annual budget of about 16000 RM.

Located at 29 Potsdamerstrasse, the institute was managed by Ernst Freud. When it opened on February 14, 1920, it included lecture rooms, offices for consultation, and a library. Karl Abraham was in charge of the first courses. In the autumn of 1928, the institute moved to larger quarters at 10 Wichmannstrasse.

To counter the growing popularity of “wild analysis” and courting respectability in the eyes of the medical establishment, regulations were developed during 1923–1924 that governed acceptance of candidates (after three preliminary interviews), decided on the curriculum and role of training and control analyses, and also ruled on formal membership admissions. Medical studies (even if unfinished) were demanded of analysts-in-training; pedagogical studies were required for child analysts. Non-physicians in Germany enjoyed relative freedom to practice therapy. Thanks to Felix Boehm, the treasury was subsidized by members of the institute and money was available to support candidates. The monthly cost of training ranged from 200 to 300 RM.

Analytic training began with a didactic analysis (six months minimum) with indications as to treatment decided by the analyst-in-training committee. Theoretical teaching was the responsibility of the training analyst. After at least two semesters of theoretical studies, the candidate undertook at least two years of practical work at the polyclinic; this period would come to be known as “control” or “supervision” and was followed by transition to autonomous clinical work with approval of the training committee. Hanns Sachs described the training experience as a “novitiate” that was run like a “technical seminary.” Reacting against regimentation, a group of rebellious young analysts founded what became known as the “Kinderseminar” (Children’s Seminar).

The institute also trained non-therapeutic analysts who were permitted to attend all but technical courses on treatment. Members of groups from Frankfurt, Stuttgart, Leipzig, and Hamburg attended workshops and conferences at the BPI.

In 1930, ninety-four therapists worked at the BPI, sixty of whom belonged to the International Psychoanalytic Association (which then totaled four hundred). The Prussian-like hierarchical structure was criticized by Siegfried Bernfeld as damaging to psychoanalysis. The BPI acquired a reputation for rigidity that was exported through emigration and escape from Germany during the Nazi era. A detailed report published in 1930 on the institute's tenth anniversary allows a better understanding of the training system that would become the basis for standards set by the International Psychoanalytic Association (Colonomos).

Institutes modeled after the Berlin Psychoanalytic Institute were soon founded in Vienna, London, Budapest, The Hague, Frankfurt, New York and Chicago, and Paris (in 1934 and again in 1954). Other institutes in the United States based on the BPI were established in Philadelphia, Boston, Detroit, Topeka, San Francisco, Washington, D.C., Los Angeles, Seattle, Denver, and New Orleans.

A wave of voluntary emigration brought Melanie Klein and Walter Schmilberg to Britain, and Franz Alexander, Jenő Hárnik, Sándor Radó, Karen Horney, and Hanns Sachs to the United States. Among the most influential of some seventy-four analysts and candidates-in-training obliged to leave Germany were Siegfried Bernfeld, Max Eitingon, Otto Fenichel, Wilhelm Reich, Theodor Reik, and Ernst Simmel.

The number of students at the BPI, some two-hundred twenty-two strong in December 1931, declined steeply after the National Socialists came to power, with only thirty-nine in attendance in December 1933; the number of analytic candidates fell from thirty-four in the fall of 1932 to eight in July 1934. The demand for treatment remained constant, however. In 1935 there were still fourteen analysts in Germany. A series of state interventions, forced resignation of Jewish analysts, and concessions made by the remaining "Aryan" analysts, including the "aryanization" of the directorate, damaged the institute from without and drained it from within. Both the treasury and committee meetings, as well as conceptual terminology of psychoanalysis, came under state control. The BPI was renamed the German Institute of Psychoanalysis, and all the institute's assets were transferred "on loan" to the German Institute for Psychological Research and Psychotherapy (*Göringinstitut*, or Göring Institute), founded in 1936.

After the war, in 1950, the Karl Abraham Institute, established in association with the German Psychoanalytic Association (DPV) and directed by Carl Müller-Braunschweig, renewed the tradition of the BPI.

### **BERMAN, ANNE (1889–1979)**

Anne Berman, a French pharmacist, was the personal secretary of Marie Bonaparte and a translator of psychoanalytical works. She was born March 23, 1889, and died April 25, 1979. After her dissertation, "La Famille des Boraginacées" (The Family of Boraginaceae), was completed, she worked in the laboratory of Dr. Toulouse at the Sainte-Anne hospital until 1924. That year the Souffron pharmacy on 54, rue de Miromesnil went up for sale. She bought the pharmacy, where she worked for several years. She was a pharmacist delegate to the Chambre Syndicale and, on May 22, 1928, was accepted as a member of the Soroptimists, an organization founded in California in 1921 with the goal of recruiting women who excelled in their profession.

After undergoing analysis with Marie Bonaparte, she became her secretary. She was accepted as the first member of the Paris Psychoanalytic Society on January

10, 1927. She administered the secretariat of the Institut de Psychanalyse (Psychoanalysis Institute) from its inception in 1934.

She translated several of Freud's work including *Psychoanalytic Procedure*, *An Outline of Psychoanalysis*, the first two volumes of Ernest Jones's *Life and Work of Sigmund Freud*, Anna Freud's *The Ego and the Mechanisms of Defense*, and *The Birth of Psychoanalysis, Letters to Wilhelm Fliess*.

At the time of Berman's death, Serge Lebovici wrote, in the *Revue française de psychanalyse*: "A tireless reader, a musician who was especially fond of Wagner, Annette remained a close friend of the psychoanalysts of her generation and was able, because of this, to contribute to a history of the birth of psychoanalysis in France. In spite of her discretion, we will remember her as among those who did the most to spread the knowledge of Freud's work in France."

### BERNAYS-FREUD, MINNA (1865–1941)

The younger sister (by four years) of Martha Bernays, Sigmund Freud's wife, Minna Bernays was born June 18, 1865 (June 16 according to some sources), in Hamburg and died February 13, 1941 in London. She was the youngest of seven children, the daughter of Jewish businessman Berman Bernays (1826–1879) and Emmeline Philipp (1830–1910). Three children died while still young—Fabian, 1857, Michel, 1857–1859, and Sara, 1858–1859—the eldest brother (Isaak, 1855–1872) died at the age of seventeen from a bone infection presumed to be of tubercular origin. The father

was the third son of the rabbi (*chacham*) Isaak Bernays (1793–1849). Both of his brothers were distinguished men: Jacob (1824–1881) was a philologist and Michael (1834–1897) was an expert on literature. The mother was from a well-to-do family, originally from Sweden on the father's side, and from Hamburg on the mother's side.

When Minna was four years old, in 1869, the Berman family moved from Hamburg to Vienna after the father finished serving a four-year jail sentence for bankruptcy fraud. In Vienna, Berman Bernays worked as a secretary for the economist Lorenz von Stein and as a writer for the *Zentralblatt für Eisenbahnen und Dampfschiffahrt* (Rail and Steamship Transport Journal). Nothing is known about Minna Bernays's childhood and education. When her father died in December 1869, she was brought up by her mother and Sigmund Pappenheim, the father of Bertha Pappenheim, the woman made famous by Breuer as Anna O.

In 1882–1883 Minna spent several weeks in Sicily because of pulmonary tuberculosis. On February 18, 1882, at the age of seventeen, she became engaged to Ignaz Schönberg, a student in the philosophy department at the University of Vienna, who was studying with Georg Bühler, the orientalist. Schönberg received his doctorate on May 12, 1884, and was appointed to the Indian Institute at Oxford, a position that had been offered to him by Monnier Williams, the editor of a Sanskrit dictionary. He contracted tuberculosis, however, and had to resign his position in February 1885, and broke off his engagement to Minna in June. After leaving Great Britain in August, he returned to Meran, near Vienna, where he spent the winter. He died in early February 1886, in Vienna.

From 1883 to 1895 Minna Bernays spent most of her time in Hamburg with her mother, who was ill. For short periods of time she worked as a companion and children's tutor; she also participated in a workshop for manual crafts, like the one run by Freud's sister Rosa. In November 1885 she spent a few months with Freud (November 29, 1895, according to Wilhelm Fliess). In March 1896 she obtained a position in Frankfurt (March 7, 1896), but in June she quit and moved in permanently with her sister's family; she remained here for the rest of her life, except for the brief periods of time she spent away on holiday or for health reasons.

In Martha's absence she ran the house, took care of the children, cooked, and made handicrafts. She served as host to Freud's guests and students, handled some of his correspondence, played mahjong and tarot with him, and corrected his manuscripts.

In 1887 Freud undertook a voyage of several days, or several weeks, with Minna to various resorts and rest homes in Bavaria and northern Italy. They traveled by foot, by coach, and by train, visiting the southern Tyrol and the Engadine, while Freud's wife rested with the children. In general, Freud's vacations with his wife were less adventurous. Minna often accompanied Freud's children on their summer vacations to Berchtesgaden, Reichenhall, or Aussee.

In May 1938, a few weeks before Freud, Martha, and Anna, Minna emigrated to Great Britain, for, unlike her sister, she had retained her German citizenship. She died there three years later from heart disease.

According to descriptions of her from letters and personal recollections, Minna was an intelligent woman with a lively personality and a sense of humor, who read German and English. On occasion she could be highly sarcastic and inaccessible, caustic at times, with a kind of Germanic stiffness. She was often ill, and suffered from migraines, digestive, cardiac, and eye problems. Her tuberculosis required additional treatment in 1900.

Sigmund Freud's relationship to Minna Bernays has given rise to considerable speculation (see the Freud-Ferenczi correspondence of December 16, 1912). In 1957 Carl Gustav Jung stated in an interview that Minna had mentioned a sexual relationship between her and Freud (Billinsky, J. M., 1969), but Jung's claim has little credibility. Similarly, the attempts to find proof in the *Interpretation of Dreams* or the *Psychopathology of Everyday Life* of intimacy between Freud and Minna are not convincing (Swales, P., 1982). The remaining correspondence, approximately two hundred letters from different periods between 1882 and 1938, provide no indication of such a relationship. The letters do demonstrate the existence of a strong bond between them, which Freud confirmed to Marie Bonaparte, telling her that at the time of his relative isolation, Wilhelm Fliess and Minna Bernays were his only friends.

Unlike Martha, Minna remained close to Jewish traditions. She was the only member of the family who refused to be cremated. Few traces of her personal papers remain. But the Sigmund Freud Museum in London houses several examples of handicrafts made by her.

### **BERNFELD, SIEGFRIED (1892–1953)**

An Austrian philosopher and psychoanalyst, Siegfried Bernfeld was born March 7, 1892, in Lemberg, the capital city of Galicia, and died April 2, 1953, in San Francisco. Bernfeld distinguished himself in the extent of his knowledge, the originality of his ideas, and his qualities as an educator. A prolific and exacting writer, he was also an outstanding teacher, admired by his students and respected by his colleagues. Freud said he considered him the most gifted of his students and disciples.

His parents lived in Vienna but his mother returned to her hometown to give birth to her first child. In 1910 Bernfeld completed his studies at the Gymnasium and entered the University of Vienna, where he obtained a Ph.D. in philosophy, while also studying psychoanalysis, sociology, education, and biology. All branches of knowledge held an interest

for Bernfeld, who was also involved in contemporary political issues. A lucid and passionate left-wing Zionist, he was active in political struggles while he was a university student.

Impregnated with the ideas of psychoanalysis and Marxism, Bernfeld founded, in 1919, the *Kinderheim Baumgarten*, where nearly three hundred Jewish children, refugees from Poland, were housed. His first book, published in 1921, examined this short, intense period of his life.

In 1925 he published two important works on infant psychology and education. *Psychologie des Säuglings* (Infant Psychology) is a well-known work that makes use of psychoanalysis and drive theory to develop a new psychology of the infant. *Sisyphos* is a critique of the idealist notion of education and comes down strongly in favor of a non-authoritarian system, one that respects the life of the instincts and the needs of the student.

Attracted by the fame of Max Eitingon's institute, Bernfeld traveled to Berlin in 1926. There he underwent analysis with Hanns Sachs and rapidly won the admiration of his students. While there he studied the scientific foundations of psychoanalysis and, returning to his first love, biology, researched the theory of instincts. At the end of his Berlin period, he contrasted his position (as a Freudian and Marxist) with that of Wilhelm Reich in two important articles, and wrote an essay on interpretation.

In *Der Begriff der "Deutung" in der Psychoanalyse* (The Concept of "Interpretation" in Psychoanalysis), Bernfeld described the concept of interpretation with the tools of the scientific method, something he shared with Moritz Schlick and Hans Reichenbach. He distinguished several types of interpretation. "Final" interpretation attempts to penetrate the unconscious intentional context in which a determinate psychic production that appears to be isolated from any context can be situated. "Functional" interpretation takes account of the value of a specific psychic fact. "Reconstruction," an instrument of psychoanalytic science, concretely reconstructs an old psychic process. Because there is a consistent relation between the psychic event and its traces, reconstruction can discover the genetic connection that is continuously repeated through impulse and desire. In this way psychoanalysis is raised to the rank of a natural science to the extent

that it provides an explanation for personal psychic events on the basis of certain laws.

The approach to psychoanalysis as a science of traces is based on the leading theories of the field: free association, transference and resistance, which inhibits the formation of missing unconscious connections (Bernfeld returns to this subject in 1941 in *The Fact of Observation in Psychoanalysis*, a work that exercised considerable influence on his disciples in California, especially Edward M. Weinschel).

With the collapse of the Weimar Republic and the imminent ascent of Hitler to power, Bernfeld realized that he could no longer remain in Germany. He left Berlin and, after a brief stay in Vienna, went into exile in France in 1932.

Little is known about Bernfeld's life in France. Apparently, he was not well received by the Paris Psychoanalytic Society. He settled in the south of France, where he met Suzanne Cassirer-Paret, who became his third wife and an important collaborator. In 1936 Siegfried and Suzanne decided to leave France and, in answer to Otto Fenichel and Ernst Simmel's invitation, emigrated to California in 1937. In San Francisco Bernfeld resumed his teaching activities and wrote, together with his wife, a series of articles that can be considered the point of departure for "Freudology." These include a documented study on the Helmholtz School (1944) and a 1946 essay in which Bernfeld discovers that the enigmatic character in "Screen Memories" (Freud, S., 1899) is no other than Sigmund Freud himself. There followed several articles on Freud's early scientific work, his studies on cocaine, and, together with his wife, an article on the childhood of the founding father of psychoanalysis and his first years in practice. Bernfeld died in 1953 while he and his wife were preparing other articles on Freud's life.

## BERNHEIM, HIPPOLYTE (1840–1919)

A professor of ambulatory health care at the department of medicine in Nancy, Hippolyte Bernheim was born in Mulhouse on April 27, 1840, and died in Paris on February 2, 1919. He studied medicine in Strasbourg and, when he received his degree in 1870, during the Franco-Prussian war, he decided to practice in France. In 1879 he was offered the chair of ambulatory medicine at the then-new department of medicine in Nancy. Around 1882, in spite of his initial reticence, he agreed to visit Ambroise Liebeault’s “clinic.” Convinced of the efficacy of Liebeault’s methods, Bernheim began to use hypnosis on some of his patients, generally working with people suffering from a variety of infectious diseases. In 1884 he published a scathing attack on the Salpêtrière: hysteria and hypnosis were no more than cultural phenomena aroused by the power of suggestion.

Bernheim now became the spokesman of a new school that was internationally recognized. In his private practice he saw neurotic patients from all over Europe. In spite of his personal admiration for Jean Martin Charcot, his position was deepened and further radicalized in two books translated by Freud, *De la suggestion et de ses applications à la thérapeutique* (Suggestion and its Therapeutic Applications) (1886 and 1888) and *Hypnotisme, suggestion, psychothérapie* (Hypnotism, Suggestion, Psychotherapy) (1891 and 1903). The prevalence of Bernheim’s position seems to have exhausted itself by the end of the century. Charcot himself, at the end of his life, in *La foi qui guérit* (The Faith that Heals) (1892), appears to have moved closer to the position of the school of Nancy. However, in Nancy, Bernheim felt isolated. He distanced himself from Liebeault, his hypnosis practice began to disintegrate, and his support for Dreyfus aroused considerable anti-Semitic hostility. After retiring in 1910 Bernheim moved to Paris. In 1913, in a book on

hysteria, he gave a favorable assessment of the *Studies on Hysteria*.

According to Bernheim, hypnosis is only a particular case of the psychological phenomenon of suggestion. Psychotherapy—a term Bernheim popularized—incorporated the power of language, the doctor’s influence on the patient, and the effect of the patient’s mind on his body. Bernheim argued for a therapy of and by the mind, which could cure nervous illnesses and suppress or calm the symptoms, even the causes, of organic disease. He seems to have been a flexible and eclectic therapist, passing when necessary from authoritarianism to insinuation, sometimes even refusing to give orders to his patients.

Shortly before the July 1889 Congress on Hypnotism held in Paris that year, Sigmund Freud came to see Bernheim in Lorraine. In a letter to August Forel, Bernheim referred to Freud as a “charming young man.” In 1888 however, Freud had turned to Charcot for support in criticizing Bernheim. After 1889 Freud would make use of some of Bernheim’s ideas to distance himself from Charcot, but he continued to remain critical of the theory of suggestion promulgated by the school of Nancy. Freud later recalled how forcefully certain experiments of 1889, involving the recall of memories originating during hypnosis, had struck him. Reading the text published in 1890 after his trip to Lorraine, the “insightful” clinician from Nancy may also have left Freud with the nucleus of an idea for the treatment of the “psyche,” or “soul,” and an interest in the magic of words.

## BETA-ELEMENTS

In his paper, “A Theory of Thinking” (*Second Thoughts*, 1967, pp. 100–120), Wilfred Bion speaks of raw sense-data and of “inchoate elements” which have to be transformed into alpha-elements by alpha functions. That description is the precursor of what he was to call later *beta-elements*. He first uses the term *beta-elements* in *Learning from Experience*: “If alpha-function is disturbed and therefore inoperative the sense impressions of which the patient is aware and the emotions which he is experiencing remain unchanged. I shall call them *beta-elements*. In contrast with the alpha-elements the *beta-elements* are not felt to be phenomena, but things in themselves” (p. 6).

Bion often speaks of *beta-elements*, raw sense-impressions, and raw emotional data. *Beta-elements* are very concrete. They are felt as bad internal “things” which can be dealt with only by expulsion. He emphasizes that the *beta-function* emotions are also experienced as physical objects.

This is an extension of Klein’s view that the infant experiences hunger as a bad internal breast that has to be expelled. It is important to keep this in mind, because otherwise some of Bion’s statements may seem contradictory, because he speaks of sense data that have to be expelled, but on many occasions he refers to the fear of death (hardly a sense-datum), which has to be expelled and projected into the breast. But for the infant at that stage, hatred and fear are experienced as bad objects. The experience is confused with the object responsible for the experience. In *Elements of Psycho-Analysis* (1963), Bion provides the following model: “[The infant] ... filled with painful lumps of faeces, guilt, fears of impending death, chunks of greed, meanness and urine, evacuates these bad objects into the breast that is not there. As it does so the good object turns the no-breast (mouth) into a breast, the faeces and urine into milk, the fears of impending death and anxiety into feelings of love and generosity ... The mechanism is implicit in the theory of projective identification in which Melanie Klein formulated her discoveries of infant mentality.”

*Beta-elements* can be dealt with only by expulsion. They are not material for thought, but underlie acting-out, hallucinations, and delusions. When *beta-elements* are projected into the mother they can be transformed into *alpha-elements*, which are elements of dream and thought, by the *alpha-function*. The nearest clinical approximations to raw *beta-elements* are bizarre objects. *Beta-elements* do not combine with one another in an integrated way, but they can become accumulated. When this happens the contact-barrier becomes a *beta-screen*. Unlike *alpha-elements*, *beta-elements* are saturated: they are not open to change by new impressions, and therefore not open to reality-testing. They can be only transformed by *alpha function*.

HANNA SEGAL

———. (1963). *Elements of psycho-analysis*. London: Heinemann.

———. (1967). *Second thoughts*. London: Heinemann.

## BETA-SCREEN

Bion first mentioned a *beta-screen* in his description of the contact-barrier in *Learning from Experience* (pp. 17–23, 1962). A *beta-screen* forms when there is a deficiency in *alpha-functioning* and *beta-elements* replace the contact-barrier.

When a *beta-screen* is formed there is no communication between the conscious and unconscious. Rational thought up to a point can exist, but cut off from emotional meaning. A *beta-screen* forms an impenetrable barrier. It is a defense against any meaningful emotional experience. As the *beta-screen* is composed of *beta-elements* which lend themselves to projective identification, it also manifests itself in a bombardment directed both against the *alpha-*

functioning of the patient himself and against any external object susceptible to arousing meaningful feelings. In analysis, the patient bombards the analyst with confused fragmentary material imbued with violence and directed against the analyst's attempt to get in touch with an emotionally significant experience.

## **BETTELHEIM, BRUNO (1903–1990)**

The psychoanalyst and educator Bruno Bettelheim was born in Vienna on August 28, 1903, and died on March 13, 1990, in Silver Spring, Maryland.

The son of a wood merchant from the assimilated Jewish middle class, Bettelheim had to give up his studies when his father died of syphilis. He was twenty-three and remained scarred by his father's "shameful" death. He returned to his studies in philosophy ten years later and in February 1938 was one of the last Jews to earn a doctorate at the University of Vienna before the Anschluss. His thesis was entitled "The Problem of Beauty in Nature and Modern Esthetics" and was supervised by the famed Karl Bühler, director of the Institute of Psychology and a pioneer of *Sprachtheorie* (theory of language).

In 1930 Bettelheim had married a schoolteacher who was a disciple of Anna Freud, but he was unhappy. He saw reflected in his wife's eyes the ugliness that had obsessed him since he first saw it in his mother's eyes. In 1936 he entered analysis with Richard Sterba, then secretary of the Vienna Society and the only non-Jew on its Committee. At the time of the Anschluss, Sterba abruptly abandoned all his patients, preferring exile to the risk of being called upon by the Nazis to rid the society of Jews.

When Bettelheim was arrested by the Gestapo on May 29, 1938, he was thus in the midst of his analysis. The ten and a half months he spent in Dachau, and

later in Buchenwald, had a decisive influence on him. To escape madness, he studied the effects of the camps on the other prisoners, the prison guards, and himself. Whenever he could, he shared his observations with Paul Federn's son Ernst.

Bettelheim was liberated on April 14, 1939, and arrived in the United States three weeks later. He had lost everything. His wife left him. His first job was to devise a test for evaluating knowledge in the plastic arts that is still in use today. Between 1941 and 1944 he taught art history, German literature, and psychology. Above all, he sought to publish the article on the concentration camps that he had been working on since his release.

Rejected several times on the grounds that it was nonobjective or "anti-German," the article finally appeared in October 1943 in the journal of the Harvard psychology laboratory. "Individual and Mass Behavior in Extreme Situations" is a study of the deportees that makes particular use of Anna Freud's concept of "identification with the aggressor." In 1945, General Eisenhower had the article distributed to American officers in Europe, who were ill-prepared for the opening of the concentration camps.

In 1960 Bettelheim returned to this text in *The Informed Heart: Autonomy in a Mass Age*, the first book in which he made a connection between his experiences in the camps and the Freudian-inspired "milieu therapy" he established at the University of Chicago's Orthogenic School, of which he became director in 1944. This connection can be summarized as follows: Having witnessed mentally sound people go insane because of the effects of the camps, Bettelheim attempted to remedy the problems of severely disturbed children by creating an environment that was totally responsive to their needs and symptoms. This approach remained Bettelheim's trademark and established the reputation of his school worldwide.

In 1973 Bettelheim retired to California. He conducted seminars, supervised therapists in training, wrote, and was a sought-after lecturer. In 1984, the death of his second wife, who was also from Vienna and had borne him three children, plunged him into a deep depression that he struggled against for another six years, pursuing his activities despite health problems. After the publication of *Freud's Vienna and Other Essays* in January 1990, he moved to a retirement home near Washington, D.C. Two months later, he

committed suicide by ingesting barbiturates and, to ensure that he would not be “saved,” putting a plastic bag over his head. Fifty-two years earlier, on the same night, the Nazis had entered Austria to the cheers of a crowd shouting “Death to the Jews.”

Bettelheim was a good storyteller and popularizer of Freud’s ideas, and his books sold very successfully. He recounted his clinical experience in three books about the Orthogenic School, *Love Is Not Enough: A Treatment of Emotionally Disturbed Children* (1950), *Truants from Life* (1955), and *A Home for the Heart* (1974), and in *The Empty Fortress* (1967), which studies three cases of autism. With regard to theory, he was a maverick. He initially conceived of his school as “putting Freud’s concepts into action.” He then distanced himself from Freud to flirt with culturalism in *Symbolic Wounds: Puberty Rites and the Envious Male* (1954). After moving closer to the ego psychology that predominated at the Chicago Institute headed by Franz Alexander (*The Informed Heart*), he returned to Freud by way of the self-psychology advocated by his friend Heinz Kohut (*The Empty Fortress*), and he ended up writing a long polemical essay denouncing the ways in which Freud had been betrayed by his English translator, James Strachey (*Freud and Man’s Soul*, 1983). A careful reading of *Surviving and Other Essays* (1979), a collection of Bettelheim’s writings on Nazism, gives a glimpse of the painful self-analysis by which he continued, first in the camps and then for the rest of his life, the work that had been interrupted by the Anschluss.

*The Uses of Enchantment: The Meaning and Importance of Fairy Tales* (1976), a study of the role of fairy tales on the development of the unconscious, is Bettelheim’s best-selling book. He also wrote a book on education in the kibbutzim, *The Children of the Dream* (1969), and many other works on children’s education (*Dialogues with Mothers*, 1962; *A Good Enough Parent*, 1987; and numerous articles).

Bettelheim’s suicide was immediately followed by a furious scandal, with former patients and students denouncing him as a liar, a brute, and a despot who was all the more hypocritical because he had preached respect for children. Beyond what it reveals about the confusion ensuing from the suicide of such a man, this scandal is interesting because it goes to the heart of Bettelheim’s clinical genius: an almost infallible intuition about what causes a child to suffer and the ability

to confront his patient’s most destructive impulses. He often compared his role to that of a lightning rod, attracting lightning and thus proving that it had not killed anyone—not even him.

Too often catalogued as a specialist in autism, Bettelheim was above all a master teacher who continually succeeded in getting the therapists under his supervision and the educators in his school to recognize the part of themselves that was put at risk by their patients’ madness. That said, his depictions of the most disturbed students in his school, including some autistic patients, were so vivid, so focused on what these children were doing—and not on their deficiencies, as was common practice—that his work had a decisive influence on the way young psychotic patients are treated in psychiatric hospitals around the world.

## BEYOND THE PLEASURE PRINCIPLE

*Beyond the Pleasure Principle* was presented by Freud as the “third step in the theory of drives.” The essay, which introduced the dynamic of the life and death impulses was “in gestation” on March 17, 1919. On May 12, Freud spoke with Sándor Ferenczi, stating “Not only have I completed *Beyond the Pleasure*

*Principle*, which I'll have recopied for you, but I have also returned to that little trifle on the uncanny and attempted ... to provide a  $\Psi$ A basis for group psychology." On April 2, he spoke of the essay to Lou Andreas-Salomé: "Where am I with my Metapsychology? First of all, it's not yet written... But if I live another ten years ... I promise to add other contributions. One of the first of this kind will be contained in *Beyond the Pleasure Principle*." The suffering of his friend Anton von Freund, whom Freud visited every day in the autumn of 1919, followed by the death of Freud's daughter Sophie in January 1920, interrupted the work. Completed between May and July, it was published in December. Chapter 6 was added in 1920 (Grubrich-Simitis, 1993) and, between 1921 and 1925, three subsequent editions came out, with a modified text. These were soon translated into English, Spanish (1922), and French (1927).

Returning to his metapsychological writings of 1915, Freud introduced the "pleasure principle," which he related to Fechner's principle of stability. The evocation of traumatic neurosis, children's games, repetition during the transference, and fate neurosis suggested a "more primitive," "more elementary," "more instinctual" tendency than the pleasure principle, independent of it and manifested by the repetition compulsion.

Unconvinced by his clinical studies, Freud introduced the "speculation that often looks far afield" (chapter 4). The topography and functions of the Pcs.-Cs, system were examined from the classical point of view, using the *Studies on Hysteria* (1895d) and *The Interpretation of Dreams* (1900a) as references. The protective shield function enabled him to define trauma from the vantage point of psychic economy and introduce the function of binding psychic energy that relates to the repetition compulsion.

Chapter 5 continued along these lines, then the referent changed: "But how is the predicate of being 'instinctual' related to the compulsion to repeat? At this point we cannot escape a suspicion that we may have come upon the track of a universal attribute of instincts and perhaps of organic life in general... It seems, then, that an instinct is an urge inherent in organic life to restore an earlier state of things which the living entity has been obliged to abandon under the pressure of external disturbing forces; that is, it is a kind of organic elasticity, or, to put it another way, the

expression of the inertia inherent in organic life." The essay continued to pursue this theme. Extrapolation from this led to the death instinct: the initial state of living being is inanimate matter deprived of energy, and the death instincts tend toward its reestablishment; the pleasure principle is at their service; the instincts of self-preservation too, because they tend to reestablish an earlier state.

The regressive and conservative functions of the sexual drives and their primal existence were less easy to analyze. An extensive investigation of biological research on death and reproduction followed (chapter 6), in which Freud equated the ego instincts with the death instincts, and the sex instincts with the life instincts. The myth related by Aristophanes in the *Symposium* led Freud to develop the hypothesis that, initially, living substance was "continuous." Eros attempts to reestablish this continuity by combining gametes. The death instinct, however, disunites organisms to achieve its goal, and instinctual conflict is established.

*Beyond the Pleasure Principle* created, through the use of an instinctual dualism that had been missing since the introduction of narcissism, a space for stylization of considerable dimension; its substrate is inanimate matter and living substance; its dynamics involve the primary tension in living things, external forces likely to be integrated, and internal tendencies leading to the reestablishment of an earlier state. In actual terms this space is "sufficient" for stylizing all the modes of stability of dynamic processes: from strict identity to instability, and including the flexible stability of living things. Freud incorporated earlier metapsychological investigations into his essay, and he provided Ferenczi with a pathway to future research. In addition to *Group Psychology and the Analysis of the Ego* (1921c), *Beyond the Pleasure Principle* served as a conduit to *The Ego and the Id* (1923b), Freud's "second topographic point of view." The relationship between the death instinct, hatred, and the destructive instinct led to their eventual reassessment and an analysis of sadomasochism. *Beyond the Pleasure Principle* served as an essential element and organizing principle for Freudian psychoanalysis.

Because it was difficult, the essay was often poorly received and misunderstood. This attitude was typified by Ernest Jones (1953–57, III), unlike that of Sándor Ferenczi, who had anticipated the theme in 1913. The

death drive has either been rejected or reduced to destructive drives (Melanie Klein), or made to serve as a justification for a structuralist viewpoint (Jacques Lacan). Jean Laplanche (1970) highlighted the problems and paradoxes in the essay, including the chiasmus that transforms the sex drives, disturbing and pathogenic, into Eros, life's only safeguard.

The "inherent thrust toward organic life, to the reestablishment of an earlier state," can be separated into various dynamics and types of stability through the use of qualitative dynamics (Porte, 1994), and through them we can better understand the aptness of Freud's questions and the magnitude of his efforts.

### BIBLIOTECA NUEVA DE MADRID (FREUD, S., *OBRA COMPLETAS*)

The Biblioteca Nueva de Madrid was the first publishing house to print a Spanish language edition of the "complete works" of Sigmund Freud; it was referred to as such even though it has never been finished. Nearly

contemporary with the German publication of the *Gesammelte Schriften* (1924–1934), the Spanish edition was the first complete translation of Freud's work abroad. Freud himself was surprised that a Madrid editor, José Ruiz-Castillo, would want to publish his work in Spanish. At this time the Spanish population was small and the cultural level relatively undeveloped. In fact the initiative for the project was taken by a well-known Spanish intellectual, José Ortega y Gasset, who had introduced German scientific and philosophic ideas to the Spanish public through the review *Revista de Occidente*. At his suggestion the publication rights were purchased in 1917, but Europe was then at war; all correspondence for the project and the initial proofs had to be sent by diplomatic courier. The first volume, with a preface by Ortega y Gasset, appeared in 1922, and seventeen additional volumes were published by 1934. If we are to believe the letter sent by Freud to his translator, Luis López-Ballesteros y de Torres, on May 7, 1923, he was very agreeably surprised by this version.

Its characteristics need to be considered in relation to its function within the Spanish historical context, which was then in the throes of a cultural and literary renewal. This explains why López-Ballesteros's translation was written in elegant Castilian and was highly literary, which significantly enlarged its readership. However, the translation, although it allowed Spanish readers to familiarize themselves with Freud's thought, lacks any sense of consistency. The primary reason is the absence of any systematic conceptual approach, made worse by the repeated literary and moralizing interjections of the translator, who exercised a certain degree of liberty in his work. There were also a number of omissions of words and sometimes of entire sentences, which considerably altered the original meaning.

## BIBRING, EDWARD (1894–1959)

A Jewish doctor and psychoanalyst, Edward Bibring was born April 20, 1894, in Stanislau, in Galicia, and died in Boston on January 11, 1959. He obtained the equivalent of his B.A. in Czernowitz and went on to study history and philosophy. After his military service during the First World War, during which he was a prisoner in Russia, he studied medicine in Vienna. His interest in psychoanalysis was stirred by the Vienna Seminar on Sexology, created in 1919 by Otto Fenichel for medical students. It was here that Bibring met his future wife, Grete Lehner.

In 1922, Bibring obtained his diploma in medicine at the University of Vienna and the same year was accepted for training by the Vienna Psychoanalytic Society. He underwent analysis with Paul Federn, and in 1925 became an associate member and in 1927 a full member of the society. He served in a number of positions: treasurer from 1928 to 1938, successor to Paul Schilder as head of the psychosis section in 1929 at the psychoanalytic clinic, and replaced Eduard Hitschmann as director of the clinic in 1932. After 1934, Bibring was a teaching analyst and supervisor in Vienna, secretary of the education committee for the Vienna Psychoanalytic Society, and a co-editor of the *Internationale Zeitschrift für Psychoanalyse*.

In May 1938, following the Anschluss and the rise of National Socialism in Austria, Bibring and his wife Grete emigrated to Great Britain. There he became a member and teaching analyst of the British Psycho-Analytical Society and was one of the editors of the *Gesammelte Werke Sigmund Freuds*. In February 1941, following an invitation from Tufts Medical College to teach, he and his wife left for Boston. He became a member and training analyst of the Boston Psychoanalytic Society and was its President from 1947 to 1949. He practiced psychiatry at Beth Israel Hospital.

In his memoirs, Richard Sterba wrote of Bibring that “He had difficulties expressing himself in writing.

His obsessive character pushed him to undertake such exhaustive research in the literature that it blocked his own analytic output . . . that is why his literary legacy is so limited compared to his knowledge and the richness of his thought” (Sterba, R., 1982).

## BIBRING-LEHNER, GRETE (1899–1977)

A doctor and psychoanalyst, Grete Bibring-Lehner was born in Vienna on January 11, 1899, and died August 10, 1977, in Cambridge, Massachusetts. She was the daughter of Viennese Jewish parents, business people and members of the Jewish intellectual bourgeoisie. She attended a girls' school where she studied the humanities, including psychology, which led to her discovery of Freud. She began her studies at the department of medicine of the University of Vienna in 1918 and participated in the 1919 working group formed by Otto Fenichel to study sexuality and psychoanalysis, the Vienna Seminar on Sexology. Among the students in this seminar were several future analysts, including Wilhelm Reich and Edward Bibring, whom she married in 1921.

Through her participation in the seminar, Bibring-Lehner was able to attend meetings of the Vienna Psychoanalytic Society. Upon completing her medical

studies in 1924, she went on to specialize in neurology and psychiatry. She became a member of the Vienna Psychoanalytic Society in 1925. She completed her personal analysis with Hermann Nunberg while she was finishing her medical studies. She was one of the first students of the Vienna Training Institute, founded in 1925. Bibring-Lehner worked at the psychoanalytic clinic, gave presentations on the technique of therapy, and, after 1934, was a member of the education committee of the Vienna Association. Her first work on psychoanalysis, “The Phallic Phase and its Disturbances in Young Girls,” was published in 1933 in the *Zeitschrift für psychoanalytische Pädagogik*.

After the Germans entered Austria, she migrated with her family in May 1938 to Great Britain and became a member of the British Psycho-Analytical Society. In 1941 the family left for the United States, where Bibring-Lehner became a member and training analyst with the Boston Psychoanalytic Society. She taught psychoanalytic psychology at Simmons College School of Social Work in Boston. In 1946 she joined the administrative staff of the psychiatric division of Beth Israel Hospital. She was named professor of psychiatry at Harvard Medical School in 1961.

She received a number of professional and academic distinctions. In 1955 she was elected president of the Boston Psychoanalytic Society. From 1959 to 1963 she was vice president of the International Psychoanalytic Association and, in 1962, became president. In 1968 *The Teaching of Dynamic Psychiatry* was published, of which she was the general editor. Her research on pregnancy and mother-child relationships provided an important contribution to women’s psychology.

## **BICK, ESTHER (1901–1983)**

Esther Bick, a physician and psychoanalyst, was born of orthodox Jewish parents in 1901 near Kraków, Poland, and died on July 20, 1983, in London. Her maiden name remains unknown. Her friends referred to her as Nusia. Unable to study medicine in Poland because of the many restrictions on Jews, she moved to Vienna, where she worked with Charlotte Buhler on the experimental observation of young twins. It was during this period of her training that the foundations were established for her later work in psychoanalysis. Having refined a methodology for the objective observation of infants (time studies, quantitative descriptive analysis), she continued to formalize a new method of observation that was able to take into account the subjective and emotional environment of the child, together with the experience of the observer.

Her marriage is difficult to date precisely and appears to have been short-lived. Following Germany’s annexation of Austria on March 12, 1938, Esther Bick reached London, where she became a student of Melanie Klein. Martha Harris indicates in the obituary she wrote for Bick’s death that her brother and the rest of her family died in concentration camps and that only one of her nieces escaped the holocaust. This niece later moved to Israel, although Bick did not learn of this until the 1950s.

During the Second World War, Bick worked in a nursery in Manchester, where she began an analysis with Michael Balint. She completed her analytic studies in London, while working at a child guidance clinic in Middlesex with Portia Holman. In 1949 she joined the Tavistock Clinic, where John Bowlby asked her to provide a training course for future analysts. There she developed her method of infant observation, which encouraged observers to watch and listen to infants during their early development and focused on in-depth analysis of the capacity for attention and psychic transformation. It was also during this period that she began a second analysis with Melanie Klein.

Esther Bick wrote little, but what she did write was influential and is intentionally situated within what has customarily been referred to as the post-Kleinian movement. She noted the importance of the skin during infant relations (this opened the way to an entire field of research on the establishment of psychic envelopes and, in France, to the work of Didier Anzieu on the skin ego). She was also interested in the observation of infants from a psychoanalytic perspective. Bick's methodology for infant observation has been integrated into the training of child analysts, and even of some adult analysts, in several countries (Great Britain, Belgium, Italy). In France, the issue is more controversial, especially regarding the status of observed material compared with conventional analytic material. Some applications of her method have been developed not only for training but also for therapeutic purposes.

In any case, the rigor of Bick's methodology, together with her sense of ethical conduct, have had a profound influence on child psychologists since the 1970s. Her work has drawn their attention (along with that of some adult psychologists as well) to the more archaic levels of functioning and the earliest stages of mental development in the infant. In France, Bick's ideas have been taken up by authors like Geneviève Haag and Didier Houzel, who trained with Bick.

Bick's two great passions throughout her life were psychoanalysis and Israel, and she placed her hopes in both of them. Bick ceased clinical practice in 1980.

## **BIGRAS, JULIEN JOSEPH NORMAND (1932–1989)**

A Canadian psychiatrist and training analyst, Julien Bigras was born February 12, 1932, in Laval, Quebec, and died May 10, 1989, in Montreal. He spent his childhood at the family farm and studied medicine and psychiatry at the University of Montreal; he completed his psychoanalytic training at the Paris Psychoanalytic Institute.

A member of the Paris Psychoanalytic Society (1963) and the Canadian Psychoanalytic Society (1954), and a training analyst, he maintained a psychoanalytic practice, directed a seminar, published the review *Interprétation* (Montreal) and two collections of books in Paris and Montreal, and collaborated on *Études Freudiennes* (Denoël, Paris) and *Patio* (Paris). He also ran a seminar at McGill University (1983–1989) and participated in the Clinical Lacanian Forum in the United States.

He published ninety-one articles, twenty-six chapters in anthologies, and eleven works of fiction including *L'Enfant dans le grenier* (1977), *Le Psychanalyste nu* (1979), *Kati of course* (1980), *Ma Vie, ma folie* (1983), and *La Folie en face* (1986).

He was a great admirer of Donald Woods Winnicott, Harold Searles, and Sándor Ferenczi because of their lack of dogmatism and their clinical freedom of expression during transference. Madness, incest, the therapeutic use of stories, and transference and violence associated with the psychoanalyst were common themes throughout his work. Bigras's research led him to ask two fundamental questions: 1) Is violence necessary for access to the unconscious, does it provide the only opportunity for the analysand and for the psychoanalyst/analysand to rediscover or recreate a new and singular maternal language, a primal language, the only one that can produce the fecundity of being? 2) Is the violence of the psychoanalyst (the unanalyzed in all of us) an expression of the other's desperate cry to be heard, a limiting transference situation in which the

one who is best able to hear this cry would be his own patient? Can writing or any other form of creative art provide confirmation, and pick up the thread where the analysand or the analyst left off?

## **BINDING/UNBINDING OF THE INSTINCTS**

Binding is the mechanism whereby the free-flowing energy of the primary processes becomes attached to ideas, thus giving instinct a representative within the psychic agencies. In this way, instinctual excitation seeking an object is gradually tamed by the ego, and ideas are linked to one another and then maintained in a relatively stable state. This mode of functioning, characteristic of the secondary processes, enables the work of thinking to take place. Unbinding, on the other hand, is the abrupt retransformation of bound energy into free energy seeking discharge. Binding and unbinding are thus two essential economic aspects of the work of the psyche.

Freud first used the notion of binding in October 1895, in “Project for a Scientific Psychology” (1950c), proposing “the hypothesis of what is, as it were, a *bound state* in the neurone, *which, though there is a high cathexis, permits only a small current,*” and asserting that “the ego itself is a mass like this of neurones which hold fast to their cathexis—are, that is, in a bound state” (p. 368). At this time, on his way to discovering the unconscious, Freud was seeking to understand the surging up of elements that did not belong to the ego’s thought processes: “If a passage of thought comes up against a still *untamed mnemic* image of this

kind, then its indications of quality, often of a sensory kind, are generated, with a feeling of unpleasure and an inclination to discharge, the combination of which characterizes a particular affect, and the passage of thought is interrupted... What is it, then, that happens to *memories* capable of affect till they are *tamed*? ... Particularly large and repeated binding from the ego is required before this facilitation to unpleasure can be counterbalanced” (pp. 380–381).

At the dawn of psychoanalysis, Freud was seeking to explain how the energy of the primary process could be held in check and yet at the same time continue to procure pleasure and be used in the construction of the ego. In “Project for a Scientific Psychology,” the notion of binding was given its full place, since it helps establish a level of relative constancy in the ego. By contrast, instinctual excitation, when it is too strong, threatens the ego with unbinding.

Freud made a brief comment in “Formulations on the Two Principles of Mental Functioning” (1911b): “Thinking was endowed with characteristics which made it possible for the mental apparatus to tolerate an increase of stimulus while the process of discharge was postponed. It is essentially an experimental kind of acting, accompanied by displacement of relatively small quantities of cathexis together with less expenditure (discharge) of them” (p. 221). Later in “Instincts and Their Vicissitudes” (1915c), Freud emphasized, “A particularly close attachment of the instinct to its object is distinguished by the term ‘fixation’” (p. 123). In “The Unconscious” (1915e) he emphasized the opposition between “two different states of cathectic energy in mental life: one in which the energy is tonically ‘bound’ and the other in which it is freely mobile and presses towards discharge” (p. 188).

In *Beyond the Pleasure Principle* (1920g), in revamping his earlier instinctual dualism, Freud took traumatic neurosis as one of several bases for the new opposition between the life and death instincts. In this context, “it would be the task of the higher strata of the mental apparatus to bind the instinctual excitation reaching the primary process. A failure to effect this binding would provoke a disturbance analogous to a traumatic neurosis; and only after the binding has been accomplished would it be possible for the dominance of the pleasure principle (and of its modification, the reality principle) to proceed unhindered” (pp. 34–35).

In his paper “Negation” (1925h), Freud added a new element: “The general wish to negate, the negativism which is displayed by some psychotics, is probably to be regarded as a sign of a defusion of instincts that has taken place through a withdrawal of libidinal components” (p. 239).

Finally, in *An Outline of Psycho-Analysis* (1940a [1938]), Freud condensed his ideas by making binding and unbinding the two essential features of his theory of the instincts: “[We] have decided to assume the existence of only two basic instincts, *Eros* and *the destructive instinct*. . . . The aim of the first of these basic instincts is to establish ever greater unities and to preserve them thus—in short, to bind together; the aim of the second is, on the contrary, to undo connections and so to destroy things” (p. 148).

Although the fundamental idea of binding and unbinding underwent gradual clarification as Freud’s research advanced, it gained a new coherence with his last theory of the instincts. In particular, it now shed light on fixation as a response to excess binding after an unbinding that flooded the psychic apparatus. One problem remained unsolved, however, namely the differences, in economic terms, between unbinding and failure of binding. Unbinding resulted from an active process that Freud plainly related to Thanatos (the death instinct), whereas the failure of binding seemed to be more passive, perhaps a result of a limit on available libidinal energy.

Lastly, free association seems to be based on more or less effective instances of the binding and unbinding of ideas among themselves and of ideas and effects. Such binding and unbinding in turn determine the nature of the transference.

### **BINSWANGER, LUDWIG (1881–1966)**

Ludwig Binswanger, a Swiss psychiatrist, was born on April 5, 1881, in Kreuzlingen, Thurgau, Switzerland, where he died on February 7, 1966. In Kreuzlingen he was director of clinical psychiatry at Bellevue Sanatorium, an internationally renowned institution founded by his grandfather. Binswanger took over responsibilities in 1910 from his father, passing them on to his own son in 1956.

He spent his school years in Constance, Germany, and studied medicine in Lausanne, Heidelberg, and Zurich. In 1906 he obtained the position of assistant at the Burghölzli Psychiatric Clinic in Zurich, directed by Eugen Bleuler. In 1907 he defended his doctoral dissertation on association tests before Carl Gustav Jung.

Binswanger devoted his life to psychiatry and the search for new therapeutic treatments. His father had introduced a revolutionary method for running the clinic, according to which the “doctor’s family will also assist in treating the patient.” The entire institution became, in effect, an extended family presided over by a patriarch. Ludwig Binswanger was raised in a world where “the father’s teachings were the absolute law.” He developed an interest in psychoanalysis at the Burghölzli Clinic, where the medical staff included some of the leading psychoanalysts of the time (Karl Abraham, Max Eitingon, Franz Riklin, and Hermann Nunberg). Jung was the director. In 1907 he met with Freud (“his most important human experience”) in the company of Jung. This led to other meetings and a thirty-year friendship, as shown by their lengthy correspondence. Although Freud had difficulties, recognized by Freud himself, in maintaining friendships with people who did not share his ideas, and although they had different attitudes toward fundamental aspects of psychoanalysis and its potential uses, they enjoyed an extended friendship. This friendship was based on an understanding of mutual expectations: Freud hoped to break down the wall separating official psychiatry and psychoanalysis, and Binswanger sought

to fight for the acceptance of a new theory under Freud's paternal control.

Binswanger wrote nearly a hundred articles and books. He wrote reports of analyses ("Versuch einer Hysterie Analyse," 1909; "Analyse einer Hysterischen Phobie," 1911) and methodological criticisms of psychoanalysis like *Die drei Grundelemente des wissenschaftlichen Denkens bei Freud* (The three fundamental elements of Freud's scientific ideas; 1921). In *Grundformen und Erkenntnis menschlichen Daseins* (Fundamental forms and the recognition of human being-in-the-world; 1953), Binswanger attempted to define existential analysis as an empirical science involving an anthropological approach to the individual essence of being human.

Over the years Binswanger's contributions to psychoanalysis were marked by an increasing reserve, as shown in his introduction of psychoanalytic therapy as an element of institutional care. In 1907 his uncle, Otto Binswanger, a professor of psychiatry in Jena, presented him with a hysterical patient, Irma, for analysis, which he undertook on the basis of his reading alone. He treated a number of other patients who required institutional care, including some of Freud's patients. His beginner's enthusiasm was soon subject to setbacks as a result of his lack of rigor. He concluded, "Ten years of effort and disappointment have been the price to pay to be able to recognize that only a select number of our institutional patients can benefit from analysis."

Binswanger began to subject psychoanalysis to a methodological and critical analysis. He began by attacking the methodology of general psychology and then attempted an epistemological criticism of psychoanalysis itself. He made use of Edmund Husserl's phenomenology and the hermeneutics of Wilhelm Dilthey and Friedrich Schleiermacher. For him, the link between Freud's scientific method and clinical psychiatry is a shared reduction of human existence to a schema or system. In his new approach, human existence is necessarily human, and the task for existential analysis is to describe the fundamental orientations of that existence.

After Martin Heidegger's *Being and Time*, Binswanger underwent a second transition from phenomenology to phenomenological ontology and switched from a methodological approach to an anthropological approach. For Heidegger, *Daseinanalytik* (existential

analysis of being in the world) consists in describing the structure of human existence as such. Binswanger's *Daseinanalyse* attempted to contrast the natural sciences, which treat the human being as a "system of organic functions," with a phenomenological methodology that attempted to explore humanity's subjective existence in its totality and that looked at the individual as a being present in the world, a being responsible for its own existence from within. To help the patient, the therapist engages with the patient's primal world and how the patient is present in the world. Mental illnesses are "modifications of the fundamental structure and structural bonds of the being-in-the-world as transcendence." Therapy does not consist in "an attempt, starting with the ego, to enable the organism to connect with another through language, but makes language itself its starting point."

*Daseinanalyse*, as practiced by Binswanger, Medard Boss, Henri F. Ellenberger, and Rollo May, maintained a distance from the theory and practice of Freudians. Freud himself acknowledged, "We are unable to establish a dialogue between us."

## BIOLOGICAL BEDROCK

In the last paragraph of “Analysis Terminable and Interminable” (1937c), Freud wrote: “We often have the impression that with the wish for a penis and the masculine protest we have penetrated through all the psychological strata and have reached bedrock [*gewachsener Fels*: “the living rock”], and that thus our activities are at an end. This is probably true, since, for the psychical field, the biological field does in fact play the part of the underlying bedrock” (p. 252).

As a limit imposed upon psychoanalytical treatment, which is brought to a halt by its inaccessibility to psychic working over, the biological level played a complicated and ever-present motor role in Freud’s work. By 1894 he had already introduced three important notions related to this frontier: *libido*, or psychical sexual energy transmuted from somatic energy; *conversion*, or the hysterical mechanism of transformation of psychic libidinal energy into somatic innervation; and the *sexual instinct*, the earliest attempt to conceptualize such “phase shifts”—whether continuous or sporadic—between the body and the mind.

In *Three Essays on the Theory of Sexuality* (1905d), what Freud called “that part of the theory . . . which lies on the frontier of biology” (p. 133)—the theory of the instincts—created the dynamic frame of reference in which psychic morphogenesis could be grafted onto the underlying biology of onto- and phylogenesis. And in his preface to the third edition (1914) of the *Three Essays*, Freud added: “I must, however, emphasize that the present work is characterized not only by being completely based upon psycho-analytic research, but also by being deliberately independent of the findings of biology. . . . Indeed, my aim has rather been to discover how far psychological investigation can throw light upon the biology of the sexual life of man. . . . there was no need for me to be diverted from my course if the psycho-analytic method led in a number of important respects to opinions and findings which differed largely from those based on biological considerations” (p. 131). Both the interdependence and the relative autonomy between the mental and the biological were thus affirmed.

In fact Freud drew attention to infantile sexual activity before its organic correlates were discovered—the word *hormone* came into use in 1905. He specified the two developmental biological traits responsible for the singular ubiquity of sexuality in human mental life, namely prematurity and the latency period. Freud inferred that humans were descended from a species that reached sexual maturity at the age of about five; this conclusion, which is confirmed by current paleo-anthropology, relates the Oedipus complex to the “bedrock” of the biological development of the species.

Another point of contact between the mental and the biological lay in mnemonic phenomena, in memory traces and their transmission. As Freud wrote in *The Interpretation of Dreams* (1900a), “Dreams and neuroses seem to have preserved more mental antiquities than we could have imagined possible; so that psychoanalysis may claim a high place among the sciences which are concerned with the reconstruction of the earliest and most obscure periods of the beginnings of the human race” (p. 549). The life and death instincts, another interface with the “bedrock,” were the basis of a hypothetical biology centered on the diversity of the stabilizing mechanisms of living beings—on their ability to internalize external factors and to regularize and convey them on the biological and the mental levels simultaneously. In short, Freud was proposing a kind of Lamarckianism revisited whose necessity would one day be acknowledged by official science: “For incalculable ages mankind has been passing through a process of evolution of culture,” he wrote to Albert Einstein, which “is undoubtedly accompanied by physical alterations; but we are still unfamiliar with the notion that the evolution of civilization is an organic process of this kind” (1933b [1932], p. 214).

Penis envy and castration fears were paradigmatic of the complicated, intrinsic causal relationship between the mental and the biological. The unique narcissism of human beings, along with the ideal individual and collective forms to which it gave rise, was likewise, by virtue of prematurity, closely bound up with biology.

The transition between soma and psyche lies at the core of Freud’s work. His theory of the instincts is the conceptual instrument that makes it possible to examine this zone without falling prey to neurophysiological reductionism or to the dichotomies of idealism.

This set of problems has often been avoided since Freud. It may not be strictly necessary to confront it as a practical matter in treating neuroses, but it is surely essential to do so if we wish fully to understand the dynamics of mental functioning. There are many ways, however, to evade the issue, and to maintain the ancient split between soma and psyche: neglecting or rejecting the theory of the instincts (like the British school); confining that theory to an exclusively clinical realm (Melanie Klein), or to an exclusively structural one that ignores the economic dimension (Jacques Lacan); or suppressing Freud's biological work on fantasies (Gantheret). The diametrically opposite approach, a neopositivist reading of Freud's work as a "biogenetic fable" (Sulloway), has the same result. On the other hand, some biologists with a more nuanced epistemology (Jean-Didier Vincent, Alain Prochiantz) have been reassessing the dynamic point of view in their discipline in a way that restores its relevance to the Freudian position, which a certain number of psychoanalysts (such as those concerned with the earliest mother-child bonds and with psychosomatic illnesses) have never abandoned.

## **BION, WILFRED RUPRECHT (1897–1979)**

Wilfred Ruprecht Bion was born at Mattra (United Provinces, India) on September 8, 1897, and died in Oxford (Great Britain) on November 8, 1979.

The first eight years of Bion's life were spent in India, where his father was a civil engineer. In 1905 Bion was sent to school in England, where he remained for ten years before taking up military service. While he read history at Queen's College, Oxford, (1919–1921) he became curious about Freud's writings and later furthered his interest in psychology by reading medicine at University College Hospital, London (1924–1930), where he won the Gold Medal for Surgery and the Silver Medal for Diagnostics. He entered analysis with John Rickman in 1938, being forced to terminate by the outbreak of World War II. During the war, as a military psychiatrist, he initiated a new approach to group therapy. He entered analysis with Melanie Klein in 1945, and qualified as an associate member of the British Psychoanalytical Society in 1950.

Bion came from a Protestant missionary family, Swiss Calvinist of Huguenot origin on his father's side and Anglo-Indian on his mother's. This religious background, combined with the fact that the family was isolated from other Europeans for extended periods, meant that the small boy was in close contact with two very different cultures. Experiences of contrast and opposition, but also of mediation and love between two worlds formed a background to, and a basis for, Bion's later theories regarding what it may mean for an individual to be both a member of his group and in contrast or opposition to it at the same time.

This experience was reinforced by the carnage of World War I: he joined the Royal Tank Regiment (1916–1918) where he was awarded the Distinguished Service Order, the Legion d'Honneur (chevalier) and was mentioned in dispatches. Although distant from psychoanalysis, these experiences nurtured his understanding of terror, awe, dependence, love, hatred, and hatred of understanding and knowledge; this latter helped in his deep contact with psychotic patients.

He held several appointments in public positions: Secretary (1933–1939) and then Chairman (1946) of the Medical Section of the British Psychological Society (BPS); Chairman of the Executive Committee, Tavistock Clinic, London (1945); Director of the London

Clinic of Psychoanalysis (1956–1962) and President of the British Psychoanalytical Society (1962–1965). He continued as an active member of the Executive of the BPS, and as Chairman of The Melanie Klein Trust, until he left for California in January 1968. He taught a great deal in Latin America during the last decade of his life before his return to England in 1979 a few months before his death. In 1978 he became an honorary member of the Los Angeles Psychoanalytic Society and in 1979 an Honorary Fellow of the A. K. Rice Institute.

Bion's main contributions to psychoanalysis belong to the fields of psychoanalytical technique and epistemology, with particular reference to the process of thinking. He approached this latter subject from different viewpoints (vertices): that of the group; of the psychotic, schizophrenic or borderline patient; and that of the individual thinker, "genius" or not, who has to deal with the pressure of attacks, from within and without, due to hostility towards both the thinking process and the resulting thoughts. The principal concepts he developed are those of "reverie based on free-floating attention", "alpha-function," which Bion himself felt could replace the Freudian theory of primary and secondary processes, *alpha-* and *beta-elements*, container and contained, and "reversed perspective." His writing is commonly considered challenging, particularly the trilogy *A Memoir of the Future* (1975, 1977, 1979/1991). His other most important publications are *Experiences in Groups* (1961), *Four Servants* (1977) and *Attention and Interpretation* (1970).

Bion's influence in the field of group psychotherapy and the development of more or less closely related group techniques was both very rapid and widespread. In the field of psychoanalysis, despite the fact that his thinking is firmly rooted in that of Freud and Klein, his innovative ideas and theories engendered a great deal of controversy, and were hardly accepted until the 1970s.

## **BIPOLAR SELF**

The bipolar self is made up of two components: the grandiose self, that of mirroring or ambitions; and the idealized parental imago, that of both idealization and ideals. The two poles are linked together by a tension

arc, the alter ego. First appearing in Heinz Kohut's *The Restoration of the Self* (1977), the bipolar self was the hallmark of a new metapsychology: generalized self psychology.

The two constituent poles of the self are formed in response to the degree of the receptivity of caregivers to the subject's narcissistic needs. The grandiose self acquires its strength through the responses of the self objects to mirroring needs, and the idealized parental imago by means of responses that enable fusion. Together both sectors are a source of strength to the self. Each pole is a possibility, a potential for the self. One pole can compensate for the other, and the self will be fragile only if both poles have been thwarted.

When its earliest needs have not been responded to, the infant turns to a less rejecting source. In such a case, it is this second source that will be activated and worked through in the transference, leaving the earliest traumas in the dark. Anything that has been resolved or surmounted will not be examined in analysis. Developments that are no longer the result of conflict are seen as a natural process if narcissism is taken to be a given.

## **BIRTH**

Birth is the prototype for all discontinuities in the relation between a mind and its objects. Otto Rank's *The Myth of the Birth of the Hero* (1909) introduced this theme into psychoanalytic literature.

In the same year Freud took an interest in dreams of birth in an addendum to *The Interpretation of Dreams* (1900a). Birth, as a passage from intra-uterine life to extra-uterine life became for him "the first experience of anxiety, and thus the source and prototype of the affect of anxiety" (*SE*, 5: 525, note 2). He returns to this theme in *Introductory Lectures on*

*Psychoanalysis* (1916-17a [1915-17]), in which he speaks of the "separation" (*SE*, 15: 397) of birth.

This is the theme that Wilfred Bion developed in *Caesura* (1975) when he made birth the paradigm for all psychic discontinuity, which means that experiences lived through before the caesura must be capable of being retranscribed in a psychically assimilable form after the caesura. Taking a more genetic point of view, other authors have applied the term "psychic birth" to the moment when children become conscious of their individuation and the separation between them and their libidinal objects (Mahler, Margaret, 1975; Tustin, Frances, 1981).

## **BIRTH, DREAM OF**

The dream of birth is a dream that depicts, generally in a transposed way, the birth of the dreamer or, in women, the act of giving birth.

In *The Interpretation of Dreams* (1900), Freud classed this type of dream among the "typical dreams,"

but this classification appeared only with his addenda to later editions. In an addition made in 1909, he wrote: "A large number of dreams, often accompanied by anxiety and having as their content such subjects as passing through narrow spaces or being in water, are based upon phantasies of intra-uterine life, of existence in the womb and the act of birth" (p. 399). He also reported, in a note dating from 1909, Carl G. Jung's opinion that, in women, dreams of having teeth pulled signified childbirth (pp. 387–88, note 3). He cited the dream of a young man "who, in his imagination, had taken advantage of an intra-uterine opportunity of watching his parents copulating" (pp. 399–400). In subsequent addenda he analyzed the dream of a young woman which expressed her fear of (and wish for) the loss of her virginity and the birth of the baby that would result, as well as several other dreams with this meaning reported by Otto Rank and Karl Abraham. In 1919, he added to the 1909 note cited above Ernest Jones's observation that what the pulled tooth and childbirth had in common was the meaning of "separation of a part of the body from the whole" (pp. 387–88, note 3). Accordingly, the dream of birth can be linked to the theme of castration.

As with most of the other "typical dreams," there is hardly any further discussion of this type of dream in Freud's work, and the later literature is limited, despite the fact that such dreams are often encountered in clinical work.

## **BISEXUALITY**

The notion of bisexuality—according to which all human beings simultaneously possess both masculine and feminine sexual dispositions—was introduced into psychoanalysis by Freud.

It should be noted that the notion of bisexuality has always existed, as witness its mention in most

religions. The idea of a primeval divine couple that is demonstrated by myths and rituals of human androgyny, is based on the existence of a supreme androgynous divine being from whom the couple are separated (Eliade, 1964).

The idea of bisexuality was already present in philosophical and psychiatric literature at the end of the 1880s, but its importance within the psychoanalytic movement begins with the influence of Wilhelm Fliess. In 1901, convinced of the scope of psychical bisexuality, Freud informed Fliess of a project that unfortunately did not see the light of day: "My next book, as far as I can see, will be called 'Bisexuality in Man'" (1950a, p. 334).

Freud based his theory on anatomical and embryological data: "a certain degree of anatomical hermaphroditism occurs normally. In every normal male or female individual, traces are found of the apparatus of the opposite sex" (1905d, p. 141). This observation resulted in his conception of an "originally bisexual physical disposition [that] has, in the course of evolution, become modified into a unisexual one, leaving behind only a few traces of the sex that has become atrophied." But he did not apply this conception to the psychical domain: "It is impossible to demonstrate so close a connection between the hypothetical psychical hermaphroditism and the established anatomical one" (p. 142).

Freud did not give these biological facts the same scope as did Fliess, who believed that the psychic mechanism of repression has a biological foundation. For Freud, it is not the apparent anatomical sex that represses the opposite sex: "I am only repeating what I said then in disagreeing with [Fliess's] view, when I decline to sexualize repression in this way—that is, to explain it on a biological grounds instead of on purely psychological ones" (1937c, p. 251).

Throughout his career, Freud emphasized the importance of bisexuality in mental phenomena: "[W]ithout taking bisexuality into account I think it would scarcely be possible to arrive at an understanding of the sexual manifestations that are actually to be observed in men and women" (1905d, p. 220). Nor would it be possible to understand the conflicts that result from it: "In order to explain why the outcome is sometimes perversion and sometimes neurosis, I avail myself of the universal bisexuality of human beings" (1950a, p. 179). And it was through the analysis of the

psychoneuroses that Freud found confirmation of the “postulated existence of an innate bisexual disposition in man” (1908a, p. 165–166).

Nevertheless, it is noteworthy that there were some hesitations in his considerations of this question. In 1923, he attributed the difficulty of disentangling the problem of object choice in the first sexual period to “the triangular character of the Oedipus situation and the constitutional bisexuality of each individual” (1923b, p. 31). Thus he suggested that bisexuality is independent of the processes of identification. Next he argued that identification with the father or mother is the result of the oedipal situation and is strictly linked to bisexuality, because the identifications are simultaneously masculine and feminine. However, when he saw the child’s ambivalence toward its parents as deriving from an origin other than identification, he insisted on the weight of innate bisexual dispositions: “It may even be that the ambivalence displayed in the relations to the parents should be attributed entirely to bisexuality” (p. 33). On the one hand, then, the notion of bisexuality makes it possible to explain, in both boys and girls, the oedipal identifications with the parent of the opposite sex, thus feeling the Oedipus complex from any form of determinism. But on the other hand, if bisexuality does not have a biological-anatomical origin, the question of its origin remains obscure: Is it a consequence of anatomy? The result of identifications with both parents? Freud’s answer, especially around the time of *The Ego and the Id*, was that bisexuality was an intrinsic aspect of sexual differentiation itself.

Be that as it may, the concept is constantly invoked and continuously used in day-to-day psychoanalysis. The role played by bisexuality in the different stages of psychosexual development helps to determine the various modalities of the subject’s attachment to objects.

It must also be emphasized that even if Freud never abandoned the notion of psychical bisexuality, he considered the difficulty in connecting the concept to the theory of drives as a serious lacuna in psychoanalytic theory. Thus the “theory of bisexuality is still surrounded by many obscurities” (1930a [1929], p. 106).

Finally, a supplementary problem must be introduced: A deeper understanding of the concept of bisexuality necessarily would not facilitate an under-

standing of the ideas of masculinity and femininity. For as Freud warned us, to give any new content or attach any mental qualities to the concepts of masculine and feminine only gives way to anatomy or to convention: “The distinction is not a psychological one” (1933a [19320, p. 114]). This indicates that as long as a satisfactory psychoanalytic definition of masculine and feminine cannot be found, the notion of bisexuality “embarrasses all our enquiries into the subject and makes them harder to describe” (1940a [1938], p. 188).

## BIZARRE OBJECT

The term *bizarre object* was coined by Wilfred Bion (1957) to denote a distinctive kind of object existing in the world of the psychotic. By violent projection of unwanted psychic elements, the psychotic personality constructs its universe of bizarre objects. This world is different from the world of part objects containing projections that constitutes the normal world of the paranoid schizoid position as described by Melanie Klein (1946).

The psychotic personality uses a form of splitting and projective identification that is not merely excessive but different, in the aspects of the psyche, especially those ego and superego functions which lead to awareness of reality, are split off, fragmented, and violently expelled into the external world. In this way a hostile conglomerate is formed of aspects of objects with fragments of the psychic apparatus and internal objects. In “The Differentiation of the Psychotic from the Non-psychotic Personalities” (1957), Bion gives examples: “If the piece of personality is concerned with sight, the gramophone when played is felt to be watching the patient; if with hearing, then the gramophone when played is felt to be listening to the patient. The object, angered by being engulfed, swells up, so to speak, and suffuses and controls the piece of personality that engulfs it: to that extent the particle of personality has become a thing” (p. 51). And he concludes: “The consequences for the patient are now that he moves, not in a world of dreams, but in a world of objects which are ordinarily the furniture of dreams.”

## BJERRE, POUL (1876–1964)

A doctor, writer, sculptor, and psychotherapist, Poul Bjerre was the first Swede to develop an interest in Freud and psychoanalysis. He was born in Göteborg on May 24, 1876, and died in Vårsta on July 15, 1964. Bjerre was the son of a Danish businessman and spent his early life in Göteborg, on the west coast of Sweden, where his father had moved his business. Poul Bjerre was the oldest child; his younger brother Andreas, an eminent criminologist, was a professor of criminal law at the University of Dorpat (Lithuania). He committed suicide in 1925.

In 1905 Bjerre married his sister-in-law’s mother. They had no children. His wife, sixteen years his elder, had three children from a previous marriage. In 1906 she fell ill and their marriage remained essentially platonic.

In 1907, after his wife’s death and the completion of his medical studies, Bjerre took over the Stockholm practice of Otto Wetterstrand, a renowned European specialist in hypnosis. Although Bjerre never really abandoned hypnosis, he soon took an interest in psychoanalysis. In December 1910 he traveled to Vienna to meet Freud but the meeting was disappointing. As he was to describe later, he perceived Freud as being cold and distant. His meeting with Alfred Adler was more fruitful, however, and he always felt closer to Jung and Adler, without considering himself anyone’s protégé.

In 1911 Bjerre introduced psychoanalysis to a meeting of the Order of Swedish Doctors. His presentation, which was judged too long for publication in the Swedish medical review *Hygiea*, appeared in *Psyke* a year later, together with articles from other researchers in psychology. However, Bjerre maintained a critical attitude toward psychoanalysis. In 1913 he stated that the conscious mind was more important than the unconscious and criticized Freud during the international congress held in Munich. On several subsequent occasions he expressed satisfaction for having distanced himself early from Freud. At the Munich conference, however, Freud introduced him to Lou Andreas-Salomé, with whom he had a brief but stormy and passionate affair.

When Bjerre introduced psychoanalysis to Sweden in 1924 in an early publication, he included articles not only by Freud but by Adler, Jung, and Alphonse Maeder as well. He concluded the book with one of his own articles in which he explained the evolution of psychoanalysis based on his own research.

Bjerre wrote throughout his life. He wrote a biography of Nietzsche in 1903 and translated from several languages. He was interested in the personality of the celebrated industrial magnate Ivan Kreuger and studied the influence of Hitler's ideas on psychoanalysis. In an article published in 1934 he claimed that the three fundamental works of psychotherapy were Liebeault's *Le Sommeil provoqué*, Freud's *Interpretation of Dreams*, and Hitler's *Mein Kampf*. He had dealings with Jewish and non-Jewish doctors alike and felt that the psychoanalytic movement was pro-Semitic in the same way that Hitler was anti-Semitic. Although he became interested in German culture at a young age, he was not a defender of Nazism.

Six years after the foundation of the Finno-Swedish Psychoanalytic Society in 1940, Poul Bjerre established a psychotherapeutic organization whose administrative directors shared a partial rejection of Freudian theories. Like the other members of the society, Bjerre felt that Freud laid too much stress on the sexual life of the individual and the role of the unconscious, to the detriment of the conscious mind. Moreover, Freudian psychoanalysis was too intellectual and placed too much importance on dream analysis instead of appreciating its curative value and understanding that every individual naturally harbors so-called psychosynthetic conciliatory forces. Early in his career he had, for example, believed that paranoia could be cured by convincing the patient of its absurdity by means of rational arguments, while he maintained the conviction that hypnosis was the best and most effective psychotherapeutic method.

Bjerre never underwent analysis. He could not understand psychoanalysis as a whole and did not practice it. However, he played an essential role in the development of psychoanalysis in Sweden. The majority of Swedish psychoanalysts have, at one time or another, referred to his introduction to Freud's theories.

## **BLACK HOLE**

Frances Tustin introduced the idea of *black holes* in her *Autistic Barriers in Neurotic Patients* (1986). The term was chosen by analogy with ideas in modern astrophysics, which has discovered zones of extraordinary density in the universe that are probably related to the condensation and fusion of several stars. Once formed, such hyperdense zones are thought to exert a sort of attraction upon other stars, which are thus at risk of plunging into the core of these vast concentrations of matter, which swallow them up and strip them of all individuality. It is not hard to see how the metaphor of a "black hole of the psyche" can help explain, or at least help us picture what happens at the core of the psyche of autistic children.

Indeed Tustin had already elaborated on a notion first proposed by Sydney Klein (1980), that of "autistic islands." And, most significantly, in her first book, *Autism and Childhood Psychosis* (1972), she had painstakingly recounted the case of John, who had described to her, on emerging from autism, what he himself called "the black hole w/ the mechant piquant." What John was striving to verbalize in this way was all the pain and suffering he had felt on the occasion of far too brutal and premature a separation between the breast and the nipple, this at a time when nipple and mouth are inextricably conjoined (as described, albeit in a different way, by Piera Aulagnier, with her "complementary zone-object"). Naturally it is less a physical separation that is involved here than a mental one—or even, to be quite precise, the inscription in the psyche of the process of separation.

If, for one reason or another, this process turns out to be impossible or impeded, the child is liable to feel as if a part of him- or herself has been cut off.

This traumatic organization of the psyche leaves its mark in the shape of "autistic islands" which fail to become integrated into the cycles of deferred effects and historical time: Their massiveness and their intensity, in autistic children, are an obstacle to their

becoming part of mental functioning, and they end up serving as pathological poles of attraction for a whole variety of psychic elements which accrete within their sphere of influence and thus become incapable of dispersing in a manner at once orderly and differentiated.

In the wake of Frances Tustin, the post-Kleinian tendency in psychoanalysis has made wide use of the concept of the black hole, extending it to nonpsychotic subjects in whom autistic islands are possible even if in such cases they are less significant and less serious in their implications.

## **BLACKETT-MILNER, MARION (1900–1998)**

Marion Blackett-Milner, a British psychoanalyst, was born in London in 1900 and died there on May 29, 1998.

Born into a scientific family—her brother Patrick Blackett won the Nobel Prize for physics—she first took an interest in education after graduating as a psychologist from the University of London. In 1938 she wrote a book based on her research in educational child psychology, *The Human Problem in Schools*. She married Dennis Milner in 1927 and gave birth to a son in 1932.

Her first book, *A Life of One's Own*, published under the name Joanna Field, appeared in 1934. It was in fact her diary, beginning in 1926, in which she recounted in a remarkably authentic style her observations and discoveries about herself. Her future destiny is already discernible in this autobiographical work. It was followed by two other autobiographical books: *An Experiment in Leisure*, in 1937 and, fifty years later, *Eternity's Sunrise* in 1987. In 1950 she published *On Not Being Able to Paint*, in which she develops a method

that consists of allowing one's hand to wander freely over the paper in order to see what it produces. The drawings thus produced represent not only external objects but also the structure of one's own feelings and thoughts.

She began to train as an analyst in the 1940s while also becoming an enthusiastic painter. She was analyzed by Sylvia Payne, qualified in 1943 and began to practice in London. *The Hands of the Living God*, published in 1969, is one of Milner's most remarkable contributions as a psychoanalyst. It is the complete, marvelously well-written and illustrated story of the treatment of a very ill patient, a moving account of the way in which she communicated her emotions through the medium of drawing whenever words failed her. In the meantime in 1952 she published an article on "the role of illusion in the formation of symbols," in which she does not limit the meaning of the word symbol to a defensive function (Ernest Jones) but stresses its creative potential. She insists on the function of a "malleable" environment in the process leading to recognition of the world outside oneself. She developed the idea of a "medium" between the reality created by oneself and external reality: a sort of modeling clay for the mind, the intermediary between representation and figuration, a malleable substance by means of which impressions are transmitted to the senses and with which we can give shape to our fantasies. Patients model their own creative process through therapists, who recognizes as well in themselves an inside and an outside, a part that is separate and another that is a part of the patient.

Her theories about the separability of the object complement Donald Winnicott's work on the transitional object and the creativity of the baby. In her last work, *The Suppressed Madness of Sane Men. Forty-Four Years of Exploring Psychoanalysis*, published in 1987, she sums up her principle observations and her articles on the relationship between psychoanalysis and creativity.

On May 29, 1998, Marion Milner died in her London home at the age of ninety-eight, while working on another publication. She contributed to our understanding of the mechanisms of symbolization and interpenetration between the subjective and objective world both in art and psychoanalysis, and deepened our knowledge of the processes by means of which the psyche is born of the soma, and of the way

in which we really learn to live and communicate with our bodies. Masud Khan used to say that Milner had “an inexhaustible reserve of energy for living, working, writing, and painting.” She was extremely original and inventive in her own self and in her thinking, as well as being a member of the Independent Group of the British Psycho-Analytical Society. She was passionate about esthetics, creativity in art and analysis, and the role of symbolism in the thinking process. Both her autobiographical and psychoanalytical writings constitute, as Harry Guntrip said about Winnicott, with whom she was very close, “the natural expression of [her] personality.” In it she manifested a total commitment to exploring the inner world and the farthest reaches of the being, at the frontier of the Self and non-Self.

## **BLANK/NONDELUSIONAL PSYCHOSES**

*Blank psychosis* is defined as a psychosis with no readily identifiable clinical manifestation, where analysis alone affords access to a psychotic core: a nuclear structure that is the source of possible psychotic development without necessarily producing actual symptoms.

Jean-Luc Donnet and André Green (1973) introduced the notion of blank psychosis, based on a

psychoanalytic session with a patient, “Z,” conducted in a general psychiatry department.

As early as 1911, Eugen Bleuler had distinguished “simple schizophrenia” and “latent schizophrenia,” and his notions of “schizoid” and “schizothymia” had already raised the issue of the boundaries of psychosis.

Psychoanalysis first considered the internal boundaries of psychosis in order to fathom its outer limits. Helene Deutsch described the “as if” personality in 1934, and as early as 1939 Maurits Katan studied “prepsychosis” in his work, “A Contribution to the Understanding of Schizophrenic Speech.” Since Otto Kernberg’s 1967 book *Borderline Conditions and Pathological Narcissism*, the study of prepsychosis has often been combined with that of borderline states.

Rather than a syndrome, blank psychosis evokes a structure that is not manifest. It can be mistaken for a depressive state with a configuration that is difficult to pinpoint, for a borderline state, or it can refer to psychotic development without obvious signs. Consistently nuclear, it corresponds to three parameters according to the “princes” description: a) oedipal organization remains triangular, but the two parent figures are identified according to their good or bad character rather than the masculine/feminine opposition; b) object relations bring internal objects into play; c) the subject is torn between good objects and bad objects, and between the good ego and the bad one, on account of the objects being driven back into the ego.

Unlike psychosis, the role of the external objects in blank psychosis shows that the subject continues to cathex reality, which is doubly inscribed, even as projection considerably modifies the subject’s apprehension of it. However, there are strictly speaking no delusions, in the sense of either persecution by the bad object or protection by the good object.

“Empty” or “paralyzed” mental functioning of thought results from an active decaathesis that is attributed to “the destructive drives’ attack on the binding processes in so far as they are a function of consciousness’s awakening to reality” (Kernberg, 1975).

The description of blank psychosis has had an effect comparable to the impact, in the 1970s, of the “borderline” category, linked to the expansion of a North American clinical tradition. The extension of psychoanalytic practice to the treatment of psychosis, and the

surprises generated by this work, have motivated further interest. During the 1960s, Kernberg participated in a long-term study of forty-four difficult cases treated by psychoanalysts at the Menninger Clinic. When psychosis was triggered after several years in the same analytic situation, Kernberg considered such cases to involve “borderline patients” whose “ego is better integrated than in psychotics except where close human relations are concerned” (1975). With regard to both the triggering and the stabilization of psychosis, he focused less on biological continuity than on the structural continuity of the ego’s defensive reactions, from a perspective informed by the work of Anna Freud. He sought to understand the negative factor that undermines the ego’s consistency to a point of critical instability: “All defensive mechanisms also contain the germ of the ego’s destruction” (Kernberg, 1975). Numerous studies of borderline states have similarly focused less on symptoms than on prepsychotic “personalities,” their degree of consistency—albeit paradoxical—or their narcissism.

Meanwhile, Jacques Lacan, faithful to the “formal envelope of the symptom,” demonstrated the importance of “elementary phenomena” (Lacan, 1993, p. 14) in the prepsychotic phase: intuitions, echoes, words, forced gestures, and the like, all of these intermittent and erratic. In the course of the interview, “eclipses” or “blanks” (or even memorization) in the patient’s speech mark an impasse or confusion with regard to the signifier. Lacan unfailingly examined the sudden appearance of any neologism or surface manifestation of the “kernel of dialectical inertia” (p. 22). His criticism of Maurits Katan focused on the reconstruction of the “prepsychotic” phase, and the confusion of levels—imaginary, symbolic, and real—and also on the confusion between “understanding” and “imagining” in Katan’s account. In Lacan’s view, Katan’s and innumerable other conceptions of “borderline states” had made naïve use of Freud’s notions regarding the ego (the second topography) and his text “The Loss of Reality on Neurosis and Psychosis” (1924).

The “sinthomatic” structure described by Lacan in *The Seminar of Jacques Lacan: Book III, The Psychoses* (1955–1956) opened new perspectives on the psychotic kernel, as did Piera Aulagnier’s work on “psychotic potentiality.”

### **BLANTON, SMILEY (1882–1966)**

An American psychiatrist and psychoanalyst, Smiley Blanton was born in 1882 in Unionville, Tennessee, and died on October 30, 1966, in New York. A patient of Freud, his *Diary of My Analysis with Freud* appeared in 1971. Born in the South into a family of strict Presbyterians, he studied medicine at Cornell University, became an M.D. in 1914, and was trained in psychiatry by Dr. A. Meyers at Johns Hopkins hospital in Baltimore. After serving in World War I, he received a degree in neurology and psychological medicine from the Royal College of Physicians and Surgeons in London in 1922–23.

He taught at the University of Minneapolis, where he had created the first child guidance clinic associated with a public school; then, in 1927, created a nursery school at Vassar College in Poughkeepsie, New York. Two years later he moved to New York City, intending to practice psychoanalysis. Through George Amsden, who was leaving to be analyzed by Sándor Ferenczi, he replaced Clinton McCord, who had just finished his analysis with Freud.

The first period of the analysis began on August 31, 1929, in Berchtesgaden, where Freud spent his vacations. Blanton later described his first meeting with Freud: “A small, frail and graying man suddenly appeared and moved toward me to greet me. Although he seemed older than in the photographs I was familiar with, I recognized the silhouette that approached me to be that of Freud. Cigar in hand, he spoke to me almost timidly.”

Blanton took great care in recording Freud's remarks, which were frequent and lengthy; Freud also provided numerous suggestions on analytic technique, avoided interpreting his patient's colitis, asked him not to write down his dreams, and added, "For an analyst not to relate his dreams, now that's a sign of serious resistance!" He would soon involve him in his research concerning Shakespeare's identity.

From September to the end of October, Blanton followed Freud to the Schloss Tegel clinic in Berlin, and then resumed his analysis in Vienna. He was again forced to interrupt his analysis at the end of April when Freud went to the Sanatorium Cottage of Vienna and then to Berlin for treatment of his heart problems. At the end of Blanton's analysis, on May 30, Freud provided him with a letter of recommendation to Ernest Jones: "I would like to introduce you to Dr. Smiley Blanton. He is a pleasant man, especially interested in the orientation of children (Vassar College). He has undergone six months of personal analysis with me; I think he will return home a sincere believer in PsA."

Five years later, in August 1935, Blanton had a further two weeks of analysis with Freud, who was then at his vacation home in Grinzing. Freud accepted payments before the sessions began by saying, "I accept them on account. If I happen to die before the fortnight is over, they will be returned to you!" During the analysis Freud spoke about Ferenczi and technique—Blanton was now seeing patients of his own—signed a copy of the *Interpretation of Dreams* for him, and, when Blanton left on August 17, after expressing his wish to return the following year, responded, "I regret that I cannot promise I will be here . . ."

However, two years later, on August 1, 1937, Blanton was again in Grinzing with Freud. He described him as "more alert and more dynamic than he was two years ago . . . His hearing remains poor, but no more than it was two years ago." While planning a trip to London, their discussion turned to phenomena that Freud was skeptical of, such as parapsychology, "with the exception of telepathy, whose existence is possible and which deserves to be studied."

In London, on August 30, 1938, Blanton saw Freud for a final week of therapy that lasted until September 7, the day before Freud was scheduled for a new operation. Blanton resumed his habit of recording his dreams and investigating the resistance that occurred during their interpretation. As for Freud, "he appeared

to me as dynamic, alert, and lucid as ever." But, Freud confided to him, "At my age it's natural that one thinks of death. Those who think about death and talk about it are those who are not afraid, while those who are afraid neither think about it nor talk about it." Blanton added, on September 5, 1938, "In reading these pages, it will become apparent that the professor spoke often to me of death."

Later in his career, Blanton collaborated with Norman Vincent Peale in establishing the American Foundation of Religion and Psychiatry. They opened the Religio-Psychiatric Clinic at the Marble Collegiate Church on lower Fifth Avenue, where free assistance was offered to people suffering from emotional disturbances such as anxiety and depression. The clinic also trained clergymen of all denominations to help people deal with their emotional difficulties. Blanton and Peale wrote several books together, most notably their first collaboration, *Faith Is the Answer: A Pastor and a Psychiatrist Discuss Your Problems*.

## **BLEGER, JOSÉ (1923–1972)**

An Argentine doctor, psychiatrist, and psychoanalyst, José Bleger was born in 1923 in Santiago del Estero, Argentina, and died on June 20, 1972, in Buenos Aires. He was one of the most original of the Argentine school of psychoanalysts. Through his psychiatric research he investigated psychotic phenomena, an interest that was to become the focus of all his later work. He was intimately familiar with the work of Karl Marx and an active militant in the Argentine communist party; he studied psychoanalysis with Enrique Pichon-Rivière.

Bleger conceived of the human being as a social being and affirmed the necessity of questioning the way in which the individual isolates and separates himself

from others rather than the way in which he unites with others and socializes. An overview of these ideas is presented in his *Psicoanálisis y dialéctica materialista*, published in 1958. Ronald Fairbairn was deeply influenced by this theory, and it was through Fairbairn that Bleger was able to confirm that object relations determine the intensity and nature of anxiety as well as defensive strategies and tactics.

It is in *Simbiosis y ambigüedad*, published in 1967, that Bleger describes his most important theoretical concepts and their development. Here, in his psychoanalytic research, Bleger for the first time confronts the subject of symbiosis, generally following Kleinian positional structures. He describes an object that, for this primitive position, he describes as “agglutinated” by fusional anxieties and defenses that correspond to the so-called “glischrocaric” position. He initially attributed these anxieties and defenses to the “psychotic part” described by Wilfred Bion, but he then characterized them as increasingly undifferentiated. This led him to conceive of a step prior to the paranoid-schizoid position described by Melanie Klein.

Psychoanalytic psychopathology changed fundamentally in this theory, which Bleger reformulated in his work on schizophrenia, autism, mania, melancholy, perversion, addiction, and psychosomatic illnesses. The analytical technique concerning the framework, split interpretation, and timing varies depending on the form of the intervention and its participation in the phenomena of restitution.

Bleger also conducted research in the fields of institutional psychology, family psychology, and group phenomena. The problem of Judaism in the USSR turned him into an active militant in favor of the Jewish question and the international political aspects of the denial of freedom. He died prematurely in Buenos Aires at the age of forty-nine, at a time when his work was on the point of reaching its fullest expression.

## **BLEULER, PAUL EUGEN (1857–1939)**

Paul Eugen Bleuler, a Swiss professor of medicine, holder of the chair of psychiatry at the University of Zurich and director of the university psychiatric clinic of Burghölzli in Zurich (1898–1927), was the son of Johann Rudolf Bleuler and Pauline Bleuler-Bleuler. Born April 30, 1857, near Zurich, he died July 15, 1939. Bleuler came from a family of well-to-do farmers. He went to several schools, then studied medicine in Zurich, graduating in 1881. From 1881 to 1884 he was an assistant physician at the university psychiatric clinic of Waldau-Bern. From 1884–1885 he went to Paris to study with Charcot and then to London and Munich, where he studied with Gudden. From 1885 to 1886 Bleuler worked as an assistant physician to August Forel at Burghölzli. From 1886 to 1898 he was director of the psychiatric clinic of Rheinau-Zürich, finally assuming the position formerly held by Forel in Burghölzli in 1898, where he remained until 1927.

His first scientific contact with Freud occurred in 1892, during his work on aphasia. In 1896 Bleuler prepared a favorable report on Breuer and Freud’s work, *Studien über Hysterie (Studies on Hysteria, 1895)*. The first correspondence with Freud took place in 1898. In 1900 Bleuler asked his assistant, Carl Gustav Jung, for a report on the *Interpretation of Dreams* (1900) for the clinic. Extensive correspondence between Freud and Bleuler did not begin until 1904, however. Moreover, it was through Jung’s work and therapeutic success, between 1900 and 1909, that Bleuler came to appreciate the possibilities and usefulness of Freudian psychoanalysis. His liberal attitude and open-mindedness only make sense when we consider the influence of August Forel, who saw himself as the vehement defender of hypnotherapy, a man open to a dynamic, scientific, and public comprehension of psychic pathologies (Forel himself was a violent critic of Freudian ideas).

Bleuler’s publications between 1906 and 1911 reveal his caution—not entirely uncritical—regarding Freud’s work. In 1907, under his direction, the Freudian Association of Zurich was founded at his clinic. Through his work and attitudes, Bleuler unleashed a storm of

scientific criticism, especially in German and Swiss psychiatric circles. He also had to withstand personal attacks from those close to him, including Forel and Constantin von Monakow. Additionally, there was pressure from Freud and Jung who, impelled by tactical interests, wanted to secure his active participation in the Zurich regional branch of the International Psychoanalytic Association. These efforts came to a head during a meeting between Freud and Bleuler in December 1910 in Munich. Bleuler's ambivalence, often hinted at and now out in the open after Freud read his article "Die Psychoanalyse Freuds" (Freud's psychoanalysis; 1911), can be explained by the number of constraints that impeded his desire for knowledge and his critical scientific mind. Bleuler was unable to overcome these conflicts and after eleven months he gave up his position. With his "Kritik der Freudischen Theorien" (1913), he lost his position in the orchestra of Freudian science. That same year he, along with Jung, gave up his responsibilities in psychoanalytic circles. Unlike Jung, Bleuler maintained a distant but polite relationship with Freud.

Bleuler's scientific contribution to psychoanalysis is modest. But the scope of his influence, which should not be underestimated, is largely based on his political and medical activities. Through his personality and responsibilities, Bleuler opened the doors of international scientific discourse to Freud and psychoanalysis. "After this it was impossible for psychiatrists to ignore psychoanalysis any longer. Bleuler's great work on schizophrenia (1911), in which the psychoanalytic point of view was placed on an equal footing with the clinical systematic one, completed this success" (Freud, 1914d, p. 28)

### **BLOC—NOTES DE LA PSYCHANALYSE, Le**

Created in 1981 by Mario Cifali, its director, *Le Bloc—Notes de la psychanalyse*, published by Éditions Georg, in Geneva, is a Freudian review affiliated with the work of the seminar of the Cercle Freudien. There is a relation between Lacan's 1975 conference in Geneva before the Swiss Psychoanalytic Society—Raymond de Saussure center—and the creation of the review. It was further promoted by Serge Leclair's suggestion to found a study center for psychoanalysis in Geneva. The center was intended for young people with sufficient background to investigate Freudian ideas. Jenny Aubry, Roger Lewinter, François Perrier, George Dubal, Michel de Certeau, Mireille Cifali, Monique Schneider, Françoise Dolto, and Conrad Stein all gave their approval to the initiative.

Along with theoretical and clinical articles written by psychoanalysts from the various schools, *Le Bloc—Notes de la psychanalyse* has presented unpublished historical documents. These include the correspondence between Freud and Otto Rank concerning the book *The Trauma of Birth* (issue 10) and the interview between Max Graf, the father of "Little Hans," and Kurt Eissler (issue 14). Three issues of the review were particularly sought after by readers: "Éducation, médecine, place de la psychanalyse" (issue 7), "Les traumatismes psychiques" (issue 12), and "Le père" (issue 13).

### **BLOCH, JEAN-RICHARD (1884–1947)**

Jean-Richard Bloch was a writer, historian, and socialist propagandist. He founded the socialist review *L'effort* in Poitiers in 1910, collaborated with the publisher Frédéric Rieder, and edited the newspaper *Ce soir* with Louis Aragon. He was the first French editor to publish articles of a psychoanalytic nature.

Born in Paris into a Jewish family that had settled in Auxerre (Yonne) in the eighteenth century, he studied history at the Sorbonne (with Charles Seignobos), received his teaching degree in 1907, and was appointed to the lycée in Lons-le-Saulnier, then in Poitiers (1909). He collaborated with Gaston Thiesson and Dr. René Morichau-Beauchant, his friend for many years, in producing *L'effort*, a “journal of struggle and ideas.” Morichau-Beauchant was the psychology and psychiatry editor for the review.

In *L'effort* Bloch presented Morichau-Beauchant's very first article on psychoanalysis, “L'inconscient et la défense psychologique de l'individu” (The unconscious and the psychological defense of the individual; 1910), published a year before his “Le rapport affectif dans la cure des psychonévroses” (The affective relationship in the treatment of psychoneuroses; 1911). He later published three additional articles by this same author. A reader of Freud, Bloch himself wrote an article entitled “La mort d'Œdipe” (The Death of Oedipus), followed by two novels, *La nuit Kurde* (1925; *A Night in Kurdistan*, 1931) and *Sybilla* (1935), where the influence of analysis is obvious. Writing *La nuit Kurde* had a therapeutic effect on its author: “I have to complete my work... I have overcome my neurasthenia, my apprehension; I have taken back possession of my ego.”

## **BLOS, PETER (1904–1997)**

A German psychoanalyst with a degree in education and a PhD in biology, Peter Blos was born February 2, 1904, in Karlsruhe (Germany), and died June 12, 1997, in Holderness, New Hampshire (United States). Blos's childhood and adolescence were marked by the spiritual influence of his father, a doctor drawn to Gandhi's ideas. Early in life he became a friend of Erik Homburger, who later became the psychoanalyst Erik Erikson. Blos studied education at the University of Heidelberg to become a teacher, and then obtained a doctorate in biology in Vienna.

During the 1920s, he was introduced to Anna Freud, who asked his help in creating a school for children undergoing analysis. The project was supported and encouraged by Eva Rosenfeld and Dorothy Burlingham, a friend of Anna Freud, whose children attended the small school. Blos invited Erik Homburger to join him there. Within the Vienna psychoanalytic circle August Aichhorn exerted considerable intellectual influence on Blos, which strongly affected his psychoanalytic training. Blos entered psychoanalysis through teaching, while giving his work an orientation and sensitivity influenced by spirituality.

To escape the rise of Nazism, Blos fled Vienna in 1934 for the United States, where he settled in New Orleans. There he was hired as a teacher in a private school, before leaving for New York, where he continued his analytic training. According to Aaron H. Esman, he became a member of the New York Psychoanalytic Society, becoming a special member in 1965 and then a supervisor and trainer. As a teacher he introduced, in 1972, a course on delayed adolescence, which he discontinued in 1977. He continued his clinical practice and did some teaching at the Columbia Psychoanalytic Center as cofounder of the Association of Child Psychoanalysis. When he retired from professional life, he spent his time writing poetry and fiction, playing the violin, and practicing carpentry in his country home in Holderness, New Hampshire. He died there at the age of ninety-three, by the side of his second wife.

Of his four published books, it is *On Adolescence: A Psychoanalytic Interpretation* that led to his national and international recognition. This book, supported by his extensive clinical experience with adolescents, picks up the thread of an idea that Sigmund Freud failed to develop. Freud identified the beginning and end of the

process of puberty, largely ignoring the intermediary stages. Blois decided to elucidate the various stages of development of the personality, from latency to post-adolescence. His goal was to present a unified theory of adolescence, a necessary first step in introducing an adolescent-specific psychopathology and psychotherapeutic technique. Five years later he developed a key concept, inherited from the work of Margaret Mahler, the “second individuation process.” Here, the emphasis is on the importance of renegotiating the separation with the parents’ imagos during adolescence. The author emphasizes the importance of gaining access to regression, which, contrary to what occurs in the case of the infant and the adult, is tied to the ego.

The second individuation process is what made Blois well-known. His theoretical and clinical approach to the gradual development of the personality, delinquency, and the problems of the ego (superego, ego ideal, integrative capability) also made a significant contribution to understanding adolescence. In the United States he is considered an eminent specialist, a forerunner of child and adolescent analysis, who trained several generations of analysts in adolescent psychotherapy.

## **BODY IMAGE**

In psychoanalysis, *body image* is the mental representation one has of oneself, which gradually develops in each individual. The body image encompasses fantasies, especially unconscious fantasies, and also involves the environment. The body is one of the subjects Freud dealt with most frequently. In several of his papers, he referred to the constitution and development of the erogenous zones, their representations and importance in the formation of the body image.

The body image is constantly being created and recreated. Caresses and the first affectionate contacts with the people who surround the child during infancy are responsible for molding the body image, and return to the child the image of his own body through containment and eye contact. This is a dialectic process, in which the environment also plays a role. Piera Aulagnier (1991) says that to transform a sensitive region of the body into an erogenous zone, the physiologically sensitive reaction is not enough: time and subjective interrelation are required for the signs of somatic life to become signs of psychic life. In his work on the mirror phase, Jacques Lacan (1949/2004) describes a mechanism of identification that is established through the transformations that occur in infants when presented with a reflection: The mirror offers a tempting image of comprehensive unity, representing what is felt to be a precarious and fragmented self. It was Esther Bick (1968) who, on the basis of clinical material, studied the development of the concept of the skin and its relationship with introjection and projective identification. Didier Anzieu (1985) calls *moi-peau* (skin-ego) the image of the ego the infant uses in the course of the early phases of his development to represent himself as an ego, on the basis of experiences connected with the body surface.

Various models or clinical hypotheses, such as the neurotic body image, and the primitive-psychotic body image, may be postulated on the basis of clinical psychoanalytical work. The neurotic body image, closer to the notion of normalcy, is the unconscious mental representation of the skin, complete and whole, which envelops and contains warmly. This skin represents the mother’s and father’s support and warmth, which are in turn the basis for the containment of the self and the limits of the body image. Conversely, in the model of the primitive-psychotic body image, there is no notion

**BLUSHING, FEAR OF.** *See* Erythrophobia

of skin, but instead the notion of fluid as the nucleus of the primitive-psychotic body image. Thus, there is only a vague psychological notion of a wall that contains vital fluids, or blood, and fantasies of bleeding, or “emptying out” of those vital fluids. Sometimes this emptying out is linguistically expressed in a fast, uncontrolled speaking style.

This means that the primitive-psychotic concept of the body breaks through and invades what up to then was a different type of mental functioning. These experiences may be expressed through words or through body language, as in psychosomatic disorders. Some patients may have hypochondriac ideas related to the primitive-psychotic body image, such as alleged blood infections, leukemia or hemophilia.

Some concepts related to body image are: hypochondria, body fragmentation, delusions of denial of parts of the body (known as Cottard’s delusion), and somatic delusion. Hypochondria based on the psychotic primitive body image may lead to suicidal accidents.

## **BOEHM, FELIX JULIUS (1881–1958)**

German physician, a specialist in neurological and mood disorders, psychoanalyst and president of the German Psychoanalytic Association (DPG), Felix Boehm was born in Riga on June 25, 1881, and died in Berlin on September 20, 1958. Remembered more as a practical psychotherapist than as a theorist, Boehm was an “Aryan” member of the psychoanalytic community during the Nazi era.

Boehm’s father, Paul, was an industrialist originally from Fürstenwalde; his mother, Luise, née Zelm, was the daughter of merchants. His brother, Paul Boehm (1879–1951) took over his father’s business, while Edgar Boehm (1889–1922) became an architect in Berlin. All three brothers were associated with the “Rubonia Clique,” a group of Baltic Germans, and so became acquainted with Alfred Rosenberg, who would become the principal ideologist of National Socialism and was ultimately sentenced to death at Nuremberg.

Boehm studied engineering in Munich before pursuing medical studies in Geneva, Freiburg im Breisgau, and Munich. Among his teachers were F. von Müller, Emil Kraepelin, and Ernst Cassirer. He was analyzed by a Polish student of Freud, Eugenia Sokolnicka, and became a member of the Munich regional group of the International Psychoanalytical Association in 1913. In 1914 he married B. E. Welsch, with whom he had three children. Enlisting as volunteer doctor during the First World War, he was promoted to chief physician and served as a psychiatric expert in a war tribunal held in Gernersheim.

In 1919 Boehm settled in Berlin and began an analysis with Karl Abraham, taking a doctorate in 1922, with a thesis on “Two Cases of Delirium by Arteriosclerosis.” He taught at the Berlin Psychoanalytic Institute from 1923 to 1933, set up scholarships at the Institute, and collaborated with the newly founded Berlin Psychoanalytic Polyclinic. Boehm placed his daughters into a prophylactic psychoanalysis with Melanie Klein. In 1928 he began studies in ethnology and worked with Eckhard von Sydow, a philosopher and art historian.

After Hitler's accession to power and the Nazis' immediate efforts to discredit psychoanalysis, Max Eitington resigned as president of the DPG and Boehm, viewed by Freud as "so-so," took his place. Viewing his role as "savior of psychoanalysis," he served as president of the DPG from 1933 to 1936 and as director of the Berlin Psychoanalytic Institute. He advocated harsher racial laws and expelled Jews from the DPG in December 1935. The next year Boehm was appointed to the administrative board of the German Reich's Institute for Psychological Research and Psychotherapy (Göringinstitut); however, despite his cooperation with the National Socialist authorities, he was not longer allowed to conduct didactic analyses.

Beginning in 1939, Boehm directed a research team that investigated homosexuality, always one of his main interests, and undertook a follow-up study of the institute's polyclinic patients. From 1941 to 1945, as health officer and expert in service to the Wehrmacht, Boehm took part in sentencing to death "malingerers," deserters, and homosexuals.

After the war, in 1947 Boehm was one of the founders of the Institut für Psychotherapie, and in 1949 he was appointed director of instruction and training policy for educational psychology. In 1950 Boehm became president of the reconstituted DPG which, to his considerable disappointment, was refused admission to the International Psychoanalytic Association.

## **BONAPARTE, MARIE LÉON (1882–1962)**

Marie Bonaparte, a French psychoanalyst, founding member of the Paris Psychoanalytic Society, and

princess of Greece and Denmark, was born on July 2, 1882, in Saint-Cloud, France, and died on September 21, 1962, in Saint-Tropez. She was the only daughter of Prince Roland Bonaparte (great nephew of Napoléon Bonaparte) and Marie-Félix Blanc (who died a month after her birth). In 1907 she married Prince Georges of Greece and Denmark, with whom she had two children, Eugénie and Pierre.

The melancholic preoccupation of her writings attests to her state of mind. René Laforgue wrote in a letter to Freud that she suffered from an obsessive neurosis that did not affect her intellect but slightly disturbed her mental equilibrium. Bonaparte herself wrote, "At times I have the sensation of catastrophe. I wish an unknown star would destroy the planet." Dissatisfied with her life, she found solace in her imagination.

In 1924 Bonaparte published a collection of stories, *Le Printemps sur mon jardin* (Spring in my garden). Using the pseudonym A. E. Narjani, she wrote an article describing clitoral surgery entitled, "Considération sur les causes anatomiques de la frigidité chez la femme" (Consideration of the anatomical causes of frigidity in women). Later, the disappointments of her sexual and emotional life were reflected in her symbolic novel *Les glauques aventures de Flyda des Mers* (The sad adventures of Flyda des Mers).

Although she gave expression to her adult problems in her novels and essays, her other writings described the vicissitudes of her childhood. Raised by a nurse, she filled her child's world with imaginary characters whose adventures she described in small notebooks with black covers she called her "Bêtises" (Whimsies). Around the time of her father's death on April 14, 1924, she rediscovered them. On her father's nightstand she found a copy of Freud's *Introductory Lectures on Psychoanalysis* (1916–1917a [1915–17]).

Bonaparte began an analysis with Freud on September 30, 1925. She used her childhood writing to reinforce her creative work. In 1939 she began to publish facsimiles of her childhood writings together with her psychoanalytically informed commentaries on them.

As a result of her work with Freud and the friendship and confidence that developed between them, Bonaparte soon became his representative in the French psychoanalytic world, which was then being organized. In 1926, with the help of Eugenie Sokolnicka, René Laforgue, Rudolph Loewenstein, René Allendy,

Edouard Pichon, and others, she founded the Société psychanalytique de Paris (Paris Psychoanalytic Society). As Freud's advocate, she firmly resisted the psychiatrists of Saint-Anne's Hospital, who were drawn to a form of French psychoanalysis swept clean of "Germanic slag."

She translated several of Freud's works, including *Leonardo da Vinci and a Memory of His Childhood* (1910c), *An Autobiographical Study* (1925d [1924]), *Jokes and Their Relation to the Unconscious* (1905c), *The Future of an Illusion* (1927d), "Prospectus for 'Schriften zur angewandten Seelenkunde'" (1907), and some of his papers on metapsychology.

Bonaparte's research on applied psychology, society, war, criminality, and female sexuality were published in the *Revue française de psychanalyse*, which she founded with René Laforgue, Angelo Hesnard, and Edouard Pichon. In the first issue of the journal, Bonaparte published her paper "Le cas de Mme Lefebvre," which describes the oedipal crime of a woman who murders her pregnant daughter-in-law. The paper also affirmed Bonaparte's opposition to and condemnation of the death penalty.

Bonaparte's two volume study of Edgar Allan Poe appeared in 1933. She divided his life and work into distinct cycles, which may be seen in her life as well. She characterized these cycles as cycles of the mother: the living-dead mother, the landscape mother, the murdered mother; and as cycles of the father: the revolt against the father, the conflict with consciousness, and passivity toward the father.

Anna and Sigmund Freud translated her book *Topsy: The Story of a Golden-Haired Chow*, illustrated with photographs taken by her daughter, Eugénie, into German. In June 1938, with the assistance of the American ambassador William Bullitt, Bonaparte helped Freud and his family leave Nazi Austria. During World War II, between 1941 and 1944, Bonaparte lived in Cape Town, South Africa, where she wrote articles about the myths of warfare.

Her talks at the Institut de psychanalyse de Paris (Paris Institute for Psychoanalysis) and her articles were published in the *Revue française de psychanalyse* and, after the war, were collected into several volumes: *Psychanalyse et biologie* (Psychoanalysis and biology; 1952), *Introduction à la théorie des instincts* (Introduction to the theory of instincts; 1951), *Psychanalyse*

*et anthropologie* (Psychoanalysis and anthropology; 1952).

In *Female Sexuality* (1951/1953) she compared the libidinal evolution of the sexes. After a shared anal phase of passivity toward the mother, the young girl experiences a temporary phallic phase toward the mother, followed by a second (cloacal and phallic) phase of passivity toward the father. The final genital phase is passive and is accompanied by a relative exclusion of the phallus and affirmation of the vagina. Bonaparte insisted that the father had an important and beneficial role to play in the quality of the love expressed toward the daughter. When a young woman fails to make the transition from clitoral sadism to vaginal masochism in her sexual development, there are two types of alloplastic adaptation available: the Halban-Narjani operation, which involves surgically moving the clitoris toward the vagina, and psychoanalysis, which alone is capable of relaxing the young woman's intense fixation on the phallic clitoris.

During the 1950s, as vice president of the International Psychoanalytical Association, Bonaparte defended Margaret Clark-Williams, who was accused of illegally practicing medicine, and tried to save the life of Caryl Chessman, who had been condemned to death in the United States. Through her generosity a library and institute of psychoanalysis were created in 1954 in Paris. During the schism within the Société psychanalytique de Paris in the 1950s, she supported Sacha Nacht, though without much optimism, in his dispute with Jacques Lacan.

The first two volumes of her memoirs, *Derrière les vitres closes* (Behind closed doors) and *L'appel des sèves* (The call of life), were published in 1953. Prince George of Greece, her husband and "old companion," died on November 25, 1957. In 1959 she presented her final paper, "Vitalisme et psychosomatique" (Vitalism and psychosomatics) to the Twenty-First International Psychoanalytic Congress. She died on September 21, 1962, of leukemia in Saint-Tropez, where she maintained her summer home, Le Lys de Mer, named after the plant.

### BOOK OF THE IT, THE

Groddeck's *Book of the It*, first published in 1923 by the Internationaler Psychoanalytischer Verlag, was a great success. It was followed by a second and third edition in 1926 and 1934. Translations exist in Dutch, Swedish, English, French, Italian, Spanish, and Japanese.

*The Book of the It* is written in the form of an epistolary novel. The fictional author of the letters is the psychoanalyst Patrick Troll, and the fictional addressee is a lady who wishes to learn, in a playful manner, about psychoanalysis. Groddeck wanted to present his 1916

and 1919 conferences and psychoanalytic concepts in a popular work. He wrote the letters in 1921 and sent them to Freud, whose response was very encouraging ("Their style is fascinating; their tone musical, clever, and impertinent"). At the request of the reading committee, Groddeck made some cuts, though with some reluctance.

What is remarkable about *The Book of the It* is, first, the content and, second, the presentation. Groddeck highlights the new concepts introduced by psychoanalysis: the infantile, the Unconscious, primary processes, sexuality. He defends the position of Friedrich Nietzsche in *Beyond Good and Evil* on public discussion of humanity's many perverse tendencies. He describes the illnesses of the body and of the mind as products of the It. He thus opens up a "space for illness" (Chemouni, 1984), a place where the individual It deploys itself under the constraint of symbolizations and associations and where analytic treatment can begin to unfold between the analyst and the patient.

The whole of *The Book of the It* is an analytic experience, a game that stimulates with its clinical illustrations, reflections, and fragments of self-analysis that Groddeck uses to involve the reader in the dialog. The individual is controlled by the all-powerful It, the role of the body and mind being to express It. There is nothing we can say about the It; we cannot grasp it theoretically; we can know it only through its accomplishments.

Freud used the concept of It in his metapsychology, and ego psychology enlarges its theoretical scope. Only in the course of the last few decades we have begun to understand and appreciate the significance of Groddeck's original contribution to psychoanalysis.

## **BORDERLINE CONDITIONS**

The nosological concept of *borderline conditions* (or states) arose from what was defined in the English-language literature as "borderline personality organization," a term used to refer to a wide range of patients whose symptoms could not be explained in terms of either neurosis or psychosis.

There are three common misconceptions concerning borderline conditions to be avoided if their dynamics are to be understood, the first two of which arise from the term itself:

- that they exist at the "borderline" of neurosis or psychosis or constitute a transition between the two, when in fact they are neither pre-psychoses nor severe neuroses;
- that they are transitory "states" because of the various forms in which they can manifest within one individual. Otto Kernberg (1975) prefers to use the term "borderline organization" because, as Daniel Widlöcher (1979) emphasizes, this is an unstable condition existing within a stable structure;
- finally, that the wide variety of clinical manifestations eliminates any need to define the fundamental psychodynamics that these conditions have in common.

The borderline condition is more than a pathology that consists more often in manifest behavior than

internal suffering and in an attitude of object-dependency that, depending on the level of mentalization, can range from drug addiction to violent passages to the act in the "psychopathic" subject. This disorder can produce a wide range of visible manifestations, including extraordinary lapses of consciousness, an "as-if" mode of existence with loss of feeling, and an indefinable state of inefficacy. This range nevertheless stems from the same narcissistic rationale, the same archaic reaction, and a similar way of establishing the required defenses in the outside world.

The narcissistic component of the borderline condition restricts the experience of conflict to its traumatic impact. The Oedipus complex is overcome without having been resolved (Bergeret); however, the narcissistic disorder is neither a depression nor a form of neurotic or psychotic decompensation experienced as an object loss. This in no way detracts from the archaic nature of the need, the intolerance of frustration, the intensity of the rage, or the violence of the reaction. Accordingly, the pregenital quality of the need becomes a threat to an object that is absolutely necessary but has become frightening through projection—an object both that needs protection and from which protection has to be sought.

In the context of such a risk and this overwhelming atmosphere, the borderline patient actively strives to deal with reality rather than to negotiate the drive. Given the impossibility of dissociating the affect from the representation in a way that would enable repression and displacement to occur, and in the absence of an internal object that would be the guarantor of subtle difference, everything is organized in the external world so as to secure the object. Accordingly, this demonstrates the radical choice that the subject has to make in using the denial of the reality that he is able to perceive but not cathect to avoid any conflict. This subject also deploys splitting and—to avoid any internal conflict between love and aggression—completely separates good from bad in the external world or intensely idealizes the object on which he cannot rely.

The concept of omnipotence provides the key to a better understanding of a wider range of manifestations in borderline conditions, including that which characterizes the deeper disorder beneath the neurotic exterior, which ranges from unstable behavior to anti-social reactions and also extends from childish personalities and depressive tendencies to what is described

as narcissistic perversion. Heinz Kohut (1971) classified the megalomania in borderline conditions as one of the “archaic narcissistic configurations” that exist in the Self, which is considered not as an agency of the psychic apparatus but at the very least as a structure in which the representations retain a degree of autonomy in relation to the rest of the life of the drives.

In sum, the borderline condition remains an entirely external striving that results from an incapacity to tolerate internal ambivalence, which produces both the economy of depression at the internal level and the economy of delusion at the external level.

AUGUSTIN JEANNEAU

## **BOREDOM**

Boredom is a state of malaise, close to anxiety, characterized by a feeling of emptiness. Its origin is attributed to objects that the subject claims are boring, in other words, odious (*inodiosus*) in the etymological sense of the word.

Boredom (languor, neurasthenia) was one of the dark humors of ancient medicine (boredom was associated with the spleen, and melancholy, with the liver). It became the ailment of the era during the Romantic period, as typified by François-René de Chateaubriand in *René* and *The Genius of Christianity* (part 2, book 3).

Sigmund Freud did not see boredom as a specific symptom. He noted that the idleness of young women created a state of reverie dissociated from reality and susceptible to hysteria (1895d). But he saw their lassitude as normal, since other objects cannot occupy the place of the primitive lost object, the penis (1910h). Sándor Ferenczi in “Névrose du dimanche” (1919/1974) saw a link between the development of anxiety and the absence of exterior censure associated with a need to work.

With the introduction of the notion of the withdrawal of libidinal cathexis, psychoanalysis provided significant insight into the concept of boredom. Without libidinal cathexis, one loses drive and an ability to make demands, except for a need for a change associated with a miraculous arrival of an object that would again give life to one’s activities. This feeling of a loss of interest in things is, in fact, a loss of libido. Otto Fenichel assimilated boredom with a type of depersonalization in which the subject feels that he must do something but does not know what. Heinz Kohut pointed out the link between the analyst’s boredom and the feeling of exclusion that the patient provokes in him by withdrawing emotionally. Ralph Greenson saw boredom as a defense against fantasy activity or as a result of one’s unconscious perception of one’s resistance.

The analysis of boredom reveals a kind of phobic-obsessional fluctuation between withdrawal of libidinal cathexis and ardent desire driving impulsive acts that provide an outlet (Mijolla-Mellor, 1985). As with inhibition, boredom is not simply a lack of movement but a pointless stagnation, to which is added an enduring hatred of time. It is a defense against a phobic anxiety over a primary, but undifferentiated, investment in objects.

### **BOREL, ADRIEN ALPHONSE ALCIDE (1886–1966)**

Adrien Borel, a French psychiatrist, was born March 19, 1886, at 80 rue Bonaparte in Paris, and died September 19, 1966, in Beaumont-lès-Valence. The only son of a doctor from the Ardèche in southern France, Borel studied in Privas and Lyon. He joined the army for three years but gave up his commission after a year. After moving to Paris to study medicine, he became an intern in 1908 and a doctor of medicine in 1913. An

auxiliary surgeon during the First World War, he was seriously wounded by a piece of shrapnel on March 1, 1915. After a brief stay in Aisnay-Le-Château, he settled in Paris.

Part of the staff of L'Évolution psychiatrique, created in 1925, he was a committed member of the Annales Médico-Psychologiques, to which he was accepted in 1923 and made a full member in 1931. It was here that he met Professor Briand, Georges Heuyer, Gilbert Robin, and others. A participant in Henri Claude's working group at Sainte-Anne's Hospital, he was one of the twelve founding members of the Société Psychanalytique de Paris (Paris Psychoanalytic Society), founded in 1926, and its president from 1932 to 1934. He participated in several meetings but made few references to psychoanalysis and none at all after the 1940s. He did not join the small group of analysts that came together in Paris during the Occupation.

He had a lengthy and important affair (until 1940) with Annette Berman, the secretary of Princess Marie Bonaparte, and it was she who became his principal point of contact with the world of psychoanalysis. Borel himself never underwent analysis and after a few sessions with several patients, including the writers Georges Bataille and Michel Leiris, who publicized his name as a therapist, he quickly abandoned analytic practice.

In 1940 he married Blanche, one of his former patients, a woman whose identity always remained ambiguous among his colleagues and friends. He never introduced her as his wife in the world he frequented and never involved her in his professional affairs.

His first research effort, his medical thesis (1913), was devoted to organic and neurological theory. He investigated several of the methods available at the time, except the psychoanalytic method, to alleviate mental suffering, which was his major concern. His last article was about lobotomy (*L'Évolution psychiatrique*, 4, 1949). He worked in several hospitals (Sainte-Anne, Bichat) and in a number of private psychiatric clinics, where he met "aesthetes," drug addicts, and individuals for whom public hospitals were out of the question.

Interested in artists and writers, painters, and "creative" individuals in general, Borel participated with René Allendy in the Groupement d'Études Philosophiques et Scientifiques pour l'Examen des Tendances Nouvelles (Philosophic and Scientific Study Group for the Examination of New Trends) in 1922. He wrote a

great deal, but much of his writing was destroyed. He published no more than a handful of pages in his own name, generally co-signing his work with other authors, primarily Claude. He wrote one work jointly with Robin, *Les Rêveurs éveillés* (Éditions Gallimard, collection “Bleue,” 1925).

An extremely gentle man, according to Bataille, cordial and corpulent, Borel’s energy often resulted in a loss of temper and disagreements with others. Protective, good-natured, and paternal, he had many points in common with the character of the Curé de Torcy, a role he played at the age of sixty-four in Robert Bresson’s film *Diary of a Country Priest*. He died September 19, 1966, of a cerebral hemorrhage at his summer home in Beaumont-lès-Valence.

## **BORNSTEIN, BERTA (1899–1971)**

Child psychoanalyst Berta Bornstein was born in 1899 in the Austro-Hungarian city of Krakau (today Kraków, Poland), and died on September 5, 1971, in Maine in the United States.

Shortly after her birth, Bornstein’s parents settled in Berlin, where her father was an engineer. The eldest of four children, she had one sister and two brothers.

As a young educator of handicapped children (*Fürsorgerin*) in Berlin, Bornstein was just twenty years old

when she began analytic training with Hans Lampl and Edward Bibring. She participated in the child seminar directed by Otto Fenichel from 1924 to 1939 at the Berlin Psychoanalytic Institute, and by 1929 was working closely in Vienna with Anna Freud. Bornstein’s loyalty to both Fenichel and Anna Freud never wavered. She lived in Berlin, Vienna, Prague and, after leaving Europe shortly before War World II, in New York.

Bornstein brought innovative techniques to child psychoanalysis. She emphasized the precocity of children and so was able to reduce the time required to win their confidence. In her view, psychoanalysis of children ought to proceed by way of analysis of the defenses. “The introductory phase of child analysis was dropped when Berta Bornstein developed the analysis of defenses,” stated Anna Freud in 1971 (Blos, 1974, p. 36).

Bornstein pioneered a new understanding of latency. She revealed the dynamics of defense mechanisms and the progressive claims of identification and sublimation. Bornstein was opposed to the widespread view that latency is an “ideal” period during which instinctual conflicts do not exist. She suggested that latency could be divided into two stages: from five and half to eight years of age, and from eight to ten. The common factor is development of the superego as it struggles against incestuous and pregenital wishes expressed through masturbation. The first phase of latency, Bornstein believed, is favorable for psychotherapy.

Bornstein wrote only a few papers, but her clinical cases are models of technical and theoretical clarity. Bornstein’s last analytic work, concerning “Frankie,” a child of five-and-a-half years with symptoms of phobia, insomnia, and urine retention, would be validated in a follow-up analysis of the patient as an adult, conducted and presented by Samuel Ritvo in 1965. She was a widely admired teacher who taught not only at the New York Psychoanalytic Institute but also at the Menninger Clinic and Yale University. She was a member of both the New York Psychoanalytic Society and the Philadelphia Psychoanalytic Society. The name of her younger sister, Steffi, is frequently mentioned in accounts of the history of psychoanalysis; she was also a child analyst but died prematurely, in Prague, in 1939.

## **BOSE, GIRINDRASEKHAR (1886–1953)**

Indian psychoanalyst and physician Girindrasekhar Bose was born in 1886 and died in 1953. He was the founder of the Indian Psychoanalytic Society.

Bose, the youngest of nine children, was the son of a chief minister of a minor princely state in British India and a mother who was a poet. After finishing school, he studied chemistry in Calcutta's Presidency College and then joined the Medical College where he received his medical degree in 1910. He was married at the age of seventeen to Indumati, who bore him two daughters. He was greatly interested in yoga, magic, and hypnotism and in fact used hypnotic therapy in his medical practice during his early years and also occasionally after he became a psychoanalyst.

While practicing, as a doctor, Bose studied psychology in the newly opened department of psychology at Calcutta University. Appointed lecturer at the age of 31, after he finished his Master's degree in two years, he made psychoanalysis compulsory for all students of psychology. His doctoral thesis, *Concept of Repression* (1921) in which he blended Hindu thought with Freudian concepts and which he sent to Freud, led to a correspondence between the two men and to the formation of the Indian Psychoanalytic Society on January 22, 1922. He developed his own overly didac-

tic therapeutic technique, primarily aimed at cognitive change, which was based on his theory of "opposite wishes" (1933).

As he was the founder-president of the Indian Psychoanalytic Society and someone who conducted most of the training analyses, Bose's idiosyncratic technique came to characterize the therapeutic style of most Indian psychoanalysts. Bose's contribution, however, was less in the doubtful value of his new technique but in his emphasis on the role of culture in psychoanalysis. He did not uncritically accept the universalist premises of psychoanalysis, but engaged with Freud in a lively correspondence where he pointed out some of the cultural variations in psychoanalytic concepts, such as castration anxiety, which he had encountered in his Indian patients. His other great contribution was organizational in that he laid the foundations of psychoanalysis in India and placed the Indian Psychoanalytic Society on a sound footing through the thirty-one years of his presidency and until his death.

## **BOSTON PSYCHOANALYTIC SOCIETY AND INSTITUTE**

Psychoanalysis in Boston dates from 1906, when James Jackson Putnam published the first paper in English on the treatment of hysteria by "Freud's method of psycho-analysis." In 1909, Putnam met Ernest Jones, a Welshman then living in Canada, at Morton Prince's

house, where Boston psychiatrists regularly met to discuss the current psychotherapies of suggestion. Jones was a vigorous spokesman for Freud, and with Putnam's growing enthusiasm for psychoanalysis, both men took part in the annual meeting of the American Therapeutic Society, opened by Morton Prince. Putnam spoke on Freud's discoveries about the childhood origins of adult neuroses, and Jones firmly differentiated psychoanalysis from all the psychotherapies of suggestion. He emphasized the difference between the hypnotist's domination of his subject and the analyst's use of free-association, "in almost every respect the reverse of treatment by suggestion."

This meeting marked the high point of the psychotherapy movement, welcoming psychoanalysis as if it were another form of suggestive therapy. Its importance was soon overshadowed in September 1909 by the Clark University Lectures at Worcester, Massachusetts, where G. Stanley Hall, an experimental psychologist and friend of William James, had invited many notable scientists to celebrate the twentieth anniversary of Clark. Sigmund Freud, Carl Gustav Jung, Sándor Ferenczi, Jones, and Abraham Arden Brill all attended. Brill had studied analysis in Zürich with Jung in 1908, where he met Jones, and together they had visited Freud. At Clark, Freud delivered his *Introductory Lectures*, his only address to the general public, and was invited by Putnam to visit their family camp after the meetings.

Thus Putnam developed a close friendship with Freud, reflected in their lively correspondence, and he and Jones proselytized widely for the cause of psychoanalysis. Jones persuaded him to found the American Psychoanalytic Association in 1911, and Putnam was its first president. (Shortly before, Brill had founded the New York Psychoanalytic Society.) Putnam established the first of several Boston Psychoanalytic Societies in 1914, which met weekly until his death in 1918.

Putnam's successor was Isidor Coriat, who re-established the Boston Psychoanalytic Society in 1924–1928, and again in 1930. He was the only Freudian analyst in Boston during the period after Putnam's death, leading an eclectic group of men and women analyzed by Freud, Jung, Otto Rank, and Paul Schilder.

During this era, Americans were obliged to travel abroad for analytic training, and in 1930 four newly-

trained analysts, led by Ives Hendrick, arrived in Boston from Vienna and Berlin. They sought to create an institute, modeled on the Berlin Psychoanalytic Institute, that provided full analytic training, with analyses, seminars, and supervised control-cases. The first training-analyst was Franz Alexander, who came to Boston in 1930 and returned a year later to found the Chicago Psychoanalytic Institute. In Boston, Alexander was succeeded by Hanns Sachs, a leading training-analyst from Berlin, but not a physician. This created conflicts with Hendrick's new constitution, which rejected non-M.D.s for training, and required approval by an Admissions Committee, rather than by the individual analyst. After a stormy period of reorganization, half the membership resigned, to allow ten properly analyzed members to be approved by the American Psychoanalytic Association. Boston became a constituent Society in 1933, and in 1947 a Society/Institute, called the BPSI.

The original members were mostly Americans, with a few Canadians, until the arrival of Felix and Helene Deutsch in 1935. They were part of the great intellectual migration, fleeing from Nazi domination in Germany in 1933 and Austria in 1938. Within the vast influx of refugee artists, scholars, and scientists that transformed American cultural life, the émigré analysts formed a small but influential group. They most nearly resembled the architects of the avant-garde Bauhaus and the pioneer nuclear physicists, who seemed to represent new specialties, already sought after in Boston.

The European analysts were welcomed everywhere by eager colleagues and by their former analysands. In the Boston Institute, as its membership tripled over the next ten years, the refugees soon outnumbered their native American colleagues. Unlike other American cities with refugee analysts from all of Europe, most of Boston's analysts were Viennese. This occurred because the Deutsches were friends of Jenny and Robert Waelder, the next to arrive. The Waelders obtained an academic post for Edward Bibring, accompanied by his wife Grete, and Mrs. Beata Rank joined the Deutsches' circle. Lucie Jessner was the only non-Austrian refugee who completed her analytic training there.

As the Boston Psychoanalytic Institute became Europeanized, local American institutions were influential in the distribution of analysts within the community. The pioneer analyst Clarence Oberndorf had first

noted the tendency for American analysts to hold positions in institutions. They worked in hospitals, medical schools, and schools of social work, in marked contrast to Freud's isolation from academic medicine. By 1949, ninety percent of Boston analysts held institutional posts of some kind, often working in research teams with non-analysts.

Another local tradition was Boston's unusual number of institutions devoted to children, including nineteenth-century protective agencies and the Home for Little Wanderers. The Judge Baker Guidance Center dated from 1917, and the new J. J. Putnam Children's Center from 1943, founded by Marian Putnam, the daughter of Boston's first analyst, and Beata Rank from Freud's Viennese circle. Created for the study and treatment of preschool children, the Putnam Center came to specialize in the long-term treatment of childhood autism. Child analysts were soon established in other clinics and all the university teaching hospitals. Thus Boston became an important center for training in child psychotherapy.

In two other American specialties, psychosomatic medicine and general hospital psychiatry (consultation-liaison psychiatry), Boston analysts played important parts. Stanley Cobb, chief of psychiatry at the Massachusetts General Hospital (MGH) and a founding member of the BPSI, established the first department of psychiatry in a general hospital in 1935. He taught interns and medical students how to understand their medical and surgical patients, as well as psychiatric patients, a tradition his successor Erich Lindemann continued with his medical students. Cobb welcomed refugee analysts to the MGH and invited Felix Deutsch to collaborate in psychosomatic research. Deutsch, like Franz Alexander in Chicago, expanded psychosomatic research into a major specialty, far beyond its limited scope in Vienna.

After the Second World War, there was a great increase in the demand for psychoanalytic training, partly prompted by physicians returning from military service. They had been exposed to great numbers of psychiatric casualties and taught psychoanalytic methods of treatment, like the "abreaction" therapy of Grinker and Spiegel. This demand for psychiatrists was supported by a corresponding increase in government funds for psychoanalytic training and research.

The next twenty years was a halcyon era for psychoanalysis in Boston. The Institute increased from a few

dozen members in the 1930s to over one hundred active and affiliate members in 1974 and more than two hundred by the beginning of the twenty-first century. All the chiefs of psychiatry in hospitals and medical schools were analysts, and psychiatry was a popular specialty for young physicians. For some residents psychoanalytic training was accepted as the next step in academic advancement.

The high tide in analysis began to ebb in the late 1960s, during the Vietnam War, with cuts in federal support for analytic training and research. The number of suitable patients for psychoanalysis began to dwindle, both for analysts and for candidates with supervised cases. Within the BPSI there was dissatisfaction among candidates and younger analysts, who resented the impersonality of training and the dictatorship of the Education Committee. An experiment with a deanship proved unsuccessful, and its termination by the Education Committee provoked violent protests as high-handed and autocratic.

A period of strife followed, with attempts to create a better balance between the functions of the Institute and the Society. The conflict seemed to be between traditionalists and reformers, but the crucial issue was resentment over the limited access to training-analyst status. From 1973–1974, five training analysts proposed to secede from the Institute, while retaining their membership in the Society. Their aims were vague, but they emphasized the creation of a smaller group, free from committee work and bureaucratic rules, with a more intimate atmosphere for intellectual discussion. The new Psychoanalytic Institute of New England, called PINE, was recognized by the American Psychoanalytic Association in 1991.

In spite of fears that Boston was too small for two institutes, and that the new institute would graduate many unqualified training-analysts, PINE proved successful. Both institutes have flourished, and a third Boston institute, the Massachusetts Institute of Psychoanalysis (MIP) was founded by clinical psychologists.

All institutes have faced the continuing decline in suitable patients and the recent loss of traditional psychiatric institutions, like the Massachusetts Mental Health Center. In spite of these unfavorable changes in the economic and cultural support for psychoanalysis, as well as changes in clinical psychiatry and medicine itself, the number of applicants for analytic training has diminished relatively little. The BPSI has even expanded in terms of outreach to the community,

public lectures on cultural topics, and elective courses for non-analysts on psychoanalytic psychotherapy. The viability of analytic training seems partly sustained by offering supervision in long-term psychotherapy, while dynamic teaching in medical schools has been declining. And the scientific and intellectual life of the analytic community remains lively and attractive, in contrast to the increasingly organic orientation of current clinical psychiatry, with its emphasis on drugs and the genetic etiologies of mental illness.

## **BOUNDARY VIOLATIONS**

*Boundary violations* in psychoanalysis refer to the egregious and potentially harmful transgressions of the analytic frame that represent exploitation of the patient's vulnerable position.

While the most widely discussed boundary violation is sexual relations between the analyst and the patient, nonsexual boundary violations are common as well. These may include such phenomena as soliciting donations from one's patient, entering into a business transaction with one's patient, excessive self-disclosure of the analyst's personal problems, and breaking the patient's confidentiality.

Maintaining professional boundaries should not be construed as a call for rigidity. Indeed, a flexible analytic frame is necessary to respond to patients with

varying needs, conflicts, and deficits. The elasticity of the frame reflects not only the patient's specific needs, of course, but also the analyst's subjectivity. Moreover, there are situations in which a break of the frame may be a helpful departure from the usual boundaries. Gutheil and Gabbard have referred to these instances as *boundary crossings* rather than violations.

In addition, counter-transference enactments are inevitable to some extent, and the differentiation between a useful enactment and a boundary violation is sometimes ambiguous. A useful enactment generally involves an analyst who has caught himself or herself in the midst of the enactment before it escalates to the point of becoming a serious violation. Also, the capacity of both patient and analyst to analyze the incident may determine whether a particular behavior is destructive or productive. Finally, enactments that are repetitive and unresponsive to the analyst's own self-analytic efforts are more likely to be harmful than those that are subjected to self-analytic scrutiny and prevented from recurring.

The concept of boundary violations is a relatively recent addition to the psychoanalytic literature, although the early history of psychoanalysis was replete with such violations. While Sándor Ferenczi was analyzing Elma Palos, he professed his love for her and ultimately referred her to Freud for analysis. Ernest Jones's common-law wife, Loë Kann, was a former patient of his. Margaret Mahler acknowledged in her memoirs that she had been sexually involved with her analyst, August Aichhorn. Many of these instances were ignored; if they did come to light within psychoanalytic institutes, the solution was often to send the analyst back for more analysis rather than to take any form of disciplinary action.

With the rise of the women's movement, female patients became more assertive in expressing their sense of having been exploited by male analysts (cases of sexual boundary violations most commonly involve a male analyst and a female patient), and some form of reparation was often demanded.

Gutheil and Gabbard first attempted to delineate the concept of boundary violation and boundary crossings in a 1993 article. Subsequently, Gabbard and Lester argued that preservation of professional boundaries not only protects the patient from harm, but also serves to create "the analytic object," which is an amalgam of the transference object and the new object jointly created by the subjectivities of analyst and patient.

Critics of the new emphasis on boundary violations have expressed concern that such limits may constrict

the spontaneity of the analyst. Rigidity might prevent the analyst from engaging the patient. Attention to boundaries, however, does not promote coldness or rigidity in the analytic relationship. The intent is exactly the opposite. Professional boundaries define the parameters of the analytic relationship so that the patient can interact in an atmosphere of safety that includes an analyst who can be warm and spontaneous.

Another concern expressed about the concept of professional boundaries is that sexual boundary violations are committed by predatory analysts with severe psychopathy or antisocial personality disorders. Other analysts, the argument goes, need not concern themselves with boundaries because they are essentially ethical. Systematic studies of analysts who have had sexual and nonsexual boundary violations with patients, however, suggest that many who have otherwise been ethical and honest may be susceptible to falling in love with the patient and transgressing boundaries at a time in their lives when they are under great personal stress. Hence there is a strong argument for teaching constructs like professional boundaries and boundary violations to all analysts.

## **BOUVET, MAURICE CHARLES MARIE GERMAIN (1911–1960)**

A French psychoanalyst, Maurice Charles Marie Germain Bouvet was born August 14, 1911, in Eu (Seine-

Maritime) and died on May 5, 1960, in Paris. His father, a graduate of the École Polytechnique and a career officer, married while he was stationed in Clermont-Ferrand. It was here that Bouvet completed his secondary education and his medical studies. He did his internship between 1931 and 1932.

After arriving in Paris he was appointed a resident in 1936, a doctor at a psychiatric clinic in 1939, and made head of clinical services under Professor Laignel-Lavastine in 1940. In 1942 he served as doctor and interim director of the psychiatric hospital in Moisselles and was transferred to a hospital in Clermont in the Oise region of France from 1943 to 1945.

Because of his fragile health, Bouvet began to experience problems with his vision by 1940, which resulted in near blindness. During the Occupation he began a teaching analysis with Georges Parcheminey, soon followed by supervised analyses with John Leuba and Sacha Nacht. He became a member of the Paris Psychoanalytic Society in 1946 and was made a member on November 16, 1948. For a number of years Bouvet served as treasurer and vice president, before becoming president in 1956. During the period prior to the 1953 split in the society, Bouvet felt that liberalization of the organization was needed. However, possibly because of the analysis he was conducting with Daniel Lagache, Bouvet decided to remain neutral. He subsequently decided to remain within the society, primarily because of his medical background.

His publications had attracted notice as early as 1948. In November 1952, he was reporter for the XV Conférence des Psychanalystes de Langues Romanes, whose topic was “The Ego in Obsessive Neurosis: Object Relations and Defense Mechanisms.” In 1954 he published “La cure-type” (The standard cure) in the *Encyclopédie médico-chirurgicale*, there describing the distinction between “transference resistance” and “resistance to transference.” In that same article Bouvet expressed his fidelity to Freud, indicating that interpretation must adhere closely to the behavior of the ego. The following year Jacques Lacan’s article “Les variantes de la cure” (Different forms of therapy) seemed to supply a rebuttal to Bouvet, the only theoretician in the Paris Psychoanalytic Society who could take advantage of his growing reputation. He returned to the problems of therapy during the Twentieth International Psychoanalytic Congress, which took place in Paris in July 1957, with a report on “Les variations de la technique (Distance et

variations)” [Variations in technique: Distance and variations].

Lacan maintained his critical stance while Bouvet promoted “object relations” in 1952 and completed his study of the subject in “La clinique psychanalytique. La relation d’objet” (Clinical practice in psychoanalysis: Object relations), published in *La Psychanalyse aujourd’hui* (1959). For Bouvet the object relation represents “a flow of drive energy, a movement controlled and directed by the ego toward external objects.” He described the various aspects of object relations and their pathological states, such as phobias, obsessions, psychoses, and perversions, emphasizing the regression to oral or anal object relations in “pregenital” subjects with “weak” egos. He established a “distance relation” between the subject and its objects, which becomes greater as these are transformed by projection.

Bouvet studied these mechanisms in detail, especially in the context of obsessive neurosis, and described the states of depersonalization that occur whenever the patient is unable to defend himself through isolation because of the uncontrollable violence of his affects and the predominant anal-sadistic projection that characterizes such patients. This was the theme of the XXI Congrès des Psychanalystes de Langues Romanes in April 1960: “Dépersonnalisation et relation d’objet.” Unfortunately the decline in his health prevented Bouvet from presenting the article, which was read by Pierre Marty. Afflicted with malignant hypertension and respiratory failure, he died on May 5, at the age of forty-nine.

The analyst of André Green, Michel de M’Uzan, François Perrier—and even, for a short while, of Maryse Choisy—he was remembered through the creation of the Prix Maurice Bouvet in 1962; his publications were collected and published in 1968. As Michel de M’Uzan wrote in his introduction, “For many Michel Bouvet was a master, but a discreet master, who was as demanding in the affirmation of his knowledge as he was in his sense of freedom. Nothing demonstrates this better than the way his ideas were transmitted.”

Although he is not widely remembered today and his concepts of the object relation and standard cure have assumed negative and outmoded connotations in France (unlike the United States), he remains a key figure in the theoretical and clinical fields he investigated throughout his life.

## BOWLBY, EDWARD JOHN MOSTYN (1907–1990)

An English psychiatrist and psychoanalyst, Edward John Bowlby was born February 26, 1907, in London and died September 2, 1990, in Skye Ball, Great Britain. His childhood was divided between an urban life in London, where he was raised by nannies, and vacations in the countryside with his family. In 1938 he married Ursula Hongstaffs, a musician, with whom he had four children. He began his medical studies in 1929 in London and entered into analysis with Joan Rivière. He worked as a psychiatrist at the London Child Guidance Clinic until the war, when he joined the army. After the war Bowlby joined the Tavistock Clinic, where he served as director of the children’s center from 1950 to 1972. As Donald Winnicott’s secretary at the British Psychoanalytical Society from 1956 to 1961, he organized training sessions and research activities. From 1950 to 1972 he was a mental health consultant for the World Health Organization. In 1980 he was named professor of psychoanalysis at University College in London.

Bowlby studied psychoanalysis in order to become a child psychoanalyst. His first supervised psychoanalysis with Melanie Klein in 1937 soon revealed a fundamental difference between them: For Bowlby the environment and its role were not sufficiently accounted for in Klein’s theories. Based on his highly original clinical training (he worked with handicapped and institutionalized children) and his sensitivity to the function of the

mother-child bond and the environment, he developed the position that the instinct for preservation is as important as that of sexuality and that the mother-child bond is independent of infantile sexuality.

His admission to the British Psychoanalytical Society, which was then (in 1940) torn by the struggles between Kleinians and supporters of Anna Freud, is important. Bowlby acknowledged his connection to Anna Freud while regretting her refusal to accept the reality of trauma. In 1958, for the appearance of his article "The Nature of the Child's Tie to his Mother," Bowlby proposed a revision of metapsychology: abandonment of the theory of anaclysis, abandonment of the economic point of view, emphasis on the dynamic point of view, and definition of the unconscious as the interiorization of interpersonal experiences. He was criticized and rejected by the Psychoanalytical Society with unusual severity. Deeply wounded by the reaction of his peers, he gradually withdrew from the Society, and turned to other scientific activities then in vogue (ethology, cybernetics, and systems theory). He worked for more than twenty years on his book on attachment. It was only after 1981 that he was asked to return to analysis and develop the clinical and psychotherapeutic implications of his theory.

Bowlby's work had a tremendous impact on public health especially, in providing a better understanding of the effects of separation on young children, and the prevention of these effects. He also made numerous contributions to social science: contributions to developmental psychology and psychiatry, especially the roles of security, reciprocity, intersubjectivity, and the interpersonal development of thought in the young child; contributions to the understanding and management of borderline states; theorization of so-called non-specific factors in psychotherapy, and treatment of so-called "inaccessible" families subject to multiple risks.

## **BRAIN AND PSYCHOANALYSIS, THE**

The effort to establish the relationships between psychological functioning, the organization of the apparatus that implements it, and the working and structure of the brain, is an issue that has been raised continually since the beginnings of psychoanalysis. Psychic activity that arises wholly independent of the brain itself is inconceivable. The question is whether we can identify specific cerebral mechanisms and structures that could be said to govern those characteristics of mental functioning that psychoanalysis has discovered.

This means viewing psychoanalysis in the context of a much more general problem, that of the relationship and interaction between mind and brain. Freud was confronted with this question long before he developed an interest in psychopathology and the psychotherapy of hysteria. His work on aphasia (1891b) is part of what has been rightly described as a neuropsychological tradition (Pribram and Gill).

In the early 1890s, thanks to the anatomicopathological methods introduced by Paul Broca, it was shown that the function of language resulted from independent mechanisms that could be altered in isolation and that such specific alterations were tied to relatively localized lesions. This work, especially that of Carl Wernicke, confirmed the existence of cerebral localizations and the "modular" nature of the mechanisms involved in the exercise of particular functions. Freud, anticipating the findings of much later neuropsychology, went on to criticize the exaggeratedly modular approach involved in this conception of the brain and proposed a more comprehensive and functionalist view of cerebral activity according to which the "centers" identified would participate in carrying out their respective functions.

In 1895, in what is known as his “Project for a Scientific Psychology,” a work that remained unfinished and was later abandoned, and which was to have been titled “Psychology for Neurologists,” Freud proposed a structural and functional model based on the recently recognized concept of the neurone to describe brain functions in relation to mental activity. Like many others at the time (Gauchet), he was careful to conceive of mental activity independently of consciousness, and attempted to base his picture of psychic functioning on the model of the brain. That picture already bore the imprint of Freud’s own metapsychology, especially with respect to the assimilation of consciousness to an internal perception, the dissociation between perception and memory traces, the priority of “hallucinatory” representation over reality, and in other facets.

Freud soon abandoned any pretensions to constructing a model of the brain likely to account for the features of mental life revealed by psychoanalysis. This abandonment was strictly methodological, however, and throughout his work he firmly maintained the idea that brain mechanisms must ultimately determine these features. On several occasions, in fact, he risked drawing parallels between cerebral and metapsychological models.

Subsequently, and especially during the last four decades of the twentieth century, the considerable progress made in understanding the brain has not failed to invite speculation among psychoanalysts. Hemispheric laterality, cortical-subcortical dissociation, individualization of the limbic circuit, experiments with self-stimulation leading to the isolation of structures of positive and negative reinforcement (pleasure–unpleasure), humoral transmission systems, and so on, have resulted in research and the construction of models involving a distinct parallelism.

This immediately raises several questions. No one contests the need to postulate the existence of cerebral mechanisms, but does it follow that we need them to identify the symbolic structures (language, social structures, etc.) that influence mental development? Clearly every particular aspect of mental life can be explained by some form of psychological determinism, but what can be said about the functions of dreaming, in particular its function as a guardian of sleep? Will we ever establish any strict isomorphism between brain functions and mental functions? All such questions are still open.

More generally, a distinction may usefully be drawn between those who believe that the psychoanalytic

conception of mental life can help us understand the workings of the brain and those who feel that this understanding must involve reducing the complexity of observed mental activities to elementary cognitive mechanisms. This debate affects psychoanalysts and philosophers as well as specialists in brain physiology.

## **BRAZIL**

Psychoanalysis aroused strong resistance when it first appeared in Brazil, provoking different reactions in different milieux. Salvador-born Julian Moreira (1873–1933) was the first to speak of Freud, in 1899. In 1903 he was appointed director of the national hospital for the insane in Rio de Janeiro, where he settled for the rest of his life. An innovative psychiatrist with an international reputation, he invited his disciples and collaborators to study psychoanalytic ideas. In 1914 Jenserico Aragão de Souza Pinto published “On Psychoanalysis. Sexuality in the Neuroses.” Two conferences in 1919 awoke the interest of future psychoanalysts: Franco da Rocha’s “On delusion in general” (at São Paulo) and “Psychology of a neurologist—Freud and his sexual theories” by Medeiros e Albuquerque in Rio de Janeiro.

In the 1920s, physicians in São Paulo and Rio sometimes criticized psychoanalysis in a Manichean fashion: on the one hand it was labeled charlatanesque while being enthusiastically hailed on the other. It must also be said that psychoanalytic ideas arrived at a time of great effervescence that saw the publication of “modernist” literary reviews and the *Semana de Arte Moderna* in 1922. Influenced by the European

avant-garde, this atmosphere facilitated the acceptance of psychoanalytic ideas in São Paulo.

It was there that Durval Marcondes published several articles and Osorio Cesar wrote about the artistic productions of the mentally ill. Among Juliano Moreira's disciples in Rio, Antonio Austregesilo produced somewhat superficial work but others, such as Neves Manta, Carneiro Ayrosa, and Murilo de Campos, were doing more important work, and Deodato de Moraes was busy producing his excellent book *A psicanálise na Educacao* (1927), while J. P. Porto-Carrero continued to work on many books and articles.

Again in Rio but outside Moreira's entourage, Henrique Roxo was quoting Freud as early as 1905 but he proved to be very organicistic in his views. During the 1930s Aloysio de Paula wrote on applied psychoanalysis and Gastão Pereira da Silva, a physician and journalist, contributed to propagating psychoanalytic ideas. Mauricio de Medeiros, who occupied the chair of psychiatry in the 1950s institution, supported the psychoanalytic approach.

Although born at Alagoas, Arthur Ramos, physician and psychiatrist, was considered to be a citizen of Bahia. His thesis *Primitivo e locura* (1925) was widely commented on and, between 1930 and 1932, he studied Freud's work with a small group. He settled in Rio in 1934. A professor of anthropology and ethnography, he became a renowned specialist on Africa and wrote some psychoanalytic works. At Porto Alegre in 1924, João Cesar de Castro wrote *Concepcao Freudiana das Psiconeuroses* and in France Martim Gomes published *Les Rêves* (1928). Ulisses Pernambucan came under the influence of Juliano Moreira while studying medicine in Rio. He went on to become a pioneer of social psychiatry in Brazil and considered psychoanalysis as the subtlest means of penetrating the human mind.

In 1927 Marcondes founded the first Sociedade brasileira de psicanálise in São Paulo. Although it had no training section it was nevertheless recognized by the International Psychoanalytic Association with a view to propagating Freud's ideas. In 1928 Marcondes gave his blessing to the setting up of a subsidiary branch in Rio (V. Rocha, Marcondes, and Porto-Carrero).

Thanks to Marcondes's persistent pressure on Ernest Jones, the Jewish German psychoanalyst Adelheid L. Koch, who had been analyzed by Otto Fenichel,

emigrated to São Paulo with her husband in 1936, and in 1937 began to analyze Durval Marcondes, Darcy Mendonça Uchôa, Virginia Bicudo, Flavio Dias, and Frank Philips, soon to be joined by three more patients. Because she was the only qualified analyst, she singlehandedly conducted analyses, gave seminars and acted as supervisor. The first São Paulo Grupo psicanalítico, which she founded in 1944 with her first analysands, was provisionally accepted in 1945 as the Sociedade brasileira de psicanálise de São Paulo (SBPSP). It received definitive recognition at the Amsterdam Congress (1951).

The early days in Rio de Janeiro were not so easy. Dissatisfied with the official teaching of psychiatry, a group of young physicians founded the Centro de estudos Julian Moreira in 1944 and envisaged two possible hypotheses for the formation of a future psychoanalytic group: either to invite training analysts or seek training elsewhere. Intense correspondence with foreign analysts bore no fruit. Thus, from 1945 to 1947, Alcyon Baer Bahia, Danilo Perestrello, Marialzira Perestrello, and Walderedo Ismael de Oliveira began training at the Asociación Psicoanalítica Argentina (APA) with analysts who had qualified in Berlin, Paris, Vienna, and Buenos Aires.

In 1947 the Instituto brasileiro de psicanálise was founded in Rio in order to facilitate the legal arrival of foreign analysts. Mark Burke, analyzed by James Strachey and a member of the British Psycho-Analytic Society (BPS), arrived in February 1948. He was followed in December 1948 by Werner Kemper, a German psychoanalyst analyzed by Carl Müller-Braunschweig and who had worked during World War II in the Göring Institute before joining the DPG (Deutsche Psychoanalytische Gesellschaft). They both commenced training analyses almost immediately. In the beginning Burke and Kemper worked in collaboration with each other but in 1951 they separated amidst serious mutual reproaches. Kemper was expelled from the institute and, along with his analysands, founded the Centro de estudos psicanalíticos.

The four physicians who had gone to Buenos Aires returned between 1949 and 1950, both Perestrello and Walderedo having become associate members of the APA. Three groups were then formed: "the Argentinians," Burke's group, and Kemper's group. The "Argentine" group formed no alliances with either of the other two. When Burke suddenly left Brazil before his group had completed their training, three of his

students left for London and the others completed their supervisions at São Paulo.

During the 1953 international conference in London, Kemper's group was recognized as a study group under the sponsorship of the SBPSP, and as the Sociedade psicanalítica do Rio de Janeiro (SPRJ) at the 1955 international conference in Geneva. Its founders included seven full members (Werner Kemper, Katrin Kemper, Fabio Leite Lobo, Gerson Borsoi, Inaura Carneiro Leão Vetter, Luiz Guimarães Dahlheim, Noemy Rudolfer) and four associate members.

Three Brazilians arrived from London in 1954 and 1956 (two of them as associate members of the BPS). They became known as "the English." After a series of agreements and disagreements, the "Argentineans," the "English," and the "Burkians" finally accepted the sponsorship of São Paulo and were recognized as study groups at the Paris congress in 1957. The founders were the full members A. A. Bahia, D. Perestrello, and Walderedo I. de Oliveira (of the APA) and Henrique Mendes (SBPSP), with, as associate members, Decio Sobres de Souza and Edgar Guimarães de Almeida (of the BPS), M. Perestrello (APA), Mario Pacheco de Almeida Prado (SBPSP), and three physicians who were finishing their training at São Paulo.

At the Copenhagen congress in 1959, the group was recognized as the Sociedade brasileira de psicanálise do Rio de Janeiro (SBPRJ), with fourteen founders from different backgrounds: the eight previously mentioned, along with Luiz L. Werneck, João Côrtes de Barros, and Pedro Ferreira (already qualified with the SBPSP), M. T. Lyra (associate member of the BPS), Inaura Carneiro Leão Vetter and Zenaira Aranha (SPRJ), analyzed by Kemper. In Rio Grande do Sul, Mario Martins, Zaira Martins (1945), and José Lemmertz (1947) began their analytic training with the APA. The Martins couple returned in 1947 and Lemmertz in 1949. They qualified a few years later.

During the Edinburgh congress in 1961, the Porto Alegre study group was accepted under the sponsorship of the SPRJ. And the Sociedade Psicanalítica de Porto Alegre (SPPA) was recognized at the Stockholm conference in 1963 with, as founders, the three previously mentioned members, along with Cyro Martins (APA), Celestino Prunes, and Ernesto La Porta (SPRJ), together with José Maria Santiago Wagner (already in training at Porto Alegre). In 1946 Iracy Doyle Ferreira left for the United States and trained at the William Alanson Institute of Psychiatry (WAIP). Upon return-

ing she spread the contributions of Harry Stack Sullivan, Erich Fromm, Karen Horney, and Abram Kardiner. Around 1950 she started several training analyses and, in 1952, founded the Instituto de Medicina Psicológica (IMP), which received WAIP authorization in 1953.

On May 6, 1967, the Associação Brasileira de Psicanálise (ABP) was founded with a view to uniting the four societies recognized by the IPA in order to foster and provide assistance for future core and study groups and to publish a joint review. In 1975 the ABP created the Recife psychoanalytic core group and the Pelotas core group in 1987. Having met all the requirements of the IPA, these two groups were admitted as study groups. The Sociedade Psicanalítica de Recife and the Sociedade Psicanalítica de Pelotas became provisional study groups at the San Francisco congress in 1995. Three new study groups were recognized: the Porto Alegre group in 1992, the Ribeirão Preto group in 1993, and the Brasília group in 1994. During the Barcelona congress in 1997, the first of these groups was admitted as the Sociedade brasileira de Psicanálise de Porto Alegre. In 2005 four other core groups, located at Belo Horizonte, Campo Grande, Curitiba, and Espírito Santo were working with a view to being recognized as study groups.

Durval Marcondes, Mario Martins, and Danilo Perestrello were posthumously named honorary presidents of the ABP.

The military dictatorship (1964 to 1985) affected not only political life but also, in a direct and particularly harsh manner, the cultural life of the country. Ideas were suppressed and censorship was openly practiced in university, literary, artistic, and scientific circles, as witnessed by the events at the famous Instituto Oswaldo Cruz. The atrocities committed by groups and individuals in the name of "Institutional Acts" are known throughout the world. The psychoanalytic milieu also suffered an unhealthy influence. Although some candidates and analysts took an active part in the struggle for the redemocratization of the country, others proved to be full of anti-communist prejudice. However, some of these same colleagues, while being politically to the right, maintained a psychoanalytic position in their consulting rooms without blindly submitting to their political ideology.

In 1973 the clandestine newspaper *Voz Operária* denounced Amilcar Lobo Moreira da Silva, a candidate for the SPRJ (Rio I), as a member of the military

police's torture squad. An analyst from the other Rio society, SBPRJ (Rio II), Helena Besserman Vianna, sent the press cutting to Argentina, where it was published in the review *Questionamos*, directed by Maria Langer. The denouncement was communicated to the IPA and other psychoanalytic societies, along with the name of the candidate and his analyst, Leáo Cabernite.

This courageous denouncement was not taken seriously by Serge Lebovici, president of the IPA, or by David Zimmermann, president of the Coordinating Committee for Psychoanalytic Organizations in Latin America (COPAL), nor was it credited by the managing council for Rio I, with Leáo Cabernite as its president. It was considered to be a "rumor" and "calumny" against Amilcar Lobo. A persecution campaign was started against the person who made the denunciation (who suffered the consequences in her society) and not against its subject.

An IPA committee visiting Rio came to no firm conclusion, but in October 1980 Amilcar Lobo was definitively excluded from the SPRJ as a trainee candidate. In 1981 ex-prisoners identified Amilcar Lobo before the Commission for the Rights of Man of the Brazilian Bar Association. When questioned, the ex-prisoners provided the following statements: "Lobo did not torture people directly but he supervised prisoners' health to determine whether they could continue to be tortured or not." Sometimes "Lobo acted in two stages: firstly he evaluated vital data and checked their capacity to resist torture, then he administered medicines intravenously in order to make it easier to acquire information." In 1986 a group of prisoners appeared at an assembly of the SPRJ to confirm these accusations. In 1988, when Lobo's guilt had been proven, the regional medical council struck him off the register of physicians. The federal council later amended the suspension to thirty days. Informed of this situation, the IPA wrote to the SPRJ stating the necessity of expelling Cabernite. Cabernite had resigned not long before in "disgust" at the IPA's attitude and now asked to be reinstated. In the course of an assembly in 1993 he was reinstated by vote. Disturbed by this resolution, which they considered to be contrary to the statutes, the president of Rio I, Claudio de Campos, and his colleagues in the managing council resigned from their positions. An ethics commission was formed to study the Cabernite case. After a two-year study, a long report recommended expelling Cabernite from the society and suspending another

incriminated member, La Porta, for one year. At the end of 1995 an assembly of Rio I discussed the report and refused to accept the recommendations of the ethics commission. Six members resigned immediately. This was followed by a controversial debate, many members of the SPRJ being unable to accept this "lack of respect" for the study and efforts of the ethics commission. To highlight their difference from the leadership of Rio I without however resigning from it, they founded the Grupo Pró-Etica and published a small journal, *Destacamento*.

Other societies manifested their discontent when Cabernite was granted an amnesty, speaking of a possible sanction for the SPRJ. For several years the executive council of the IPA had not considered the Besserman-Lobo-Cabernite problem in an impartial fashion. In 1995, however, during the presidency of Horacio Etchegoyen, the executive committee rehabilitated Helena Besserman Vianna and in 1997 appointed an ad hoc investigating commission consisting of members from Europe and North and South America to study all the documents and present a report that would be available to all IPA members at Barcelona. Having heard all parties in the dispute, the executive council was to elucidate the problem in an objective manner.

In March, 1997, Cabernite resigned definitively from the SPRJ. The report considered him guilty of unethical and morally reprehensible conduct and concluded that he could not be admitted under any circumstances into any IPA-affiliated psychoanalytic society. During the Barcelona congress in July 1997, the executive council unanimously accepted and ratified the ad hoc commission's report.

Psychoanalytic ideas were first introduced at a university level by Marcondes, Bicudo, Danilo Perestrello, and Oliveira, and later by Mendonça Uchôa, Renato Mezzan, Portella Nunes, Prunes, P. Guedes, and Zimmermann. Medical (non-psychiatric) circles were pervaded with a dynamically charged atmosphere under the influence of Danilo Perestrello, Gernandes Pontes, Miller de Paiva, and Capizano, who inculcated psychosomatic concepts and accorded great importance to the physician-patient relationship, with the help of Mario and Cyro Martins, J. Mello Filho, A. Eksterman, and others. With regard to the relationship between psychoanalysis and the arts, literature, and mythology, it is essential to mention the contributions of Bahia, Cyro Martins, Meneghini, Hermann, Marialzira

Perestrello, Nosek, Oliveira, Honigsztejn, David Azoubel, and many more. Nise da Silveira conducted research into the artistic production of mental patients and created the “Museu do Inconsciente.” Some articles by these authors have become known abroad.

In 1928 Marcondes published the first and only issue of *Revista brasileira de psicanálise*, although the review reappeared in 1967 with the BPA. The SBPSP publishes the IDE review and its Institute publishes the *Jornal de psicanálise*. For two years the two Rio societies published the *Revista de psicanálise do Rio de Janeiro*. The SBPSP publishes *TRIEB* and the SPPA publishes the *Revista de psicanálise de Porto Alegre*.

It must be said that the country has other societies in addition to those affiliated with the IPA. The short-lived Sociedade de psicologia individual (Adlerian) was founded in the 1930s. In 1994, during the presidency of Horus Vital Brazil, the IMP took on the name Sociedade psicanalítica Iracy Doyle and was affiliated with the International Federation of Psychoanalytical Societies (IFPS). It publishes *Tempo psicanalítico* and *Cadernos do Tempo psicanalítico*. The Sociedade brasileira de psicoterapia de grupo was founded in December 1958 with twenty-six members and Walderedo de Oliveira as president. Following the foundation of the Associação brasileira de psicoterapia analítica de grupo, the affiliated societies changed their name to “Analytic group psychotherapy.” The Rio de Janeiro society is currently called GRADIVA. The *Círculo brasileiro de psicanálise*, founded in 1956 in southern Brazil, is affiliated to the IFPS and comprises about ten sections scattered over several cities. The Recife society publishes two reviews: *Revista psicanalítica* and *Cadernos de psicanálise*. In 1963, in Belo Horizonte, Father Malomar Lund Edelweiss founded the *Círculo psicanalítico de psicologia profunda* (Igor Caruso), affiliated with the IFPS, which in turn led to the founding of other societies.

Because the two Rio IPA-affiliated societies refused to accept non-physicians, a group of nine psychologists founded the Sociedade de psicologia clínica in Rio in 1971 with Maria Regina Domingues de Moraes as president. In 1989 it changed its name to Sociedade de psicanálise da cidade and published *Foco* and *Cadernos de psicanálise*. In 1967 Werner Kemper returned to Germany leaving his wife Kattrin and two sons in Brazil. In 1968 she left the SPRJ, followed by several of her analysands. In 1969 four of them along with four people linked to Father Malomar founded

the *Círculo psicanalítico do Rio de Janeiro* (affiliated to the IFPS), which Kattrin Kemper joined in 1972.

In São Paulo the Sedes Sapientiae, founded in the 1970s, took an active interest in social problems, organized specialist courses, a psychoanalysis department from 1985, and published *Percurso*. With a Jungian orientation, the Sociedade brasileira de psicologia analítica (founded in São Paulo in 1975) and the Associação jungiana brasileira operate in São Paulo and Rio. They are both affiliated with the International Association for Analytic Psychology.

There are many Lacanian societies. The Campo freudiano was dissolved after operating for fifteen years and, spurred on by Jacques-Alain Miller, eleven founders created the Escola Brasileira de Psicanálise do campo freudiano (EBP) in Rio de Janeiro in June 1995. The EBP is a member of the World Association of Psychoanalysis and numbers five sections and three secretariats. It would be impossible to mention all the societies and groups in the different schools: It is currently essential to maintain a certain pluralism in terms of ideas.

Following the IFPS 1989 congress, a Forum brasileiro de psicanálise was opened up to all societies with a view to reconciling different theories. Emilio Rodríguez, a former full member of the APA, has lived at Salvador (Bahia) for more than twenty years. Without belonging to any society, he is respected for his profound humanistic culture and his independent spirit.

Freud’s work has been and still continues to be the basic subject of study in the majority of Brazilian societies. As early as 1950, Kleinian ideas enjoyed great popularity in Rio and São Paulo, thanks to Decio de Souza, V. Bicudo, Philips, and Lyra, and thanks to the couple Mario and Zaira Martins at Porto Alegre. Some Rio and São Paulo analysts underwent a second analysis and attended seminars and supervisions at the British Society. Several Kleinians visited Brazil. For several years the founders and members of societies not affiliated to the IPA attended courses by Arminda Aberastury and Mauricio Knobel. Sándor Ferenczi, Karl Abraham, Wilhelm Reich, and William Fairbairn were studied in turn. Donald Winnicott has been taught since 1970. Bahia and Philips, and then León Grinberg, introduced Wilfred Bion in the 1970s, and his theories continue to receive widespread dissemination. Heinz Kohut’s self psychology has been taught since 1980. Many societies not affiliated to the IPA conduct in-depth

studies of Lacanian thought, which was not introduced in IPA societies until the end of the twentieth century. The different schools are involved in disputing the right to dispense training in a more democratic manner than formerly.

## **BREAKDOWN**

The term *breakdown* draws on Donald Winnicott's posthumous article "The Fear of Breakdown," published in 1974. Winnicott was referring to mental breakdown associated with a serious failure of the facilitating environment at such an early stage that the self is not yet capable of dealing with it, experiencing it, integrate it, giving it meaning, or retain a recognizable memory of it.

Winnicott describes the temporal paradox that results when the disaster occurs too early in the child's development to be properly experienced. The fear of breakdown is the product of the persistence of this unassimilated experience, which is perceived as a continuing permanent threat even though the disaster has actually already happened.

The interpretation according to which the feared cataclysm has already occurred gives meaning to its reactualization during the transference in response to the minor failures of the holding environment. The

breakdown emphasizes the essential fact that the loss of the object occurred before the object and self were differentiated. Here Winnicott distinguishes his own position from that of Melanie Klein: self and object exist and function during infancy. Yet, for Winnicott, the issue is not an object loss that can be metabolized through introjection (mourning) or incorporation (melancholy), but rather the subject's experience of annihilation, and mental agony.

In this way, at the end of his life, Winnicott completed his conceptualization of the pathogenic infantile deprivation in the environment before the self had had a chance to organize itself: a massive deficiency resulting in the organization of a psychosis and breaks in continuity leading to "psychotic depression." When the self is sufficiently organized, this same situation can lead to antisocial tendencies. Winnicott's "primitive agony" can be compared to the "black hole" of autism described by Frances Tustin.

In these cases, therefore, the recollection of infantile trauma is not to be found in memory traces of the event but in the subject's anguished sense of fragility.

## **BREAST, GOOD/BAD OBJECT**

The primitive ego cannot perceive or conceive of the objects in its external world as whole, multifaceted persons. Instead it lives in a world of one-dimensional objects that have either good or bad intentions towards the infant (Klein, 1932).

Abraham's concept of whole-object love was a way of talking about the integration of various impulses from all levels of development—the libidinal stages and the phases of early aggression linked with them. All these levels were, in Freud's view, linked and integrated under the dominance of the genital libido. Working with children, Melanie Klein found herself confronted with partial impulses towards objects, toys, and the

person they represented. She was impressed by how pure these relations were, either wholly hating or wholly loving.

She noticed, too, that the objects were related to as if they had similar single-minded attitudes and impulses towards the ego (Klein, 1929). Some objects were feared and hated as terrifyingly violent and punitive, and some were loved for their equal benevolence. The objects themselves had internal states and the ego was greatly preoccupied by their good or bad relations with itself. This sharply redirected her attention from the satisfactions of libidinal impulses toward the relations to objects.

The predominance of the child's hatred and fears led her at first to concentrate on the harshness of objects, and she believed it represented in play a superego of great ferocity (Klein, 1932, 1933). The multiple representations and nuances of these superego figures led her to understand that the superego was not a unitary object but a composite of many figures inside the child. Her attention, once drawn to these internal objects, expanded to recognize an internal world of good objects as well as bad ones.

With her more disturbed patients she noted the concreteness of these internal objects, good or bad. They were conceived by the child as actual physical entities roaming around inside it. She believed that this concreteness is not just explicit in children and disturbed (schizophrenic) adults, but it is also the character of a deep layer of the unconscious in all people.

Klein's observations led her to the view that oedipal configurations occurred in phantasies at a very early age. It became clear to her that the father particularly was regarded for some time as a very restricted function, called in short-hand "father's penis." This occupied mother and took her mentally and physically from the infant. It was thought that at the earliest stages mother was little more than a breast. When she fed, she was "good breast" and when she frustrated she was an evilly intentioned "bad breast." Likewise the penis inside her was a "bad penis" if it was an obstruction in the infant's way to the breast. But it could be a "good penis" if it was felt to protect mother (or the breast) for the infant. The parents as part-objects-breast and penis were believed by the infant to be in some form of intercourse defined by the infant's own phantasies. The bad parents (breast and penis) were

dangerous, threatening to destroy each other, and known as the "combined parent figure." In contrast, the infant in loving mood, could then fantasize in an intercourse of great, benign, and beautiful creativity.

Klein's point of view put great weight on the internalization of these part-objects that loved or hated the infant. Ordinary steady development and sanity depended on the internalization of the good object. This gives rise to an internal good state of mind. The ego develops a continuity in its feeling of being loved. Conversely when introjection is mostly of bad objects there ensues a state of internal turmoil, disorganization and ultimately fragmentation.

The early introjection of a good object/breast results in a benign internal state, and a growth of the ego. The object is drawn into the ego itself or assimilated to become a benign core to the personality. The ego, and the personality, tends therefore to build up from objects that are internalized and assimilated. Bad, evil objects may be internalized and remain unassimilated, constituting a permanent internal threat, often expressed in hypochondriacal complaints.

At a stage when the external objects can be perceived in a more realistic way, there is a tendency, through internalizing them as a mixed object, for the internal state to become populated by objects that are a mixture of good and bad. This poses an alarming change for the personality, known as the depressive position. Its characteristic anxiety—guilt—derives from the sense of the internal object now being a spoiled good object, damaged and with the threat of its death.

The classical Oedipus complex displays a restricted version of the polarities; the one a good source of all libidinal satisfactions, and the other hated parent, thought to be dangerous, obstructing, and castrating.

Klein's early descriptions of an internalized punitive object relate to the concept of the superego, notably a harsh one. The variety of forms of this object, in play, dreams and phantasy manifestations, led her to believe that the superego is a large repertoire of objects, only some of which had moral aspects.

The primitive experience of separating apart good and bad features of the world, does occur in Freud, notably in "Die Vereinigung" ("Negation") (Freud, 1925) where he places the origins of judgment in the narcissistic decision to take in good things and eject bad things.

Fairbairn presented a schema in which the ego, itself split, relates to three internal objects—the libidinal, anti-libidinal and ideal objects—to form three paradigm endopsychic structures. Though there is leeway for much variation in these structures, they are rather different from the free world of internal play and drama of Klein’s internal objects.

Freud’s descriptions of infancy are rooted in the drive theory and are distinct from Melanie Klein’s conception of the good and bad breast. Good and bad objects are in themselves motivated with good or bad intentions towards the ego. The latter downplays the libido theory and promotes object-relations to the center of metapsychology.

## **BREASTFEEDING**

Suckling is the action whereby milk is fed to the infant until it is weaned. By extension, the term refers to breastfeeding as well as bottle-feeding. Before an emphasis was placed on the importance of the object and the infant’s environment, psychoanalysts spoke little of maternal suckling. However, Sigmund Freud, in a text that needs to be viewed in historical context, titled “A Case of Successful Treatment by Hypnotism,” evokes the case of a young woman, “occasionally hysterical . . . who is willing to feed her infant but behaves

as if she doesn’t want to” (1892–93a). The dimension of the unconscious conflict is not taken into account here and Freud clings to the idea of will and counterwill. An outline of maternal psychopathology is given, and here the difficulties of breastfeeding are treated by hypnosis.

Suckling is not a psychoanalytic concept. In speaking of suckling we cannot forget the physical link associated with the reality of the nutritive relation. The image of the infant at the mother’s breast has considerable metaphoric and symbolic value; it is an image that makes us nostalgic for a sense of original fulfillment and can be compared with that other, “final,” image of death, as characterized by the iconography of the old man at the breast. The container, the breast, and its content, milk, are both associated with projected fantasies. The milky substance, a liquid that contrasts with the solidity of the breast, is a vehicle of fantasies of fusion and vampirism. Once the infant’s teeth begin to grow, the fantasies are those of oral sadism and cannibalism. There is an analogy to be made between the breast and the penis, between milk and sperm, one of which nourishes and one of which fecundates, and at the same time an incompatibility because sperm is, in fantasy at least, supposed to spoil milk; thus there is a separation between the sexual and the nutritive.

A dichotomy has always existed between the breast as a nourishing object and the breast as an erotic object, a separation that helps avoid the confrontation between an incestuous mother and the importance of maternal libidinal and erotic investment. However, in *The Interpretation of Dreams* (1900a), commenting on the “dream of the Fates (*Knödel*), Freud wrote that “at the woman’s breast love and hunger meet.” For the breast satisfies both the alimentary and the sexual impulses: “To begin with, sexual activity attaches itself to functions serving the purpose of self-preservation and does not become independent of them until later. No one who has seen a baby sinking back satiated from the breast and falling asleep with flushed cheeks and a blissful smile can escape the reflection that this picture persists as a prototype of the expression of sexual satisfaction in later life” (1905d). The nipple is a sexual object throughout Freudian metapsychology. The transition from sucking the nipple to sucking is a key moment in the organization of the earliest feelings of autoeroticism and investment of the mouth as an erogenous zone. Freud does not mention (Laplanche, 1997) the erogenous erotic component for the mother during breast-

feeding. For the infant the breast assumes (secondarily) its forbidden erotic value with the organization of the oedipal conflict; initially the infant simply “is the breast” (Freud, 1941f [1938]), during a period of primary identification with the breast and primal fusion.

It has become obvious that the object plays a key role in enabling the polarization of the libido into certain zones. This follows their unification when the infant is breastfeeding and the libido experiences a sense of satisfaction, at a time when the mouth that sucks and the nipple that nourishes are inseparable and indistinguishable. The mother “(moreover) makes a gift to the infant (while she is lavishing her attention on him) of feelings arising from her own sexual life . . . and clearly grasps these as a substitute for a separate sexual object” (1905d). Freud returned to this position and developed it in his *Outline of Psychoanalysis*: “She is not content to nourish, she cares for the infant and thus awakens in him many other physical sensations, agreeable and disagreeable. Thanks to the care she lavishes, she becomes his first seductress. Through these two relations, the mother acquires unique importance, incomparable, unalterable, and permanent, and becomes for both sexes the object of the first and most powerful of his loves, the prototype of all later amorous relations” (1940a [1938]).

The role of the object and precocious maternal seduction as it occurs through breastfeeding are questioned by contemporary analysts. Jean Laplanche (1987) has developed the idea that sexuality is implanted in the infant through the initial seduction of the adult, and emphasizes the unconscious sexuality of the seducer. From this follows the possibility of a significant reassessment of the role of the impulses, the role of the object, and anaclysis; he also raises the question of the primal. For Paul Denis the question of mastery is present at the heart of the initial experiences of feeding, but the encounter between the mouth and the nipple, to the extent that it combines kinesthetic and sensory feelings, instinctual excitation and pleasure/unpleasure, is an essential period during which the activity of the initial representation takes place (the “pictogram” of Piera Aulagnier, 1975). For authors such as Esther Bick, the emphasis is on the presence-absence of the breast during this primitive stage of undifferentiated autosensuality characterized by the encounter between mouth and nipple. The role of the object remains essential for enabling the consensual union and unification of the libido. The mother’s container function is experienced as a “skin”: “The

optimal object is the nipple in the mouth, together with the mother’s touch (holding), speech, and familiar odor” (1968).

With respect to bottle or breastfeeding, Freud responds only in terms of privation. In all cases there remains a feeling of “having sucked too little and for too short a time,” the nostalgia for the breast being stronger for the child who has been bottle-fed (1940a [1938]). Melanie Klein (1952), writing about breast- and bottle-feeding, returns to the question of the primacy of the object and instinct, the importance of the exterior object and the reality of the breast. For her the breast is the object of intense fantasized projections because it is a primordial object. The cannibalistic oral impulses directed toward the mother’s breast are especially intense. As for the mother, the fact of feeding her baby has a restorative effect because it terminates the sadistic fantasies with respect to her own mother: “The nourishing and beneficial milk she dispenses signifies for the unconscious that her sadistic fantasies have not been realized and that their objects have rediscovered their integrity” (1932).

For Donald Winnicott breastfeeding is expanded to the baby’s environment in the broad sense and to the richness of the experience the mother offers. The quality of maternal holding and handling is essential, for these are both a function of the mother’s internal conflicts and of her own infantile experiences. The foundations of psychic health depend on this “facilitating environment.” The experience of the survival of the object in the face of the baby’s attacks seems to her essential and in the end helps her advance the idea of difference “between the survival of a part of the mother’s body and the survival of a bottle” (1987). Although he is cautious when discussing mothers and does not dismiss the unconscious maternal implications, he emphasizes the importance of the carnal reality of the experience of the breast; in this body-to-body relation, the exchange of glances and the sensual experience are essential to communication.

Breastfeeding is a situation that so profoundly involves the mother’s body and psychic life that it is subjected to the unconscious conflicts that affect the mother and to the fantasies awakened through the encounter between a specific mother and a specific infant. Suckling extends the period of pregnancy and birth and is inseparably a part of the woman’s sexual life and her life history. Primitive psychic activity is associated with these very first contacts that are always difficult to conceptualize.

Psychoanalysts who care for infants are conscious of this in their clinical activity and research.

The invention of the bottle (1820), followed by the introduction of sterilization (1892–1898), have profoundly altered breastfeeding. Artificial milk eliminates the need for direct recourse to another woman, in the position of wet-nurse, and the baby's survival (in reality) no longer depends on the product of the mother's body. The transition from mother's milk to artificial milk, while it abandons its natural origins, cannot be assimilated to the transition from raw food to cooked food discussed by Lévi-Strauss. But how can social and cultural ideology be made to mesh with unconscious maternal choices?

## **BRENTANO, FRANZ VON (1838–1917)**

Franz von Brentano, a German Dominican philosopher and theologian, was born in Marienberg in 1838 and died in Zürich in 1917. His ideas influenced Edmund Husserl and Martin Heidegger. It was in 1874, the year Brentano published his *Psychologie vom empirischen Standpunkt* (Psychology from an empirical standpoint), that the young Sigmund Freud, an eighteen-year old student, wrote to his friend Eduard Silberstein[RB1], "I, a doctor and atheist empiricist, I have signed up for two courses in philosophy . . . One of the courses—you will be amazed when you hear this—concerns the existence of God; Prof. Brentano, who is teaching the course, is a man, a thinker, and a marvelous philosopher." On March 7, 1875, he added, "Both of us (me and Paneth) have grown closer to him, we sent him a letter with our objections and he invited us to his home, refuted us, seemed to take an interest in us. . . . Concerning this remarkable man (he is a believer, a teleologist [!] and a Darwinist, and damned intelligent, even brilliant), who in many ways satisfies the requirements of the ideal, I will have much to tell you in person. But I can give you this piece of news now: under Brentano's influence especially (which has had a maturing effect), I have made a decision to sit for the doctorate in philosophy and will study philosophy and zoology."

The most detailed report of the visit to Brentano shows how he influenced Freud: "He totally condemns [Herbart's] a priori constructions in psychology and feels that it's unforgivable that he never thought of considering spontaneous experience or provoked experience to see if they confirmed his gratuitous

hypotheses; he claims unhesitatingly to belong to the empirical school, which applies the method of natural science to philosophy and, in particular, to psychology (this is, in fact, the principal advantage of his philosophy, the only thing that makes it bearable for me), and he revealed to us several interesting psychological observations that show the inanity of Herbart's speculations. According to him, it is more necessary to submit certain specific problems to more extensive research, in order to achieve definite partial results, than to claim to embrace philosophy as a whole, which is not possible, given that philosophy and psychology are still young sciences, which cannot expect any support, especially from physiology."

Aside from the affirmation of empiricism and the primacy of observation and experiment that Freud would never forget, the meeting with the Catholic theologian is the only time that Freud, "an atheistic Jew," had a momentary metaphysical hesitation. He described the experience as follows: "Ever since Brentano imposed his God on me with ridiculous facility, through his arguments, I fear being seduced one of these days by proofs in favor of spiritualism, homeopathy, Louise Lateau, etc. . . . It's a fact that his God is nothing but a logical principle and that I have accepted it as such. Yet, we proceed down a slippery slope once we acknowledge the concept of God. It remains to be seen at which point we stumble. Moreover, his God is very strange. . . . It is impossible to refute Brentano before hearing him out, studying him, exploring his thought. Confronted with such a rigorous dialectician, we must strengthen our intellect by addressing his arguments before confronting him directly."

Freud's connection to philosophy lasted longer than this first contact, and it was Franz von Brentano who suggested to Theodor Gomperz, five years later, that Freud translate the twelfth volume of the *Complete Works* of John Stuart Mill (1880a), which contained "On the Emancipation of Women," "Plato," "The Social Question," and "Socialism."

### **BRETON, ANDRÉ (1896–1966)**

A French poet, the founder and theoretician of the surrealist movement, André Breton was born February 19, 1896, in Tinchebray, France, and died in Paris on September 28, 1966. Until he was four years old, Breton was raised in Brittany by his maternal grandfather. Nostalgia for those early years of astonishment, fear, and surprise never left Breton. In 1907 he entered the Lycée Chaptal in Paris. In 1913 he began studying medicine, published his first verses, and established literary friendships, first with Paul Valéry, followed by Guillaume Apollinaire and Pierre Reverdy.

Mobilized in 1915, in July 1916 he asked to be assigned to the army's neuropsychiatric center in Saint-Dizier. This period had a "decisive influence" (*Conversations*, 1952) on Breton. As a student of medicine, he observed his patients with close attention. He developed a strong interest in psychiatry and in Freud, whose ideas he encountered for the first time in Emmanuel Régis's *Précis de psychiatrie*. As a poet he began to ask questions about literary creation. The discourse of madness contained striking images, how did these come into being? How did madmen and poets develop their language? What was the relationship between subject and object embodied in language?

Freud provided a response to these fundamental questions but Breton had access to them only in the form of Régis's introduction. As a result his concept of Freudian analysis was distorted. Although Breton understood the role of the libido, the conflict between desire and censure, and the dream work that provides insight into the artistic process, he believed with Régis that the analytic method was a mechanized collection of the subject's verbal outpourings, which he repeated as they popped into his mind, like a "recording device"

(Régis). This was a formula Breton was to use in his *Surrealist Manifesto*: “We ... who have turned ourselves into ... modest recording devices in our art ...” (1924). Transference, the analyst’s suspended attention in the face of the representations supplied by the subject or their interpretation, dream associations, all of this disappeared. Although Breton continued his medical training until 1920, he was not interested in therapy. His meeting with Freud in 1921 had no affect on him (1924). The problems he wanted to resolve were different: “There is the entire question of language.” (1919)

With psychoanalysis, Freud provided Breton with a theory of language. “Those verbal representations that Freud claims are ‘memory traces arising principally from acoustic perceptions’ are precisely what constitute the raw material of poetry” (1935). The poet as dreamer is the “receiver of Indirect Contributions” supplied by the figurative activity of the preconscious mind, where representations of words and things make contact with one another. He “yields to the collage” of associations (1919). This leads to the creative experiments Breton conducted from 1919 to 1924 (automatic writing, hallucinosis, half-sleep, automatic writing, and others), which found a large number of applications in literature.

In the *Surrealist Manifesto*, Breton condensed the theoretical conclusions he drew from his experiments. This was the founding text of the surrealist movement that did so much to introduce Freudian ideas to France and elsewhere. Although Breton used Hegelian dialectics to criticize Freud (*Communicating Vessels*, 1932; the republication of 1955 contains three letters from Freud to Breton), he continued to study him (*Carnet*, 1921, *Cahier de la girafe sur la Science des rêves*, 1931, *Position politique du surréalisme*, 1935, *Anthology of Black Humor*, 1940) and emphasize the importance of his thought. “Surrealism ... considers the Freudian critique of ideas ... to be the first and only one with a basis in fact” (1930).

## **BREUER, JOSEF (1842–1925)**

Josef Breuer, an Austrian doctor, was born January 15, 1842, in Vienna, where he died on June 20, 1925. Breuer, the son of a liberal Jewish professor of theology, studied medicine in Vienna and obtained his degree in 1864. He served as an assistant in internal medicine to Theodor Oppolzer, and worked on heat regulation and the physiology of respiration (Hering-Breuer reflex); upon becoming a practitioner in 1871, he set up his practice in Vienna. He also conducted research on the function of the inner ear (Mach-Breuer theory of the flow of endolymphatic fluid) and, although he became a specialist in internal medicine in 1874, he returned to his research in 1884.

He was the friend and family doctor of several members of the Vienna Teachers College and of Viennese high society. He maintained a correspondence with artists, writers, philosophers, psychologists, and colleagues in his field, and in 1894 was elected a corresponding member of the Academy of Sciences. Well versed in philosophy, Breuer was interested in the theory of knowledge and the theoretical foundations of Darwinism (1902 conference, exchange of letters with Franz von Brentano). He was an active participant in discussions on the foundations of politics and ideology, and discussed issues of art, literature, and music. As an assimilated and enlightened Jew, he adopted a kind of pantheism that he derived from Goethe and Gustav Theodor Fechner. His favorite aphorism was Spinoza’s *suum esse conservare* (preserve one’s being). He was gripped by a form of skepticism and spoke, following William Thackeray, of his “demon ‘but’,” which forced him to question any newly acquired knowledge. Because of his detailed knowledge of the history of ideas and social history, his appreciation of the political conditions of his era, as well as for reasons having to do with his own life, he believed it was nearly impossible for him to undertake a questionable action.

Underlying Breuer's research on physiology was the quest for the relation between structure and function, and thus for a form of teleological query. He was particularly interested in regulatory processes in the form of self-control mechanisms. Unlike a number of physiologists in the so-called biophysicalist movement, inspired by Ernst Brücke, Hermann von Helmholtz, and Emil Du Bois-Reymond, Breuer believed in neovitalism.

In 1880–1882 Breuer treated a young patient, Bertha Pappenheim (Anna O.), for a nervous cough and a multitude of other hysterical symptoms (mood swings, alterations in states of consciousness, visual disturbances, paralysis and contractions, aphasia). During the many long interviews, doctor and patient saw that some symptoms disappeared when the memory of their first appearance returned and could be reproduced, and the associated affects could be awakened and abreacted. This occurred at specific times of day, during spontaneous auto-hypnotic states. Based on these observations, initially accidental, patient and doctor developed a systematic procedure whereby the individual symptoms were gradually recalled during their appearance in reverse chronological order, until they disappeared for good following a reproduction of the original scene. Sometimes artificial hypnosis was used during therapy if the patient was not in a state of auto-hypnosis. The patient, who at times “forgot” her native language and understood only English, jokingly referred to this therapy as the talking cure, or chimney sweeping.

During the therapy, a stay at a clinic near Vienna was required because of the patient's heightened risk of suicide. In spite of the apparent and surprising success of the method, certain manifestations remained. These included the temporary loss of her native language and violent neuralgia of the trigeminal nerve, which required morphine treatment, leading to addiction. Because of her symptoms Breuer had his patient admitted for further treatment to Dr. Ludwig Binswanger's Bellevue sanatorium in Kreuzlingen in July 1882. She left in October, improved but not fully cured (*Histoire de la maladie*, in Hirschmüller, A. 1978). She lived until 1888 in Vienna, was treated on several occasions, then moved to Frankfurt, where she had an active life as a writer, social worker, defender of women's rights, and a leader of the movement of Jewish women in Germany (Jensen, E. 1984; Tisseron, Y. 1986; Heubach, H. 1992).

In 1882 Breuer discussed the case with his colleague Sigmund Freud, fourteen years his junior. Freud tested Breuer's method on patients after he began working as a neurologist. Starting from the theories of Jean Martin Charcot, Pierre Janet, August Ferdinand Möbius, Hippolyte Bernheim, and others, they jointly developed a theoretical framework for the operation of the psychic apparatus and for their therapeutic procedure, which they called the “cathartic method” in reference to Aristotle's ideas about the function of tragedy (catharsis as the purification of the spectators' emotions). In 1893 they published a preliminary report entitled “On the Psychic Mechanisms of Hysterical Phenomena”. This was followed two years later by the *Studies on Hysteria*, the “cornerstone of psychoanalysis” (Ilse Grubrich-Simitis), establishing the foundations of the field. There was a chapter on theory (Breuer), a chapter on therapy (Freud), and five case histories (Anna O., Emmy von N., Katharina, Lucy R., Elisabeth von R.).

Freud continued to develop the theory and technique as they developed the work jointly (defense neuroses, free association). Breuer was not convinced by the exclusive emphasis on sexual factors and Freud saw Breuer's caution as a sign of aloofness. In 1895 the distance between the two men increased, resulting in the end of their collaboration. Breuer continued to take an interest in the development of psychoanalytic theory but abandoned cathartic therapy. Freud later proposed the hypothesis that Anna O.'s treatment had been suddenly interrupted because of a violent erotic transference, accompanied by hysterical pregnancy and childbirth. This version of events, constructed retroactively by Freud and spread by Ernest Jones, among others, cannot withstand historical scrutiny. More recent attempts to show that the description of the case of Anna O. was a “fraud” (Mikkel Borch-Jacobsen) are a form of unsubstantiated polemic.

### **BRIERLEY, MARJORIE FLOWERS (1893–1984)**

Marjorie Flowers Brierley, British psychoanalyst, was born on March 24, 1893, and died on April 21, 1984.

Entering University College, London, in 1916, she gained her BSc Hons (first class in psychology) in 1921, and her MB BS in 1928, registering as a medical practitioner in 1929. Concurrently, she trained with the British Psycho-Analytical Society, having personal analysis with John Carl Flugel (1922–1924), and Edward Glover (1925–1927). She was "passed for practice" in October 1929, becoming a full member in 1930, and training analyst, control analyst and lecturer to students in 1933.

In 1922 she married William B. Brierley, botany professor at Reading University, formerly husband to Susan Isaacs.

Between qualification and the late 1940s she served actively on many committees of the British Society, including the Training Committee and Board and Council, and helped organize the Controversial Discussions of 1943–1944 (King, Pearl, 1991). She read thirteen papers to the Society and published eleven papers, thirty-one book reviews and twenty-four abstracts in the *International Journal*, and one book. In 1954 her husband retired and they moved to the country, whence she published twenty-six further book reviews and two articles, continuing as assistant editor of the *International Journal* until 1978.

Her earliest psychoanalytic publications, two papers on the then-topical subject of female development (1932, 1936), were notable for scholarship and independence; Brierley was, though not aggressive about it, one of those who differed from Freud. Her book, *Trends in Psycho-Analysis* (1951), contained versions, sometimes revised or expanded, of all her other papers of 1934–1947. These included "Affects in Theory and Practice," a concise and original review, which aimed to restore affects (which had never lost their importance in psychoanalytic practice) to their consonant place in theory, which had lapsed into disuse after Freud focused more on repressed unconscious and instinct theory. The chapter "Problems Connected with the Work of Melanie Klein" derived from her papers "A Preparatory Note on Internalised Objects," and "Internal Objects and Theory," and on contributions Brierley made to the Controversial Discussions.

Valuing the great enrichment of Klein's new ideas of infantile phantasy and object relationships, she acutely explored problems concerning *inter alia* precocity, regression, and differences between stages, as well as terminology confusing concept and phantasy conceptually. A later chapter extended this differentiation to describe two independent aspects of psychoanalytic theory, the abstract objective, "Metapsychology," and the subjective, which she named "Personology." Later sections explored metapsychology as "Process Theory," and many other aspects and ramifications of psychoanalytic thinking.

John Bowlby described Brierley as "[p]robably having a better grasp of scientific principles than anyone else" (King 1991), regarding her 1937 paper on affects. This paper was considered "seminal" and as "opening a new era in understanding," when the 1977 International Congress took "Affect" as its main theme. Calm and open-minded, she contributed significantly towards the partial resolution of acrimonious disputes within the British Society prior to and after the Controversial Discussions. During them, her clarifying contributions were much valued by both sides. Her writings are remarkable for concision, clarity, scholarship, intelligence and great intuitive sensitivity.

### BRILL, ABRAHAM ARDEN (1874–1948)

The American psychiatrist Abraham Brill was born on October 12, 1874, in Kanczuzg, Austria (then Galicia) and died on March 2, 1948, in New York City.

His father was a noncommissioned officer in the Austrian Army who served with Maximilian in Mexico. After spending his childhood in Austria, Brill emigrated to the United States in 1889 at age fifteen, without his family and with almost no money. He worked to support himself through high school and college, graduating from New York University in 1901. He received an MD degree from the College of Physicians and Surgeons, Columbia University in 1904.

Brill worked as a psychiatrist in the New York State Mental Hospital System at the Central Islip State Hospital under the tutelage of Adolph Meyer and August Hoch. From 1902 to 1907, he traveled in Europe, first to Paris and then, at the suggestion of Frederick Peterson, to Zürich; there he learned about Freud's new science, psychoanalysis, from the staff of the Burgholzi Psychiatric Clinic (which included Eugen Bleuler and Carl Jung). He returned to America a year later and accepted a position as assistant physician of mental disease, Bellevue Hospital, which he held until 1911. In 1909 he attended the Clark University Conference, traveling with Freud's party from New York. He became the first practicing psychoanalyst in America and interested a small group of New York psychiatrists in psychoanalytic ideas.

In 1911, Sigmund Freud urged Ernest Jones to establish the American Psychoanalytic Association (APA) with James Jackson Putnam as president, and Brill as secretary. Brill refused to participate and instead, on February 12, 1911, with fifteen other physicians, founded the New York Psychoanalytic Society,

several months before the APA was established in May of that year. From that time to the close of the First World War the New York Psychoanalytic Society was kept alive, practically single handedly, by Brill. He was the expositor and public advocate of psychoanalysis par excellence. He spoke at medical, neurological, and psychiatric societies, and to lay groups as well. He lectured to social workers, the New York City Police College, the Education Department of NYU—many of these lectures were reprinted in professional journals and lay publications. During the 1930s he presented a weekly radio broadcast lecture on mental health themes.

Of greatest importance for the dissemination and promulgation of psychoanalytic ideas in America were Brill's translations. Brill translated into English the major work of Sigmund Freud, some of Carl Gustav Jung's works, and Bleuler's *Textbook of Psychiatry*. His own publications included numerous journal articles and important books, including *Psychoanalysis* (1921). His *The Basic Writings of Sigmund Freud* was published in 1938.

Abraham Arden Brill's importance to psychoanalysis was also as a leader of both psychoanalytic and psychiatric institutions. Brill became a member of the APA in 1914. He served as president of the APA in 1919 and 1920 and again from 1929 to 1935. He was president of the New York Psychoanalytic Society from 1911 to 1913 and from 1925 to 1936. His influence on psychoanalysts both in New York and the United States was at its zenith between 1929 to 1936. During this period he played a central role in restricting membership in the New York Society and in the APA to physicians. He defied Freud, who was supportive of lay analysis, because of his concern about "quackery," medical treatment by poorly trained or unauthorized practitioners. It was Brill's conviction that the survival of psychoanalysis in the United States depended on maintaining its medical identity.

Brill also played an important role in achieving autonomy for the APA within the International Psychoanalytic Association (IPA). These organizational and credential principles were maintained until overturned by the settlement of a lawsuit brought against the IPA, the New York and Columbia Psychoanalytic Institutes, and APA by a group of psychologists in the 1980s. From the years immediately preceding World War II and until his death in 1948, Brill was displaced first by the Americans Bertram Lewin and Lawrence Kubie, and then by the Viennese psychoana-

lysts who emigrated to New York to escape Nazi persecution. However, he remained a proud and respected figure who more than any other psychoanalyst was responsible for the growth of psychoanalysis in the United States.

## **BRITISH PSYCHO-ANALYTICAL SOCIETY**

The London Psycho-Analytical Society, formed in 1913, was composed of thirteen members, only four of whom worked as psychoanalysts, while others agreed with Jung. On February 20, 1919, ten members interested in Freud's work agreed to disband that group and to re-form it as the British Psycho-Analytical Society. They decided only to accept as members, those who were interested in and practiced psychoanalysis. The members elected Dr. Ernest Jones as president and decided that members and associate members should be elected. They drew up rules for the Society, and in 1924 the Institute of Psycho-Analysis (IPA) was set up to hold property, to deal with financial and other matters concerning publication. Later the Institute became responsible for the administration of the Clinic and of training activities. The officers of the Society were responsible for the scientific activities of members and were its link with the IPA.

In 1926, the London Clinic of Psychoanalysis was established. Members gave one session a day freely to the Clinic, for the next thirty years. It was disclaimed from the National Health Service (NHS) in 1948–49 and it is still an independent clinic. As membership increased, so the committee structure expanded, and after 1946 committees were governed by the "Gentleman's Agreement." In September 1972 the Society was registered as a Charity: No. 264314.

By 1920 there were thirty members and associate members of the British Society. During the 1920s several members of the British Society went to Europe for

analysis with Freud, Hans Sachs, Karl Abraham and Sandor Ferenczi. The approach of these analysts influenced the British approach to psychoanalysis. By 1925 there were fifty-four members of the Society, who came from a number of professional disciplines, among them were psychiatrists, medical practitioners, teachers, graduates and "gentlemen scholars." In 1927 Melanie Klein became a member of the Society and she brought with her various scientific differences with the Viennese, and especially with Anna Freud.

After 1933 the growth of anti-Semitism under Hitler put the lives of Jewish psychoanalysts in danger, first in Germany, and then from 1938 in Austria. Many became refugees, and some of them, including the Freuds, accepted membership of the British Society, to the great enrichment of psychoanalysis in London. Originally, to become a member, associates read a clinical paper to the Society or to a Panel, but since 1975, they have had the option of taking a two-year membership course.

In 1925 at the Bad Homburg Congress in Germany, the first Conference of delegates from branch societies took place and agreed that training should be the responsibility of a training committee and not of an individual. In 1926, the British elected their first training committee and formalized their training. The need for medical qualifications was discussed but most members of the Society supported Freud's point of view against this requirement.

Disagreements in the British Society and criticisms of Melanie Klein's theories led to the "controversial discussions," which were concerned with what kind of psychoanalysis should be taught to students. Following these discussions, Glover resigned from the Society and Anna Freud resigned from the training committee. When Sylvia M. Payne was elected as President in 1944, she suggested a change in the training program in order to include Anna Freud's approach to psychoanalysis. Training was divided into Course A, which catered to the majority of the British Society (i.e. the Middle Group and the Kleinians) and Course B, which catered to Anna Freud's approach. In order that no one group could dominate the others, it has been agreed that all committees contain representatives of each group. This was not written down in the Society rules, so it was called the "gentlemen's agreement." Groups are now designated as Kleinian, Independent (Rayner, 1991), and Contemporary Freudian.

These earlier training arrangements were revised in the early 1960s when a separate curriculum committee was set up alongside the training committee. Later in 1973, after much research, a new structure was agreed upon, which allocated aspects of the training process to separate sub-committees, whose chairmen were members of the policy-making education committee. Training takes place primarily in London, although special arrangements have been made for selected students from Scotland and Northern Ireland to be trained as psychoanalysts.

Since 1919 the scientific and clinical interests of members have included the role of anxiety, hostility and aggression, the theory of symbolism, character problems, the origin and structure of the superego, problems of psychoanalytic technique, a psychoanalytic theory of psychoses, and the psychoanalysis of children. They also applied psychoanalytic understanding to the arts, educational, and social issues.

Interest in the early development of infants and the possibility of analyzing them increased with the move of Klein to London in 1927. Her ideas started to have implications for work with adult patients, which some members considered to be incompatible with Freud's approach. Klein's critics objected to her use of fantasy, her interpretation of Freud's concept of the death instinct, and her concept of internal objects. When Anna Freud and her colleagues arrived in 1938, they joined Klein's critics. Between 1942 and 1944 Scientific Meetings were arranged to explore these differences, after which members agreed to differ within the context of the gentleman's agreement (King and Steiner 1991).

After the Second World War the scientific life of the Society continued to be characterized by interest in child analysis, psychotic and borderline conditions and the application of psychoanalysis to the arts and social issues. The division into three groups created at times serious disagreements, but properly contained they contributed to the creativity and liveliness on the scientific life of the Society. In the early twenty-first century, the scientific differences between members have decreased, and interest now centers on technique and the "here and now" of the analytic relationship rather than on the elucidation of theoretical issues and concepts.

As papers on applied subjects were seldom read at Scientific Meetings, in 1968 a special Section was set up that became known as the "Applied Section." Through this section and courses of public lectures,

alongside the Annual Ernest Jones Lecture, links have been made with colleagues from other professional disciplines.

During the 1920s, Susan Isaacs did research on the social and intellectual development of young children in the Malting House School, Cambridge (Isaacs 1933). In 1932, Edward Glover carried out and later published research on the way members of the Society worked as psychoanalysts (Glover and Brierley 1940). In 1957, the Research Committee was set up to facilitate applications for members' research. Interest also centers on the conceptualization in statistical terms of the outcome and effectiveness of psychoanalysis. In 1981, the Erich Simenauer Foundation was set up, through the generosity of the late Prof. Simenauer, who was an Honorary Member of the Society, to support and encourage psychoanalytic research work.

After Ernest Jones died, his remaining papers were given to the Archives of the Society. They cover his work for the International, as well as for the Society. When Pearl King became honorary archivist, she began to index the Archives on a computer database. This is an ongoing task. The Archives have become an important center for research into the history of psychoanalysis.

In 1920, the *International Journal of Psycho-Analysis* started publication—the first psychoanalytic journal in the English language. A Glossary Committee of Joan Riviere, James and Alix Strachey, and Ernest Jones, worked in collaboration with the Freuds on the task of translating Freud's work and concepts from German into English. In 1924, The International Psycho-Analytical Library was started with the Hogarth Press. In 1986, the Institute launched The New Library of Psychoanalysis in cooperation with Tavistock and then Routledge.

Following the Second World War, the Society sponsored the translation of Freud's complete psychological works into English and their publication in twenty-four volumes as the *Standard Edition*. James Strachey carried the main responsibility for this great achievement, with the help of Anna Freud (Steiner 1987). A revised Standard Edition is planned; it is to include matter from previously unknown papers, corrections, and a glossary of German words having controversial translations.

Professional and public concern with the legitimacy of psychoanalysis as a medical specialty led the British Medical Association in 1927 to set up a committee to investigate it. After meeting for two years, they agreed

not to oppose the use of psychoanalysis, by those trained by the Institute of Psycho-Analysis, as a treatment for mental illness. Since then the Society has presented evidence to a number of Royal Commissions.

In 1956, on the centenary of Freud's birth, the London County Council placed a commemorative plaque on the house where he had lived in Maresfield Gardens, Hampstead. In 1986, following the death of Anna Freud, this house was opened by Princess Alexandra as the home of the Freud Museum. In 1975 David Astor donated the money for a Freud Professorship at University College, London. Initially, the professors were appointed annually, but in 1984 Dr. J. J. Sandler was appointed as the first full-time Freud Professor. The Society built up close links with hospitals in the NHS, especially with the Tavistock Clinic and the Cassel Hospital, which resulted in their facilitating the training of psychoanalysts who were on their staff. The Society also supported the Anna Freud Center in its training of child psychotherapists and child psychoanalysts.

Several members of the British Psycho-Analytical Society have held important professional roles in the psychoanalytical world: Ernest Jones, William H. Gillespie, Adam Limentani and Joseph Sandler were presidents of the IPA. The Society has organized four IPA Congresses: in Oxford in 1929, in London in 1953, in Edinburgh in 1961 and in London in 1975. The Society was responsible to the IPA for the Sponsoring Committees for Australia and Canada, and it has trained candidates from many countries.

Joseph Sandler and Anne Marie Sandler were Presidents of the European Psychoanalytical Federation. Since 1969, every two years the Society has organized the English Speaking Conference for European psychoanalysts.

## **BRÜCKE, ERNST WILHELM VON (1819–1892)**

A German doctor and physiologist, Ernst Wilhelm von Brücke was born June 6, 1819, and died January 7, 1892, in Vienna. The son of a portrait and historical painter, following his mother's premature death he was raised by his uncle, the superintendent C. Droyesen, in Stralsund. He studied medicine in Berlin and Heidelberg in 1838 and became a doctor of medicine in Berlin in 1842. In 1843 he became an assistant to Johannes Müller at the Museum of Comparative Anatomy and a prosector; in 1846 he also served as a teacher of anatomy at the Academy of Fine Arts in Berlin.

Brücke completed his degree in physiology in 1844 and was appointed full professor of physiology and general pathology in Königsberg, and professor of physiology and (microscopic) anatomy in Vienna, where he held the chair of physiology for forty years, until his appointment as professor emeritus in 1890. He was ennobled in 1873 and became rector of the University of Vienna in 1879. He was a member of the Academy of Sciences, the Prussian Order of Merit, and the Upper House of Austria, and received numerous decorations and honorary distinctions. As a co-founder of the Physics Society in 1845 (the Berlin and later the German Physics Societies were offshoots of this organization), he was, along with Emil Du Bois-Reymond, Hermann von Helmholtz, and Karl Ludwig, one of the defenders of organic physics, which, in contrast to the then-dominant vitalist tradition, held that all vital manifestations were the result of physico-chemical forces in the organism.

Brücke was the most learned physiologist of his time and helped enrich several areas of natural science. He was active in the physiology of optics, the physiology of

plants, the physiology of digestion, of the blood, the nerves, and the muscles, cellular physiology, biochemistry (the purification of pepsins, which led to our understanding of enzymes), the physiology of speech, and even linguistics. His many publications included the two-volume *Vorlesungen über Physiologie* (Lessons on Physiology; 1873, 1874). Brücke's laboratory was a place where fundamental research on the exact sciences of nature was carried out and he introduced a new methodology to the Vienna school of medicine, which was strongly influenced by his work.

Sigmund Freud, who described Brücke as the "highest authority who has ever had an influence on me," worked in Brücke's laboratory between 1876 and 1882. His earliest writings on neurophysiology are based on his work there and Brücke's influence is clearly evident in Freud's earliest theoretical writings on psychoanalysis. Brücke, who had sponsored Freud for a professorship, referred, in his letter of recommendation, to Freud's work on neurology as being "very important." He also helped Freud obtain the travel stipend that allowed him to work with Charcot in Paris.

## **BRUN, RUDOLF (1885–1969)**

Rudolf Brun was a Swiss physician, a neurologist, holder of the chair of neurology (1940), and member of the Swiss Psychoanalytic Society. He was born March 15, 1885, in Zurich, where he died on January 14, 1969. Brun was born into a family of

Huguenots. His father was a professor of art history in Zurich. As a young man Brun studied in Zurich, completing his medical studies in Zurich, Geneva, and Algiers. Upon leaving school in 1909, he became an assistant to C. von Monakow (clinical work and brain anatomy) at the Zurich Neurological Institute. He completed his training as a general practitioner at the regional hospital in Glarus in 1911–1912 and studied neurology in London and Paris from 1912 to 1913. Under the influence of August Forel, while Brun was still a student, he began studying the behavior of ants, and his research soon attracted the attention of the scientific community. Between 1918 and 1925 he was head physician at the Zurich Neurological Institute.

He was exposed to Freud's writings during his studies but it wasn't until 1916, during his psychological experiments with animals and humans, that he was willing to accept the theory of drives. After 1925 he had his own practice as a neurologist and psychoanalyst. After the makeover of the Swiss Psychoanalytic Society in 1919 he became an associate then a full member, and shared administrative duties with Philipp Sarasin, with whom he completed a training analysis in 1925–1926. Together with Emil Oberholzer he provoked a break between the *Ärztgesellschaft für Psychoanalyse* (Medical Society for Psychoanalysis) and the Swiss Psychoanalytic Society, which he returned to in 1947. He never met Freud in person.

Brun wrote more than 120 publications on entomology, anatomy and pathology, neurology, and psychoanalysis. In the *Allgemeine Neurosenlehre* (1942) he established the position of psychoanalysis in biology. For Brun neuroses were the result of conflicts between the primary (sexual and self-preservative) and secondary (social) instincts. Anxiety is the result of libidinal stasis caused by hormonal activity. Actual neuroses, in Freud's sense, assumed considerable importance for Brun. Because of his biological orientation, Brun reacted violently to beliefs that were based, according to him, on "transcendental idealism," such as *Daseinanalyse* (existential analysis).

**BRUNSWICK, RUTH MACK (1897–1946)**

Ruth Mack Brunswick, a psychoanalyst and psychiatrist, was born in 1897 in Chicago, died January 25, 1946 in New York City.

Ruth Brunswick's father, Judge Julian Mack, became a famous jurist on the U.S. Circuit Court in New York, and also he was known as a prominent Jewish philanthropist. His only daughter Ruth attended Radcliffe College during World War I, and also graduated from Tufts Medical School.

In 1917 she married Dr. Herman Blumgart, who later pursued a successful career as a heart specialist; his brother Leonard had gone to Vienna for a short analysis with Sigmund Freud at the end of World War I. Ruth had completed her psychiatric residency when, at the age of twenty-five, she also went to Freud. Her marriage was already troubled; her husband saw Freud in an unsuccessful effort to salvage the marriage, but Freud evidently decided the relationships was hopeless.

Ruth had fallen in love with a man five years younger than herself, Mark Brunswick, at the time a music student. Ruth was still in analysis with Freud in 1924 when Mark as well began to consult Freud. According to Mark, Freud later admitted that it had been a mistake for Freud and Ruth to have discussed Mark's case in detail.

In the meantime Ruth was teaching at the Vienna Psychoanalytic Training Institute; her specialty was the

psychoses, an area of study that Freud personally avoided. Ruth and Mark were married at the town hall in Vienna in 1928; it was one of the few weddings Freud ever attended. Ruth's access to Freud seemed unique; she came to meals at his apartment, visited him in summers, and was on excellent terms with his children. Ruth was considered a member of Freud's extended family.

Ruth played a special role in mediating between the American analysts and Freud's circle in Vienna. She became an important channel through which wealthy American patients arranged to undergo analyses with Freud. In recognition of her special standing, Ruth became one of the few women who received a ring from Freud. She also played a notable part in supervising Freud's precarious health. Her own patient in analysis, Dr. Max Schur, became appointed Freud's personal physician.

Ruth had health problems, though, that her doctors could not diagnose as unquestionably organic. By 1933 or 1934 at the latest she had developed a serious drug problem, and by 1937 she had become an addict. Her failure to overcome her difficulties was the main reason for Freud's final disappointment in her.

The worst of Ruth's drug addiction occurred in America; her mother died in 1940, her father in 1943. Ruth and Mark were divorced in 1937, and then—against Freud's advice—they re-married in six months. Mark finally divorced her in 1945. Ruth's death in 1946 was the end-result of a pattern of self-destructive behavior. She had been drinking paregoric the way an alcoholic consumes whiskey. Her health was undermined, and the federal authorities had taken note of her drug-taking. She caught pneumonia, recovered, and then died from the combination of too many opiates and a fall in the bathroom; she had hit her head and fractured her skull. The full tragedy was for many years not publicly known. The cloudy circumstances associated with Ruth's medical troubles, and the misfortune of her early death, have obscured both her scientific contributions and her immense personal standing with Freud.

Ruth's central contribution to psychoanalytic thinking had to do with her special concern with the child's earliest relationship to the mother. In 1929 she was one of the first in print to use the term pre-oedipal, and Freud himself adopted it two years later. Otto Rank probably deserves the credit for being the earliest to invoke the concept, but Ruth was tactful

enough to be able to emphasize the importance of the mother in the development of the child, without any revolt on her part against Freud's basic ideas.

She will also be remembered as the Wolf Man's second analyst. In 1926 Freud referred the Wolf Man to Ruth for treatment, paying her a high compliment; he knew that anything she published would become famous in the clinical literature. She wrote an article about the Wolf Man in close collaboration with Freud. She also trained some famous future analysts; she analyzed Muriel Gardiner, Max and Helen Schur, and Robert Fliess, the son of Freud's former friend Wilhelm. Her most famous student was Karl Menninger, who saw her later in the United States.

Ruth had a special talent for manipulating Freud's theoretical concepts, and using them to set forth new ideas of her own. Freud admired her freedom, which helps to account for his partiality toward her. Ruth's analysis with Freud stretched, with some interruptions, from 1922 until 1939. Unwittingly Freud had helped bring about the dependency that it ideally should have been the task of analysis to dissipate. Mark claimed that Freud had first treated Ruth in too close a way, and then tried to be too distant. To insiders within the analytic movement Ruth's death was proof that analytic treatment could not be counted on to prevent human misery. It was left to others, such as Rank and Melanie Klein, to go on to make "pre-oedipal" problems the centers of their respective systems of thought.

Ruth Mack Brunswick was one of the most important women in Freud's immediate circle during the last years of his career; but the tragedy of her life, and the implications it made about her work, has meant that her name is relatively unknown to the general public.

## **BULIMIA**

*Bulimia* (from the Greek *boulima*: hunger [*limos*] of an ox [*bous*]), a medical term that has entered common usage, refers to an eating disorder characterized by episodes.

A bulimic episode (a binge) is defined as a fit of frenzied overeating in which an excessive amount of food is consumed in a short time; this episode involves a sense of loss of control. It can occur several times in one day and can completely overwhelm the subject. Bulimia always entails a major and overwhelming event that is convulsive or ritualized, and violent. There is usually an awareness of the pathological nature of this behavior, combined with fear of an inability to avoid it, pleasure, shame, and self-denigration. In addition to bulimia relating to food, there is a form of bulimia that relates to various consumer items (medicines, pathological buying) and to sex.

There are descriptions of bulimic episodes dating from antiquity. Medical dictionaries, particularly in the English language, refer to this disorder from the beginning of the eighteenth century (Blankaart, 1708). Historically, bulimia was predominantly a male disorder and was akin to hyperphagia and gluttony. It was long considered a manifestation of the same order as neurotic symptoms (Janet, 1903); Sigmund Freud referred to it as one of the symptoms of anxiety neurosis and also recorded it as an eating compulsion motivated by a fear of starvation.

As a manifestation of orality in the broad sense, bulimia is generally a form of pathological behavior, a passage to the act that is often impulsive and bypasses any mentalization or psychic material. It then has a defensive function in warding off psychotic disorganization or depressive affects. Karl Abraham mentioned it in his work on melancholia and, in *Fear of Breakdown* (1974), Donald Winnicott described it as a form of defense against the frightening nature of the void.

Bulimia is also associated with the addictions (Radó, 1926). In 1945, Otto Fenichel classified it as a "drugless addiction." Marie-Claire Célérier regards it as a symptom on the boundary between a psychosomatic loss of meaning and a hysterical signifier (1977), while Joyce McDougall describes it in terms of a symptomatic act that substitutes for the undreamt dream.

Bulimia is a widespread phenomenon in Western societies that is both on the increase and more out in the open. It has gradually become a syndrome in its own right—bulimia nervosa—with a separate status from anorexia nervosa and obesity. Wermuth and Russell first established the diagnostic criteria for the bulimic syndrome. In addition to bulimic episodes, these include various strategies for controlling weight and a psychiatric co-morbidity that can be severe (thymic disorders and addictions). These criteria reflect the notions of loss of control, chaotic functioning, inadequate mentalization and relationships of dependency (Jeammet, 1991) that are observed in these patients.

Contemporary discussions of bulimia refer to a complex, multi-faceted disorder that combines eating binges with a range of strategies for maintaining a normal weight, distortions in cognitive functioning and body-image perception, and emotional disturbances (Vindreau, 1991). In the majority of cases, the origins of the disorder are traced back to adolescence and its physiological and psychodynamic transformations. As of 2004, ninety percent of bulimics are women but the bulimia rate is rising among men. Whereas the incidence of the syndrome is three percent in the general population, it rises to seven percent in some adolescent, student, and high-school groups.

The conception of bulimia has developed from a simple compulsive substitution for a repressed sexual drive, into the widely-recognized, contemporary bulimia nervosa. Throughout this development, its definition has closely reflected both sociological and cultural changes and the psychopathological theories that prevailed over time. Above all, both the recourse of acting out through eating behavior, and the perceived need for particular bodily sensations in order to produce a psychic effect (Brusset, 1991), pose questions relating to self-esteem, difficulty in controlling behavior and emotions, narcissistic difficulties, and the quest for identity.

## **BULLITT, WILLIAM C. (1891–1967)**

William C. Bullitt, an American political leader, was born on January 25, 1891, in Philadelphia and died on February 15, 1967, in Paris. With Freud, he was coauthor of “Thomas Woodrow Wilson: A Psychological Study” (1967), and he helped Freud to immigrate to London.

Bullitt was raised in Philadelphia and educated at Yale College in New Haven, Connecticut. He became a prominent figure in American foreign policy. He was a U.S. advisor at the negotiations for the Treaty of Versailles and went to see Lenin on behalf of the U.S. and British delegations. When Bullitt's Russian mission was disavowed, he became bitter toward President Wilson and testified before Senator Henry Cabot Lodge's congressional committee; the secretary of state

was then forced to resign, and Bullitt's evidence also helped defeat the entry of the United States into the League of Nations. In 1933 when President Roosevelt extended diplomatic recognition to the Soviet Union, Bullitt became the first U.S. ambassador. Next Bullitt was ambassador to France from 1936 until the German invasion toppled the French Third Republic. Bullitt performed the role of a roving ambassador all over Europe and possessed a unique set of diplomatic contacts. As ambassador to Austria, Bullitt helped Freud escape Vienna in June 1938 after the Nazis moved into Austria, though what role Bullitt played is not entirely clear.

The stories about Bullitt are colorful. His role in destroying the political career of Undersecretary of State Sumner Welles during the Second World War ruined Bullitt's standing with Roosevelt. Bullitt then attempted to become elected mayor of Philadelphia but was badly beaten. His early disappointment with the Soviets led him to become one of the first cold-war warriors. Bullitt was impulsive and high-handed, mercurial and impressionable—altogether not easy to work with. His brilliance did not prevent his becoming known as intemperate and unstable, even if he could be charming and debonair. In 1948 Bullitt became a Republican and remained on personal terms with some of the great and mighty. But he ended up as an outsider, a political exile.

In 1926 Bullitt published a novel that sold some 150,000 copies. In the late 1920s Bullitt, who had been a patient of Freud's, began a collaborative study with Freud on Wilson, who both authors, for different reasons, hated. It has remained a curiosity how Freud and Bullitt came to write such a polemical assault, using psychoanalytic concepts, in their book on Wilson. It is still unknown who wrote which sections. Part of the scholarly problem has stemmed from Bullitt's fascination with intrigue; Freud privately complained about Bullitt's secretiveness shortly after the manuscript was completed. The book on Wilson may be one of the first efforts at psychological history, but it was so partisan as to have damaged the case for using psychology to understand political leaders.

## **BURGHÖLZLI ASYLUM**

The psychiatric asylum in Burghölzli entered the history of psychoanalysis as a result of the interest shown by Eugen Bleuler and his students (including Carl Gustav Jung) in Freud's theories and their possible application to the mental patients at the asylum. By the mid-nineteenth century there were a number of significant problems with this former clinic. Plans for its reconstruction were made between 1860 and 1864 with the help of Wilhelm Griesinger, a professor of internal medicine at the University of Zurich. The actual work took place between 1864 and 1870. On July 4, 1870, work on the Burghölzli was completed.

The various medical directors of the Burghölzli left their mark on the institution. The first director, Bernhard von Gudden (1870–1872), Gustav Huguenin (1873–1874), and Eduard Hitzig (1875–1879), had a purely biological orientation. Brain pathology and physiology were the focus of their research. It was August Forel (1879–1898) who brought international attention to the clinic. The Burghölzli then served as a bridge between the dynamic approach taken by French psychiatry and the biological orientation of German psychiatry. Forel's celebrated book on hypnotism reflects the importance of the asylum at the time.

Bleuler, the director from 1898 to 1927, who had worked with Jung at the Burghölzli, opened the field to psychoanalytic research and its application in an institutional framework. In 1913 he distanced himself from Freud's work because of personal conflicts and scientific disagreements. The clinic lost its importance as a center of psychoanalytic research and a vehicle for its dissemination. The Burghölzli would never again generate the level of interest in psychoanalysis shown at that time.

The clinic did play a central role in the diffusion of psychoanalysis between 1904 and 1913. It was not only the first clinic in the world where Freud's theories were scientifically tested and his therapeutic methods applied to patients, but also an internationally renowned research center for analytical psychology and therapy. For Freud the Burghölzli served to legitimize his work in the face of the often violent polemics against him. Aside from Jung, Adolf Meyer, Abraham Brill, and Emil Oberholzer, a number of Freud's students, including Karl Abraham, worked at the Burghölzli.

The Burghölzli has become a modern psychiatric clinic with 341 beds and more than 1600 new patients annually (1996). In addition to treating a wide range of conditions, there are ambulatory and semi-ambulatory services for all sectors of psychiatry. It administers its own school of nurses. As a university clinic the Burghölzli has continued to pursue teaching and research activities since its inception. Its research in the field of psychopathology and in the treatment of mental illness has attracted international attention.

### **BURLINGHAM-TIFFANY, DOROTHY (1891–1979)**

Psychoanalyst Dorothy Burlingham was born in New York on October 11, 1891, and died in London on November 19, 1979. She was closely associated with Anna Freud and her personal history is intimately linked to the psychoanalytic movement.

Burlingham's grandfather, Charles Tiffany, was the founder of the famous jewelry store, Tiffany & Co., and her father was Louis Comfort Tiffany, the celebrated painter and artisan. In 1914 Dorothy wed a surgeon, Robert Burlingham, but their marriage was soon troubled, in great part due to his phobias and episodes of manic-depressive illness. The couple separated in 1921.

After moving to Vienna with her four children in 1925, Dorothy began analysis with Theodore Reik. Her life subsequently became entwined with that of the Freuds, as Anna Freud took her children into treatment. In spite of becoming Anna's close friend, Dorothy undertook a second analysis with Sigmund Freud. The situation was loaded with a series of fantastically complex entanglements. Ernst, son of Sophie Halberstadt (Freud's daughter, who died in 1920) was best friends with Bob, Dorothy Burlingham's son. Both attended the Hietzing School, which had been founded in 1927 by Anna and Dorothy, together with Eva Rosenfeld, with a view to raising children from their milieu in a "psychoanalytic" fashion.

Burlingham fled Vienna upon the Nazi invasion in 1938, and after a short stay in the United States, and following Freud's death in London, settled close to Anna Freud near Maresfield Gardens. During the war, Anna and Dorothy founded and managed together the Hampstead War Nurseries, where they undertook historic research which they reported on in *Infants Without Families* (1943). Their collaboration led them to a groundbreaking description of infantile depression and an important advance in psychoanalytic psychopathology.

Their friendship was profound, and Dorothy's death powerfully affected Anna. She continued to care for her friend's children with such emotional investment that it provides an interesting perspective on the mechanism of "altruistic surrender" that she had once described.

In addition to her work with Anna Freud, Burlingham wrote several studies of blind children and, in addition, undertook early research on the psychology of identical twins.

### **BURROW, TRIGANT (1875–1950)**

A forgotten American psychoanalyst and pioneer of group analysis, Trigant Burrow was born in Norfolk, Virginia, on September 17, 1875, and he died on May 25, 1950, in Westport, Connecticut.

Burrow was the fourth child of John and Anastasia Burrow; his father was Protestant, his mother, a Catholic. His father was a scientifically-minded wholesale pharmacist. At the beginning of his higher education, Burrow attended Fordham University, where the dogmas of the Catholic church began to lose their significance for him. Following his graduation in 1895, he entered the medical school at the University of Virginia, 1899. One year was spent in post-graduate study of biology, one year touring Europe where he attended the psychiatric clinic in Vienna of Professor Wagner-Jarureg. Returning to America he spent three years in the study of experimental psychology, for which he received a PhD in 1909 based on his study of the process of attention. This was a subject that he pursued later in his psychoanalytic career when his interest turned back to physiological processes.

Burrow began to work with the Swiss psychiatrist Adolf Meyer at the New York State Psychiatric Institute, and was introduced to Freud and Jung who were in America for the Clark University Lectures. Burrow was immediately determined to study psychoanalysis and at the age of thirty-four moved with his family to Zurich for a year's analysis with Carl Gustav Jung. This involved considerable financial hardship, but he greatly valued his experience there. This was at the time when Freud and Jung were still closely associated. Burrow was proud of the fact that he was the first American-born person to study psychoanalysis in Europe. In 1910, he returned to Baltimore to work with Meyer at Johns Hopkins University. In 1911, he joined

Ernest Jones and others to found the American Psychoanalytic Association (APA).

Between 1911 and 1918, Burrow published eighteen papers on psychoanalysis. His originality is shown in papers written from 1914 onwards. They anticipate much later work in infant development: He writes of the “preconscious” experience of the infant, which remains part of the psyche throughout life. He does not mean Freud’s preconscious, that which is accessible to consciousness, but that which is prior to consciousness, when the infant is at one with the mother. For the infant the mother is the infant’s love subject, not love object, and the preconscious mode is a feeling that goes out of the infant’s primary identification with the mother. In the womb there is a primary physiological unity between infant and mother and a psychological union, a pre-objectless state. These manifest in later life as states of quietude and self-possession. The break in physiological and psychological union with the mother through birth is restored when the infant nourishes at the breast, experiencing a semblance of organic unity, completion and satisfaction. This anticipates much later work, of Margaret Mahler on separate individuation, and Kohut and his self-object theory. Burrow saw resemblances between his ideas and those of Ferenczi.

Burrow’s move into group analysis was preceded by his accepting the challenge of one of his analysands, Clarence Shields, to change places with him. Accepting the role of patient, Burrow was immediately impressed with the nature of his own resistances and an appreciation of the social forces at work in the analytic situation. Soon he extended his study to the group situation where he, his colleagues and pupils entered into an intensive study of group processes. Burrow’s emphasis was on the analysis of the “here and now”: “Group analysis or social analysis is the analysis of the immediate group in the immediate moment.” Every member of the group, including the analyst, is both an observer of his own processes and is observed by all the other members of the group. The analyst does not have a privileged position.

Throughout his life Burrow thought of himself as being a psychoanalyst and a Freudian. He believed that he was extending the relational aspects that were already present in Freud and in correspondence tried to persuade Freud of the validity of his work with groups. He failed in this and in 1926 Freud wrote: “As

far as the group is concerned an analytic influence is impossible.” Some of Burrow’s attempts to have his papers published in the *Internationale Zeitschrift* were blocked by Paul Federn and Sandor Rado.

Burrow saw the “I-persona” that is each individual’s self-image as being derived from social influences. From infancy onward, society imposes concepts of what it is to be good and bad and each internalizes these social images and adapts to the demands of society. Thus individuals are divided from the primary organismic unity with society, the world; in group analysis individuals become aware of the strength of the social self-image and can begin to overcome its influence and to reunite with the group as a whole, with the wider society.

Between 1925 and 1928, Burrow published a further thirteen papers, nine of which were given to the APA. He tried to persuade his fellow analysts that the neurotic structures of the individual are replicated in the neurotic structures of society: society is hysterical too, has its own elaborate system of defense mechanisms. He was appointed president of the American Psychoanalytic Society in 1925, but continued his critique of psychoanalysts. “We need to rid ourselves of the idea that the neurotic individual is sick and that the psychopathologists are well. We need to accept a more liberal societal viewpoint that permits us to recognize without protest that the individual neurotic is in many respects not more sick than we ourselves.” Burrow insisted that consensual observation is synonymous with scientific method and therefore it is only in the group “laboratory” situation that sexual fantasies, family conflicts, and the social mask become observable. At the annual meeting of the APA in 1925, he said that neurosis is social and that a social neurosis can be met only through a social analysis.

In 1933, when the APA reorganized itself, Burrow was asked to resign his membership. He accepted this with dignity and tried to remain on friendly terms with many of his former colleagues.

In the last phase of his work his interest turned back to the process of attention. Through physiological research and self-observation he described the process

by which each individual experiences the tensions of being a member of society: that is, by muscular tension in the ocular and forehead regions, which he called “ditution.” Through training it is possible to identify and to give up this process and to experience “cotention,” an experience that restores the sense of unity with the social.

Burrow and his followers formed the Lifwynn Institute (Foundation for laboratory research in analytic and social psychiatry) in Westport, Connecticut, which has carried on his work.

Burrow’s psychoanalytic and group analytic work anticipated the findings of much later workers. Sigmund Henrich Foulkes, the founder of group analysis, acknowledges his influence, having read his work in 1926. Many of the techniques of group therapy and of the encounter group movement originate from Burrow and his group laboratory. He wrote seven books and seventy articles, and had this comment: “Psychoanalysis is not the study of neurosis: it is a neurosis,” but for Freud he was a “muddled bubbler” (letter to Sándor Rádo, September 30, 1925).

## CÄCILIE M., CASE OF

“Frau Cäcilie M.” is the pseudonym given by Sigmund Freud to Anna von Lieben (her identity was discovered by Peter Swales [1986]), a patient Freud described only briefly in the *Studies on Hysteria* (1895d). Born Baronne von Todesco in 1847 into a rich Jewish family living in Vienna, she was treated for several years by a number of celebrated physicians, including Jean Martin Charcot, before being sent to Freud, in 1887 or early 1888, by either Josef Breuer or Rudolf Chrobak.

Freud treated Cäcilie M. until November 1893. Although the case receives scant attention in the *Studies on Hysteria* and in his correspondence with Wilhelm Fliess, it was significant. “This was shown in the case of another patient, Frau Cäcilie M., whom I got to know far more thoroughly than any of the other patients mentioned in these studies. I collected from her very numerous and convincing proofs of the existence of a psychical mechanism of hysterical phenomenon such as I have put forward above. Personal considerations unfortunately make it impossible for me to give a detailed case history of this patient, though I shall have occasion to refer to it from time to time” (1895d, p. 69)

Von Lieben had been suffering sporadically from a facial neuralgia when she became Freud’s patient. In 1925 Freud wrote that she had been sent to him “because no one knew what to do with her” (1925d, p. 18) after thirty years of hysterical disturbances, absences, and pain, which, against a background of depression and feelings of low self-esteem, had led to a serious morphine dependence.

She was nine years older than Freud and was forty-one when he met her. Through her mother, born Gomperz, she found herself involved in a family that

played an important role in Freud’s life. Apparently, she met him prior to a trip to Paris, since a letter from Charcot dated September 26, 1888, makes reference to a consultation with the Parisian master, a consultation that does not appear to have been the first:

“I am very grateful to you for the details you have provided concerning the state of Madame de L. Your difficult and extensive analysis of the varied and complex physico-psychic phenomena she presents show that you have grown attached to this interesting person just as we ourselves grew attached during her stay in Paris. I am in complete agreement with you on the method to be followed at this time. Moral treatment must play the principal role and, from the point of view of medication, there is absolutely nothing to say in general. One must naturally act following the indications of the moment. With respect to the diarrhea of which she complains and sometimes lasts two or three weeks, wouldn’t it be appropriate to see how she responded to a few centigrams of silver nitrate taken internally? . . . But, I repeat, it is on her psyche that we must act, as you perfectly understood and it is in this way that we can be useful in this case. Moreover, compared to what she was before, the Mademoiselle de L. of today is much better in all respects. She is, as she herself recognizes, up to a certain point prepared to struggle for her life, something she was not willing to do previously” (de Mijolla, 1988).

Because she was difficult to hypnotize, he accompanied her in July 1889 to Nancy to see Hippolyte Bernheim, who failed to obtain the desired results. This setback was part of what led Freud to abandon hypnosis and suggestion, which nonetheless had enabled his patient “to lead a tolerable existence” (1925d, p. 18).

According to Freud, she presented a “hysterical psychosis of denial,” with broad periods of amnesia regarding the traumatic moments she had lived through. Toward the end of 1889 “an old memory suddenly broke in upon her clear and tangible and with all the freshness of a new sensation” and a “cathartic cure” could be undertaken, not however without “accompanied by the acutest suffering and the return of all the symptoms she had ever had” (1895d, p. 70n). It took three years of “chimney sweeping” to pay back “the old debts” (p. 70n), with alternating periods of irritability, depression, and anxiety.

Cécilie influenced Freud as well; she taught him the mechanism of “hysterical conversion” associated with a process of symbolization. Her trigeminal neuralgia, for example, appeared to be determined by a “traumatic scene” during which her husband had made a remark to her that she re-experienced during treatment, saying “It was like a slap in the face” (1895d, p. 178).

She had an intuition of a future state that led her to remark, “It’s a long time since I’ve been frightened of witches at night,” the night before she experienced this fear. For Freud, “On each occasion what was already present as a finished product in the unconscious was beginning to show through indistinctly. This idea, which emerged as a sudden notion, was worked over by the unsuspecting ‘official’ consciousness (to use Charcot’s term) into a feeling of satisfaction, which swiftly and invariably turned out to be unjustified. Frau Cécilie, who was a highly intelligent woman, to whom I am indebted, for much help in gaining an understanding of hysterical symptoms, herself pointed out to me that events of this kind may have given rise to superstitions about the danger of being boastful or of anticipating evils” (1895d, p. 76n).

It is known that Freud saw her as often as twice a day (like Emmy von N.), even during his vacations, which earned her the name of Prima Donna in a letter to Fliess dated July 12, 1892. These two wealthy patients provided the bulk of his income for several months during 1889, but it was for other reasons that he was disappointed when Anna terminated her cure in 1893. On November 27, 1893 he complained in a letter to Wilhelm Fliess “My head misses the usual overwork since I lost [Cécilie M.]” (letter to Wilhelm Fliess, November 27, 1893, in 1985, p.61). On February 8, 1897, he returned to the subject, “If you knew... [Cécilie M.], you would not doubt for a moment that only this woman could have been my teacher” (1985, p. 229).

Peter Swales, after a long investigation, has written a fairly complete biography of this patient, who was a member of Vienna’s aristocracy and an active participant in Jewish intellectual life. It is easy to understand the extent to which she could have influenced Freud, who also saw in her a refutation of the theories of Pierre Janet on the congenital deficiencies of the mental state of hysterics. She died on October 31, 1900, of a heart attack.

## CAHIERS CONFRONTATION, LES

Under the editorial direction of René Major, *Les Cahiers Confrontation* was the eponymous publication that broadened the audience for the discussions and debates that constituted the well-known series of seminars, *Confrontation*. In articles that asked probing and provocative questions outside the usual bounds of various disciplines, each issue of the biannual publication (1979-1989), which featured original cover art with drawings by Valério Adami, helped to extend psychoanalytic investigation into the broader realms of culture and contemporary thought.

Indeed, *Les Cahiers* played a precursor role in creating what became known as the “Confrontation effect” that impacted a number of associations and publications of

analysts, who appealed to related disciplines in pursuing and developing psychoanalytic research.

Some themes addressed in *Les Cahiers* directly related to issues in psychoanalytic practice, theory, or institutions. Examples include *L'Etat cellulaire* (The cellular state), *Les machines analytiques* (Analytic machines), *La sexualité masculine* (Male sexuality), *Les fantômes de la psychanalyse* (The ghosts of psychoanalysis), *Télépathie* (Telepathy), *L'Etat freudien* (The Freudian state), *L'Interprétation* (Interpretation), and *La logique freudienne* (Freudian logic).

*Les Cahiers* also examined aspects of art and literature, in articles such as *Art et désordre* (Art and disorder), *America Latina* (Latin America), *Correspondances* (Correspondences), *Palimpsestes* (Palimpsests), and *Déchiffrement* (Deciphering). Philosophical issues included Derrida and *Après le sujet Qui vient* (After the subject, who?); religion was the focus of *Conversion* (Conversion) and *La religion en effet* (The impact of religion). Articles from these issues were frequently cited in numerous works both in France and abroad, by among others, Alain Badiou, Etienne Balibar, Alan Bass, Jean Baudrillard, Antoine Berman, Maurice Blanchot, Michel de Certeau, Philippe Lacoue-Labarthe and Jean-Luc Nancy, Jean-François Lyotard, Charles Malamoud, Guy Rosolato, René Thom, Maria Torok, Marc-Alain Ouaknin, Serge Viderman, Paul Virilio, Samuel Weber, and influenced the texts of famous writers Julio Cortazar, Carlos Fuentes, Gabriel Garcia Marquez, and Octavio Paz.

The publication of *Les Cahiers Confrontation* marked a fruitful period, during which psychoanalysis opened up to and participated in the important cultural debates of the times. Issues included feminism and phallogocentrism, the role of psychoanalytic institutions with their inherent contradictions and aporias, and politics and the putative end of ideology. A variety of issues anticipated questions that would subsequently gather currency, including the return of religion and the contribution of Lacanian thought to rethinking Freudian orthopraxis.

*Editions Confrontation* represented a publishing outcome of *Les Cahiers* that enabled major communications from the seminars to find their way rapidly into print. Numerous works published under these auspices are still in demand. *L'Inanalysé* (Un-analyzed) discussed analytic theory in terms of a sort of coded residue of what is unthought and unthought-out in

established psychoanalysis; contributions to *Le corps et le politique* (The body and politics) played a role in dissolution of the Ecole freudienne de Paris. *Le lien social* (Social cohesion) raised issues as to the social nature of analysis. *Géopsychanalyse* remains famous today for questioning why analysts at an International Psychoanalytical Association congress in New York failed to take a principled stand regarding the role of analysis in human rights violations during the Argentinean military dictatorship (1976-1984).

Other publications included *Affranchissement* (Franking/emancipation) in which, regarding the publication of *La carte postale*, the fundamental question of the divisibility (or its opposite) of the letter is discussed, as well as Derridian reading of Freud's *Beyond the Pleasure Principle*. The texts that comprise *Psychoanalyse et apocalypse* (Psychoanalysis and apocalypse) appeared in the context of the dissolution of the Ecole Freudienne de Paris and the disintegration of the Lacanian movement. In *Les Années brunes* (The dark years), German analysts discussed the compromises made in the name of psychoanalysis under the Third Reich.

## **CANADA**

Although Ernest Jones chose Toronto as the city from which he would undertake his campaign to institutionalize psychoanalysis in North America, Montreal is the city where it got its start in Canada. In 1957 the International Psychoanalytic Association (IPA) officially recognized the Canadian Psychoanalytic Society (CPS). Although English and French were the society's two official languages, exchanges and teaching activities took place almost exclusively in English until 1969, when the Société Psychanalytique de Montréal (Montreal Psychoanalytic Society) was established. Only after the Canadian Psychoanalytic Society created a French section, along with other English sections, did it institute a training program in French. Mirroring the relationship between Quebec and the remainder of Canada, the Société Psychanalytique de

Montréal and the English-language sections were two isolated entities that continued to question the reasons for their cohabitation.

In 1908 Ernest Jones established himself in Canada as a neuropathologist at the Toronto Lunatic Asylum. He remained there until 1913, when he returned to Europe, after having contributed to the foundation of psychoanalysis in the United States. However, no permanent organization was established in Canada as a result of his presence there, and it would take another forty years before psychoanalysis gained a foothold in the country.

After being established in Montreal, a large metropolis of psychoanalysis in Canada is the result of a paradox that is as strange as it is revelatory of the unique character of the country: an anti-Franco Spanish refugee, Miguel Prados, formed an alliance with a French-Canadian priest, the Dominican Noël Mailloux. Beginning in the spring of 1945, four interns from the Allan Memorial Institute of McGill University, founded by Dr. Ewen Cameron in 1944 and affiliated with the Royal Victoria Hospital, began meeting at the home of Dr. Prados, who had obtained a position at the Neurological Institute in the early 1940s. There they discussed clinical cases and studied what they referred to as “Freudian doctrine.”

In early 1946 they decided to form a group known as the Cercle Psychanalytique de Montréal (Montreal Psychoanalytic Circle). At this time Prados had only undertaken a self-analysis and was not affiliated with any psychoanalytic association. In 1948 Father Mailloux, who had founded the Institute of Psychology at the University of Montreal at the same time as Cameron was founding the Allan Memorial Institute, joined the group, which grew considerably from this time on. The number of members grew to forty, with as many guests invited to meetings. From New York they invited Sándor Lorand, Edith Jacobson, Bertrand D. Lewin, Phyllis Greenacre, Rudolph Loewenstein, Rene Spitz, George Gero, Charles Fisher, and Kaufman; from Detroit, Leo Bartemeir and Richard and Editha Sterbas; from Boston, Eduard Lindeman and Edward and Grete Bibring.

Although the circle certainly helped to spread psychoanalysis, it did not promote the training of Canadian psychoanalysts. Forced to seek training at institutions in the United States, these candidates had little inclination to return to Canada. In 1948, with the

help of the Lady Davis Foundation and Father Mailloux, Professor Théo Chentrier, a member of the Société Psychanalytique de Paris (Paris Psychoanalytic Society), became the first psychoanalyst to immigrate to Canada. He was appointed professor at the University of Montreal and joined the Cercle Psychanalytique, of which he later became an enthusiastic and loyal director. Between 1948 and 1950 the circle was very active and held semimonthly meetings, along with weekly seminars on clinical practice and theory.

In 1950 Dr. Eric Wittkower of the British Psychoanalytic Society came to the Allan Memorial Institute. Then in 1951 Georges Zavitzianos, a member of the Société Psychanalytique de Paris, immigrated to Montreal. In the autumn of that same year, Dr. Alastair MacLeod, of the British Psychoanalytic Society, was hired by the psychiatry department of McGill University. Finally, in September 1952 Dr. Bruce Ruddick, who had just completed his training at the New York Institute, returned to Montreal.

With the arrival of these four psychoanalysts, all members of organizations recognized by the IPA, members of the circle felt that it was time to seek official status. Since recognition could only be granted to members who belonged to an affiliate group, Théo Chentrier, Alastair MacLeod, Miguel Prados, Bruce Ruddick, Eric Wittkower, and Georges Zavitzianos formed a study group and applied to the IPA, hoping to be recognized at the 1951 congress. As the bylaws required a recommendation from an affiliate group, they turned to the Detroit Psychoanalytic Society, which was familiar with the circle, to obtain recognition as an independent organization and affiliate of the American Psychoanalytic Association (APA). Since the APA had recently discredited the Detroit training program, it was suggested to the study group that they contact the Boston Psychoanalytic Society, which they never did. At the end of September 1951, the group learned that during the congress in Amsterdam, its request had been referred to the office of professional standards of the American Psychoanalytic Association. Although the professional-standards committee may have supported the request, the APA's official response was that the time was not right: a member of the group was an analyst but not a physician, and the Canadians were planning to admit lay analysts.

Faced with this situation, the study group withdrew its request to the American association and turned to the British Psychoanalytic Society, which granted them

membership after no more than a few weeks of deliberation. As a result, in March 1952 the Canadian Society of Psychoanalysts became an affiliate of the British Psychoanalytic Society. Chentrier was the president, and MacLeod the secretary. The response from the APA was immediate. They let it be known that the Marienbad Agreement of the 1936 IPA congress gave them exclusive control over all of North America. The British Psychoanalytic Society replied that since Canada was part of the British empire, it was only fair that it serve as sponsor in this case. The Americans rejected out of hand a compromise that would have involved joint sponsorship from both associations. In July 1952, after lengthy negotiations, the British Psychoanalytic Society indicated that it would not oppose an agreement with the APA if this solution would help to establish in Canada a psychoanalytic society recognized by the IPA. To facilitate negotiations with the Americans, Chentrier, who was not a physician, decided in August 1952 to give up the presidency of the Canadian Society of Psychoanalysts. MacLeod became president, and Ruddick secretary. After being dissolved on October 17, 1953, the society was replaced by the Canadian Society for Psychoanalysis. But more important, in October 1952 Prados proposed dissolving the Montreal Psychoanalytic Circle because he was convinced that the Americans confused it with the Canadian Society of Psychoanalysts, which consisted exclusively of member analysts. These concessions turned out to be pointless because the Americans never granted affiliate status to the Canadian group.

On October 17, 1953, the group was officially formed as the Canadian Psychoanalytic Society. In December 1953 the group withdrew its request for membership in the APA and reaffirmed its membership in the British Psychoanalytic Society, which had never been abandoned. Because Canada is bicultural, with equal weight given to French and English, it was decided that the society would officially be bilingual. During the summer of 1953, Dr. Jean-Baptiste Boulanger, his wife Françoise, and Dr. J. P. Labrecque, all of whom were trained by the Société Psychanalytique de Paris, became members of the study group. The following year, Dr. W. Clifford M. Scott, a Canadian psychoanalyst who had become president of the British Psychoanalytic Society; Drs. Hans and Friedl Aufreiter of the Vienna Psychoanalytic Society; and André Lussier, who was completing his training at the London Institute, joined the new organization. Initially incorporated in Quebec by the lieutenant-governor of the

province in 1955, it became incorporated under Canadian federal law on April 3, 1967. And with the sponsorship of the British Psychoanalytic Society, it became officially recognized as a member of the International Psychoanalytic Association on July 31, 1957, during the twentieth IPA congress.

The British Psychoanalytic Society also sponsored the Canadian Institute of Psychoanalysis. This professional organization made its initial foray into the professional sphere in 1954 in a university setting, at the Allan Memorial Institute of McGill University (directed by Dr. Ewen Cameron). With the help of Doctor Clifford Scott, agreements were concluded in mid-1954 to initiate a training program identical to that of the British Institute, with three training analysts. After thriving in Britain for a quarter century, Scott, at Cameron's request, returned to Montreal to run the program. The way was now open for training future analysts.

The first students had already begun their training in Montreal, London, Paris, or the United States. Scott helped them complete their training. The other analysts supported this decision, with the exception of Cameron, who had integrated psychoanalysis in his program at the university so it would be under his direct control. When Cameron refused to hire another training analyst, Scott and the other colleagues realized they could avoid his controlling efforts only by forming their own autonomous institute. The training committee of the Canadian Psychoanalytic Society developed and introduced a teaching program in 1958. The first seminar was held on April 4, 1959. On October 1, 1960, members of the society ratified a proposal recommending the creation and incorporation of the Canadian Institute of Psychoanalysis, which was done on March 17, 1961, in Quebec. Jean-Baptiste Boulanger was the first director. The first training program, in 1959, had twelve teachers for thirteen students. Of the thirty-seven candidates trained from 1959 to 1967, eleven were French speakers.

Around 1968 and 1969, for cultural as well as geographic reasons, a federal model was used to create different sections within the Canadian Psychoanalytic Society. A French-speaking section was created in Montreal, the Société Psychanalytique de Montréal, and an English-speaking section in Quebec, the CPS Quebec English Branch. In Ontario the Toronto Psychoanalytic Society was formed. Currently, at the start of the twenty-first century, the Canadian Psychoanalytic

Society has approximately four hundred members, seven sections, and three institutes. In addition to those already mentioned, which have had an associated institute since their formation, three sections—the South Western Ontario Psychoanalytic Society (located in London), the Société Psychanalytique de Québec, and the CPS Western Canadian Branch—do not yet have an institute, while the Ottawa Psychoanalytic Society is still in the process of formation, since it does not have the requisite number of training analysts (five). Service agreements have been concluded with the CPS Quebec English Branch so that candidates of the Ottawa Psychoanalytic Society can continue to be trained locally. For the CPS Western Canadian Branch, the national executive committee recently authorized two training analysts from the Seattle Psychoanalytic Society in the United States to work with the Toronto Psychoanalytic Institute to train candidates in Western Canada locally. Candidates of the Société de Québec must complete their training in Montreal, since the Quebec group has only a single training analyst. Candidates of the Western Canadian Branch in Ontario undergo training at the Toronto Institute.

The CPS Quebec English Branch consists of analysts from Montreal from various ethnic and cultural backgrounds who concentrated on English language and culture when sections were created in 1969. As of 2002, it consisted of a hundred members. The training program of its institute was, until the first few years of the twenty-first century, much more academic than that of the Société de Psychanalyse de Montréal (SPM). Since 2000, the CPS Quebec English Branch has added European authors such as Piera Aulagnier, Wilfred Bion, and Jacques Lacan to the fourth-year program.

Psychoanalysis has also made progress in Toronto. In September 1954, Alan Parkin, who had just completed his training in London, England, arrived in the city. In 1956 he created the Toronto Psychoanalytic Study Circle with a core of eleven psychiatrists with an interest in psychoanalysis. He attempted to establish a psychoanalysis training program at the department of psychiatry of the University of Toronto and obtain recognition for his study group from the Ontario Psychiatric Institute. After two years of activity the circle decided to transform itself into the psychotherapy section of the Ontario Psychiatric Society by opening its doors to all members of that association. The request was ratified on January 23, 1959, and two years later,

on January 20, 1961, the psychotherapy section held its first scientific congress. In his *History of Psychoanalysis in Canada*, Parkin comments on the prodigious growth of this section, which in January 1970 had no fewer than ninety-three members. The establishment of psychoanalysis within the context of psychiatry helped determine the medical orientation psychoanalysis assumed in Ontario. This growth continued until psychoanalytic psychologists of the Ontario Psychological Association, with the support of Division 39 of the American Psychological Association, decided, at the end of the 1980s, to found their own organization, the Toronto Contemporary Society, and their own institute, the Toronto Institute for Contemporary Psychoanalysis. Initially, candidates training at the new institute were not physicians; then psychiatrists began to apply to the organization, although it was not a part of the IPA. They were attracted by the diversity of approaches used in its training program and wanted to escape the incessant conflicts between Freudian and Kohutian factions that divided the Toronto Psychoanalytic Society. The Toronto Psychoanalytic Society would likely have split if there had not emerged a third group, the post-Kleinians, whose members were partisans of object-relations theory and followers of Margaret Mahler and Otto Kernberg. Their emergence prevented the complete polarization of the society. Today the Toronto Psychoanalytic Society has approximately 130 members.

After the formation of the first three sections of the society and the institute, other sections were created when at least five analysts or training analysts belonging to the same geographic or cultural community submitted a request. In 1972 the Ottawa Psychoanalytic Society was formed, followed by the Ottawa Institute in 1978. Then, also in 1978, the CPS Western Canadian Branch was founded, consisting of members scattered throughout the four western provinces. Donald Watterson, in Vancouver, was the first psychoanalyst to settle in British Columbia, yet there was little growth in psychoanalysis in the province until the end of the twentieth century. Julius Guild settled in Edmonton, Alberta, followed by Perry Segal in 1971 and Hassan Azim in 1973, but as of 1998 there was only one analyst in Calgary and two in Edmonton. Similar numbers were found in Winnipeg and Manitoba. Even though it covers an area that is roughly a third of Canada, the CPS Western Canadian Branch currently has only ten members: six in British Columbia, three in Alberta, and one in Manitoba.

The Southwestern Ontario Psychoanalytic Society is the sixth section of the Canadian Psychoanalytic Society. It was founded on June 5, 1982, and currently has fourteen members. Formed in 1988, the Société Psychanalytique de Québec (Quebec Psychoanalytic Society), with ten members, is the most recent of the seven sections of the Canadian Psychoanalytic Society. The senior member is Henri Richard, who began practicing after psychoanalytic training in Paris from 1952 to 1959. A few years later he was joined by Noël Montgrain, who had also studied at the Institut de Psychanalyse de Paris (Paris Institute for Psychoanalysis). There is currently no organization in the maritime provinces of eastern Canada. Aside from the cultural and economic centers of Montreal and Toronto, psychoanalysis throughout Canada has grown very slowly.

For years oral communication was the primary mode of transmission within the Canadian Psychoanalytic Society. The first generations of analysts were more absorbed with fundamental issues and transmission than in the preparation of written texts. Although a number of practitioners—such as W. Clifford M. Scott, Georges Zavitzianos, Jean-Baptiste Boulanger, Jean-Louis Langlois, Paul Lefebvre, André Lussier, Jean Bossé, Pierre Doucet, Guy Da Silva, and Roger Dufresne—wrote important articles, they spent the majority of their time training future generations of analysts.

The ephemeral character of psychoanalytic reviews bears witness to the phenomenon. The first issue of the *Revue canadienne de psychanalyse*, published in 1954 and sponsored by the Canadian Psychoanalytic Society, was the final one until the reappearance, nearly forty years later in the spring of 1993, of the semiannual bilingual *Canadian Journal of Psychoanalysis/Revue canadienne de psychanalyse*, edited by Eva Lester. Similarly, the Société Psychanalytique de Montréal has, since 1988, published an internal periodical three times a year, the *Bulletin de la Société Psychanalytique de Montréal*. Julien Bigras, however, was the first to promote written communication within the psychoanalytic community with the review *Interprétation*, of which he was the founder and editor-in-chief from 1967 to 1971. Josette Garon, Jacques Mauger, Lise Monette, and François Peraldi continued his efforts with the publication of *Fragages*. In the autumn of 1992, Dominique Scarfone published the first issue of *Trans*, a semiannual, semithematic, interdisciplinary journal. The journal played a key role in

encouraging the exchange of psychoanalytic ideas and also played an important role in the Montreal psychoanalytic community by organizing annual colloquia open to the public. Despite this success, the editorial committee decided to discontinue publication in the spring of 1999 with the publication of issue ten of the journal. The year 1992 also saw the introduction of the semiannual *Filigrane*, financed by the publication of *Santé mentale au Québec* and directed at psychotherapists and professional psychoanalysts whose clinical methods were compatible with psychoanalysis.

Patrick J. Mahoney, Jean Imbeault, and Dominique Scarfone are among the first analysts to make significant contributions on an international level to a critical analysis of the psychoanalytic corpus.

In Canada, as elsewhere, the Canadian Psychoanalytic Society and its various sections are not the only entities involved in psychoanalysis. Alongside them have always existed unaffiliated psychoanalysts working alone or in small groups. Among the first to practice psychoanalysis outside an institutional context was Michel Dansereau, a doctor who had trained with René Laforgue in Casablanca, Morocco, and was active during the 1950s. Much later were François Peraldi, who arrived in Montreal in 1974, and Mireille Lafortune, who was active during the late 1960s.

There also exist many organizations devoted to psychoanalysis. In 1986 François Peraldi established the Réseau des Cartels (Network of Cartels), composed of analysts interested in the work of Jacques Lacan. This network did not survive the loss of its founder, and in 2004 only a single cartel is still active. The Association des Psychanalystes du Québec (Quebec Association of Psychoanalysts), founded in 1967 and having only ten members in 2004, is Lacanian in focus. The Association des Psychothérapeutes Psychanalytique du Québec (Quebec Association of Psychoanalytic Psychotherapists), founded in 1985 and consisting of some 150 members in different regions of Quebec, includes clinicians who make use of psychoanalytic methods. The association organizes colloquia and conferences, to which members of the Société Psychanalytique de Montréal are invited. The Groupe d'Études Psychanalytiques Interdisciplinaires (Interdisciplinary Psychoanalytic Study Group) consists of some fifteen professors from the Université de Québec at Montreal who teach psychoanalysis while practicing. The Institut Québécois de Psychothérapie (Quebec

Psychotherapy Institute), which has existed since 1992, provides a two-year training program in analytic and systemic psychotherapy. Father Henri Samson, who trained in France and was a contemporary of Father Mailloux, founded the Institut de Psychothérapie de Québec in the 1960s for those who wanted training in analytic psychotherapy. The Groupe Interdisciplinaire Freudien de Recherches et d'Interventions Cliniques et Culturelles (Interdisciplinary Group for Freudian Research and Clinical and Cultural Interventions), founded by Willy Apollon and cooperating with psychiatrists from the Robert-Giffard Center, has gained a considerable reputation in analytic psychotherapy based on Lacanian principles, especially in its work with psychotic patients. The Cercle Jung de Québec (Quebec Jung Circle), founded in the 1970s by Marcel Gaumont, a Jungian analyst trained at the Jung Institute in Zurich, promotes Jungian psychoanalysis in Canada through public conferences and discussions. André Renaud, a psychoanalyst with the Société Psychanalytique de Québec, established in 1984, and ran until 1996, *Étayage* (Support), a training program for doctors, psychiatrists, psychologists, and social workers who wanted to study analytic psychotherapy. Finally, a group of analytic psychotherapists has also been at work in British Columbia in Western Canada.

### CAPACITY TO BE ALONE

This notion made its first appearance in the mid-1950s in a paper less than ten pages long (Winnicott, Donald, 1958/1965), yet it would be fair to say that today it informs the thinking, and even more the practice, of every psychoanalyst. To be alone in the presence of someone else—what better way could there be of describing the analytic situation and relationship?

Winnicott's aim in his paper is stated without preamble. Rather than the fear of being alone or the wish to be alone, both of which are so often described, what interests him is something that makes it possible to for us to love. He describes a solitude understood not as a defensive withdrawal that cuts us off from a hostile world, nor as neglect, abandonment, or even destruction of the self, but rather as a positive experience and, even more than that, as “a most precious possession” (p. 30).

This is indeed the discovery here, for the capacity to be alone—with the stress on the word “capacity,” for Winnicott speaks elsewhere of a capacity to dream, and there is surely a link between the two—is not a resigned tolerance of the effective absence or disappearance of the other person. This capacity, paradoxically, is quite compatible with the other's presence.

But what is meant by “presence” here? To transform a loss or separation into a departure implying a return—in other words, a “*Fort! Da!*” is itself no easy thing, and to experience the other's absence as their continued presence within oneself amounts to a further step still. To be able to tell oneself “I am alone” without feeling forsaken—such is the prerequisite for what Winnicott considers an essential achievement: to be assured of a sense of continuity as between oneself and the other person, or, better still, to perceive discontinuity in a permanent bond, or even its rupture, as the very precondition of that's bond's survival.

As so often in Donald Winnicott's work, the seeming simplicity of his assertions conceals an analysis of considerable complexity. This is confirmed if one reads “The Capacity To Be Alone” in conjunction

with another, almost contemporary text, “Primary Maternal Preoccupation” (1956/1958), for such a reading makes it clear that the figure of the absent/present “other” should not be too hastily identified—as it frequently is—with the mother as object. Thus a number of authors, among them François Gantheret, prefer to speak of “the maternal” as an extension of what Winnicott—nonetheless reproached by some for idealizing the mother—meant when he wrote of maternal “illness” or “madness.” In venturing to use such terms, Winnicott is referring to an initial state in which the mother experiences the needs of her infant as her own and treats what is external as if it were internal—a state, in short, that is not far removed from psychosis. It is only a break in this continuum, once it is mastered, that can make it possible for “bodily needs” to be transformed into “ego needs,” and using Winnicott’s own words, for a psychology to be born from the imaginary working out of physical experience. This imaginary working out Winnicott calls “ego-relatedness,” as opposed to “id-relationships.” First comes “I am,” which is then as it were amplified by “I am alone” (1958/1965, pp. 33–34).

I am alone and at the same time I am not alone: not that I maintain the presence of the mother within myself; rather, I have managed to disentangle myself from her “madness,” and no longer feel annihilated if she goes away and if I am no longer of concern to her. It may be that each of us must stand in, to some degree, for a maternal environment susceptible to becoming a realm without borders: an “imaginary working out,” a mental life with its own inflows and outflows—truly, a “most precious possession.”

### **CÁRCAMO, CELES ERNESTO (1903–1990)**

An Argentinean physician, psychiatrist, and psychoanalyst, Celes Ernesto Cárcamo was the founder and an honorary member of the Asociación Psicoanalítica Argentina (APA) [Psychoanalytic Association of Argentina]. Born August 11, 1903, in La Plata, he died April 7, 1990, in Buenos Aires.

Cárcamo’s father, who was Spanish, with a PhD in chemistry and pharmacy, came from a long line of doctors. He was well versed in both science and the humanities and devoted much of his time to literature and journalism. His mother, an Argentinean, was the daughter of large landholders originally from the Basque country of France. Cárcamo had a quiet childhood and discovered Freud’s *Interpretation of Dreams* at an early age. He studied medicine as a young man but took courses in philosophy at the state university. He specialized in neuropsychiatry and joined Dr. Mariano R. Castex at the Clínicas Hospital, where the latest methods in medicine were practiced. Here, after studying with James Mapelli, a hypnotist and psychotherapist, he soon realized the limitations of hypnosis. Moved by a profound desire to provide therapeutic services, he studied everything available on psychopathology and psychoanalysis, with a focus on their clinical application.

Since Argentina had few practicing clinicians at this time—most psychoanalysts being self-taught or theorists—he decided to leave for France. At the recommendation of Marie Bonaparte, he studied at the Institut Psychanalytique de Paris (Paris Psychoanalytic Institute). He completed his training analysis with Paul Schiff and was supervised by Rudolph Loewenstein and Charles Odier. In February 1939 he was appointed a member of the Société Psychanalytique de Paris. He associated with scientists and writers such as Ernesto Sábató. In Paris his friend Juan Rof Carballo introduced him to Angel Garma, who wanted to settle in Argentina, and to whom he offered support and advice.

Both men arrived in Buenos Aires in 1939 with the intention of settling there. They began to provide training analyses to help establish an affiliate of the International Psychoanalytic Association (IPA), a project that came to fruition in December 1942. Upon his return to Argentina, Cárcamo had assumed the direction of the department of psychiatry and psychotherapy at the Medical and Surgical Institute of the Durand Hospital Medical School. Here he analyzed some of the pioneers of Brazilian psychoanalysis: Danilo Perestrello and his wife Marialzira, and Alcyon Baer Bahia of Rio de Janeiro, Zaira Bittencourt de Martins from Porto Alegre, and other Latin American analysts. During his tenure as director, the review *Revista de psicoanálisis* was inaugurated, its first issue appearing in 1943.

Cárcamo was the first to teach psychoanalytic technique at the Training Institute. In 1958 he taught the first course in medical psychology at the School of Medicine of the University of Buenos Aires. His writings were collected and published in 1992. Cárcamo was interested in the plumed serpent of the Maya and Aztec religions, the image of the world in aboriginal America, male impotence, female sterility, and the psychoanalytic process. With his wife he translated Anna Freud's *The Ego and the Mechanisms of Defense* and Eugene Minkowski's *Traité de psychopathologie*.

His personal prestige was of considerable benefit to the APA, especially during difficult moments in Argentina's political life. The impact of Cárcamo's personality, his integrity and lack of prejudice, together with his considerable erudition and wit, had a lasting influence on several generations of clinicians whom he analyzed or monitored.

### **CARUSO, IGOR A. (1914–1981)**

An Austrian psychologist and psychoanalyst, Igor Caruso was born February 4, 1914, in Tiraspol and died June 28, 1981, in Salzburg. Born into a family of Italian aristocrats who had settled in Russia, the young Caruso left home to study psychology in Louvain. He wrote his thesis on the development of ethics in children. The growing importance of Piaget and his followers turned his attention to philosophy and orthodox Russian philosophy, German philosophy, and new French thought. In 1942 Caruso settled in Austria and worked for a while as an assistant for children at the large Steinhof psychiatric hospital in Vienna. Shocked by the Nazis' experiments in euthanasia, he left the hospital and found work as a psychologist in a small neuropsychiatric clinic under the direction of Alfred Auersberg. Although he was encouraged to join the "Viennese working group" of the Deutsches Reichsinstitut für Psychologische Forschung und Psychotherapie (German State Institute for Psychological Research and Psychotherapy), there is no proof of his participation. Nor is it certain that he underwent his first analysis with August Aichhorn. However, it is likely that he did his training analysis with Viktor Emil Freiherr von Gebattel, a German psychoanalyst whose philosophical-anthropological-Christian ideology must have fascinated this Italian nobleman more than Aichhorn's charisma, social commitment, or his work with abandoned adolescents.

After the fall of Nazism and the end of the Second World War, Caruso distanced himself from the group formed by the Wiener Psychoanalytische Vereinigung (WPV) [Vienna Psychoanalytic Association], which he found to be too dogmatic. In 1947 he created the Wiener Arbeitskreis für Tiefenpsychologie (Viennese Depth Psychology Study Circle) as a relatively open and autonomous scientific community that rejected any form of strict orthodoxy, even though academic thought was becoming more consistent with orthodox standards.

After spending time studying with Carl Gustav Jung, in 1952 Igor Caruso defined his psychoanalytic program in his *Existential psychology: from Analysis to Synthesis*. Here the term "psychoanalysis" is primarily considered in terms of technique, while Freudian

theory is expanded in the direction of “personal psychoanalysis.” This fixation on the concept of the “totality of the person” led to a consideration of a dialectic relation between freedom and constraint, and between psychophysical conditioning and the transcendent mind as an expression of a hierarchy of values within which the formation of the highest and most sublimated aspects of the mind could not be reduced to primitive drives or understood from a naturalist point of view. The translation of Caruso’s book into six languages not only gave Caruso and his followers international recognition, especially in South America, it also led to the formation of other study circles in the largest cities in Austria. A symposium in Brussels in 1954 on personal psychology provided the opportunity for a meeting between Igor Caruso and Jacques Lacan, which was the start of their intellectual friendship and mutual admiration.

While Caruso’s early theoretical ideas were impregnated with Catholic theological concepts, these gradually disappeared from his writings, giving way to a lively discussion of Freud’s work. In 1957, in *Bios, Psyche, Person*, a book known to the Vienna study circle, he introduced a theory of symbols within the framework of the Freudian theory of drives and in relation to psychic acts and the interpretation of dreams.

During the early sixties, Caruso adopted a kind of Marxist Freudianism, which is apparent in his *Soziale Aspekte der Psychoanalyse* (Social Aspects of Psychoanalysis), 1962. The emphasis, here and in his subsequent essays on the social dimensions of psychoanalysis, implies an analysis of concrete, material structures of power in the analysis of the ego and superego, and of the analyst as the bearer of ideologies and rationalizations of which he needs to be made aware. In 1962 Caruso also published a series of articles that he wrote in French between 1952 and 1961 with the title *Psychanalyse pour la Personne*. It contains his program for the reform of psychoanalysis, which must be, according to Caruso: realistic; in search of truth; concrete; world-based; existential; historic; of its time and therefore liberating; and personalistic, the gradual growth of consciousness leading to gradual personalization (“Une analyse de l’opacité,” 1960).

A confrontation with the phenomenon of separation and refusal of the death impulse led to his *Die Trennung der Liebenden* [Love and Separation], published in 1967. Of his written work (approximately two hundred publications excluding his books) this

essay has become the most widespread and the most popular.

In 1972, Caruso was appointed to the chair of psychology at the University of Salzburg, a remarkable event that reflected the recognition of Caruso and of psychoanalysis in Austria. Following the boom in psychology of the late seventies (the *Psychoboom*), which affected members of the Salzburg study circle and spurred an interest in *Bioenergetik*, transactional analysis, Gestalt therapy, and so on, Caruso felt obligated to show his disapproval by leaving the association, which was now psychoanalytical in name only.

“I am an orthodox disciple neither of Freud nor Jung nor Adler. I am not eclectic, or the head of a new school of psychoanalysts,” wrote Caruso in *Existential Psychology: From Analysis to Synthesis*. His existential psychology was a critical attempt that, in spite of its Freudian references, became increasingly less Freudian.

After his retirement from the University of Salzburg in 1979, Caruso spent the remainder of his life examining theoretical questions, primarily issues of epistemology and methodology characteristic of a psychoanalysis that was closely related to other fields, especially the social sciences.

## CASE HISTORIES

Case histories are a classic form of documentation in psychopathology literature. They range from clinical sketches to highly detailed and extended accounts, as

in the Madeleine case, which occupies both volumes of Pierre Janet's *De l'angoisse à l'extase* (1926–1928).

Psychoanalysis caused the form to drift toward what might more properly be called a “report on analysis.” With a view to publication, analysts elaborate written accounts based on everything they have heard from a patient, in order to reconstitute the sense and significance of the patient's psychic and symptomatic functioning, as well as the progressive unfolding of the cure itself in the transference/counter-transference exchange.

Sigmund Freud evokes his patients in his early writings (*Studies on Hysteria*, 1895d), but it is in dealing with the analysis of the Rat Man that he expresses the difficulty of giving an account of an analysis, in a letter to Jung dated June 30, 1909: “How bungled our reproductions are, how wretchedly we dissect the great art works of psychic nature! Unfortunately this paper in turn is becoming too bulky. It just pours out of me, and even so it's inadequate, incomplete and therefore untrue. A wretched business.” (1974, p. 238).

Reports are difficult to write because where previously the analyst disentangled the elements in the flow of associations, in order to allow the interpretable meaning to organize itself, in the report, the analyst instead must dismantle and take apart in order to reproduce. Between communication *in* the analysis and the communication *of* the analysis, the transformation is as radical as that which exists between the logic of primary and secondary processes.

The heuristic necessity of the report on the analysis is nevertheless obvious because it is this reflective phase that enables us to focus on any given point of theory, thus breaking not with clinical practice but with the rule of not initially selecting anything in order to afford equally-distributed attention to the associational material. As a transmission of knowledge without a prescriptive target, and relating equally to theory and to clinical practice, the analysis report belongs in the theoretical domain (Laplanche, 1980).

The desire to give an account of the analysis derives from the analyst's counter-transference. The disturbance then becomes the object of thought and the motive for communication and may even remobilize the analyst's questions about his own non-analyzed past. But the report also has an institutional, more or less codified role and forms a part of exchanges that contribute to progress and recognition.

Freud stressed the ethical and moral problems posed by the analysis report: “It is certain that the patients would never have spoken if it had occurred to them that their admissions might possibly be put to scientific uses: and it is equally certain that to ask them themselves for leave to publish their case would be quite unavailing” (1905e [1901]). But he nevertheless defends the necessity for it in a letter to Oskar Pfister (June 5, 1910): “Thus discretion is incompatible with a satisfactory description of an analysis; to describe the latter one would have to be unscrupulous, give away, betray, behave like an artist who buys paints with his wife's house-keeping money or uses the furniture as firewood to warm the studio for his model. Without a trace of that kind of unscrupulousness the job cannot be done” (1963, p. 38).

The models for dreaming and jokes shed light on the respective methodologies used for the situations of dialogue and transcription (Mijolla-Mellor, 1985). While commenting on the difficulties relative to reports on analysis, Freud highlights the necessity for them and also their power of seduction, commenting that his case histories read “like novels” (as in the case of Katharina, 1895), a fair turning of the tables on someone who never hesitated to see novels as the equivalent of case histories.

## CASTRATION COMPLEX

In psychoanalysis, the word “castration” is associated with several others that define it and that it in turn defines. These include “anxiety,” “threat,” “symbolic,” “fear,” “terror,” “disavowal,” and above all “complex.” Beyond the everyday connotations of the term, the specifically psychoanalytic definition of castration is rooted in the act feared by male children, namely the removal of the penis. The essential connection between “castration” and “complex” derives from the fact that psychoanalysis views the castration complex, in tandem with the Oedipus complex, as the organizing principle of psychosexuality and, more broadly speaking, of mental life in general.

The metapsychological position of the castration complex was described relatively late in Freud’s work, but the word “castration” appeared earlier, linked to various psychoanalytical notions the consideration of which makes it possible to trace his theoretical course chronologically.

Castration fantasies, the symbolic aspects of castration, and mythological references to castration all figured in *The Interpretation of Dreams* (1900a) and in *The Psychopathology of Everyday Life* (1901b). In the *Three Essays on the Theory of Sexuality* (1905d), where Freud dealt with sexual aberrations, infantile sexuality, and the metamorphoses of puberty, fear and anxiety concerning castration were evoked several times, and the subject became even more prominent in the later revisions of the book. In 1915, and again in 1920, the set of problems surrounding castration was clearly set in its Oedipal context, and castration was treated as a major theoretical and clinical notion.

In “On the Sexual Theories of Children” (1908c), in connection with the evasive answers that parents give to children’s questions as to “where babies come from” and about sexuality in general, Freud noted the coexistence in children (bespeaking a first split in

mental functioning) of an official version, that of the parents, and a set of firmly believed “theories.” The first such theory was the belief that every human being had a penis. It was the collapse of this belief that would give rise to the castration scenario. It is notable that Freud from the outset took the psychosexual profile of the boy as his model; as a result he was led later to explain female psychosexuality by reference to that model. Meanwhile, already in this paper of 1908, he was pointing out how the clitoris was conceived of as “a small penis which does not grow any bigger” and the female genitalia were viewed as “a mutilated organ” (p. 217).

The case history of “Little Hans” (1909b) illustrated and rounded out Freud’s discussion of the “sexual theories of children.” In Freud’s eyes, the castration complex was still a sort of psychopathological nucleus, frequently encountered, which had also left “marked traces behind in myths” (p. 8). This nucleus was amplified with a second surge of the castration threat, the moment of *seeing*, as when Little Hans (aged three and a half) saw that his newborn baby sister had no penis. This observation occasioned an act of disavowal: Little Hans decided that as his sister grew up, her penis would get bigger (p. 11).

Only later, however, in a deferred manner with respect to the two phases of the threat of castration, would castration anxiety make its appearance. Note that Freud long used the words “anxiety” and “terror” almost interchangeably with reference to the fear of castration; he eventually drew a clear distinction in *Inhibitions, Symptoms and Anxiety* (1926d [1925]), contrasting the “anxiety as signal” that triggered repression with the various terrors characteristic of psychosis. Although Freud’s account of 1909 did not yet use the term “phallic,” when he introduced the concept of the infantile genital organization in 1923, he claimed universality for it precisely under that heading.

In *Totem and Taboo* (1912–13a), Freud presented the myth that he believed was the basis of human socialization. The threat of castration and the murder of the father were themes present in Freud’s writings in this vein throughout his work, concluding with *Moses and Monotheism* (1939a). “The Taboo of Virginity” (1918a) had a similar perspective, though it was concerned with more properly psychological issues. This paper was one of a trio of short works called “Contributions to the Psychology of Love.” In the first,

“A Special Type of Choice of Object Made by Men,” the theme of castration was latent throughout, the object-choice under consideration being made from the “constellation connected with the mother” (the mother and the whore “basically...do the same thing”) (1910h, pp. 169, 171). In the second paper, “On the Universal Tendency to Debasement in the Sphere of Love” (1912d), Freud described incestuous wishes as giving rise to an equivalent of castration, either in the direct form of male impotence or, indirectly, by means of projection, in the form of the debasement of the love-object. The third text, “The Taboo of Virginity,” dealt explicitly with the castration anxiety precipitated in men by contact with women, universally recognized as a danger to male sexuality, that is to say, as always potentially castrating.

In the delusions of Dr. Schreber, castration was an obligatory emasculation, but an acceptable one in that it would afford him access to female “states of bliss,” so much more voluptuous than male ones (1911c, p. 29). With “On Narcissism” (1914c), Freud appeared to reject the castration complex; in point of fact, however, his allusion to castration was part of a refutation of Adler’s conception of “masculine protest” (pp. 92–93), while his clear account of the narcissistic hypercathexis of the penis tended on the contrary to reinforce the notions of the castration complex in boys and of penis envy in girls.

The metapsychological papers of 1915 contain no reference to the theme of castration. At the same period, however, Freud was at work on his case history of the “Wolf Man” (1918b [1914]), where castration played a prominent role in the “reconstruction” of his patient’s infantile neurosis. The Wolf Man sought through identification to assume the passive position of his mother during sexual intercourse; he chose the fantasy of anal penetration by his father, implicit in which was a castration fantasy. In this case history Freud opted for several theoretical hypotheses related to castration. These included the definition of femininity; castration as at once feared as a narcissistic injury and desired as a precondition to penetration by the father; repression; erogenous displacement onto the bowel; splitting of processes of thought and ideation; and radical disavowal (*Verwerfung*, translated by Jacques Lacan as *forclusion* (“foreclosure”). All the same, castration as a complex was still not regarded by Freud at this time as an organizing principle of the psyche; he felt simply that as threat, anxiety, or fantasy

it was sufficiently freighted with meaning to bring about reorganizations of the psyche.

In his paper “On Transformations of Instinct as Exemplified in Anal Erotism” (1916–17e), Freud returned to his earlier theoretical options and brought them together, notably with respect to female sexuality and anality. He presented female sexuality as centered on penis envy and on the wish for a child, the two being equivalent. A like set of equivalences obtained in the psyche, “as an unconscious identity,” between feces, penis, gift, and baby—all of them part-objects, all of them small, “detachable” parts of the body (p. 133). In this way Freud came back to the idea of a “pregenital” phase (already mentioned in 1905) predicated on genital castration conceived as anal castration, just as an oral castration could be said to describe separation from the breast. The word “castration” thus came in all cases to indicate the sexual implications—even if they were deferred—of such separations.

“The Infantile Genital Organization” (1923e) was presented as an addition to, and a development of the *Three Essays on the Theory of Sexuality*. The paper stressed the fundamental difference between the pregenital organizations of the libido on the one hand and, on the other, the part played by the infantile genital organization in the two-phase institution of sexuality. The infantile genital phase was characterized by the primacy, in both sexes, of the cathexis of the male genital organ. The evolution of Freud’s thinking here thus concerned not only the discovery of the anatomical difference between the sexes but also the fact that it was the presence or absence of a penis that gave full meaning to that difference. “What is present, therefore, is not a primacy of the genitals, but a primacy of the *phallus*” (p.142). The replacement of “penis” by “phallus” here clearly indicated Freud’s new perspective. Further, and quite logically, he added that “the castration complex can only be rightly appreciated if its origin in the phase of phallic primacy is also taken into account” (p. 144). The sadistic-anal pregenital antithesis between active and passive gave way to the antithesis between phallic and castrated. The sexual polarity between male and female would not coincide with masculine and feminine until puberty.

“The Dissolution of the Oedipus Complex” (1924d) rehearsed some now familiar arguments, but it did so from the phallic perspective proposed in “The Infantile Genital Organization.” The phallic genital organization of the child succumbed to the threat of castration. This

threat was conveyed first through what was understood and then through what was seen; when its full effect was felt, the child “turns away from the Oedipus complex” (p. 176). But the object-cathexes thus abandoned were replaced by identifications. The period of latency followed: libidinal tendencies were desexualized and sublimated, and the introjection of paternal authority formed the nucleus of the superego.

An important issue nevertheless remained unresolved, that of female sexuality, including its relationships with the Oedipus complex, with the superego, and with latency. Was it also characterized by a phallic organization and a castration complex? Freud maintained that the girl, realizing that a clitoris was not on a par with a penis, accepted castration as an established fact. For her the threat of castration and the superego were thus of lesser significance. A more general threat was that of the loss of love. Penis envy tended to be replaced by the wish to obtain an oedipal child from the father.

According to “Some Psychical Consequences of the Anatomical Distinction between the Sexes” (1925j), whereas castration was experienced by boys essentially as a threat, girls looked upon it as a reality to which they were already subject. Either alternative derived directly from the “primacy of the phallus” in both sexes. When the girl observed a boy and his penis, she recognized that she did not have a penis, and wanted to have one. Worse, she might develop a masculinity complex (the wish to be like a man) or, as a further step, disavow reality by “refusing to accept the fact of being castrated” (p. 253). Naturally, the consequences could sometimes be serious, ranging from feelings of unfair treatment to narcissistic injury, from jealousy to the sort of onanistic fantasy described in “A Child Is Being Beaten” (1919e). The mother, in such cases, though the original love object, was blamed for this effective castration.

With puberty, however, a powerful wave of repression would bear down upon all sexual activity in girls that was of a “masculine” stamp (clitoridal masturbation), clearing the way for the development of a passive and receptive femininity. Likewise, and at the same time, she would take her father as an object of Oedipal love and transform her penis envy into the wish for a child from him. In short, “In girls the Oedipus complex is a secondary formation. The operations of the castration complex precede it and prepare for it” (1925j, p. 256).

For Freud, therefore, the anatomical difference between the sexes was interpreted in the same way by

both girls and boys. It is this Freudian account of female sexuality that has been most widely criticized.

*Inhibitions, Symptoms and Anxiety* (1926d [1925]) introduced Freud’s second theory of anxiety: the earlier notion that the affect associated with a repressed idea was converted into anxiety was replaced with a conception of anxiety as an alarm signal that itself triggered repression. Anxiety and the castration complex were both central to this new conceptualization. Revisiting the cases of “Little Hans” and the “Wolf Man,” Freud clearly expressed the view that “the motive force of repression” was anxiety in face of the threat of castration (pp. 107–8). He added that the fear of being devoured, bitten, and so on, as well as animal phobias, and phobias and imaginary fears in general, should also be attributed to castration anxiety, which for its part was the fear of a danger felt to be thoroughly real (*Realangst*). This theoretical picture explained what the three types of neurosis, hysterical, phobic, and obsessional, had in common: “in all three the motive force of the ego’s opposition is, we believe, the fear of castration” (p. 122). Furthermore, whether with respect to pregenital forms (experiences of separation from breast or feces) or with respect to more developed forms (social or moral anxiety stoked by the superego), it was invariably the danger of castration that was feared, and distinctly not the danger of death, no representation of which existed in the unconscious. Nor was the “birth trauma” evoked by Otto Rank involved here.

The prototype of anxiety was the suckling’s state of distress in the absence of its mother; from the economic standpoint, this biological situation implied an increase in the tension created by need. The pivot of anxiety—deferred, relative to that initial distress—was the castration complex. The heir of the castration complex was anxiety vis-à-vis the superego. In women, fear of losing the object’s love played the same role as castration anxiety in men (p. 143).

Freud’s paper on “Fetishism” (1927e) broached the issue of the disavowal of female castration. “Probably no male human being is spared the fright of castration at the sight of a female genital” (p. 154). For the fetishist, at the place where the penis ought to be, there was indeed a penis, in the variable (and often vivid) form of a personal fetish whose presence and employment implied a splitting of the ego: one part acknowledged the castration of women while the other disavowed it, in a single, perpetual process that protected the fetishist from the terror of castration.

In “Female Sexuality” (1931b) and throughout the *New Introductory Lectures on Psycho-Analysis* (1933a), especially in the lectures entitled “Femininity” and “Anxiety and Instinctual Life,” Freud reasserted the importance of the structuring role of the castration complex. He reiterated his general position as follows: “The danger of psychical helplessness fits the stage of the ego’s early immaturity; the danger of loss of an object (or loss of love) fits the lack of self-sufficiency in the first years of childhood; the danger of being castrated fits the phallic stage; and finally fear of the super-ego, which assumes a special position, fits the period of latency” (p. 88).

The closing pages of “Analysis Terminable and Interminable” (1937c) addressed what Freud continued to look upon as an anti-analytical enigma, even, in a sense, a scandal: men would not understand that passive submission to a master does not amount to castration, while women could not admit that they have no penis and that this is their nature. In short, men’s fear of castration and women’s penis envy corresponded to a refusal of femininity (i.e., of castration) by both sexes—a refusal graven in the “bedrock” of the biological (pp. 250–53).

In the myriad forms in which it manifested itself in mental life, as interpreted theoretically by Freud, castration was omnipresent, and closely bound up with the Oedipus complex; if female sexuality was something of a stumbling-block for it, the concept was firmly anchored to the difference between the sexes and the difference between the generations. Starting out from empirical observations, such as those in the case history of “Little Hans,” Freud’s theoretical path led him beyond clinical experience into fundamental questions of epistemology. Castration turned out to be more than the fantasy of a child under threat; embedded in the Oedipus complex and the oedipal situation, this fantasy emerged not only as an organizing principle in the psychic life of the individual but also as prototypical of the “split” which, as distinct from fusion, made possible individuation and the secondary processes (temporality, succession, language, psychical working-out, thought, and so on). In this perspective, Jacques Lacan laid much stress on symbolic castration, making the phallus responsible for the organization of difference, hence for splitting, and hence for the symbolic order, though at the same time he continued to endow this order with the sexual aura specific to the human condition.

It was precisely this anthropological dimension that would seem to have been misapprehended by most English-language authors. For Melanie Klein, admittedly, the castration fantasy continued to play a predominant role in the development of childhood psychosexuality, but it intervened at a late stage, even though she spoke of an early Oedipus complex. As early as the nineteen-twenties, Sándor Ferenczi and Otto Rank had been critical of the castration complex, while, later on, Freud’s account of the link between castration and femininity had, not unjustifiably, been questioned. Castration had barely any place in the theoretical and clinical contributions of D. W. Winnicott, whose definition of femininity was highly original; nor did it have much significance for Wilfred Bion, and it had even less for Heinz Kohut, for whom the Oedipus and castration complexes refer merely to late, relative, and contingent events in mental life.

Another conceptual difficulty that should not be overlooked is that attending the relations between the castration complex and the death instinct. It is notable that *Beyond the Pleasure Principle* (1920g) pays scant attention to the castration complex, whereas *Inhibitions, Symptoms and Anxiety* (1926d [1925]), largely focused on the castration complex, makes no mention of the death instinct.

In its role as organizer of mental life, the castration complex sometimes fails, either because it has not been sufficiently developed to be effective, or because it is apparently overwhelmed. In such cases the subject finds himself grappling directly with instinctual disintegration and exposed to the ravages of the destructive instincts. In psychotic functioning, castration anxiety, so far from playing a structuring role, itself constitutes a terror operating in the same mode as archaic fears of dismemberment.

The fact is that two different perspectives are present here. While Freud undoubtedly considered that the castration complex played a basic organizing role in mental life as a stage in which the anxieties and distress of an earlier time—even the earliest time—were revived in a deferred manner, he simultaneously looked upon it a stage in the formation of the superego. And it was thanks to the part played by the superego that instinctual renunciations would eventually be effected under the pressure of unconscious feelings of guilt and the need for punishment.

Although such instinctual sacrifices were injurious to the individual, they were essential to the “process of

civilization,” that is, to the development of conscience and thought. This process was subject, like the individual, to that instinctual duality which, we must not forget, was based at once upon an antagonism and an inextricable connection between the life and the death instincts. The great lesson of *Civilization and Its Discontents* was that “This conflict is set going as soon as men are faced with the task of living together” (1930a, p. 132). Living together indeed requires at the very least the symbolic marks of sacrifice (circumcision, for instance), and such marks are planted on the sexual body, thus clearly demonstrating the power of the notion of castration in the various registers of human reality.

## CATASTROPHE THEORY AND PSYCHOANALYSIS

The mathematical concept of catastrophe theory was proposed by René Thom in 1968 and was presented in his *Structural Stability and Morphogenesis* (1972/1989). Thom's "Elementary catastrophes" refer to the seven dynamic configurations that a form, being sufficiently stable to be recognized in ordinary space-time, adopts in order to appear, subsist, and change.

René Thom introduced his work as follows:

This work aims to provide a formal structure that can be used to attack any morphogenetic problem in general. Based on a consideration of the mechanisms at work in embryological development, this formal structure leads to a universal method that can be used to associate any morphological appearance with a local dynamic situation that engenders it, in a way that is independent of the substrate—material or immaterial, living or non-living—that supports it. In this way we introduce the notion of 'catastrophe,' whose applications range from physics...to linguistics...and biology. This book provides the first systematic attempt to consider problems of biological control in geometric and topological terms as well as those associated with the structural stability of shapes (1989).

The research on which catastrophe theory depends, as undertaken by Alexandre Liapounov (1857–1918), in Russia, on structural stability, and by Henri Poincaré (1854–1912), in France, on qualitative dynamics, has continued (differential topology, dynamic systems, and so on). Structural stability treats shapes and phenomena according to an intrinsic variability that their persistence in time imposes on them, and not as if they remained strictly identical to themselves—"the simple stability" that classical science requires. In this way the energy a being expends to persist can be taken into account, and consideration given

to the stylization of structurally stable shapes, according to a dynamic that is qualitative because it indicates "state trajectories," possible histories and events, without measuring quantities. Catastrophe theory resolves the following problems: Given a structurally stable dynamic situation dependent on an unknown (or even infinite) number of parameters, it describes all the possible variations and changes in the situation with the help of a finite and minimal number of parameters. If the situation can be represented in conventional space-time, the theory provides for seven kinds of change, the seven elementary catastrophes, depending on at most four parameters.

Determining psychic forms, constructing a dynamic that creates them, then making the problems associated with the stability and regulation of these forms intelligible—their possible histories—was the work of Freud. Psychoanalysis is psychic morphodynamics. That a theory addressing conditions of possibility and constraints can serve to make Freud's work more intelligible goes without saying. A standard case involves the coexistence of primary narcissism and a primary object relation that one of the catastrophes, the "cusp," can be used to model. Similarly, one of the aspects of the duality of the life and death drives can be described as the necessary co-presence of structural and simple stabilities.

The application of the "exact sciences," even the geometrization of a part of thermodynamics, to any non-mathematico-physical domain is complex. But René Thom began to work out the epistemological implications of catastrophe theory. In his *Semiophysics: a sketch* (1988/1990), he developed a *phusis* of meaning. He shows how these mathematics subvert the Galilean subdivision of the world and respond to Aristotle's—and Freud's—questions by treating form and dynamic together in their subjection to time. He then restores the emergence and instrumental value of these mathematics within the framework of natural philosophy, where, by means of "pregnancy"—drives according to Freud—signification becomes a process immanent in a vital dynamic. These analyses, which overturn epistemologies in force since the Galilean revolution, provide access to "laws of nature that are vaster and of greater scope" (1914d) than Freud had hoped.

## CATASTROPHIC CHANGE

The concept of catastrophic change emerged from Bion's mathematical period in which he expressed interested in physical transformations. When an analysand undergoes a violent psychotic change, for instance, what aspects of him remain invariant through that change, from the pre-catastrophic through the actual catastrophic to the post-catastrophic stage. Invariance in change is a concept Bion borrowed from mathematical set theory. He also relates the invariance in change to differing modes of representing an image, such as in art, where the artist has to represent a three-dimensional world on a two-dimensional surface. Bion asserts, "It should...be possible to detect a pattern that remains unaltered in apparently widely differing contexts. It would be useful to isolate and formulate the invariants of that pattern so that it could be communicated" (Bion 1970).

His basic thesis in this regard is that "the psychoanalyst should be regarded as transformation of realization (the actual psycho-analytic experience) into an interpretation or series of interpretations" (Bion 1965). He invokes the term "catastrophic" to designate a psychic event in an analysand that subverts the order or system of things in the environment and/or in the analysand himself, and this catastrophic change represents either a controlled or uncontrolled regression on the part of the analysand where the emergence of violence is pivotal.

Analysis in the pre-catastrophic stage differs from the post-catastrophic stage insofar as the former is characterized by the analysand's being unemotional, theoretical, and not manifesting any evidence of change. In addition, hypochondriacal symptoms are manifested. In the post-catastrophic stage the presence of violation is obvious, it lacks an ideational template, in contrast to the pre-catastrophic stage where "ideational violence" without affect is more in evidence. The analyst must then look, according to Bion, for the invariants in the post-catastrophic stage that correspond as invariants from the pre-catastrophic stage, e.g., hypochondria in the latter may be invariant with paranoid relations with external objects in the former. Returning to the middle stage, catastrophic change, that stage is characterized by the emergence of violence.

Bion encloses the phenomenon of pre-, post-, and catastrophic changes as transformation as follows: In terms of the analysand, the transformation is, when a realization takes place, from T (patient) a to T (patient) b. In the analyst, if there is no observed change, the event is inscribed as T (analyst) a *and* T (analyst) b. In the event of a change, the inscription is: T (pre-catastrophic change) to T (post-catastrophic change).

## CATHARTIC METHOD

The so-called "cathartic method" was a treatment for psychiatric disorders developed during 1881–1882 by Joseph Breuer with his patient "Anna O." The aim was to enable the hypnotized patient to recollect the traumatic event at the root of a particular symptom and thereby eliminate the associated pathogenic memory through "catharsis." The term was derived from Aristotle's use of it to describe the emotionally purgative effect of Greek tragedies.

Reading the case history of Anna O., one sees that the method developed gradually. At first, Breuer limited himself to making use of the patient's self-induced hypnotic states in which she would strive to express what she preferred to avoid talking about when normally conscious. Later on, Anna O. began inventing stories around a word or words she heard, at the conclusion of which she awakened serene and improved. After the death of her father, such stories evoked diurnal fears and hallucinations. The cathartic effect, linked to the emotional state that accompanied these fears, required the doctor to listen without actively seeking etiological clues. Anna O. aptly described this procedure, speaking seriously, as a "talking cure", while she referred to it jokingly as "chimney-sweeping" (1895d, p. 30). At this juncture Breuer began to more systematically employ a technique by which, while Anna O. was in a trance, he repeated to her a few words that she herself had muttered while in a self-induced "absence."

It was probably in August 1881 that the method acquired its definitive form. This was when Anna O., after refusing to drink water and suffering near-hydrophobia during hot weather, remembered the disgust she felt when she happened upon her English lady-companion's dog while it was drinking from a water glass. As soon as she described the event, she asked for water and "thereupon the disturbance vanished, never to return" (p. 35). Other examples provided Breuer with evidence that "in the case of this patient the hysterical phenomena disappeared as soon as the event which had give rise to them was reproduced in her hypnosis" (p. 35), and that systematic application of what she called "chimney sweeping" would put an end to one after another of such morbid phenomena. To move the treatment along faster, Breuer began use hypnosis, which he had not regularly employed previously.

Freud and Breuer filled out the notion of catharsis with the concept of "abreaction"—a quantity of affect that was linked to memory of a traumatic and pathogenic event that could not be evacuated through normal physical and organic processes as required by the "principle of constancy" and so, thus blocked (*eingeklemmt*), was redirected through somatic channels to become the process at the origin of the pathological symptoms (1893a).

Tired of poor results and of the monotony of hypnotic suggestion, by 1889 Freud appears to have

decided, in treating Emmy von N., to employ "the cathartic method of J. Breuer." But failure to regularly induce hypnotic states inclined him by 1892 to give up hypnosis, which his patient Elisabeth von R. disliked. He asked her to lay down and close her eyes but allowed her to move about or open her eyes as she wished, and he experimented with a "pressure technique": "I placed my hand on the patient's forehead or took her head between my hands and said: 'You will think of it [a symptom or its origin] under the pressure of my hand. At the moment at which I relax my pressure you will see something in front of you or something will come into your head. Catch hold of it. It will be what we are looking for.—Well, what have you seen or what has occurred to you?'" (Freud 1895d, p. 110). This procedure "has scarcely ever left me in the lurch since then," (p. 111) Freud added, claiming that this was the case to such an extent that he told patients that it could not possibly fail but invariably enabled him to "at last [extract] the information" (p. 111).

Breuer's method little by little thus became an "analysis of the psyche" which prefigured "psychoanalysis," a term that first appeared in print in 1896. The technique would be developed progressively over the course of a dozen years. By 1907, when Freud undertook analysis of the "Rat Man," he no longer actively demanded that patients produce material, but asked only that they verbalize what spontaneously came to mind.

Freud's thesis, according to which trauma at the root of displaced energy towards the *soma* is invariably sexual in nature, led to a rupture in his relationship with Breuer, but it also determined the future course of psychoanalysis. His explanation of the difficulties that patients experienced during treatment to defend themselves against pathogenic memories would come to be known as "resistance," while the concept of "transference" would emerge from his understanding of Breuer's sudden termination of Anna O., or the time that a patient, upon waking from hypnosis, threw her arms around his neck.

Catharsis and abreaction, even while still observed during psychoanalytic treatment, no longer constitute therapeutic aims as in 1895. However, they remain prominent in several psychotherapeutic techniques, such as in "Primal Scream" therapy and certain types of psychodrama.

energy, which, neutral in itself, can be added to a qualitatively differentiated erotic or destructive impulse, and augment its total cathexis. . . . It seems a plausible view that this displaceable and neutral energy . . . proceeds from the narcissistic store of libido—that it is desexualized Eros” (p. 44). The adherents of ego psychology have made this supposed neutral energy into the energy powering their “conflict-free ego.”

## **CATHECTIC ENERGY**

In the most general terms, cathectic energy is the energy attached to various psychic formations. Freud used this expression in two different contexts: one where it clearly designates a libidinal cathexis, and another where by implication the energy in question is of a different nature—neutral or desexualized.

In this last, narrower sense, cathectic energy appears in the letter to Wilhelm Fliess of January 1, 1896, as “free psychic energy,” small quantities of energy bound to the phenomena of attention and consciousness. In *The Interpretation of Dreams* (1900a), cathectic energy is the energy invested in thoughts by the preconscious as opposed to the countervailing “energy of the unconscious”: “[the primary processes] appear whenever ideas are abandoned by the preconscious cathexis, are left to themselves and can become charged with the uninhibited energy from the unconscious which is striving to find an outlet” (p. 605). Freud would continue throughout his career to maintain this distinction between the energy whose displacements regulate the processes of thought and fuel cathexis, on the one hand, and the countercahexes of the instinct on the other.

As for the origin of this energy, Freud wrote in *The Ego and the Id* (1923b), for example, that he “reckoned as though there existed in the mind . . . a displaceable

---

## **CATHEXIS**

A key concept from the economic point of view, “cathexis” refers to the process that attaches psychic energy, essentially libido, to an object, whether this is the representation of a person, body part, or psychic element. Implicit in Freud’s early works, the idea of cathexis stems directly from the hypothesis of psychic energy. The term first appeared in 1895 in *Studies on Hysteria*, as well as in “Project for a Scientific Psychology” (1950c [1895]). It then recurs throughout Freud’s works.

The term is used to designate various psychic impulses in energetic terms. As a result, “cathexis” is also used to refer to organizational psychic impulses, the interplay of symptoms and regressions, and the workings of attention and pain. Freud used it to describe major and modulated quantitative phenomena in symptoms and psychic processes. The term also denotes the binding of psychic energy to interconnected representations in the progressive organization of the psyche. Cathexis relates to the affects, where the issue of the quantum of affect becomes paramount (Freud, 1933a [1932]). A feeling not cathected with energy, or loaded with a certain quantity of affect, does not become fixed in memory. Psychic objects and representations are the result of cathexis. Most psychic mechanisms have to be considered from the economic point of view, that is, in terms of cathexis, decathexis, anticathexis, and hypercathexis. The concept

of cathexis thus underpins Freud's entire theory of the constitution of the psyche.

Everything that takes place in the body or the psyche can be an object of cathexis. Real persons are cathected only through the intermediary of the psychic representations constructed of them. Cathexes are objective when they are directed at individuals with a corresponding existence in the external world and are narcissistic when they have meaning only for the subject. Any stable psychic formation, essentially any psychic formation constituted from a stable cathexis, can in turn become the support for a cathexis added to its constituent cathexis.

Every cathexis has an impact on psychic equilibrium because it reduces the quantity of free energy, but the cathexes most constitutive of the psyche are the drive cathexes. Libidinal cathexis of the object of the drive and of the experience of satisfaction obtained in the subject's interaction with that object constitute the most vital internal objects that can support pleasurable ego functioning.

The concept of fixation has to be understood in terms of libidinal cathexes that have remained organized around historically determined objects (in the widest sense). Freud used many different metaphors to describe this process. He used military metaphors to describe how troops (psychic energy) occupy (cathect—the literal meaning of “Besetzung”) a particular piece of the psychic territory and how some of these troops remain behind to establish a base for a return of forces that have completed the advance. Freud also used metaphors from banking, deploying an analogy between libidinal cathexes and financial investments. With the metaphor of an amoeba, Freud illustrated how narcissistic and objective cathexes are related: the pseudopodia that the amoeba extends toward objects are currents of object cathexis that can be withdrawn back into the subject and turned into narcissistic cathexes. The stronger the narcissistic fixation, the greater the potential for narcissistic regression.

The concept of displacement too is related to that of cathexis. Quantities of cathected libido, or psychic energy, can be displaced onto other supports. These displacements result from the greater or lesser capacity of cathected libido to detach from its early objects and from its “viscosity” (1916–1917a [1915–1917]).

Cathected psychic energy is essentially libido. In the context of his structural theory, Freud theorized that

the id is the source of libido and thus the origin of libidinal cathexes. Freud also posited a form of free energy that can emanate from the ego and hypercathect a particular psychic element. Via this process, the ego essentially comes to direct cathexes. Such free energy is neutral and displaceable energy belonging to hypercathexis, which plays a part in the economy of attention, perception, and the ego's preparation for possible traumas (1940a [1938]). It is Freudian formulations of this kind that formed the basis for ego psychology, which postulates a conflict-free sphere of the ego. The term “hypercathexis” is also used more generally to refer to libidinal intensification of an existing cathexis.

In *Inhibitions, Symptoms, and Anxiety* (1926d [1925]), Freud addressed the issue of psychic pain caused by substantial cathexis directed at a lost object. Freud outlined how a painful bodily lesion imposes a substantial narcissistic cathexis that tends to “empty the ego” (p. 171). He then identified cathexis as the common element in physical and psychic pain: “The intense cathexis of longing which is concentrated on the missed or lost object (a cathexis which steadily mounts up because it cannot be appeased) creates the same economic conditions as are created by the cathexis of pain which is concentrated on the injured part of the body” (p. 171).

## CÉNAC, MICHEL (1891–1965)

Michel Cénac, a French psychiatrist and psychoanalyst and member of the Société Psychanalytique de Paris (Paris Psychoanalytic Society), was born June 28, 1891, in Argelès-Gazost (Hautes-Pyrénées), and died in Paris in 1965. He was awarded the Croix de Guerre and the Legion of Honor during the First World War and later studied medicine and psychiatry. An intern at the Asiles de la Seine in 1921, he was a student of Professor Trénel and Henri Claude and later became the head of his clinic. His dissertation, "Langages créés par les aliénés" (The Languages of the Mentally Ill), which he defended in 1928, was primarily devoted to the meaningless jargon often spoken by mentally ill patients. He soon became interested in psychoanalysis and began a training analysis with Rudolph Loewenstein. He was elected a member of the Société Psychanalytique de Paris on November 26, 1929. With Adrien Borel, in 1933 he presented a report on obsession at the VII Conférence des Psychanalystes de Langue Française (Seventh Conference of French-Speaking Psychoanalysts). Preoccupied by the links between medicine and psychoanalysis, in 1934 he published "Ce que tout médecin doit savoir de la psychanalyse" (What Every Doctor

Should Know about Psychoanalysis). In 1936 he opened a clinic for psychoanalysis with John Leuba.

In 1943, when the French police arrested Françoise and Eugène Minkowski, their daughter Jeanine took refuge with Michel Cénac. He intervened with the Prefecture of Police and was able to obtain their freedom. During the Occupation, the term "psychoanalysis" appeared only once in the title of a review, "Psychiatrie et psychanalyse: L'apport de la psychanalyse à la psychiatrie," which he signed and published in March 1943 in *Annales médico-psychologiques*, even though the content of the article reflected the reticence typical of the French (Mijolla, 1982). In a letter to Ernest Jones written on December 31, 1944, John Leuba writes, "Borel and Cénac are working as best they can . . . the second with complete probity but a technique that leaves much to be desired." He was the first treasurer, [RB1] after the Liberation, in 1946 and vice president of the Société Psychanalytique de Paris between 1949 and 1951.

Together with Jacques Lacan, at the XII Conférence in 1950, he presented a paper entitled "Introduction théorique aux fonctions de la psychanalyse en criminologie" (Theoretical introduction to the use of psychoanalysis in criminology), in which both authors expressed their disagreement with theories that stipulated the existence of a criminal instinct. Very much involved with Sacha Nacht in the origins of the 1953 split, on January 20 he announced his candidacy for president of the Société Psychanalytique de Paris against Jacques Lacan. He lost during the third round of voting. Cénac became the first senior physician of the Centre de Diagnostic et de Traitement Psychanalytique, which was created at the same time as the Institut de Psychanalyse de Paris (Paris Institute for Psychoanalysis) in 1954, and was elected president of the Société Psychanalytique de Paris in 1955.

As part of his work at the psychiatric infirmary of the Paris Prefecture of Police, where he became honorary senior physician, Cénac conducted several studies on the value of witnesses (1951), recidivism and anti-social activities (1956), juvenile delinquency (1961), and subjective post-concussional syndromes.

## CENSORING THE LOVER IN HER

The notion of “censoring the lover in her” was first introduced by Michel Fain, then reworked by Fain and Denise Braunschweig in order to highlight the way in which the mother may modulate her presence for the infant while looking after their bodily needs.

When, in the course of caring for the baby, the mother daydreams about her love life with the father of the child, this other experienced as independent of the child induces a relative distance in the relation with the child. This leads the child to create an early (primary) state of triangulation which will be the basis for the future oedipal organization.

Censoring the lover in her is therefore the effect of the internal events in the mother, leading the developing child to make room for a third party within the framework of their “real” two-person relationship. For the mother it is also this that enables her to counteract the erotic feelings caused by the contact with the infant's body. Her life as a lover thus takes on the value of a protective shield for the psyche of the child, but also for her own psyche because it “censors” a part of the erotic feelings aroused by maternal care.

## CENSORSHIP

The term censorship in everyday language connotes ideas of blame and repression of faults. This is how it appears in Freud in *Studies on Hysteria*: “we are very often astonished,” he writes, “to realize in what a mutilated state all the ideas and scenes emerged which we extracted from the patient by procedure of pressing. Precisely the essential elements of the picture were missing [...] I will give one or two examples of the way in which a censoring of this kind operates...” (1895b, p. 281–282). He then shows that what is censored is what appears to the patient to be blameworthy, shameful, and inadmissible. In a letter to Wilhelm Fleiss (December 22, 1897, in 1950a) he compares this psychic work to the censorship that the czarist regime imposed on Russian newspapers at the time: “Words, sentences and whole paragraphs are blacked out, with the result that the remainder is unintelligible” (1950a, p. 240).

Although the term appears quite frequently in writings from this first period, its status remains uncertain. Freud seems to be describing the deliberate suppression by patients, in their communication with the doctor, of what they do not wish to reveal to him, as well as the mechanism and effects of unconscious repression (1896b). A second meaning appears when he evokes the censorship which, in dream-work, results in a manifest text being presented as a riddle (*Interpretation of Dreams*, 1900a).

The metapsychological texts of 1915 elaborate on the distinctions outlined in chapter seven of the *Interpretation of Dreams*. Censorship is in fact defined as that which opposes the return of that which is repressed, at the two successive levels in the passage from the unconscious to the preconscious (the “antechamber”) and on to the conscious (the “drawing-room”) (1915e).

Censorship is thus clearly distinguished from repression: whereas repression rejects a representation and/or an affect into the unconscious, censorship is what prevents it from re-emerging. Freud nevertheless confuses this distinction later when he writes, for example: “We know the self-observing agency as the ego-censor, the conscience; it is this that exercises the dream-censorship during the night, from which

the repressions of inadmissible wishful impulses proceed” (1916–17a, p. 429). With the introduction of the structural theory Freud made a new distinction, with the ego becoming the agent of the censorship under the superego—the merciless supervisor (1923b).

Although the notion of censorship continues to be fairly widely used in psychoanalysis to describe resistance to the treatment, it has scarcely received any further elaboration and its global nature may cause it to appear to be somewhat outmoded.

## **CENTRE ALFRED-BINET**

The Centre Alfred-Binet (Alfred Binet Center), the department for child and adolescent psychiatry of the Association for Mental Health in Paris, annually receives about two thousand children for consultations and treatment. It is at the center of a group of institutions (Training Club, Foster Home Placement, Adolescent Day Hospital) and operates in coordination with an evening unit (Fondation Lyon) and a specialized homecare unit (Fondation de Rothschild). The system is sector-based, but the center receives 20 percent of its patients from outside of the sector it serves.

Created in 1956 by Serge Lebovici, who was soon joined by René Diatkine, it was the first sector-based center in France for children and adolescents. Breaking with standard practice at the time, the center sought to create essentially outpatient treatment in collaboration with the different institutions in which the children participated. The center was run by psychoanalysts and psychiatrists who were co-opted into the system and who devoted a large part of their time to analysis in an environment of reliable multidisciplinary teams. This fact clearly distinguished this system both from university institutions focused on hospitalization and from a large number of sector services later organized throughout France.

In its development, the center came to rely essentially on psychoanalytic experience and use the mediation of other disciplines. Its practice was progressively elaborated under the influence of its creators, Serge Lebovici until 1978 and René Diatkine until 1994. It continues to have considerable influence on the work of the many public and private practitioners of child psychotherapy and psychiatry who trained in its seminars. The training, while deriving some of its ideas from trends in British psychoanalysis, attempts to define the limits and principles of the analyst’s work with children by constantly sorting out what comes from the child and what comes from the environment.

The necessity of working with families in a climate of trust without inappropriate therapeutic or educational aims and generally for long periods of time led the psychoanalysts to adopt extensive therapeutic consultation and a broad range of treatments that allow children to remain in their usual surroundings. Practitioners take into account the varied conflicts in the psychic lives of the children and the pressure of their unconscious transfer/counter-transfer fantasies without any special fascination for the origin of these fantasies. This has led to a concept of child development as being dominated by successive and barely foreseeable deferred actions on the part of children in which games occupy a special place with regard to the appearance of new functions.

In 2004 nearly five hundred people trained at the Centre Alfred-Binet. In spite of its budgetary restrictions, its evolving practice has enabled it to bring together a group of consultants that benefit parents and children and to organize brief therapy sessions aimed at enlarging the range of activities

where analysts interact with young children and their families.

## **CENTRE DE CONSULTATIONS ET DE TRAITEMENTS PSYCHANALYTIQUES JEAN-FAVREAU**

The Centre Jean-Favreau (CCTP) grew out of the Société Psychanalytique de Paris (SPP) and its training institute. The agreement linking it to the Paris Social Services Department (DASS) recognizes its purely psychoanalytic vocation.

At the instigation of Sacha Nacht and René Diatkine, the *Institut de Psychanalyse* created the center in 1954. It was originally a clinic based on a model that the burgeoning psychoanalytic movement created around the time of World War I (it was similar to the Berlin Institute, for example). It provided free treatment to patients who lacked the resources necessary to pay for treatment. Unpaid analysts conducted these treatments, under the supervision of experienced analysts. This system also made it possible to explore the effects of free treatment on the analytic process and to facilitate access for non-physicians.

In 1958 an agreement was signed with the Seine prefecture borough authorities. It guaranteed an operating budget for the center, thus testifying to the public authority's interest in the renewal and use of psychotherapeutic modalities in the field of psychiatry. The center also was to contribute indirectly to training psychiatrists, who, within the framework of the policy of the sector, would then run extra-hospital clinics with a largely psychotherapeutic orientation.

The center's specific role and aims must be seen within this historical context. During a period of great innovation when many institutions were created, integrating psychoanalytic ideas into their treatment perspectives in various ways, the center based its activity around the classic analytic treatment conducted in the course of three or four weekly sessions of forty-five minutes each. This approach derived from the conviction held to this day that psychoanalytic treatment, if implemented correctly, is the most effective treatment, and the belief that psychoanalytic training is the best

way to develop the ability to conduct psychoanalytically oriented psychotherapy.

The other analytic treatments practiced at the center were developed there in order to adapt, up to a certain point, to the range of the demand; among these are various forms of psychotherapy, individual and group psychodrama, and group psychoanalysis. But these other forms of treatment derive from the model of psychoanalytic treatment, of which they are thoughtful modifications taking into consideration the method, the frame, and the processes of change, and wherein clarification of the transference remains of central importance.

The physicians who—delegated by the president of the PPS—have successively directed the center (Jeanne M. Favreau, Jean Favreau, Jean-Luc Donnet) and their assistants (Robert Barande, Monique Cournut) have thus been able to ensure compatibility between the socio-therapeutic obligations required by the agreement and the ethics of psychoanalytic practice. Some fifty analysts—including some candidates—work in the center in a very part-time fashion. The type of patient and the way the center is run make it particularly interesting from a psychoanalytic and psychiatric point of view, for several reasons.

It is a privileged situation wherein to make evaluations and assessments within the consultative framework and to evaluate the types and predictive values of the initial interviews, as well as determining the indications for the various psychoanalytically derived treatments. Its legal status makes it necessary to critically and carefully evaluate the influence of the institutional factors, particularly free sessions, on the therapeutic processes. Of course the optimal analytic situation is one in which the patient pays for the treatment. But it would be inappropriate to establish this principle as a dogma. The availability of free psychoanalytic treatment is not of interest only to patients who lack the necessary resources but, because of the infinite variety of cases seen, it contributes to an ongoing reassessment of the theory of the analytic framework and the constant difficulties surrounding it. Without this in any way taking from its essentially therapeutic aim, the center provides training through its use of consultations for teaching purposes, as well as through participation in the psychodrama sessions.

## CENTRE PSYCHOPÉDAGOGIQUE CLAUDE-BERNARD

Named after the Parisian lycée where it was first installed, the Centre psychopédagogique Claude-Bernard was founded in 1946 on the initiative of Juliette Favez-Boutonier (quickly succeeded by André Berge) and Georges Mauco.

The project came into being during the German Occupation, when these three analysts held informal meetings with Françoise Dolto and Marc Schlumberger. The idea was to create an institution that would enable children, adolescents, and their families to benefit from the discoveries of psychoanalysis in a framework other than hospital consultation. They envisaged a different approach to character disorders, language problems, and intellectual inhibitions. The revolutionary aspects of this project made it quite compatible with the vast plan of social and educational reforms that came into being at the end of the war.

Like other centers later created in other cities, this structure had a dual vocation: medical on the one hand, educational and administrative on the other, the managers of both sections being analysts. This dual vocation symbolized the “crucible” in which actors from all sorts of different disciplines worked for the benefit of the children and their families, but this diversity shared a common horizon: analytic comprehension. In 1972 the center became “medico-psycho-educational” (CMPP).

The social backdrop has changed completely over the last fifty years. Child psychology and psychoanalysis have seen their domains extended and, most of all, considerably deepened. The CMPP model has been contested, although November 1996 saw Claude-Bernard celebrate its fiftieth anniversary in good health!

The Centre had an unquestionable role in the psychoanalytic movement in France. It played a considerable part in spreading psychoanalytic concepts in the domain of education and teaching. In addition, it promoted innovative practices in the psychoanalytic domain: From the very beginning, individual psychotherapy was complemented with the addition of

child and parent group psychodrama. Innovations were also constantly introduced in other domains, educational psychology, psychomotricity, and orthophonics for example.

The question has been raised whether the multiplicity of approaches would not dilute the psychoanalytic idea at the base. On the contrary, it would seem that the conjunction of “impossible tasks” is what makes such an institution rich and dynamic.

## CERTAINTY

An internal moral conviction resulting from reflection, or subjectively imposed in the form of an intuition or illumination, certainty is an intellectual sentiment that transposes sensory evidence into the realm of thought. Sigmund Freud gave little thought to the concept except when considering its opposite, doubt, or as related to the idea of conviction, which connotes an illusory or mistaken content (delusional conviction). However, dreams are an example of a mental product accompanied by certainty since images, rather than judgments, are involved. Conversely, whenever there is doubt, it is the misrepresentation that underscores the ability of the element in question to convey meaning.

It is especially in the area of superstition and knowledge of the paranormal that Freud investigated the notion of certainty. As with paranoid delirium, he sees its origin in a projection of the contents of the unconscious onto the outside world (1901b). This idea was developed in connection with animist thought and later with the category of experience, which included feelings of seeing or experiencing something one has seen or experienced before (*déjà-vu* and *déjà-vécu*) (1914a), and feelings of alienation (*Entfremdung*), or the uncanny (*Unheimlichkeit*). What is in question in all of these are “obsolete primal convictions” associated with a primal inability to differentiate between the ego and the outside world.

Freud’s analysis of religious feelings—what Romain Rolland refers to as *oceanic feelings* (1930a [1929])—provided him with an opportunity to question whether certainty is equivalent to an objective perception. These

feelings, he wrote, are “described as feelings but are apparently complicated processes associated with determinate contents and decisions concerning those contents.” The only things that are certain are death and the relation between the mother (*certissima* [absolutely certain]) and the child, while the father is *semper incertus* (always uncertain). The fantasy of certainty, which the most skeptical researcher is never without, can thus be associated with this experience of primary and irreplaceable assurance: that of being the mother’s child. What is certain is irreplaceable. For Freud, the psychoanalyst is prepared “for the sake of attaining some fragment of objective certainty, to sacrifice everything—the dazzling brilliance of a flawless theory, the exalted consciousness of having achieved a comprehensive view of the universe, the mental calm brought about by the possession of extensive grounds for expedient and ethical action” (1941d [1921], pp. 179). This spiritual abstinence is not based on an obsessive predilection for uncertainty but, on the contrary, a desire of anticipated certainty, of possessing fragmentary crumbs of knowledge once and for all (Mijolla-Mellor, S., 1992).

The concept of certainty in psychoanalysis appears to be related both to the analysis of illusion associated with desire (Freud); or, more radically, with the destruction of critical thought, the seductive appeal of deviation, where the only possibility is one of repetition (Aulagnier, 1984), and to the always partial and painfully won acquisition of partial certainties incorporated in a renewed hypothetical-deductive approach.

## **CERTEAU, MICHEL DE (1925–1986)**

Michel de Certeau, Jesuit historian—he was a specialist on the sixteenth and seventeenth centuries and religion—was born in Chambéry in Savoy on May 17, 1925, and died at the age of sixty on January 13, 1986. He was introduced to psychoanalysis by Louis Beirnaert. He was one of the first members of the École Freudienne de Paris in 1964 and remained a member until it was dissolved by Jacques Lacan in 1980. Between 1963 and 1967 he directed the review *Christus*, together with François Roustang, introducing psychoanalysis to the magazine.

His interest in alterity and the Other led him to study the work of Jean-Joseph Surin, a Jesuit mystic of the seventeenth century who was brought in to exorcize the possessed at Loudun. To understand the mystic priest, Certeau made use of psychoanalysis together with semiotics and ethnology. A historian, like Surin, of impossible speech and the broken subject, Michel de Certeau gave exceptional pertinence to Lacanian concepts. In search of the traces of the absent, attentive to the sites of a Real that was impossible to restore, he anchored historical writing in the relation between the body and language and in the constituent division of the subject between “outside” and “inside.”

After 1968 he taught in the Department of Psychoanalysis at the Université de Paris in Vincennes. He later divided his time between the University of California at San Diego and Paris, and was appointed head of research at the École des Hautes Études en Sciences Sociales in 1984.

A tireless investigator of ideas and places, Certeau, in his historical work, demonstrated the fecundity of what Freud referred to as the work of mourning. For

him historical writing is the equivalent of the “tombeau,” a literary and musical genre practiced in the seventeenth century, which gave voice to the past in order to bury it, that is, to honor and eliminate it.

At a time when the social sciences were deeply influenced by scientism, Michel de Certeau felt that history, like psychoanalysis, was dependent primarily on a hermeneutics of loss. He defined an epistemology of the “in-between,” which hovered between science and fiction, and which studied the memory traces inscribed in a present subject to the “uncanny familiarity” of a past that was always ready to rise up to haunt our actions.

## **CHANGE**

The psychic changes observable during psychoanalytic treatment involve two distinct processes. First, the therapeutic process applies to symptoms, personality traits, and behaviors amenable to transformation. Second, the psychoanalytic process applies to how the experience created by the analytic setting and the rules of technique is lived out. The articulation of these two processes defines the question of change in psychoanalysis.

Without ever acquiring a specific conceptual status, the idea of change has been the focus of continual questioning since the beginning of psychoanalysis. As pointed out by Daniel Widlöcher (1970), it is easily traced in Sigmund Freud's work. As early as their

preliminary communication of 1893, which served to introduce their *Studies on Hysteria* (1895d), Freud and Breuer established both the modus operandi of the cathartic treatment of hysteria and the idea that the mechanism of treating the symptom is the reverse of the mechanism of its formation. The recollection of an event and its affective charge spark a process that reverses the pathogenic process brought about by repression. From that point on and indeed throughout the rest of his work, Freud drew on his observation of resistances to change to modify, deepen, and refine his model of change. Three moments mark the beginnings of psychoanalysis: the development of the rules of technique, the shift in focus from trauma theory to the role of fantasy, and the introduction of the concept of change in the form of libidinal development. Here we have an indication of the importance of a model of change to psychoanalysis.

Freud's discovery of the extent and importance of the transference between 1904 and 1910 introduced a new model of change, which is particularly well explained in his *Introductory Lectures on Psychoanalysis* (1916–1917a [1915–1917]). Transference affects the processes of change in several ways. It is an obstacle used by resistance, and it hinders the processes of association and remembering by encouraging repetition through acting out. But it is also a lever for therapeutic transformation, because the patient cathects with the therapist and this reveals features of past attachments and conflicts. Above all, repetition in the transference leads the patient to externalize a conflicted intrapsychic structure and displace it onto the relationship with the analyst. This is the origin of the tripartite therapeutic model of clinical neurosis, transference neurosis, and infantile neurosis.

Beginning in the 1920s, growing doubts about the therapeutic effectiveness of psychoanalysis led Freud to make two basic theoretical revisions. First, he introduced the dualism of the life and death instincts to account for the force of the compulsion for repetition as compared with the inertia of libidinal-object choice. The second revision was based on a more diversified analysis of the processes of resistance to change, which allowed Freud, in “Inhibitions, Symptoms, and Anxiety” (1926d [1925]), to differentiate the resistances of the id, the ego, and the superego—a distinction made possible by the new structural model but also strengthened the clinical effectiveness of treatment. On this basis Freud constructed a third model, which he

formulated in a binary manner: “Where id was, there ego shall be,” he wrote in “New Introductory Lectures on Psycho-Analysis” (1933a [1932], p. 80). In “Analysis Terminable and Interminable” (1937c), Freud offered a more modest version of this formulation, evoking a kind of to-and-fro between ego analysis and id analysis. He was also careful to recall the bases of resistance to change (libidinal viscosity, the repetition compulsion, and also penis envy in women and masculine protest in men).

Throughout his work, in fact, Freud emphasized the study of resistances. In “Analysis Terminable and Interminable” (1937c), he emphasized, “Instead of an enquiry into how a cure by analysis comes about (a matter which I think has been sufficiently elucidated) the question should be asked of what are the obstacles that stand in the way of such a cure” (p. 221).

Have developments in psychoanalytic thinking since Freud followed through on this recommendation? Probably in part, even though the various theories have focused chiefly on their respective models of change. The development of many different schools of thought after Freud owes a great deal to modifications of technique (though only in close association with the work of interpretation) and, in the final analysis, to theoretical approaches that seek to specify the articulations between a pathological model, a developmental model, and a model of change through treatment. Yet all schools of psychoanalysis have based themselves on theoretical and clinical elements already present in Freud’s work. Rather than an expression of allegiance, this is a consequence of the fact that Freud’s theory of change (and the different models successively added to it) covers a very complex reality, of which the various schools have tried to specify a particular portion.

It is worth drawing out a few main themes of these schools, though without reviewing the technical and theoretical frameworks of each (which are rarely presented in connection with the processes of change and resistance to change). The first theme concerns the psychoanalyst’s involvement in the process of change. The idea of a neutral therapist, whose “noninvolvement” ensures the necessary capacity for listening and interpretation, has given way to an ever narrower focus on the analyst’s mental efforts and role in change. This trend, already well underway in Sándor Ferenczi’s innovations in technique, is evident in studies of the role of counter-transference by Paula Meimann and Heinrich Racker, and is currently being

developed around the concepts of interaction, empathy (Ralph Greenson, Heinz Kohut), and “co-thinking” (Widlöcher).

Rather different from the foregoing is the narrative or constructivist tendency. This trend includes the otherwise varied approaches of Jacques Lacan, Roy Schafer, and Serge Viderman, all of whom in their respective ways emphasized how the work of interpretation is constructive.

Another theme is the mechanisms of externalization and internalization. Authors here have returned to the model of transference neurosis to show how pathological structures are displaced in the therapeutic relationship. Often abandoning the classical model of neurosis, these authors (including Melanie Klein and her students, as well as object-relations theorists) describe more archaic processes that become amenable to analysis once they are externalized in the transference.

A third approach stresses the reparative function of the process of change. Change is expected to affect choices of libidinal objects. This trend develops the Freudian idea of the “revision of the process” by placing considerable emphasis on the emotions and the psychoanalyst’s containing function. Such authors as Michael Balint, Donald Winnicott, and Wilfred R. Bion, very different in other respects, belong to this trend.

Other dimensions of change could, of course, be taken into consideration. The most important thing, perhaps, is to identify the reasons for the various divergences on the nature of psychic change and their impact on the activity and future development of the institutions of psychoanalysis. The problem is less one of justifying the existence of several models (which, as noted earlier, has to do with the complexity of the processes involved) than of explaining the reasons for theoretical choices. Clearly, the extension of psychoanalytic treatment to a broader range of cases and the application of psychoanalysis to serious pathologies have had a decisive impact on evolving ideas about change. Will this trend toward disparate models of psychic change continue? If not, what other trend will supplant it? What role will planned research studies, which tend to objectify certain data, play at a time when psychoanalysts are increasingly being held accountable for treatment choices, their effectiveness, and their cost?

## CHARACTER

---

Character is a psychological, philosophical, and a literary concept. A distinction needs to be drawn between this concept and the metapsychological aspects of character and its relation to symptoms and neurosis.

There are two main ways of defining it, which are interconnected. Concepts of character are designated on the one hand by the metapsychological aspects that are intrinsically connected with developments in theory and, on the other hand, by the distinction between normality and pathology and, specifically, the convergence between character and the major concepts of neurosis, psychosis, and borderline conditions.

The concept of character appeared as early as 1900 in *The Interpretation of Dreams* (1900a), in connection with the importance of mnemonic traces. The role of fixations emerged more clearly in 1905 in *Three Essays*

*on the Theory of Sexuality* (1905d), emphasizing the role of sublimation in character formation; Freud wrote: “A sub-species of sublimation is to be found in suppression by reaction-formation” (p. 238). He then described various character types associated with the partial drives in “Character and Anal Erotism” (1908b) and “Some Character-types Met with in Psycho-Analytic Work” (1916d). It was in 1913, in “The Disposition to Obsessional Neurosis: A Contribution to the Problem of Choice of Neurosis” that he most sharply differentiated symptom and character: “the failure of repression and the return of the repressed—which are peculiar to the mechanism of neurosis—are absent in the formation of character. In the latter, repression either does not come into action or smoothly achieves its aim of replacing the repressed by reaction-formations and sublimations” (1913i, p. 323).

In 1923, with the introduction of the structural theory, character is located in the ego and the importance of identifications is emphasized: “an object which was lost has been set up again inside the ego—that is, an object-cathexis has been replaced by an identification. . . . We have come to understand that this kind of substitution has a great share in determining the form taken by the ego and that it makes an essential contribution towards building up what is called its ‘character’” (1923b, p. 28). Character thus comprises the history of object-choices that have since been abandoned. However, the earliness of these identifications should not allow us to forget that the earliest identifications with the parents are those that influence the constitution of the superego rather than the ego (Lecture 32, *New Introductory Lectures on Psycho-Analysis*, 1933a). Here the function of character traits as resistance is frequently emphasized: “we may now add as contributions to the construction of character which are never absent the reaction-formations which the ego acquires—to begin with in making its repressions and later, by a more normal method, when it rejects unwished-for instinctual impulses” (p. 91).

Freud saw a degree of overlap between character and symptom in spite of their differences and maintained that it was the failure of the defensive function of character that led to repression and neurosis; in “Analysis terminable and interminable,” he demonstrated that: “the defensive mechanisms, by bringing about an ever more extensive alienation from the external world and a permanent weakening of the ego,

pave the way for, and encourage, the outbreak of neurosis" (1937c, p. 238).

The "libidinal types" (1931a) have been considered a development of character theory. However, these are in fact an attempt by Freud to attribute a key role to the agencies of the structural theory (id, ego, and superego) in a psychoanalytic nosography.

The study of character has been continued by various authors but it has been overtaken by the subject of character resistance and the associated problems of technique. Karl Abraham emphasized the importance of fixations, although he cautioned against the notion of a fixed nature as something that is disproved by modifications in character ("A Short Study of the Development of the Libido," 1924/1927). He set out to establish a semiology of psychic material and emphasized the earliness of object relations involved in symptom-formations and character-formation. Wilhelm Reich is known mainly for the modifications in technique that he advocated with patients who presented him with "character armor." This means avoiding interpreting drive impulses before having interpreted and overcome this resistance, layer by layer. In their demonstration that a large number of muscular reactions are designed to prevent the breakthrough of emotions, excitations, or anxiety, these descriptions are reminiscent of Pierre Marty's discussions of rachialgia (1963).

In *The Psychoanalytic Theory of Neurosis* (1945), Otto Fenichel also demonstrated the need to resolve the conflicts between the drives and defenses. Raymond de Saussure considered character as a developmental stage in which the subject has become stuck and not as a type that is established for a lifetime.

Jean Bergeret (1976) described character and structure by distinguishing three levels of character: Character, as an emanation from the deep structure in relational life, traces the progress or failure of the structural development; character traits, elements of the fundamental character, are often associated with elements of other forms of character, compensating for deficiencies in fundamental character through adaptive requirements, and can thus appear in a different structure from the one from which they derive. Character pathology, on the other hand, corresponds to the "borderline" economy and its decompensation leads to a deformation of the ego, with the onset of more or less severe forms of splitting.

Otto Kernberg's work on character forms part of his studies of borderline functioning. In "A psychoanalytic classification of character pathology" (1970), he proposed a classification of character pathologies with three levels of severity, corresponding to the level of development of the drives, the superego or the ego, or the more or less pathological nature of the character traits. The three levels of severity that he distinguishes are reminiscent of the levels of mentalization in Pierre Marty's theory of character neurosis.

The issues raised by character traits continue to be of interest to the French psychosomaticians among others. In "Névrose de caractère et mentalisation" (Character neurosis and mentalization) for example, Michel Fain (1997) argued that the disappearance of a character trait indicates a dementalization occurring in an essential depression rather than the resolution of a neurotic process.

## CHARACTER ANALYSIS

In the course of his clinical work in Vienna (1924–1930) and then in Berlin (1930–1933), Wilhelm Reich worked out his own techniques of psychoanalytic practice that emphasized the analysis of resistances and the structure of the character. He made his techniques public in his book, *Character Analysis* (1933/1945), his richest contribution to psychoanalysis. Character represents a stable, more or less rigid, organization of the libidinal economy of the person; it is at the same time submitted to the pressures of the drives and to social constraints, to gratifying or traumatic experiences, and to the repetitions or defenses that they give rise to: “Character is in the first place a mechanism of narcissistic protection.”

The “character traits” that it brings together under the name of “character armor” correspond to the mechanisms used by the person to deal with the repressed. Reich described two great poles of character, defined by their degree of “orgasmic potency” and the prevalence of various states of the libido: The genital character, the Reichian ideal, is distinguished by an orgasmic potency that reaches a true plenitude, a flexible and free circulation of libidinal energy, and also by modes of relation to the self, to others, and to the

world, founded on a rational approach that respects the reality principle. The neurotic character, conversely, suffers from a libidinal imbalance that gives primacy to repression and negation or, in other cases, to impulsivity and an inability to master the pressure of unconscious impulses. In addition to these fundamental character types, Reich described “some well defined forms of character,” such as the hysteric character, dominated by ostentation and sexual mobility; the compulsive character, where rigidity, retention, and obsession for order dominate; and the phallic-narcissistic character, structured so as to resist the “anal and passive-homosexual impulses.” For the masochistic character, Reich refers, through several individual examples, to a cultural form marked by guilt and the desire for punishment—in short, the death drive, as the source of the tendency towards such deadly political practices as fascism.

Reich’s broadening of character analysis included a third part called “On the Psychoanalysis of the Biophysics of Orgone,” in which Reich, linking “physical contact” and “vegetative current,” emphasized the role of violent, elementary sensations such as the feeling of “breakdown” and the “representation of death.” He proposed, on this basis, an original interpretation of the “schizoid disintegration,” by which certain symptoms typical of schizophrenia—the “faraway stare,” dissociation of the personality, and catatonia—are presented in a clarifying and suggestive light. By inscribing his researches within a “language expressive of life,” Wilhelm Reich committed himself to a vitalist vision that shall see subsequent and more ample developments.

## CHARACTER FORMATION

Character is a psychological notion that refers to all the habitual ways of feeling and reacting that distinguish one individual from another. Sigmund Freud had a sustained interest in the question of character formation, since it touches on the major themes that interested him: “anatomo-physiological destiny,” memory traces, and, more generally, the role of acquired traits, as well as the function of sublimation with regard to the “remains” of the pregenital libido.

In *The Interpretation of Dreams* (1900a), Freud defined character in relationship to the unconscious: “What we describe as our ‘character’ is based on the memory-traces of our impressions; and, moreover, the impressions which have had the greatest effect on us—those of our earliest youth—are precisely the ones which scarcely ever become conscious” (pp. 539–540). This definition posits character as a sort of memory, a collection of traces. Five years later, in *Three Essays on the Theory of Sexuality* (1905d), Freud emphasized individual psychic activity: “What we describe as a person’s ‘character’ is built up to a considerable extent from the material of sexual excitations and is composed of instincts that have been fixed since childhood, or constructions achieved by means of sublimation, and of other constructions, employed for effectively holding in check perverse impulses which have been recognized as being unutilizable” (pp. 238–239).

In 1920, in an addendum to the *Three Essays* that reiterates material presented in the article “Character and Anal Erotism” (1908b), Freud summarized, “Obstinacy, thrift and orderliness arise from an exploitation of anal erotism, while ambition is determined by a strong urethral-erotic component” (p. 239, n. 1). Character derives from instincts, but not directly, since reaction formations and sublimations intervene. Thus, as Freud noted in “Thoughts for the Times on War and Death” (1915b), “The pre-existence of strong ‘bad’ impulses in infancy is often the actual condition for an unmistakable inclination towards ‘good’ in the adult” (p. 282).

With the development of the notion of identification, that of character took on additional dimensions. Character formation was understood to be based on the mechanism of identification, that is, unconsciously identifying with character traits derived from objects. According to Freud in *The Ego and the Id* (1923b),

when a lost object is reestablished in the ego, thus allowing an identification to replace object cathexis, this “makes an essential contribution towards building up what is called its ‘character’ ” (p. 28).

The notion of character thus evolved in Freud’s work. The importance Freud attributed to it can be seen in his remarks in “Freud’s Psycho-Analytic Procedure” (1904a), where he wrote, “Deep-rooted malformations of character, traits of an actually degenerate constitution, show themselves during treatment as sources of a resistance that can scarcely be overcome” (p. 254). However, determining character traits is not easy. In “Some Character-types Met with in Psycho-Analytic Work” (1916d), Freud noted that it is not the character traits that patients see in themselves, nor those attributed to patients by persons close to them, that pose the greatest problem for analysts; rather it is the previously unknown and surprising peculiarities often revealed in the course of analysis. Freud analyzed some of the character types revealed through analysis, including those of subjects who claim for themselves the right to perpetrate injustice because they believe they have been subjected to it themselves, subjects “wrecked by success” (pp. 316 ff), and finally, taking a perspective that changed criminology, “criminals from a sense of guilt” (pp. 332 ff).

Karl Abraham (1925/1953–1955) returned to the specific issue of the anal character. A broader, more central notion of character can be found in the work of Wilhelm Reich (1933/1945). The idea of character analysis, and especially that of “character armor,” are linked to his theories of a biological energy that he later named “orgone energy.” Subsequently, these theories became a separate discipline from psychoanalysis, “bioenergy.” Citing the work of Edward Glover and Franz Alexander (who contrasted character neurosis and symptomatic neurosis), Reich reconsidered the known character types (hysterical, obsessional, masochistic, etc.) under the presupposition that the primordial function of any character type is to defend against stimulations from the external world and against repressed internal instincts. The character analysis he developed consists in isolating in the patient the character trait that is the source of greatest resistance and thus rendering it analyzable. His general idea is that the ego forms a character trait by taking over a repressed instinct to use as a defense against another instinct. Thus, character is essentially a mechanism of narcissistic protection—hence the term “character armor.”

After Reich, character became far more important among psychoanalysts whose work focuses on the ego. In the United States many studies have been published on this topic, notably Heinz Hartmann's *Ego psychology and the problem of adaptation* (1939/1958).

## **CHARACTER NEUROSIS**

The term “character neurosis” did not originate with Freud. It grew out of difficulties in treating character pathologies, distinguished by the great resistance that

character opposes to analysis. And its use spread in the wake of Wilhelm Reich's work on character analysis beginning in 1928. Sigmund Freud, in lecture 34 of his *New Introductory Lectures on Psycho-Analysis* (1933a [1932]), underscored the often extremely long duration required by character analysis, but, he assured readers, “it is often successful” (p. 156).

It was undoubtedly a lack of success with such cases that led Reich to his conception of “character armor.” At the time he was working at the Vienna Psychoanalytic Clinic with impulsive psychopaths. The problems raised by their treatment, he said, required a sharp focus on the structure of the impulsive ego.

The difficulties of regression in the transference, the inaccessibility of character fixations to analysis, and the difficulty of investing the analyst except in an idealizing mode (a defense against any erotic or aggressive investment) form the basis for the analysis of character pathologies. In his Vienna seminars between 1922 and 1926, Reich noted that the obstacle to a cure is found in the patient's whole character. He advocated a rigorous analysis of the character defenses, layer by layer, before any deep interpretation.

Hermann Nunberg (1956), denouncing what he saw as the artificial separation of the analysis of resistance and the analysis of deep contents, had serious disagreements with Reich with regard to the techniques to be implemented. In “Le traitement psychanalytique du caractère” (1928/1982), Sándor Ferenczi argued that the analyst has to reveal how character traits are unconsciously used to resist analysis and has to link them to the corresponding forgotten childhood experiences, in particular, experiences of seduction by an adult, for analysis to progress. This is in keeping with what he called analytic pedagogy, which makes use of his active technique. Following Ferenczi, Michael Balint (1932/1952) emphasized the effects of the fear of excitation, and indeed of pleasure itself, often the result of hyperstimulation of the child by an adult.

Later Otto Kernberg, in “A psychoanalytic classification of character pathology” (1970), sought to establish a form of classification based on the increasing severity of pathological manifestations by integrating the various nosographic and metapsychological data (agencies, part instincts). This terminology is reminiscent of Pierre Marty's 1980 classification of neuroses as well, poorly, or irregularly mentalized, or even as

behavioral neuroses. According to Marty, the same metapsychological elements are paramount: deficiencies in mentalization correspond to deficiencies in object internalization and to acting out, which give rise to behavior disorders. René Diatkine (1966) emphasized the suffering of persons close to the patient; in his view, the ego-syntony of character protects the subject from anxiety. Henri Sauguet (1966) established a gradation between neurotic character (close to the symptomatic neuroses) and character neurosis (close to borderline states or even psychosis).

Despite the importance of, and the number of authors who have taken an interest in, character neurosis, in France this notion is obsolescent because the general focus has shifted toward problems of symbol formation and identity construction. The term nevertheless retains some currency among psychosomatically oriented analysts, particularly in France. One area being researched concerns the connections among the structure of the superego, the presence of the ideal ego (in Marty's sense), and the quality of mentalization. In "Névrose de caractère et mentalisation" (Character neurosis and mentalization; 1997) Michael Fain emphasized how character defenses play a protective role: "The disappearance of character traits more often attests to a dementalization taking place in an essential depression than to the resolution of a neurotic process."

## CHARCOT, JEAN MARTIN (1825–1893)

Jean Martin Charcot was born in Paris in 1825, the son of a coach builder, and died of a heart attack near Lake Settons (Nièvre) on August 16, 1893. He was a physician with the Hôpitaux de Paris, a professor of clinical medicine for nervous disorders, and a member of the Académie de Médecine.

He was appointed a physician with the Hôpitaux de Paris in 1856, associate professor of medicine in 1860, senior physician at the Salpêtrière in 1862, professor of pathological anatomy in the School of Medicine at the University of Paris in 1872 (succeeding Alfred Vulpian), and in 1882 was appointed to the first chair of neurology, a position created for him at the request of Léon Gambetta, as professor of diseases of the nervous system. He was made a member of the Académie de Médecine in 1873 and the Académie des Sciences in 1883,

Charcot had an impressive career and received numerous academic honors, but the accuracy of his theories on hysteria, which he began working on in 1865 after the "department of epilepsy" was placed under his supervision, had begun to be seriously questioned at the time of his death. The work of his student, the neurologist Joseph Babinski; the rise of Pierre Janet's dynamic psychology; and especially the success of psychoanalysis all contributed to bringing down a

theoretical structure that had nurtured these developments at the beginning of the twentieth century.

Charcot was an attentive observer, which helped establish methods of neurological description and classification still in use (Charcot's disease, Charcot-Bouchard aneurysm, and so on), and possessed an almost magical talent as a speaker. He attracted a diverse group of personalities to his presentations: his public "Leçons Cliniques," held on Wednesdays, and his "Grandes Leçons," held on Fridays. His patients, it was learned after his death, had to some extent been prompted to exhibit to the audience the typical "hysterical crises" that the Master expected of them. He was particularly interested in paralysis, anesthesia, and other symptoms considered to be "hysterical," and attempted to demonstrate their "functional"—rather than anatomical—origin, a belief that contradicted a number of other practitioners, who were proponents of the surgical removal of their patients' ovaries.

He succeeded in isolating a clinical entity he referred to as the "grande hystérie" or "hystero-epilepsy." He described a crisis, or "attack," as occurring in four successive phases: the epileptiform phase, clonic spasms, emotional "acting out," and terminal delirium. In addition to these attacks patients exhibited "stigmata" (narrowing of the visual field, anesthesia)—conditions that could only exist if there were some form of "diathesis," that is, a predisposition to hereditary degeneration.

To demonstrate his ideas, Charcot publicly performed hypnosis to provoke or eliminate such symptoms, which proved they were not connected to organic lesions, unlike true neurological disorders. This was a step toward a "psychological" conception of the origin of hysterical symptoms, but Charcot wrote in 1887, "What I call psychology is the rational physiology of the cerebral cortex." He gave encouragement to the new field with the creation, in 1890, of the Laboratory of Psychology at the hospital, with Pierre Janet as its head. He supported Janet in his work on his dissertation, "L'État mental des hystériques" (The Mental State of Hysterics; 1893), and ensured publication of the work of Sigmund Freud in French medical reviews.

Freud's work with Charcot at the Salpêtrière contributed greatly to Freud's later work and the birth of psychoanalysis. Arriving in Paris on October 13, 1885, with the help of a grant from the School of Medicine

of the University of Vienna to study anatomic pathology, he was introduced to hysteria and its "psychological" etiology, which had a decisive influence on his decision to treat patients privately, which he did when he returned to Vienna in the spring of 1886.

A month after his arrival in Paris, on November 24, 1885, he wrote to his fiancée, "Charcot, who is one of the greatest of physicians and a man whose common sense borders on genius, is simply wrecking all my aims and opinions. I sometimes come out of his lectures as from out of Nôtre Dame, with an entirely new idea about perfection. . . . Whether the seed will ever bear fruit, I don't know; but what I do know is that no other human being has ever affected me in the same way." Before he left Paris at the end of February 1886, Freud obtained Charcot's approval to translate his *Leçons cliniques* into German. He took with him a number of expressions that proved useful to him later on: "theory is good, but that doesn't prevent its existence," "in those cases, it's always genital," "the wonderful indifference of hysterics," "the refusal of the sexual is enormous, like a house."

Freud and Charcot maintained their relationship through correspondence, even though the personal comments Freud added to the *Poliklinische Vorträge* (1892–1894a), his translations of the *Leçons du mardi*, left a somewhat bittersweet residue (Mijolla). Although Charcot was not interested in the cathartic method Freud had spoken to him about, Freud left the hospital with a draft for an article on hysterical paralysis that took him seven years to complete, but when published in French in the *Archives de neurologie* (1893c), represented the first "psychoanalytic" approach to the phenomenon. Freud named his first son Jean Martin, and throughout his life kept a reproduction of André Brouillet's painting *Une leçon clinique à la Salpêtrière*.

In his homage to Charcot at the time of his death, Freud confirmed his rejection of Charcot's theories but at the same time expressed his gratitude: "He was not a reflective man, not a thinker: he had the nature of an artist—he was, as he himself said, a 'visuel,'—a man who sees" (1893e). In February 1924, at the request of the review *Le Disque vert*, he wrote, "Of the many lessons lavished upon me in the past (1885–6) by the great Charcot at the Salpêtrière, two left me with a deep impression: that one should never tire of considering the same phenomena again and again (or of submitting to their effects), and that one should not

mind meeting with contradiction on every side provided one has worked sincerely” (1924a).

## **CHENTRIER, THÉODORE (1887–1965)**

Théodore Chentrier, a French psychoanalyst, was born in Marseille on November 18, 1887, and died in Montreal on July 3, 1965. A fellow student with Charles de Gaulle and Georges Bernanos at the Jesuit school of the Immaculate Conception in Paris, he began his career teaching French and Latin. A man with an inquisitive mind, Chentrier took an interest in homeopathy, morphology, graphology, and psychopedagogy, which he practiced starting in 1927 while working for Professor Laignel-Lavastine and Doctor Vinchon at the Hôpital de la Pitié in Paris. He began his analysis with Rudolph Loewenstein on July 3, 1931, and became a member of the Société Psychanalytique de Paris (Paris Psychoanalytic Society) in 1933. A friend of Paul Jury, he practiced with him in Paris from 1944 to 1948, the year he left for Quebec.

Appointed professor of psychology at the University of Montreal in October 1948, for three years he was president of the Société de Psychanalyse de Montréal (Montreal Society for Psychoanalysis). He developed a widespread reputation from his broadcasts on Radio Canada known as “Psychologie de la Vie Quotidienne”

(The Psychology of Everyday Life), an extension of his conversations with Paul Jury. The series lasted for nine years.

## **CHERTOK, LÉON (TCHERTOK, LEJB) (1911–1991)**

A French psychiatrist and psychoanalyst of Russian origin, Léon Chertok (Lejb Tchertok) was born October 31, 1911, in Lida (a Byelorussian city near Vilnius, Lithuania) and died July 6, 1991, in Deauville, France. Because of the educational quotas for Jews in Poland, Chertok studied medicine in Prague, where he defended his dissertation in 1938. On his way to America to escape the Nazi invasion, he stopped in France, where war broke out in 1939. He volunteered for the army, was demobilized in 1940, and entered the Resistance, where he worked mostly with the Jewish MOI section (“Main-d’oeuvre immigrée,” which brought together communist and foreign militants). Appointed to head the Mouvement National contre le Racisme (MNCR) [National Movement Against Racism], he founded the clandestine newspaper *Combat médical* and played an active role in saving Jewish children threatened with deportation. He was awarded the Croix de Guerre.

After the war his interest turned to psychiatry and he spent several months at Mount Sinai Hospital in New York City before being made a doctor of medicine in 1948 by the School of Medicine of the University of Paris. Between 1949 and 1963 he served as a resident and then an assistant at the Hospital of Villejuif, where, with Victor Gachkel, he became co-director of the Center of Psychosomatic Medicine, which they had recently created. From 1963 to 1972 he was head

of the Department of Psychosomatic Medicine at the La Rochefoucauld Psychiatry Institute in Paris, then, from 1972 to 1981, the director of the Déjerine Center for Psychosomatic Medicine, in Paris, where, with Didier Michaux, he started a hypnosis laboratory. The founder and executive secretary of the Société Française de Médecine Psychosomatique, he was also editor-in-chief of the *Revue de médecine psychosomatique*.

In 1948 he began a training analysis with Jacques Lacan, which was concluded in 1953, during the first split in the French psychoanalytic movement. In spite of supervised analyses with both Marc Schlumberger and Maurice Bouvet, Chertok the nonconformist was not admitted to the Société Psychanalytique de Paris; the fact that he made extensive use of hypnosis in his practice, becoming one of the leading specialists in France, certainly did not improve his chances of admission. His practice, and the many articles he wrote about his work, ultimately pushed him further and further from traditional psychoanalysis. Nonetheless, in 1973 he co-authored, with Raymond de Saussure, *La Naissance du psychanalyse, de Mesmer à Freud*, a historical work on the origins of Freudian psychoanalysis that has become a classic.

At the request of Philippe Bassine and A. E. Sherozia, he also organized a symposium on the unconscious held in Tbilisi, Georgia, in October 1979, which was attended by a number of psychoanalysts, including several from France. This was the first official event where psychoanalysis was openly discussed in Soviet Russia.

However, hypnosis was Chertok's true field of research and the subject of considerable thought. In 1987, toward the end of his life, his work took a new turn when he and Isabelle Stengers began a seminar entitled "L'hypnose, problème interdisciplinaire."

## **CHICAGO INSTITUTE FOR PSYCHOANALYSIS**

The Chicago Institute for Psychoanalysis, one of the oldest in the United States, has been both a key institution in its own right and a hub for westward expansion of the profession. Founded during the Great Depression, in the 1940s the Institute served as a training and credentialing institute for analysts who then created organizations in other cities, including Topeka, Los Angeles, and Detroit. Although ultimately most closely associated with the classical ego psychology that dominated analysis at mid-century, the Chicago Institute was distinctive for a certain tolerance of divergent points of view. Its founder, Franz Alexander, promoted several unconventional ideas and techniques; Heinz Kohut, after a long career as a purely orthodox analyst, developed his influential self psychology at the institute during the 1970s. Thomas Szasz, who became an iconoclastic critic of psychiatry, originally trained at the Chicago Institute.

Organized psychoanalysis in the city dates to establishment of the Chicago Psychoanalytic Society in 1931. N. Lionel Blitzsten, the society's first president, was considered the first trained analyst in Chicago and a charming teacher who lacked administrative interests or skills. Establishment of the Chicago Institute fell to the Hungarian analyst Franz Alexander.

Alexander, who lectured at the University of Chicago in 1930 but did not receive a warm welcome among psychiatrists there, returned to the city two years later to found and become first director of the Chicago Institute for Psychoanalysis. His objective was to create a training center outside a university setting that could also support research and clinical activities. A charismatic figure originally attached to the Berlin Psychoanalytic Institute, Alexander became a magnet for other European analysts, especially with the rise of German fascism. Alexander modeled the center on the Berlin Institute, which itself had been founded along

the lines of the great nineteenth-century research institutes designed to encourage intellectual exchange, debate, and collaboration. The Chicago Institute had a brick-and-mortar presence from the beginning and boasted classrooms, a library, and a dining room where staff lunches became an enduring feature, as they had in Berlin.

The organizational structure that Alexander established at Chicago was in certain respects unique. He proved able to attract wealthy donors, some among his analysts, and early funding was provided by Alfred K. Stern, an executive with the Julius Rosenwald Fund, a Chicago-based philanthropy, and by the Rockefeller and Macy Foundations. Alexander created a lay board of trustees with fiscal responsibility for the institute, which became a powerful source of funding, especially during the heyday of psychoanalysis. In addition, the institute was staffed by a small group of analysts with lifetime appointments and, in organizational terms, was entirely separate from the Chicago Psychoanalytic Society. This arrangement is thought to have promoted the tolerance for divergent points of view that helped Chicago avoid the splits so common in psychoanalytic institutes in other cities.

Alexander directed the Chicago Institute for the best part of a quarter century. As an administrator he was regarded as authoritarian, albeit a benign despot, while he and the analytic staff functioned as an oligarchy. Alexander's research, for which he secured large grants from the Rockefeller Foundation, was a considerable stimulus to psychosomatic medicine, which, although later engulfed by molecular psychiatry and other developments, came to enjoy a high profile by the 1950s. Also involved in research were Thomas M. French, until 1961 the institute's director of research, and the German analyst Therese Benedek, the author of a major text on psychoanalytic supervision and one of a number of prominent female analysts at Chicago.

In 1953, Alexander decided to leave the institute and he spent the last phase of his career in Los Angeles, until his death in 1964. To some extent his departure was a consequence of the advancing orthodoxy at Chicago that viewed Alexander's innovative treatment options, such as analysis only three times per week and the concept of a "corrective emotional experience," as out-of-step with techniques then in vogue.

Gerhart Piers effectively succeeded Alexander in 1956, for what became a fifteen-year administration.

He exercised power much as Alexander had done and used his influence to reengineer the training institute and introduce several other innovations, including a low-fee graduate clinic. He also paid greater attention to therapy for children and adolescents, an area that Alexander had neglected. Piers organized the Child Therapy Training Program for pediatricians, nurses, and social workers and, in 1965, developed a Teacher Education Program.

To Heinz Kohut, a recent graduate of the institute, Piers entrusted the task of reorganizing and revamping the curriculum. Kohut, who then worked closely with the forces shaping ego psychology, created a core set of classes with a historical perspective, and went on to teach the two-year theory course himself for many years. As was the case at other institutes, the new curriculum at Chicago paid little attention to the work of Melanie Klein or the British analysts who were then developing object relations theory.

Although George Pollock, who succeeded Piers in 1971, became a controversial figure late in his tenure, he was an energetic director who moved the Chicago Institute with a multi-pronged agenda. As a major administrative figure in both the American Psychoanalytic Association and the American Psychiatric Association, he raised the profile of the Chicago Institute through the effective exercise of power, though some thought his actions were based too much on a patronage-like system. In 1973, he engineered authorization from the State of Illinois for the institute to offer a doctoral program in psychoanalysis. The same year, the *Annual of Psychoanalysis* began publication and became an influential yearly review. Pollock also established the Barr-Harris Children's Grief Center, which remains in operation today, to help children cope with the loss of a parent or sibling. Research meetings at the Institute regularly drew renowned analysts as speakers, and although analysis would soon to lose much of its privileged cache to biological psychiatry, Charles B. Strozier wrote (2001), "I doubt there has been a more lively intellectual atmosphere in the history of psychoanalysis than at the Chicago Institute in the 1970s."

While Chicago remained Heinz Kohut's base throughout his career, his innovative brand of psychoanalysis was not warmly received by either Pollock or many of his colleagues at the institute. However, Kohut's deemphasis on drive theory and his view that narcissism was a separate developmental path did win

adherents—Arnold Goldberg, Charles B. Strozier, and Ernest Wolf at Chicago—and self psychology eventually established itself as a branch movement within psychoanalysis. Kohut died relatively young, at age sixty-seven in 1981, just ten years after publication of his *The Analysis of the Self*.

Although Pollock liberalized the oligarchic character of the institute's staff and was a successful fundraiser through the lay board of directors, he could not stem the effects of a nationwide decline in the popularity of analysis as it ceased to attract large numbers of psychiatrists and patients. In 1988, after Pollock was sued by the son of a patient who claimed that his mother, a wealthy donor to the institute, had been financially exploited, he resigned. Subsequent reorganization in the wake of his acrimonious departure favored greater pluralism and more power extended to the faculty. Both Arnold Goldberg, who became next director in 1989, and Thomas Pappadis, who succeeded him in 1992, brokered policies that further democratized the institute. Jerome Winer, named director in 1998, continued to broaden the focus of the institute while attempting to enhance funding and to further cooperative ventures with universities.

As was the case in other cities, the Chicago Institute for Psychoanalysis survived the recalibration of analysis as a therapy and profession by creating for itself a place within the larger context of mental health practice. While the Chicago Society for Psychoanalysis, still a separate body, is comprised primarily of medically trained analysts, the Chicago Institute serves a broader community with a more inclusive mandate. In the early 2000s, the institute provides training programs for physicians, psychoanalysts, social workers, and other professionals, and offers clinical and community services in a variety of venues for children, adolescents, and adults.

## **CHILD ANALYSIS**

The term *child analysis* refers to the application of psychoanalytic treatment and concepts to a child with a view to understanding the psychic life and mental development of children.

The notion of child analysis first appeared in the work of Melanie Klein, in the sense that she first provided an extensive definition that is both theoretical and practical. The pioneers in the field include Sándor Ferenczi, who contributed still-original ideas on the confusion of tongues between adult and child, as well as his account of the treatment of Little Arpad, and Alfred Adler, one of the first practitioners of child analysis in Vienna.

Hermine von Hug-Hellmuth was one of the first child psychoanalysts to use play techniques, but it was only with Klein that the notion of transference and the idea of psychoanalytic treatment for children appeared. This perspective placed her in sharp opposition to Anna Freud, who believed that transference did not really exist for children owing to the parents' place in the child's life. In contrast, Klein used the transference for the "deep" interpretation of hate and envy. This controversy left its imprint on the evolution of psychoanalysis in Great Britain and led to the creation of the Independent group, which consistently upheld the importance of childhood development.

In relation to adult psychoanalysis, child psychoanalysis occupies an indeterminate position that is both peripheral and central, and that is reflected in debates about the various modes of psychoanalytic training throughout the world. It is peripheral in that not all adult analysts have the inclination or training to work with children, and not all psychoanalytic societies require that their candidates have specific training or even knowledge of the elements of mental development. It is central in that the fundamental concepts of psychoanalysis are summed up in the child: infantile sexuality, transference, the unconscious, resistance, repetition, the drives, and interpretation. The case of Little Hans, described by Sigmund Freud in "Analysis of a Phobia in a Five-Year-Old Boy" (1909b) is a good example of this, even though the treatment was essentially based on observations and exchanges

between Hans and his parents, in a sort of precursor to treatment proper.

In this sense, child analysis can be seen as the application of psychoanalysis in all its facets. In fact, it has not been limited to the treatment of neuroses, but has rapidly been extended to various forms of psychosis, autism, mental retardation, childhood psychosomatic disorders, the psychoanalytic observation of infants, and ethnopsychanalysis. Donald W. Winnicott applied Klein's thinking and his own pediatric experience to a psychoanalytic approach to infants and their relational and developmental difficulties, in particular the encroachment of maternal depression on the infant's self. From this he derived a model for treating borderline states in adults.

In France, Sophie Morgenstern is credited with the first psychoanalytic use of a child's drawing. In 1958 Jacques Lacan gave an original description of the development of subjectivity in the infant, based on the notion of the mirror stage and using the concepts of privation, frustration, and castration, along with the concepts of the Real, the Symbolic, and the Imaginary. Françoise Dolto contributed a great deal to the popularization of child analysis through her analytic and pedagogical talents, and proposed the notion of the unconscious body image. Serge Lebovici, René Diatkine, Michel Soulé, Roger Misès, and Janine Simon were among the analysts most actively involved with children, through institutions that they created, such as the CMPP. (Consultations médico-psychopédagogiques [Medical and psycho-pedagogical consultations]), as well as through studies on the specific requirements of child analysis, its technique and training. Together with Michel Fain and Léon Kreisler, and working within a perspective close to that of René Spitz, Michel Soulé helped define the field of psychosomatic psychoanalytic work with infants, children, and adolescents.

## **CHILDHOOD**

Childhood is not a Freudian concept. A large part of psychoanalytic theory concerns the early years of life and childhood but, in a certain sense, we can say along with Donald Winnicott that “Freud neglected childhood as a state in itself” (1961).

Only after a wrenching period of revision (1895–1901) could Sigmund Freud come to acknowledge the active role of the child in sexual seduction and to abandon his earlier view of children as innocent victims of the incestuous desires of adults; this reversal, moreover, led him to theorize childhood sexuality for the first time. “In the beginning,” he would later write, “my statements about infantile sexuality were founded almost exclusively on the findings of analysis in adults which led back into the past. I had no opportunity of direct observations on children. It was therefore a very great triumph when it became possible years later to confirm almost all my inferences by direct observations and the analysis of very young children” (1914d).

It was in connection with the treatment of adults that Freud became interested in observing small children. As he wrote apropos of the case of “Little Hans,” “I have for years encouraged my pupils and friends to collect observations on the sexual life of children, which is normally either skillfully overlooked or deliberately denied” (1909b). Freud indeed never abandoned this line of enquiry, as witness his celebrated account of the “*Fort/Da*” game played with a cotton reel by one of his grandsons, the personal observation of which he used to support his theoretical conclusions. As related in *Beyond the Pleasure Principle* (1920g), the fact that an act provoking unpleasure would be repeated, coupled with clinical findings from his treatment of traumatic neuroses, was what led Freud to formulate the concept of the death instinct.

After the publication of the *Three Essays on the Theory of Sexuality* (1905d), the first generation of analysts

began observing and reporting on the behavior of their own children in reference to infantile sexuality, the Oedipus complex, and castration anxiety. Anna Freud shared in this activity (Geissmann and Geissmann, 1992). Soon these analysts were joined by specialists on child behavior who had themselves been analyzed. They began to observe specific populations of disturbed children, such as delinquents, then certain periods of childhood, notably that of the earliest mother-child relations, and finally certain types of problems encountered (feeding, thumb-sucking, attempts at separation, etc.). In so doing they were “systematically constructing a psychoanalytic psychology of the child, integrating two kinds of data: data based on direct observation and data based on reconstructions with adults” (Freud, 1968).

It is important to note, along with Anna Freud, that psychoanalysts at first showed considerable reluctance to undertake such direct observation of children. The pioneers were more concerned to underscore the differences between observable behavior and hidden drives than they were to point up the similarities. Their chief aim was still to show that manifest behavior concealed unconscious processes. Anna Freud was initially interested in the defense mechanisms, which became accessible to an observational approach; she then turned her attention to children’s behavior, to what they produced, and, lastly to the child’s ego. She sought to include a psychology of the ego within the analytic framework, an effort further developed later by her friend Heinz Hartmann, whom she never completely disavowed.

On a practical level she created institutions for young children, the first in Vienna in 1924–1925, the last and most complex, which was established after the war in London, being the Hampstead Clinic, an extension of Hampstead Nurseries. At the end of her life she trained child specialists at Hampstead Clinic who worked within the framework of a psychoanalytic psychology of childhood. This work involved treating the child—not only with analysis—to prevent further disturbances, conducting research, and training future specialists in children’s education and pedagogy by applying previously acquired knowledge.

During this same period, Melanie Klein also became interested in childhood. She did not base her theories on direct observation, however. Starting from the psychoanalysis of young children, she constructed a detailed picture of the internal world of the young

child. She pioneered the use of play in analysis. Like dream interpretation for Freud, the free play of the child was for Klein the royal road to the unconscious and to the fantasy life. In *The Psychoanalysis of Children* (1932), she argued forcefully that play translated the child’s fantasies, desires, and lived experience into a symbolic mode. Her technique consisted in analyzing play just as one would analyze dreams and free association in adults, that is, by interpreting fantasies, conflicts, and defenses. The inner world of the young child as she describes it is filled with monsters and demons, and the picture of infantile sexuality she presents is strongly tinged with sadism. In discussing the death drive, she describes an infant whose first act is not simply a gesture of pure love toward the object (breast) but also a sadistic act associated with the action of the drive. Here, as Freud had earlier, Klein challenged a universal human shibboleth: the innocent soul of the child. This was one of the reasons why her work was often poorly received.

The direct observation of young children has expanded considerably in recent years, helped in part advances in technology: it is now possible to study newborns and even fetuses. It is interesting to note that, in this way, the significance and the complexity of the mental life of the very young child have been confirmed, along therefore with the intuitions and efforts of psychoanalysts working during the early twentieth century.

It is clear that psychoanalysis has renewed our vision and understanding of the world of childhood. However, that world remains highly complex, especially its pathology, and it is important to avoid seeing it in terms of adult behavior. Also, while psychoanalysis has enabled us to better understand that world, we must remember, as Anna Freud remarked at the end of her life, that it does not have the power to eliminate childhood neuroses and turn the child and childhood into that place where we would so much love to find innocence, the mythical innocence of a paradise lost.

## CHILDHOOD AND SOCIETY

This book by Erik Erikson, published in 1950, is a classic because it was one of the first to show how Sigmund Freud's theory of infantile sexuality could be broadened in the light of fieldwork in cultural anthropology and sociological studies.

Erikson studied two American Indian tribes and compared their different ways of socializing children. Based on this work he elaborated his conception of the development of the ego, in which he discerned eight distinct phases that he believed were an aspect of psychology at least as important as the libidinal stages outlined by Freud. Attempting to identify positive, organizing aspects of the psyche, Erikson sought to show how these achievements of the ego continue to change and exert an influence long after the conflicts of early childhood that had so interested Freud.

Erikson was particularly interested in problems relating to youth, above all the ways in which psychosocial identity could be a key organizing concept for understanding adolescence. He approached this issue from a cultural-comparatist perspective, with a special focus on the characteristic polarities of American society. He then studied the legendary characteristics of Adolf Hitler's childhood to see how the rise of Nazism could be interpreted within the framework of typically German social structures. Lastly, Erikson interpreted what is known about Maxim Gorky's

youth, to complement his description with materials taken from Russian history.

Revised and expanded in 1963, *Childhood and Society* is the work of a pioneer who sought to raise psychoanalytic thought to the level of the modern social sciences. Although he did not renounce his early Freudianism, Erikson endeavored to provide a new way of looking at things. When asked what the aims of a normal individual should be, Freud customarily replied with two words that Erikson liked to recall: "Love and work." Erikson wanted such a maxim to become a psychoanalytic norm.

## CHILDREN'S PLAY

In psychoanalysis, "children's play" is mental and physical activity which gradually becomes more structured in the course of a child's development. This activity bears witness to a psychic capacity for "concentration" within a personal mental sphere of illusion where objects and phenomena in the external world are transformed in accordance with the subject's wishes, so serving the internal world and augmenting pleasure.

For Freud (1905d, 1905c, 1908e, 1911b), children's play, being subject to the pleasure principle, stood opposed to the constraints of critical thought and reality. The opposite of play is not seriousness but reality, even if children like to prop their imaginary objects on visible, tangible ones. Such propping is precisely what distinguishes playing from fantasizing; as the child

grows up, it is left behind. In *Beyond the Pleasure Principle* (1920g), Freud told how he observed his one-and-a-half-year-old grandson repeating in an active way—by making a wooden reel attached to a string alternately disappear and reappear—what he had had to experience passively, namely the departure of his mother; the pleasure derived from this game allowed the child to work over the unpleasurable experience of his mother's absence. In Freud's view, the compulsion to repeat that operated "beyond the pleasure principle" and the child's tendency to seek immediate pleasure through play were intimately linked. Today it is felt that play indeed helps the child tolerate the absence of an object, that it implies the cathexis of a representation: the boy with his reel successfully converts absence into nostalgia.

Melanie Klein was a closer student of the use of play in child psychoanalysis than of the phenomenon of play per se. Following Hermine Hug-Hellmuth, she devised a technique of play interpretation that treated the ordering of children's play as equivalent to the adult's production of associative material in analysis. She was thus able to apply the Freudian method to very young children, opening the way to child psychoanalysis (Klein, 1955).

Donald Woods Winnicott offered an original account of the notion of "play" and incorporated it into psychoanalytic theory. Since play was not subsumed under the sublimation of instincts, Winnicott speculated that a space existed between the mother and her baby: since the mother (or her substitute), motivated by love (or hate) and not by reaction-formations, needed to be able to adapt actively to her baby's needs, to be what the baby was capable of finding while also leaving the baby the time to find her, a realm of illusion emerged in which the infant felt omnipotent (the breast being under its magical control); such feelings of omnipotence were necessary if the infant was going gradually to accept the disillusion to come. According to Winnicott, the intermediate area between mother and infant was occupied by "transitional phenomena"—groups of functional experiences, as for example thumb-sucking, the holding and sucking of the edge of a blanket, a repeated gesture, or the production of musical sounds (Winnicott, 1974, p. 4)—and it arose between the period of primary creativity and that of objective perception founded on reality-testing. The "transitional object," created internally though found in the outside world, would be the first tangible sign of the existence

of this intermediate zone where the question whether experience was of external or of internal origin simply did not arise. Transitional objects lay "between me and not-me."

There is a direct progression, in the Winnicottian perspective, from transitional phenomena to play, from the child's ability to play alone in the presence of another person to the ability to play a game with others—at first with the mother and only later with peers. Until the age of five or six, children play alongside one another rather than with one another, as Anna Freud showed in her discussion of lines of development. Play involves the body, and the pleasure derived from the functioning of the ego in play activity requires that neither excitement nor anxiety be too intense; children's play is a precarious achievement within the area between subjectivity (not to say hallucination) and objective perception. The capacity for play, once successfully acquired, will endure in every kind of inner experimentation, in the life of the imagination and in adult creativity, although, beginning at the latency period, the individual must become capable of suspending play activity.

## CHILE

The Chilean doctor Germán Greve Schlegel (1869–1954) was the first to publish on the subject of psychoanalysis in Chile and, in general, in Latin America. His study, *Sobre psicología y psicoterapia de ciertos estados angustiosos* was presented in Buenos Aires in 1910. Sigmund Freud (1911g, 1914) wrote about the event in the *Zentralblatt für Psychoanalyse* and in his *On the History of the Psychoanalytic Movement*.

The true pioneer, however, was Fernando Allende Navarro (1890–1981), the first Chilean psychoanalyst. Born in Concepción, Allende Navarro studied medicine in Belgium and completed his doctorate in Switzerland in 1919. He specialized in neurology and psychiatry, studying with von Monakow, Rorschach, and Veragout. He began his psychoanalytic training in Switzerland and became a member of the Société Suisse de Psychanalyse [Swiss Society for Psychoanalysis] and the Société Psychanalytique de Paris [Paris Psychoanalytic Society]. Upon his return to Chile in 1925, he presented his dissertation—“El Valor de la psicoanálisis en la policlinica: Contribución a la psicología clínica”—at the University of Chile.

The consolidation of the psychoanalytic movement began in 1943 with the return of Ignacio Matte-Blanco (1908–1994) and culminated in 1949 during the international congress in Zurich, with the recognition of

the Asociación Psicoanalítica du Chili [Psychoanalytic Association of Chile] by the International Psychoanalytic Association. Matte-Blanco was born in Santiago and studied medicine at the University of Chile. In 1933 he left for London, where he trained in neuropsychiatry at Northumberland House and at Maudsley Hospital. He received his psychoanalytic training at the British Institute. He did his training analysis with Walter Schmideberg and his control analysis with Anna Freud, Melitta Schmideberg, Helen Sheehandare, and James Strachey. In 1940 he went to the United States to work at Johns Hopkins Hospital and, between 1941 and 1943, was assistant professor of psychiatry at Duke University. Upon his return to Chile he trained and analyzed a group of individuals interested in psychiatry and psychoanalysis; these men and women worked under the auspices of the Psychiatric Clinic of the University of Chile. In 1949 he was appointed professor and chair of psychiatry, which gave considerable impetus to the group but was not without complications because of the overlapping roles and responsibilities entailed.

The period was characterized by numerous activities and publications and an overall modernization of the field of psychiatry in Chile. It reached its apogee in 1960, during the third Latin American Congress of Psychoanalysis held in Santiago. The group's orientation was toward classical psychoanalysis, but it was open to new developments, many of which were inspired by work in anthropology and philosophy. Matte-Blanco published *Lo Psíquico y la Naturaleza humana* in 1954 and *Estudios de psicología dinámica* in 1955, books that contained the core ideas he would later develop in Rome and which were published in 1975 in *The Unconscious as Infinite Sets: An Essay in Bi-logic* and in 1989 in *Thinking, Feeling and Being: Clinical Reflections on the Fundamental Antinomy of Human Beings in the World*.

There was also interest in clinical research, which was reflected in a precocious psychoanalytic investigation of the field of psychosis and perversion, primarily in the work of de Ganzaraín and Whiting.

This first generation of psychoanalysts included Arturo Prat (1910–1989), Carlos Whiting (1918–1982), Erika Bondiek, Carlos Nuñez (1918–1983), Ramón Ganzaraín, and Hernán Davanzo; they were followed by José Antonio Infante, Otto Kernberg, Ximena Artaza, and Ruth Riesenber.

Important changes occurred after 1961. Because of operational difficulties and outside influences, the majority of analysts abandoned work in clinical settings and rejected the leadership of Matte-Blanco, focusing instead on the association as an independent institution. Between 1962 and 1971 several well-known members emigrated to Europe or the United States, including Matte-Blanco himself, who settled in Rome in 1966. There followed a general weakening of the movement, although training continued at more or less the same rate. There were exchanges within Latin America, and David Liebermann was called to Buenos Aires on several occasions. The connection to the universities was maintained by Professors Hernán Davanzo, Mario Gomberoff, Omar Arrué, and their staffs. The association itself became increasingly Kleinian.

In the eighties there was a sustained development in the psychoanalytic movement in Chile. Several generations of analysts were trained by Artaza, Bondiek, Davanzo, Eva Reichenstein, and Infante, who had returned from Topeka in 1978. Frequent visits by those who had emigrated, including Otto and Paulina Kernberg, Ramón Ganzarain, and Ruth Riesenber, had an invigorating effect on the profession. Access of this third generation of analysts to training and guidance within the association, together with the association's work with scientific and cultural organizations, led to the growth of a renewed psychoanalytic movement, one that was more pluralist and open to change. A number of psychoanalysts from this period stand out: Mario Gomberoff, Liliana Pauluan, Elena Castro, Omar Arrué, Ramón Florenzano, Jaime Coloma, Eleonora Casaula, Juan Francisco Jordán, and Juan Pablo Jiménez. The Argentinians Horacio Etchegoyen, Jorge Olagaray, and Guillermo Brudny provided significant contributions to the movement. The association's official publication is the *Revista chilena de psicoanálisis*.

## CHINA

Unlike in Japan and Korea, psychoanalysis in China has had a relatively checkered history. Freud's ideas achieved some notoriety in the 1920s during a period of significant social and political reform but were otherwise not taken seriously until the 1930s when the first translations began to appear. To this day, only a handful of Freud's works have been translated into Chinese.

Early translations resulted in some distortions of the original ideas for several reasons. There has been a tendency for translators to directly borrow the Japanese terminology as the two languages share a common writing system in kanji—characters, even though the same characters may mean different things in the two languages. This has produced occasional errors, as, for example, with China's initial use of the Japanese term *muisiki* for “Unconscious”, which literally means, in Chinese, “without consciousness.”

More systematic distortions were also evident. There was concern in some quarters that Freud's theory, which appeared to grant primacy to a free-reigning sexuality, could be construed as a threat to the stability of family relations. Some interpretations of the Oedipus complex were desexualised, emphasizing a social component. The female author Yonqin, writing in 1930 about Freud's theory of hysteria (and omitting all references to infantile sexuality), stated that the condition arises out of conflict between social pressure and the “biological instinct for satisfaction and fulfilment.” A motive for translating Freud, in one translator's eyes, was to forewarn a general public of the dangers of taking Freud too seriously (Zhang, 1989).

By contrast, very serious attempts have been made to rethink the oedipal myth in terms of culturally prevalent myths. In China the myth of *Hsueh Jen Keui* tells of a soldier of the Tang dynasty who kills his own son in ignorance of the kinship tie, preserving the authority of the father; some commentators have held that this becomes an exemplar of the Confucian ethic of filial piety (Zhang, 1989).

Sometimes translations of psychoanalytic and scientific articles based upon primary sources were written with a clear political purpose. The May Fourth movement of 1919 had heralded a brief renaissance in which there had been increasing call from intellectuals to modernize China and shake off certain feudalistic practices and “superstitions.” Freudian notions of sexual tension in families proved compelling to those calling for social reform. Freudian ideas could be claimed to be useful because of their allegiance to biology, medicine and education.

As several commentators have amply documented, psychiatry, as a separate discipline, was in its infancy in China before 1949. There was a home for the mentally ill in Canton which opened in 1898 run by an American missionary doctor. Before that there appears to have been little in the way of psychiatric services. By the time the Communist Party came to power a small number of psychiatric hospitals appeared in the major cities where foreign influence was quite high. The most significant was the Peking Union Medical College which launched the first full-scale academic program in 1932 with new initiatives in teaching and practice involving the disciplines of sociology and social work.

However, psychoanalysis as therapy has not easily taken root in China. This is because, it has been argued, there has been no tradition of expressiveness in the doctor-patient relationship and the doctor in a traditional Chinese setting adopts an authoritarian attitude towards patients. Before WWII there had been only one Chinese psychoanalyst, Bingham Dai, who trained under Harry Stack Sullivan and taught psychotherapy at Peking Municipal Psychopathic Hospital (allied to the Peking Union Medical College) from 1935–39. While he was of the view that, but for the Japanese invasion, psychoanalysis might have taken root in China, he downplayed the theoretical importance Freud attached to the instinctual impulses, claiming that Chinese clinicians emphasised interpersonal relations, and gave more attention to helping their patients tackle the problems of being human (Blowers, 2004).

One should also note that Chinese typically present psychological problems as somatic complaints and have deeply ingrained philosophical systems of thought for which traditional practices such as worshipping of ancestors and visits to the temple to seek one’s fortune serve in times of distress.

These practices have been understood by Unschuld (1980, cited in Gerlach, 1995) as embodying a “Medicine of parallels,” evolving out of Confucianism, Taoism and Buddhism in which “visible and invisible occurrences in the internal and external worlds of the human being (e.g. emotions, internal organs, climatic conditions, elements) are allocated to particular series of parallels and are mutually dependent on each other. Thus the dividing lines between internal and external, mind and body, are removed and a change in one link in the series of parallels will directly affect the others” (Gerlach, p. 94). These systems of thought have also been influenced by turbulent political events. After the founding of the People’s Republic of China (PRC) in 1949, the Communist government severed all ties with non-Communist countries. Attention became focused on Russia. In the early part of its first decade, all psychological work in the PRC was based upon Russian psychology and followed Pavlov’s work very closely. When this model proved less than satisfactory for explaining all psychological phenomena, there then followed two very difficult periods in which psychology was criticised and eventually shut down along with many other disciplines in the second of these periods that became known as the “Proletariat or Cultural Revolution”. Only since 1978 has psychology emerged with a new agenda, largely free of previous political constraints.

During the 1980s visiting psychoanalysts to China (Joseph, 1987) formed the impression that, insofar as psychotherapeutic methods are applied, they are oriented to behavioral therapy or use supportive techniques. They argued, however, that this circumstance maybe connected with traditional Chinese cultural patterns, which discourage both disclosure and communication about one’s own feelings and thoughts to strangers and openness to sexual desires. Insight-oriented psychotherapies face obstacles both in the traditional pattern of Chinese thought and in conflicts leading to feelings of shame more than guilt. However, there have been substantive changes since the 1980s, both in the doctor-patient relationship and in the status of psychoanalytically oriented psychotherapy, in several of China’s key cities.

In spite of there being no analysts in the early years of the PRC, by the 1990s things began to change. The German-Chinese Academy for Psychotherapy (GCAP), comprising German family therapists, behavioral therapists, and psychoanalysts under its president, Margarethe Haass-Wiesegart, initiated a range of training

programs covering behavioural, systemic and psychoanalytic trends. From 1997–1999 they began a continuous training program of six-week courses in Kunming, Beijing, Shanghai, Wuhan, and Chengdu; the curriculum consisted of psychoanalytically oriented psychotherapy. The analysts involved in this training were Antje Haag, Margarethe Berger and Alf Gerlach, the latter having first lectured in China in the 1980s. A second program was initiated in 2000 in Shanghai and Hefei.

Since 1995 the IPA has also begun reaching out to China, organising a committee for Asia, with China represented by Argentinean-trained Teresa Yuan, of Chinese descent. She began training programs at Beijing Anding Psychiatric Hospital, attended by professionals from universities in Beijing and other Chinese cities. Psychoanalytic psychotherapy has been taught in a variety of psychiatric settings in the above mentioned cities, as well as in Xian, Guangzhou, Nanjing and Hong Kong. Huo Datong, a Chinese analyst trained with a Lacanian orientation in France, recently founded a psychoanalytic center in Chengdu (Yuan, 2000).

Although these developments signal a promising outlook for psychoanalytic methods and their application in China, the range and complexity of Freud's ideas may not be fully appreciated unless and until translation revisions and translation of more of his works are undertaken, clinical psychology gets more firmly established, and the therapeutic context is expanded to encompass thorough education on a range of treatments and the possibilities of the individual psychotherapeutic scheme.

## **CHOICE OF NEUROSIS**

As soon as a unified theory of neurosis had been formulated, the factors that determined the clinical form the neurosis assumed in particular cases had to be specified. The study of the choice of neurosis was concomitant, for Freud, with the development of the general theory of psychoneuroses.

The term *neurosis*, coined in the eighteenth century by Cullen, first referred to a heterogeneous set of illnesses attributed to a crisis of nerves. During the nineteenth century, the classificatory system was revised based on individualization of illnesses as different as exophthalmic goiter (Graves' disease) and Parkinson's disease. The idea of consolidating characteristic mental disturbances (the madness of doubt and phobias) and a neurosis (hysteria) within a single framework occurred after the psychological nature of hysteria ("the great neurosis") was established at the end of the nineteenth century, by Charcot in Paris and Breuer in Vienna. Freud (Charcot's student and Breuer's collaborator) and Janet (Charcot's student) were responsible for the two principal theoretical constructions that established the unified theory of neurosis. These two constructions differed in their conceptualization of the mechanisms and causes of neurosis, and the two theories also approached the choice of neurosis very differently.

For Freud, the explanation of the choice of neurosis evolved directly from the theory of neurosis, initially described in 1896. This is expressed clearly in Freud's correspondence with Fliess (especially the letters dated January 1, May 30, and December 6, 1896) and in two articles, "Heredity and the Etiology of the Neuroses" (1896a) and "Further Remarks on the Neuro-Psychoses of Defence" (1896b), situated within the framework of the traumatic theory of neuroses: Nothing in the nature of the trauma itself enables us to differentiate the choice of neurosis; the cause must be sought for elsewhere. Initially, Freud referred to a disposition of attitude at the time of the trauma. Sexual incidents passively experienced during childhood predisposed the subject to hysteria, while those in which the child played

an active role predisposed the subject to obsessive neurosis. This theory was soon abandoned in favor of a chronological approach, and a decade later, Freud repudiated it explicitly.

Its replacement, the chronological theory, was based on the principle that the dates of childhood events play a decisive role. Initially, the date of the trauma was considered crucial. But, in a January 1897 letter to Fliess, Freud modified his position and claimed the key moment took place at the time of repression. In a letter of November of that same year, he concluded, "It is probable, then, that the choice of neurosis (the decision whether hysteria or obsessional neurosis or paranoia emerges) depends on the nature of the wave of development (that is to say, its chronological placing) which enables repression to occur—i.e. which transforms a source of internal pleasure into one of internal disgust" (1950a, p. 271).

The question was still not fully resolved, however, as Freud noted two years later in his December 9, 1899, letter to Fliess. Meanwhile, the theory of trauma had given way to the theory of libidinal development and intrapsychic conflict. Freud retained the chronological point of view, but what was important to him now was the type of relationship the relevant stage of development allowed one to establish with others: one of autoeroticism or alloeroticism (homo- or heteroeroticism). Curiously, hysteria and obsessional neurosis are lumped together, the second considered a variant of the first. What was important to him at this point was the distinction between them and paranoia, which, unlike hysteria and obsessional neurosis, originates in autoeroticism.

The approach that remained the basis for the theory of psychoanalysis and makes use of the concept of *point of fixation* can be dated to *Three Essays on the Theory of Sexuality* (1905d). In the last pages of the work, Freud discusses the role of regression, which, at the time of the conflict, leads the libido to return to an earlier stage, the choice of stage depending on an attraction factor, the tendency to fixation that characterized the earlier development of the libido. The chronological significance was no longer considered proactively (the age of the past event) but retroactively (the return to a particular position).

It is within this new conceptual framework that Freud developed the perspectives in "Formulations on the Two Principles of Mental Functioning" (1911b)

and the psychopathological study that concludes the Schreber case (1911c). Moreover, this "canonical" version was used didactically in the twenty-second chapter of the *Introductory Lectures on Psychoanalysis* (1916–1917a). On the basis of a metaphor (the migration of a people, elements of which are established at different intermediate stages) and a biological model (his own histological work on the embryology of eel gonads), he introduces the concepts of fixation and regression before emphasizing the multiple factors that go into determining a neurosis and the role of "complemental series." By insisting on the role of intrapsychic conflict, he is led to consider the role of the ego and the defense mechanisms, a consideration he had already developed in "The Disposition to Obsessional Neurosis: A Contribution to the Problem of Choice of Neurosis" (1913i).

In this last text, Freud describes the chronological factor as dependent on the development of infantile sexuality. But, while providing a now-classic description of the stages of this development, he suggests that the predisposition to the choice of neurosis has as much to do with the libidinal relationship to the object as it does to the ego defense mechanisms associated with each of the steps. He firmly maintains the chronological reference, as long as the development of the ego as well as that of the libido is taken into consideration.

This change in the Freudian outlook cannot be understood without reference to the early work of Karl Abraham. In a series of articles published between 1921 and 1925, Abraham made significant contributions to the establishment and refinement of the relation between libidinal development and nosological categories. In 1924 he published "A Short Study of the Development of the Libido, Viewed in the Light of Mental Disorders," an essay that falls well within the bounds of the Freudian perspective but goes beyond it in its description of the neuroses, proposing a chronological model that explains all aspects of mental pathology.

A few years before this, in "Stages in the Development of the Sense of Reality" (Ferenczi, 1913/1980), Ferenczi had expanded the hypothesis advanced by Freud according to which the choice of neurosis is determined by the development of the ego and the libido, specifying that development of the ego could be understood with reference to the sense of reality.

Subsequently, the term “choice of neurosis” disappeared from the vocabulary of Freud and his successors. The term itself had not been very well chosen in the sense that it was not describing choice actively made by the subject but a complex process resulting from a set of determinants. Subsequent interest turned to the comparative determination of neuroses and psychoses.

In the field of neuroses the issue then shifted from the causes determining the “choice” of neurosis (or the factors predisposing to it) to the study of structural traits that could be used to distinguish obsession from hysteria. There was less interest in symptoms than in the underlying structure. The distinction was based on a theory of the ego and libido, in keeping with the thinking that inspired it. An especially illustrative example of this type of approach is the work of Jacques Lacan and a number of his students. But these structural models tend to describe the process more than its genesis.

At the end of the twentieth century and beginning of the twenty-first, the psychoanalytic theory of neurosis and choice of neurosis were been approached from two different perspectives. The first, inspired by behaviorism, questions the principle of a neurotic structure and focuses instead on the mechanisms of conditioning that explain the production of the symptom. The second questions the unitary concept of neurosis and, within the framework of recent American nosological classifications, many clinical neuroses have lost their labels and are found scattered among heterogeneous nosological categories, implying the existence of a number of pathogenic explanations. In both cases the question of choice of neurosis never appears, at least not in the terms in which psychoanalysis has traditionally presented it. Thus the concept that had so strongly aroused Freud’s interest at the beginning of psychoanalysis seems to attract less attention from psychoanalysts a century later. The question may again become relevant if the unified concept of neurosis returns to a prominent place in nosography.

### CHOISY, MARYSE (1903–1979)

Journalist, writer, and founder of the review *Psyché*, Maryse Choisy was born in Saint-Jean-de-Luz on February 1, 1903, and died in Paris on March 21, 1979. She was an officer of the National Order of Merit, and was awarded a silver medal of Arts, Lettres, et Sciences, and the Lamennais Prize (1967).

She was raised in an old château in the Basque country by wealthy aunts. At the end of the First World War, she continued her studies in Cambridge, then entered Girton College and prepared her dissertation on Samkhya philosophy; she also studied yoga.

When she was twenty-four—the year was 1927—she had her first contact with psychoanalysis when she sought treatment with Sigmund Freud. At their third meeting she related an anxiety dream that Freud responded to by stating, “You are an illegitimate child.” Incredulous, she nevertheless followed his advice by asking her aunt about her birth. Her illegitimacy was confirmed. That was all she learned of her birth, but she never returned to Berggasse Street. It was another twenty years before she again had any involvement with psychoanalysis.

Through her career as a journalist and writer, she became an active participant in the intellectual life of the 1930s. She wrote some thirty books: novels, poems, essays, and personal journalism (she became a journalist with *L'Intransigent* in 1925), which brought her fame. Between 1927 and 1931 there appeared *Un mois chez les hommes* (A month among men; on the monks of Mount Athos), *Un mois chez les filles* (A month among girls; on prostitution), which caused a scandal upon its publication, *L'Amour dans les prisons* (Love in the Prisons), and *Un mois chez les députés* (A month among parliamentarians).

She criticized the Surrealist Manifesto, which she felt was based on a false understanding of Freud's concept of the unconscious, and, in *Nouvelles littéraires*, published her "Manifeste surréaliste," in 1927. She married the journalist Maxime Clouzet. In 1932 their daughter Colette was born. There followed *Neuf mois*, (Nine months), *Savoir être maman* (How to be a mama), and two books of children's stories.

In 1927 her first novel appeared, entitled *C6 H8 (Az03)6 Mon coeur dans une formule* (My heart in a formula). She felt she was expressing the aspirations of the younger generation of the time, breaking the habits of a "generation of pen pushers," "a generation that was horizontal from five to seven," she described, "in the twenties, we are a vertical brood." In 1929, following a mystical crisis, she dabbled in various forms of spiritualism until her meeting with Pierre Teilhard de Chardin in 1938, a turning point in her spiritual quest. She converted and, after the Liberation, devoted her efforts to bringing together science, religion, and psychoanalysis. She used psychoanalysis to satisfy her religious ideals, both those of Catholicism and those of a "meditative" and "orientalist" ecumenicalism, through which she affirmed her "adherence to the ideals of the Roman Catholic church."

The review *Psyché*, founded in 1946, reflects these concerns. Together with Father Leicester King of Oxford, she founded the Association Internationale de Psychothérapie et de Psychologie Catholique (International association of Catholic psychotherapy and psychology).

She resumed her analysis, this time with René Laforgue. She felt she was a victim of Freud's "savage" analysis, comparing herself to Dora, but she did not question his genius, which reminded her of Einstein. The fact that Laforgue was a dissident and had

dropped out of the International Psychoanalytic Association encouraged Choisy to begin a second, training analysis with Maurice Bouvet. She considered this an obligation but acknowledged she had made a "solid negative transference."

*Un mois chez les filles* was about prostitution but Choisy intended to approach it the same way Freud approached neurotics, restoring to them their humanity and avoiding Tolstoy's moralizing or the aestheticism of Pierre Louÿs and Francis Carco. (The book was rediscovered and published in 1961 in the United States as *Psychoanalysis of the Prostitute*.) In 1949 Choisy published a study on the "Métapsychologie du scandale" in *Psyché*, reprinted in her book *Le Scandale de l'amour* (The scandal of love). She published four other works popularizing psychoanalysis. Her last book, published in 1978, is volume two of her memoirs, significantly subtitled: *Sur le chemin de Dieu on rencontre d'abord le diable* (On the path to God we first meet the devil).

Choisy had an adventurous and provocative intellect that she developed through her many publications, and she occupied an important position in the intellectual world of pre-War Paris. But it was only after the Liberation that she became part of the history of psychoanalysis for two complementary reasons: First, her efforts to obtain official recognition of psychoanalysis by the Catholic church and encourage practitioners and researchers to consider positions that were different and sometimes radically distinct, and second, the creation of the review *Psyché*, which, more than all her other writing, constitutes her "psychoanalytic oeuvre" and explains her renown in the field.

## CHRISTIANS AND JEWS: A PSYCHOANALYTICAL STUDY

Rudolf M. Loewenstein began this work in France during “the wretched year of 1941”; he finished it ten years later in the United States and dedicated it to “the Christians who sacrificed themselves to defend the persecuted Jews” (1952). Loewenstein, who would become one of the founders of ego psychology in the United States, was then director of a psychoanalytic journal financed by Marie Bonaparte, with whom he began to discuss aspects of the anti-Semitic environment in France. “We are in a revolutionary period . . .,” he wrote. “Blood has not yet been spilled. . . . But the people need to grapple with someone, they need victims. . . . Hence, the Jews.”

More personal motives also compelled Loewenstein to write *Christians and Jews*. Born in Russia, he was a citizen of several nations before, having settled in France and identified himself entirely with the French, he suddenly found himself scorned and rejected by his adopted country because he was Jewish. He believed that psychoanalysis could contribute to some better understanding of anti-Semitic attitudes and might even offer a solution.

Loewenstein began by reviewing the known causes of anti-Semitism, citing various works and historical documentation. He then offered examples from his experience as an analyst; he believed that therapy represented “a good opportunity for a kind of experimental study in the incipient and developmental stages of anti-Semitism” (p. 30). Citing Leon Pinsker, the Russian physician and author of *Auto-Emancipation* (1882 [1916]), Loewenstein discussed “judeophobia” as a type of demonophobia, a near-psychosis that incorporates feelings of fear, hatred, and disgust. Certain forms of anti-Semitism represent aspects of paranoia, such as xenophobia, revulsion over circumcision, and projection of self-hatred, while other characteristics, such as religious intolerance and economic rivalry, have an opportunistic appeal.

Loewenstein’s hypothesis, based on Gustave Le Bon’s theory of collective psychology, is that anti-Semitic tendencies, latent in individuals, suddenly metamorphose in groups into violent attitudes that spread like an epidemic. Hitler’s anti-Semitic laws and his persecution of Jews, for example, enabled latent anti-Semitism in individual Germans to manifest itself. The underlying mechanisms rely on irrational and absurd medieval beliefs, such as the putatively

peculiar anatomy of the Jew (a hidden tail, menstrual periods in males) and his supposedly demonic character (engagement in ritual murder, sexual perversions), as well as modern beliefs (Jewish culpability in starting wars, international financial cabals, Jewish-Masonic conspiracies). Loewenstein also suggested another, more oedipal level to anti-Semitism, as reflected in Freud’s *Moses and Monotheism*, viewing the struggle of the early Christians, with their hatred of the old religion, as a means of avoiding the “return of the repressed”—the recollection of their own revolt against imposed religion. Finally, Loewenstein questions whether the Jews do not themselves aid in perpetuating anti-Semitic reactions, in a chapter titled “On ‘Jewish’ Character Traits and Social Structure.”

Skeptical of Zionism as a political solution because it might provoke anti-Semitism, Loewenstein called for a pedagogical solution. He proposed teaching sacred history in a less anti-Semitic spirit and, always philosophical, he suggested a mutual search for understanding between Christians and Jews for the good of mankind.

A courageous book, *Christians and Jews*, together with works by Imre Hermann (1945) and Ernst Simmel (1946), was among the earliest psychoanalytically-informed works on the subject. It is not a landmark work, however. Loewenstein’s use of a medical model, with its description of symptoms, etiology, and finally treatment, is inadequate to understand the modern antipathy and negative attitudes toward Jews known as anti-Semitism.

## CINEMA AND PSYCHOANALYSIS

As contemporaries, cinema and psychoanalysis both reveal, in their own way, mankind's complex personality. The interior dramas that psychoanalysis brings to light can be experienced within the "other scene" of cinematic fiction. The similarity of certain terms and the occasional apparent resemblances between the two techniques encourage spontaneous comparisons: During psychoanalysis the subject is confronted with fantasized "representations" and can identify with "projected" characters. And we often speak of "dream screens."

Psychoanalysis as perceived by the cinema, especially by Hollywood, has not escaped a degree of confusion. For, while engaging in one sense with the "question of lay analysis," American psychoanalytic practice is related to psychiatry. Therefore, in American film productions as well as in critical analyses of those films, there has not always been a clear distinction between psychiatry and psychoanalytic practice. To bring the relation into sharper focus, I will not consider films that depict the world of psychiatry, such as *Shock Corridor* (Sam Fuller, 1963), *Lilith* (R. Rossen, 1964), or *One Flew Over the Cuckoo's Nest* (Milos Forman, 1975). This article will avoid discussion of the serial killer films of the nineteen eighties (*Henry, Portrait of a Serial Killer* by J. McNaughton, 1985, released in 1990, *The Silence of the Lambs* by Jonathan Demme, 1991, *Seven* by D. Fincher, 1995, and others).

The term "psychoanalysis" appeared for the first time in Sigmund Freud's *Heredity and the Aetiology of the Neuroses* (1896). Almost simultaneously, on December 28, 1895, the Lumière brothers, inventors of the cinematograph, organized the first paid movie in Paris. The show, twenty minutes long, contained the famous *Arrivée du train en gare de La Ciotat* and *La Sortie de l'usine Lumière à Lyon*.

It took the cinema more than twenty years to present psychoanalytic imagery, even in a rudimentary form. In 1919, R. Wiene filmed *The Cabinet of Dr. Caligari*, in which a mad doctor—at least that's what he claims to be—uses hypnosis for evil purposes, just as the diabolical Dr. Mabuse in the film of the same name (Fritz Lang, 1922), released three years later, made use of his hypnotic powers for criminal purposes.

On the other hand it took psychoanalysis a number of years before it approached cinema. Münsterberg did write a 1916 essay, *Le Cinéma: étude psychologique*, but it was only in 1970 that, for the first time, film analysis

made use of the tools of psychoanalysis (*Les Cahiers du cinéma*, no. 223). The authors dissected *Young Abe Lincoln* (John Ford, 1939) and analyzed the importance of the Law (personified by Henry Fonda as Lincoln) and the Oedipus complex it implied.

The history of the relation between psychoanalysis and cinema can be subdivided into three major periods. In its earliest manifestations (*Caligari* and *Mabuse*), psychoanalysis became, during the thirties, a familiar figure to cinema, although it often assumed the form of caricatured archetypes, which revealed a complete misunderstanding of psychoanalytic reality. It was superficial and incompetent (*Carefree*, M. Sandrich, 1938, *Bringing up Baby*, Howard Hawks, 1938), disturbing and ambitious (*Mr. Deeds Goes to Town*, Frank Capra, 1936), or provided effective, although simpleminded, advice (*Blind Alley*, King Vidor, 1939). It still had little to do with the behavior of ordinary people.

After the Second World War, the references to psychoanalysis (psychiatrists treating shell-shocked soldiers, for example)—at least in terms of explanatory material—made psychoanalysis seem more serious and sympathetic. Its cinematic representation followed this positive evolution. It was the seductive Peterson (Ingrid Bergman) who enabled Ballantyne (Gregory Peck) to remember the traumatic childhood scene that, having been repressed, had led him to believe he was guilty of murder (*Spellbound*, Alfred Hitchcock, 1945). It is Moss, the G.I. in *Home of the Brave* (S. Kramer, 1949), who, returning home after the war, is healed of the paralysis that resulted from his inferiority complex. Psychoanalysis, although not yet fully understood, is here better integrated in social life and becomes a "serious" reference.

More recently we have seen a return to a more critical position. *Dressed to Kill* (Brian de Palma, 1980) involves an analyst who is a serial killer of women. The grasping psychoanalyst in *Passage à l'acte* (F. Girod, 1997), manipulated by his patient, becomes his assassin with few second thoughts. The psychoanalysts portrayed by Woody Allen are frequently among the funniest characters in his films. Psychoanalysis, neither caricature nor definitive "knowledge," becomes a subject for the cinema that can be treated objectively and even ridiculed.

Even though he allowed himself to be filmed by his close friends (Marie Bonaparte, Mark Brunswick, René Laforgue, Philip Lehrman, see Mijolla, A. de,

1994), Freud was never very interested in the cinema. Arguing that “he didn’t feel that a plastic representation of our abstractions worthy of the name could be made,” he disavowed his disciples, Karl Abraham and Hanns Sachs, for their collaboration on the script of *The Mysteries of a Soul* (G. W. Pabst, 1925). He also refused a considerable sum of money offered by Samuel Goldwyn to develop a script on “famous love affairs.” This suspicion of the filmic representation of psychoanalysis continued after the death of its founder. It was primarily Freud’s daughter who opposed any attempt to make a film about Freud. Fearing Anna Freud’s hostility, John Huston abandoned the idea of using Marilyn Monroe to play the part of Cecily in *Freud, the Secret Passion* (1962).

Should we attribute to this suspicion the paucity of films about Freud? The few films that do represent Freud show him during the early years of psychoanalysis. *The Seven-Percent Solution* (H. Ross, 1976) is a comedy in which the founder of psychoanalysis attempts to cure Sherlock Holmes of his cocaine addiction, a wink at Freud’s own experience. *Sogni d’oro* (Nino Morretti, 1981) involves the making of a film entitled “Freud’s Mother,” in which the fictional relations of Sigmund and Amalia are treated comically. In a more serious vein, *Nineteen-Nineteen* (H. Brody, 1984) evokes Freud in flashback psychoanalyzing two celebrated patients, the Wolfman and the young woman described in “a case of female homosexuality” (1920a). John Huston’s *Freud* (1962) is the only film that seriously and directly confronts the theoretical and practical questions of psychoanalysis through a “biographical” fiction.

Like Freud leaving the famous 1921 photograph—cigar in hand, without his glasses—to come to life in *Lovesick* (M. Brickman, 1983), the image of the fictional psychoanalyst is often a stereotype or caricature: white beard, tiny pince-nez glasses, maybe a strong foreign accent. He becomes the old doctor Brulov in *Spellbound* (1945) or the disturbing Caligari (1919) or Mabuse (1922), who make use of their knowledge of hypnosis for evil purposes. Nor are they the only ones. The analyst in *Nightmare Alley* (E. Gouling, 1947) makes use of his patients’ confidence to blackmail them.

Even though the psychoanalyst’s image in cinema evolves after the Second World War, becoming more reassuring, it still retains an aura of strangeness. The two doctors—even if they are not, strictly speaking, psychoanalysts—who appear in *Seventh Heaven* (B. Jacquot, 1997), are oddly different from the other

characters in the film. The first, and most important, disappears as mysteriously as he appears.

In Hollywood films classical Freudian concepts are used: the neurosis of anxiety, the Oedipus complex, the repression of an infantile trauma. In most cases, the model used, at least implicitly, is based on the *Studies on Hysteria*; the spectacular effects of the catharsis can be used for the purposes of dramatization. Bringing back a repressed memory is sufficient for healing. This occurs in *Secret Beyond the Door* (Fritz Lang, 1948), in *Suddenly, Last Summer* (Joseph L. Mankiewicz, 1959), *The Snake Pit* (Anatol Litvak, 1949), and even, although it is caricatured, in *Marnie* (Alfred Hitchcock, 1964). Dreams have obviously assumed their place as one of the *deus ex machina* of cinema, beginning with the dream sequence in *Spellbound*, designed by Salvador Dali. The analysis of a recurrent dream experienced by one of the characters is used to solve the “enigma” at the heart of the script. Nightmares occur in *Pursued* (Raoul Walsh, 1949), *Lady in the Dark* (M. Leisen, 1944), *Secret Beyond the Door* (1948), and *The Three Faces of Eve* (N. Johnson, 1957). Then there are the dreams of Freud himself, taken from the *Interpretation of Dreams* (1900a), which are used in *Freud: The Secret Passion* (1962). Unraveling these oneiric obsessions resolves the character’s neurosis and the story (the film) comes to an end.

For the purposes of dramaturgy, psychoanalysis is used by cinema to cure patients and especially to reveal the neuroses of psychoanalysts, their entourage, and society. *The Cobweb* (Vincente Minelli, 1955) is the model for this type of exposition. In the film Richard Widmark, a psychoanalyst working in an institution, is impotent with his wife, with whom he disagrees.

Should we be surprised then that Hollywood’s celluloid psychoanalysts, psychiatrists especially, rarely engage in any real psychoanalysis—often confused with hypnosis—and that the framework of the psychoanalytic cure is rarely respected? In *Spellbound*, Dr. Petersen (Ingmar Bergman) is seated next to her patient, the so-called Dr. Edwards (Gregory Peck); the psychoanalyst in *Sex and the Single Girl* (R. Quine, 1964), played by Natalie Wood, does the same and, as in so many representations, writes down his remarks. In *Lady in the Dark* (1944), the analyst’s seat is placed behind the couch but the patient is seated. This difficulty in displaying the psychoanalytic frame—the analyst lying on a couch and the psychoanalyst seated behind him in another plane—has been neatly

resolved by H. Brody in *Nineteen-Nineteen* (1984). Here, two of Freud's former patients recall their respective psychoanalysis. When the therapy is shown on screen, the psychoanalyst (Freud), is not in the picture, only his voice is present (Mijolla, A. de, 1994).

Even today it seems that cinema continues to insist that psychoanalysis is hypnosis (the dramatic effects of which are evident on screen) or catharsis (which facilitates explanatory shortcuts). Nonetheless, its representation has become more subtle and it is now fully integrated in the film. In *Seventh Heaven*, psychoanalysis is not only part of the script but present on screen as well. White surfaces are used by the heroine to project her traumatic memories. Similarly, F. Girod makes psychoanalysis the background for *Passage à l'acte* (1997). Psychoanalysis is given the comic treatment in nearly all of Woody Allen's films as well as a few others (*A Couch in New York* by Chantal Ackerman, 1997). Sometimes the approach is tragicomic, as in *Another Woman* (Allen, 1988), where a woman begins to question her entire life after eavesdropping on a psychoanalyst at work through a vent in her apartment.

However, there is no need to see an analyst at work or present a formal psychoanalytic situation for psychoanalysis to be presented on screen. A number of films promote a latent psychoanalytic statement without being explicit. This is the case, for example, with the melodramas of Douglas Sirk, who presents neurotic characters (*Written on the Wind*, 1956), with many of Ingmar Bergman's films (*The Silence*, 1963, *Persona*, 1966, *Cries and Whispers*, 1973, *Autumn Sonata*, 1978), with Michael Powell's *Peeping Tom* (1960), and any of Tex Avery's productions, which use comedy to present neurosis.

It is often in films where the elements of psychoanalysis are presented but not spelled out that psychoanalytic concepts appear with the greatest subtlety and relevance. What would *Un chien andalou* (Luis Buñuel, 1928), that sprawling ninety-minute dream, have been like if the script had provided a psychoanalytic explanation? Probably a poor film, slow and overbearing.

It was only natural that psychoanalysis should take an interest in film, one of many cultural constructs, as Freud did, for example, with drama, beginning with *Hamlet*. Nonetheless, the theory of cinema did not make use of the tools of psychoanalysis until the early seventies. With reference to the work of Lacan, Christian Metz provided a careful spectatorial analysis, trying to determine "what contribution Freudian psychoanalysis could... provide

in the study of the imaginary signifier." Other authors also became interested in the analogy between psychoanalysis and cinema: the importance of sight (Jean-Louis Baudry), the different meanings of the word "screen" (G. Rosolata), the place of the spectator in *Persona* (N. Brown), fetishism and film noir (M. Ernet).

However, theory shouldn't cause us to overlook the many studies of individual films and directors. Raymond Bellour (1975) provided a psychoanalytic analysis (the murder of the father, the castrating mother) of Hitchcock's *North by Northwest* (1959), a film said to be frivolous and entertaining. Minutely dissecting the sequence of the airplane attack, he reveals the importance of sight and its role in the film. Similarly, T. Kuntzel (1975) made use of the Freudian discovery of the presence of the unconscious in dreams to analyze *The Most Dangerous Game* (E. B. Shoedsack and I. Pichel, 1932). Patrick Lacoste (1990) examines *The Mysteries of a Soul* (1925) from a strictly psychoanalytical point of view and Sophie de Mijolla-Mellor (1994) analyzes the way the "anxiety of fiction" operates on the spectator of Hitchcock's films.

Throughout the nineteen-eighties American film theory looked at a number of films made between 1945 and 1960 from the point of view of psychoanalysis and feminism. In several analyses that could be described as "feminist psychoanalysis," Laura Mulvey, Janet Walker, and M. A. Doane attempted to show how the role of women in cinema reflected their role in society. The approach taken by E. Ann Kaplan, which was part of this movement—one that was more sociological than psychoanalytical—emphasized issues of race in society, which the cinema reflected.

But making use of psychoanalytic concepts to examine films from a sociological perspective (feminist or antiracist) was bound to be unsatisfactory as long as these readings involved distortion and reduction; the film and its analysis became a pretext to defend, and in a way that was not always rigorous, questionable intellectual ideas. Psychoanalysis is often a pretext in the service of a discourse; once abandoned, it is seen to be an element inessential to the logical structure of the argument. Isn't this the reproach made to cinema whenever it represents psychoanalysis, a filmic representation that is generally incomplete and often a form of caricature?

If film often "fails at" representation of the psychoanalytic situation, it is no doubt because "the uncon-

scious, like the being of philosophers, rarely makes itself visible” (J.-B. Pontalis). Moreover, “the rhythm of analysis is very different from that of film, and it is quite difficult to provide an accurate representation of the sensation” (Mijolla, 1994).

A film cannot be judged on the accuracy of its portrayal of psychoanalytic notions—within certain limits, of course—but on the relevance of the use of those notions for the dramatic presentation of its themes. “From this point of view—[the use of language and the language of images as fundamental Freudian reference points] between psychoanalysis and cinema—is formed a variant of the situation of the analyst as always being between two languages” (Lacoste, 1990).

More work needs to be done on the complex relationships that are created between psychoanalysis and cinema, beyond the application of psychoanalytic concepts to the art of film.

## CINEMA CRITICISM

The discipline of psychoanalysis and the art of the cinema evolved in parallel at the beginning of the twentieth century. Psychoanalysts soon began interpreting the appeal and meaning of movies. As early as 1916 Hugo Münsterberg wrote *The Film: A Psychological Study*, in which he suggested that film transforms the external world into the mechanisms of the mind, including memory, imagination, attention, and emotion.

Although Freud himself had little interest in the cinema, one of his disciples, Hanns Sachs, served as a consultant to George Wilhelm Pabst’s 1926 classic, *Secrets of a Soul*. This German expressionist film was the first serious treatment of psychoanalysis in film history, complete with rather sophisticated use of dream symbolism.

Since these early interdisciplinary efforts, a whole field of psychoanalytic film criticism has evolved. Systematic studies of movies first appeared in the 1950s in the French periodical, *Cahiers du Cinéma*. The *Cahiers* theorists subsequently appropriated Italian semiotics as well as the ideas of the deconstructionist Jacques Derrida and the French psychoanalyst Jacques Lacan. Film scholars influenced by Lacan and Derrida focus on the “deep structures” at work in movies and how meaning is generated in film. Lacan’s most important student in the field of film theory has been Christian Metz, whose work has become standard reading in academic cinema studies programs.

The Lacanian approach to film criticism centers on how audiences experience movies. The camera creates a “gaze” or perspective on the events of the film’s narrative. A key aspect of the Lacanian discourse is the concept of “lack,” both as the phallogocentric key to sexual difference and in the symbolic sense of viewing external reality in terms of absence and presence. These ideas have been appropriated by feminist semioticians like Laura Mulvey, who suggested that the woman’s body is fetishized because it creates anxiety in men, to whom it represents “lack,” i.e., castration. Moreover, the cinema is viewed as historically serving the interests of patriarchy, privileging the gaze of the male hero, while subordinating the female characters as the *object* of the gaze.

Interpretations of film based on Lacanian ideas have generated a good deal of criticism. Many have objected to the semioticians' methodology as top-heavy with theoretical formulations and too dismissive of the actual content of a film. In addition, a number of critics have pointed out that masculinity is regularly undermined in films and that male viewers often will identify with a female character. Moreover, male bodies are often fetishized in the cinema to the same extent as the female body.

Psychoanalytic film scholars have taken a number of different approaches that part ways with the Lacanian perspective. Bruce Kavin, Marsha Kinder, and Robert Eberwein, for example, have examined films from the perspective of Freudian dreamwork. Robert B. Ray and Krin and Glen Gabbard have taken a pluralistic approach to psychoanalytic film criticism, suggesting that Lacanian interpretations are reductionist and limiting, and that broadening one's theoretical perspective may be more useful when studying film.

## CIVILIZATION AND ITS DISCONTENTS

Between 1928 and 1930, Freud devoted himself exclusively to *Civilization and its Discontents*—apart from a handful of prefaces and his acceptance speech for the Goethe prize. Dated 1930, the book appeared in December 1929. It was an immediate success, selling twelve thousand copies the first year, with the first German reprint in 1931. The book has remained

successful over the years, generating a vast amount of commentary. There were translations into English (1930), Spanish (1936), French (1943), Italian (1971), and Portuguese (1974). Freud himself was less expansive about it: during the composition of the text, Freud's cancer was painful and required care, and Max Schur became his personal physician in the spring of 1929. The first version of *Civilization and its Discontents* was written quickly, in July 1929. Freud wrote to Lou Andreas-Salomé on July 28, 1929: "Today I wrote the final sentence, the one that concludes the book. . . . It's about culture, feelings of guilt, happiness and other elevated subjects and, it rightly seems to me, quite superfluous, unlike the earlier work, behind which there was always some internal drive. But what is there to do? One can't smoke and play cards all day long. . . . During the writing, I rediscovered the most banal truths" (1966a [1912–1936]).

Freud began with Romain Rolland's criticisms of *The Future of an Illusion* (1927c) concerning the "religious sensation" and the "simple and direct fact of the 'eternal' sensation (which may indeed not be eternal, but simply without any perceptible limits, and oceanic)" (letter to Freud, December 27, 1927). He replied to Rolland on July 14, 1929, indicating that his remarks left him little rest.

Chapter one opens with a mention of the great man (Rolland) and explains the "oceanic" feeling through the concept of narcissism. Freud then develops the extensive metaphor comparing the unconscious to the archaeologist's Rome, which, like the initial ego, supposedly contains everything. It makes evident the preservation of memory traces, as if the various stages of the city since its foundation could exist simultaneously (as in the stratified spaces and multidimensional time of mathematics). Freud concluded that the oceanic feeling may exist as a memory trace, but stated that he would not pursue the investigation of the Mothers, which he mentions without elaborating. Instead, he maintains the supremacy of the religion of the Father. Like *Group Psychology and the Analysis of the Ego* (1921c), *Civilization and its Discontents* begins by circling around psychical questions, and claiming that culture is born from the religion of the Father, characteristic of European monotheistic religions.

For several chapters Freud provides a fairly commonplace description of our relation to culture. Citing a number of European writers, Freud describes the impossibility of achieving happiness, the "essence of

culture,” the ambivalent relationships we entertain with it, and the opposition between culture and sexuality. For someone familiar with Freud’s work, there is little to learn. But, using a frequent tactic, he outlines a broader scope of understanding before advancing his more incisive hypotheses, which are sketched in terms of the economic, dynamic, and topographical points of view.

It is as if Freud were asking why the forms and dynamics of groups that he constructed in *Group Psychology* were necessary, considering the inhibitions of sexual drives, the alienation that accompanies identification with large groups and the submission it entails. The response was economic: mankind’s aggressive drives endanger culture. Freud then inserts the economic hypothesis into mental dynamics. Recalling the theory of drives, he suggests that the development of culture illustrates the struggle between Eros and death, the life instinct against the destructive instinct, as it unfolds within the human species. Once the dynamic relation has been established, there remains the problem of identifying mental formations, the correlative topography. The end of the book is devoted to a subtle study of the superego, the moral conscience, remorse, guilt, and the need for punishment. “I suspect that the reader has the impression that our discussions on the sense of guilt disrupt the framework of this essay... This may have spoilt the structure of my paper; but it corresponds faithfully to my intention to represent the sense of guilt as the most important problem in the development of civilization and to show that the price we pay for our advance in civilization is a loss of happiness through the heightening of the sense of guilt” (p. 134).

Freud’s principal thesis is that the culture of patriarchal religion creates a particular way of working for the superego, which turns its aggression against the ego and expresses itself in the feeling of guilt. This process is unregulated. Once it is triggered, it worsens and becomes aggravated, exhausting not only the aggressive drives but the sexual drives as well. Moreover, “since civilization obeys an internal erotic impulsion which causes human beings to unite in a closely-knit group, it can only achieve this aim through an ever-increasing reinforcement of the sense of guilt” (p. 133). Eros itself serves the death drives or aggressive instincts, which culture serves as well. This results in the death-driven and unregulated dynamic of the cultural process.

Freud details the ontogenesis of the moral conscience and superego from the primitive social anxiety of the child—loss of the parents’ love—to the erection of an internal authority, which does not distinguish between acts and intentions and whose power is reinforced with every rejection of a drive and every real misfortune. He then claims that the origin of the feeling of guilt is the murder of the primal father, who alone is capable of provoking the conflict of ambivalence and generating the superego.

In the last chapter Freud returns to the relations between the various terms discussed, while expanding the analogy between the origin of culture and individual development. He returns to the notion of the great man, who is likely to contribute to the development of the superego in a given cultural moment. Noting that psychic processes are sometimes more accessible in the group than the individual, Freud introduces the idea of analyzing the pathology in specific of cultural communities.

Just as *Group Psychology* analyzed the ego, *Civilization and its Discontents* examines the superego, as distinct from the ego ideal. In both texts, aggression and reality are integrated in a dynamic which links individual and collective psychology. To do this Freud simplified, identifying the death drive with the urge to destruction, and culture with Eros (“civilization is a process in the service of Eros, whose purpose is to combine single human individuals, and after that families, then races, peoples and nations, into one great unity, the unity of mankind” (p. 122). This is the text in which Freud best defends and illustrates the analogy, even the identity, between individual and cultural development—the family always serving as the medium of change.

## CIVILIZATION (*KULTUR*)

In *Civilization and Its Discontents*, Sigmund Freud defines civilization as follows: “The word ‘civilization’ [*Kultur*] describes the whole sum of the achievements and regulations which distinguish our lives from those of our animal ancestors and which serve two purposes—namely to protect men against nature and to adjust their mutual relations” (1930a, p. 89). In *The Future of an Illusion* Freud provided a more extended definition of civilization: “Human civilization, by which I mean all those respects in which human life has raised itself above its animal status and differs from the life of the beasts—and I scorn to distinguish between culture and civilization—presents, as we know, two aspects to the observer. It includes, on the one hand, all the knowledge and capacity that men have acquired in order to control the forces of nature and extract its wealth for the satisfaction of human needs and, on the other hand, all the regulations necessary in order to adjust the relations of men to one another and especially the distribution of the available wealth” (1927c, p. 5–6).

These definitions, however, leave out many aspects of the concept of civilization that Freud had mentioned in other works, including “Civilized Sexual Morality and Modern Nervous Illness” (1908d). These themes include the relationship of civilization to the superego and to sublimation, its consequences for neurosis, the origin of civilization, and the different attitudes of individuals toward civilization, especially as a function of their sex.

Freud’s conflation of civilization and culture here is surprising, especially when we consider that the distinction is clearly present when he discusses the force deployed by civilization (*Kultur*), on the one hand, and the “spiritual heritage of culture” used to “reconcile mankind” with that civilization, on the other, namely, the “spiritual heritage of culture” (1927c). Le Rider (1993) has pointed out that this opposition between culture and civilization had behind it a

philosophical tradition of which Freud was a part. Immanuel Kant (1724–1804) saw civilization as a ceremonial aspect of culture, and saw culture as achieved by means of a sustained effort (*Bildung*) and as culminating in the great achievements of art and thought. In a more radical perspective, Friedrich Nietzsche (1844–1900) saw civilization as subjugation and saw culture, in contrast, as the artistic and intellectual flowering of intact natures. The period between 1920 and 1939 saw the rise and spread of the idea of popular culture and the notion that culture is a means of fulfilling human life (Le Rider, 1993).

It is also arguable that Freud rejected this tradition and deliberately ignored the distinction between culture and civilization because of his theory of the birth of civilization and its link with sexuality. His theory might be considered an example of the cunning of civilization, in the dialectical sense in which G. W. F. Hegel (1770–1831) speaks of the “cunning of Reason” (Mijolla-Mellor, 1992). The cunning lies in the fact that humanity creates civilization by transforming and sublimating individuals’ instinctual aims and objects and sublimation simultaneously enables individuals to realize those aims and attain those objects in another form. Yet in doing this, humanity consolidates a cultural edifice that weighs upon individuals and imposes restrictions on them by dint of suppression. “There will be brought home to you with irresistible forces the many developments, repressions, sublimations, and reaction-formations by means of which a child with a quite other innate endowment grows into what we call a normal man, the bearer, and in part the victim, of the civilization that has been so painfully acquired” (Freud, 1910a, p. 36). Freud thus found himself once more in thrall to his concept of sublimation, whose shortcomings led him to confuse the coercion of institutionalized education with the process of individual learning (*Bildung*), a creative force and source of pleasure (intellectual pleasure) for the subject. The dialectic in which the sublimation of one group can become the source of suppression for another group that does not participate in the process of self-education without doubt constitutes a cunning of civilization, whereby a devitalized culture dons the mantle of civilizing norms.

Civilization appears as an entity in and of itself, a given for the subject on whom it is imposed: “The development of civilization appears to us as a peculiar process which mankind undergoes, and in which

several things strike us as familiar. We may characterize this process with reference to the changes which it brings about in the familiar instinctual dispositions of human beings, to satisfy which is, after all, the economic task of our lives" (Freud, 1930a, p. 96).

As Freud pointed out in "Civilized Sexual Morality and Modern Nervous Illness" (1908d), civilization, by imposing sexual frustration, has a direct effect on the genesis of neuroses. Freud repeatedly claimed that sublimation should not be a norm, since it is possible only for some people: "Mastering it by sublimation, by deflecting the sexual instinctual forces away from their sexual aim to higher cultural aims, can be achieved by a minority and then only intermittently, and least easily during the period of ardent and vigorous youth" (1908d, p. 192). For the others, submission, especially to sexual morality, has negative consequences ranging from neurosis to a degradation of sexual objects (1908d). Of those who sublimate, some are heroes, like Prometheus, whom Freud analyzes in "The Acquisition and Control of Fire" (1932a), or Hercules, about whom he writes, "The prevention of erotic satisfaction calls up a piece of aggressiveness against the person who has interfered with the satisfaction, and that this aggressiveness has itself to be suppressed in turn. But if this is so, it is after all only the aggressiveness which is transformed into a sense of guilt, by being suppressed and made over to the superego" (1930a, p. 138).

The process of civilizing is divided among ideals: coercion from the superego, cultural creation, and the resulting admiration from the ego ideal. "The satisfaction which the ideal offers to the participants in the culture is thus of a narcissistic nature; it rests on their pride in what has already been successfully achieved" (Freud, 1927c, p. 13). Here too the civilizing process reveals its unstable nature, for by reinforcing nationalism, the "narcissism of minor differences," and the cultural ideals of a people, it can become a pretext for a return to the most savage form of struggle: war.

Civilization appears as a separate entity, albeit one produced by humankind. It is necessary, though it is always excessive in its demands and premature in its anticipation: "It is an ineradicable and innate defect of our and every other civilization, that it imposes on children, who are driven by instinct and weak in intellect, decisions which only the mature intelligence of adults can vindicate" (Freud, 1927c, p. 51–52).

Alongside the writings in which Freud directly addresses the question of civilization, there are a number of anthropological texts in which, starting from the primitive horde and the murder of the father, he retraces the genesis of the matriarchy, the band of brothers, and the return to patriarchy. Yet these two perspectives are relatively dissociated in Freud's work to the extent that his ideas on civilization, with a few digressions to discuss ancient Rome or Louis XIV, the Sun King, in France, are for the most part related to the twentieth century. Abram Kardiner (1977) and Ruth Benedict (1935), writers on culture and psychoanalysis, would later make use of Freud's interest in anthropology.

Freud's views on the genesis of matriarchy, however, are totally dissociated from his writings about women. Women, Freud wrote, "come into opposition to civilization and display their retarding and restraining influence" (1930a, p. 103). Here too the cunning of civilization is on display: Women form the basis of civilization, "represent[ing] the interests of the family and sexual life." They are betrayed, however, by the fact that men sublimate to their detriment. "The woman," Freud concludes, "finds herself forced into the background by the claims of civilization, and she adopts a hostile attitude toward it" (1930a, p. 104).

## “CLAIMS OF PSYCHOANALYSIS TO SCIENTIFIC INTEREST”

*The Claims of Psychoanalysis to Scientific Interest* was first published in the Italian review *Scientia*. It was the first of Freud’s texts to be translated into French, and this translation was by M.W. Horn. *Scientia*’s title page contained some information concerning the publication: it was a bimonthly based in Milan, its subtitle being *International Review of Scientific Synthesis*. It was co-edited in London and Leipzig, and in Paris by Félix Alcan. Among its contributors between 1912 and 1914 were Alfred Adler, Émile Durckheim, Albert Einstein, Henri Piéron, Henri Poincaré, and Bertrand Russell.

“I have just had to do an unwanted job, a kind of introduction to psycho-analysis for *Scientia*; I did it, not wishing to refuse in view of the admirable character of that international journal,” Freud wrote to Oskar Pfister on March 11, 1913. It was in fact a “propaganda article,” in Freud’s words to Karl Abraham on September 21, aimed at making a large public more familiar with the advantages and possibilities that psychoanalysis offered to contemporary culture. Presented in German in the review and simultaneously in French in an attached fascicule containing other translations from this resolutely eclectic collection, the first part, *Its Interest for Psychology*, was thus published in the supplement to volume XIV dated September 1, 1913. The second, *Its Interest for the Non-Psychological Sciences*, was published in the supplement to the next issue, dated November 1, 1913. For unknown reasons, although World War I no doubt had a large role to play, it remained totally unknown to French psychoanalysts until 1976.

The first part is a summary, such as Freud was good at producing, of the psychoanalytic theory of

parapraxes, dreams and their interpretation, and of the hopes of curing psychopathological affections. But the second part is perhaps the most original because in it Freud develops the spirit of “conquest” (he used the expression in a letter to Jung in 1909) with regard to “other domains of knowledge,” a spirit that motivated him ever since the afflux of students put an end to his splendid isolation. The break with the Jungians further reinforced the necessity of familiarizing researchers with the “reveals unexpected relations” (p. 165) between their subjects and the pathology of mental life” (p. 165).

First mentioned were the “language sciences,” a pre-eminence that may easily seem prophetic. Interpretation is the “translations from an alien method of expression into the one which is familiar to us” (p. 176) and the study of dream symbols evokes “the earliest phases of linguistic development and conceptual construction” (p. 176). “The language of dreams may be looked upon as the method by which unconscious mental activity expresses itself. But the unconscious speaks more than one dialect” (p. 177).

“The philosophical interest of psycho-analysis” (p. 178) comes next, specifically asserting the existence of an Unconscious that is no longer a mystical hypothesis, and the new implications of this for “the relation of mind to body” (p. 178). But Freud’s distrust of philosophers found expression in the paragraph where he extols the merits of a psychoanalytic pathography that “psychography” (p. 179) that “can indicate the subjective and individual motives behind philosophical theories which have ostensibly sprung from impartial logical work” (p. 179).

It was in terms of its “biological” (p. 179) interest that psychoanalysis attracted the most criticism: the revelation of the importance of the sexual function shocked, mainly because of the light it shed on the forbidden territory of infantile sexuality. It was, however, desirable to establish a junction between the two sciences in order to have a better understanding of the instincts, a point of contact with biology” (p. 182) and to shed light on their “active” and “passive” properties in their relations with masculinity and femininity.

“The interest of psycho-analysis from a developmental point of view” followed next, organized around the evolution from the psychic life of the child to that of the adult and the discovery that “in spite of all the later development that occurs in the adult, none

of the infantile formations perish. All the wishes, instinctual impulses, modes of reaction and attitudes of childhood are still demonstrably present in maturity and in appropriate circumstances emerge once more” (p. 184). Moreover, psychoanalysis confirmed the idea that “ontogeny is a repetition of phylogeny” (p. 184), which demonstrated its “interest . . . from the point of view of the history of civilization” (p. 184) in relation to deciphering myths, understanding primitive peoples, ancient civilizations and religions. The new hypothesis was that “the principle function of the mental mechanism is to relieve the individual from the tensions created in him by his needs. One part of this task can be achieved by extracting satisfaction from the external world; and for this purpose it is essential to have control over the real world” (p. 186). The study of the neuroses demonstrated the same dynamism and thus enriched anthropological research with its discoveries.

“The interest of psycho-analysis from the point of view of the science of aesthetics” (p. 187) is next stressed, opening the door to this form of “applied psychoanalysis” that has been of such importance in the history of psychoanalysis. But Freud cautiously states that “the motive forces of artists are the same conflicts which drive other people into neurosis and have encouraged society to construct its institutions. Whence it is that the artist derives his creative capacity is not a question for psychology” (p. 187). Art “constitutes a region half-way between a reality which frustrates wishes and the wish-fulfilling world of the imagination—a region in which, as it were, primitive man’s strivings for omnipotence are still in full force” (p. 188).

The erotism underlying social relations and the repression required by the cohabitation of human beings are essential psychoanalytic contributions to “sociology.” Hence, also, “the educational interest” (p. 189) of a science that becomes more familiar with the real psychic life of the child and its evolution. “We grown-up people cannot understand children because we no longer understand our own childhood” (p. 189). Teachers learned from the discoveries concerning the “Oedipus complex, self-love (or ‘narcissism’), the disposition to perversions, anal erotism, [and] sexual curiosity” (p. 189). Psychoanalysis “can also show what precious contributions to the formation of character are made by these asocial and perverse instincts in the child, if they are not subjected to repression but are diverted from their original aims

to more valuable ones by the process known as ‘sublimation.’ Our highest virtues have grown up, as reaction formations and sublimations, out of our worst dispositions” (p. 190).

### CLAPARÈDE, ÉDOUARD (1873–1940)

Édouard Claparède, a Swiss physician and psychologist, was born March 24, 1873, in Geneva, where he died September 30, 1940. He was born into a Protestant family that left Languedoc after the revocation of the Edict of Nantes; his father was a pastor. His precocious interest in natural science, the legacy of his childhood admiration for the paternal uncle whose name he bore, would have repercussions on his future career. Claparède did not feel any religious calling and envisaged a future in the sciences. The individual who had the greatest influence on him was his uncle Théodore Flournoy, nineteen years his senior. It was because of him that Claparède developed an interest in psychology. This interest led him to study medicine, which seemed to him “the best introduction to the study of mankind.” He completed his medical studies in Geneva in 1897 after a brief period of study in Leipzig. In 1899 he became a collaborator with Flournoy, who turned over to him the job of running the psychology laboratory in 1904.

Together with his uncle, Claparède founded the *Archives de psychologie* in 1901, where the first French reviews of Freud’s work appeared, together with that of other psychoanalysts. In 1903 they published Théodore Flournoy’s review of *The Interpretation of Dreams*. There were several articles on Freud’s work,

including *Über Psychotherapie* (“On Psychotherapy”; 1905) and another on *Zur Psychopathologie des Alltagslebens* (*The Psychopathology of Everyday Life*; 1905). It was not long before discussions were underway to make the *Archives de psychologie* a French-language “psychoanalytic journal.” This effort, undertaken by Carl Gustav Jung, was unsuccessful. But the review did publish work by Jung, Alphons Maeder, Charles Baudouin, Charles Odier, Henri Flournoy, and Raymond de Saussure. Every year critical essays on psychoanalytic works appeared, but the psychoanalysis section disappeared from the review in 1930.

In 1912 Claparède founded the Institut Jean-Jacques Rousseau, where the psychoanalysts Ernst Schneider (1916–1919) and Charles Baudouin began teaching in 1915. When Sabina Spielrein came to Geneva in 1920, she became his assistant. Oskar Pfister dreamed that the institute would become a place where “teaching psychoanalysts” would be trained. But his project never materialized.

Claparède was responsible for the first French translation of Freud’s *Über Psychoanalyse, Fünf Vorlesungen gehalten zur 20 jährigen Gründungsfeier der Clark University* (*Five Lectures on Psychoanalysis*). The translation was published in the December 1920 and January and February 1921 issues of the *Revue de Genève*, with the title “Origine et développement de la psychanalyse.” The translator was Yves Le Lay. Claparède added an introduction entitled “Freud et la psychanalyse.”

Claparède took part in the Salzburg (1908) and Nuremberg (1910) Congresses. He founded the Cercle Psychanalytique de Genève (Geneva Psychoanalytic Circle) in 1919, of which he became president, but he did not belong to the Société Suisse de Psychanalyse (Swiss Society for Psychoanalysis), created on February 10, 1919. On September 19, 1919, he was invited to join. His correspondence with Freud was published by Carlo Trombetta (1970). He also corresponded with Oskar Pfister.

It can be assumed that Claparède underwent a certain amount of psychoanalysis with Pfister between 1915 and 1918. Was he analyzed by Sabina Spielrein during the twenties? We have no confirmation of this and if he did undergo analysis, it would only have been for a short period of time. Freud spoke of him as a dilettante. An eclectic individual, Claparède never wanted to become too deeply involved in psychoanalysis.

Aside from his essays in *Archives de psychologie*, Claparède published “Quelques mots sur la définition de l’hystérie” (1907), “De la représentation des personnes inconnues et des lapsus *linguae*” (1914), “Freud et la psychanalyse” (1920), “Quelques remarques sur le subconscient” (1923), “Freud va avoir quatre-vingt ans” (1936).

Claparède was not, strictly speaking, a psychoanalyst but he favored the diffusion of psychoanalysis in French-speaking Switzerland and, therefore, in France, and he defended psychoanalysis against its detractors. As Freud wrote to him on May 24, 1908, concerning psychoanalysis: Claparède is “in some sense a measure of the international growth to which we aspire.”

## CLARK UNIVERSITY

Sigmund Freud’s only visit to the United States was in 1909, when he was invited by G. Stanley Hall, first president of Clark University in Worcester, Massachusetts, to deliver a series of lectures to celebrate the twentieth anniversary of the university.

Hall invited twenty-seven other distinguished participants, all of whom received honorary degrees, including the Nobel Laureates in physics Albert Michelson and Ernest Rutherford. But clearly Freud was the most important participant, in Hall’s view; part of the celebration was delayed from July to September, the date Freud requested, so as not to interfere with his private practice. Hall also invited Carl Gustav

Jung to participate, and Freud asked Sándor Ferenczi to accompany him. The three psychoanalysts thus sojourned from Bremen to New York on the *George Washington*. They spent a week in New York, welcomed by Abraham Brill, seeing their first movie, visiting Central Park, Chinatown, the Lower East Side, Coney Island, the American Museum of Natural History, and the Metropolitan Museum of Art (Freud especially enjoyed the antiquities). At the Psychiatric Clinic at Columbia University, near Riverside Drive overlooking the Hudson River, Freud experienced an embarrassing incident of urinary incontinence. Worried that he might experience another while on stage at Clark, Jung offered to help by analyzing the incident. Freud produced a dream, but the associations to it apparently became too intimate; when Jung pressed, Freud demurred, saying he could not risk his authority by such disclosures. According to Jung's account, this began the break between the two of them.

Freud was ecstatic by the invitation and by the prospect of lecturing to a distinguished American audience. After years of working in "splendid isolation" he found himself "received by the foremost men as an equal. As I stepped on to the platform at Worcester to deliver my *Five Lectures on Psycho-Analysis* it seemed like the realization of some incredible day-dream: psycho-analysis was no longer a product of a delusion, it had become a valuable part of reality. It has not lost ground in America since our visit . . ." (Freud, 1925d, p.52). In the audience were William James (he and Freud walked together and James suffered what was probably an angina attack from the heart disease that was to kill him shortly thereafter), Emma Goldman, and many other notables.

To be spontaneous, Freud delivered the five lectures without notes or extensive preparation; he simply talked with Ferenczi shortly before each lecture about the day's topic. Later, Freud changed the text somewhat before publication by Clark's house organ. Intending a general introduction, Freud discussed hysteria, repression and the talking cure, functions and interpretation of dreams, childhood sexuality, and symptoms. One of the great intellectual events of the century, the trip greatly stimulated the growth of psychoanalysis in the United States: the American Psychoanalytic Association was founded in Baltimore just two years later, years earlier than may have been the case otherwise.

## **CLARK-WILLIAMS, MARGARET (1910–1975)**

A psychologist and psychoanalyst who practiced in France, Margaret Clark-Williams was born in the United States in 1910 to a family of prominent academics; she died in 1975.

At 21 she went first to France, then to Vienna, where she made her initial contacts in psychoanalytic circles. After a period in the United States with her two children, she returned to France in 1945 and began psychoanalysis with Raymond de Saussure, clinical training with Georges Heuyer, and university studies with Daniel Lagache; she also practiced analysis under the supervision of John Leuba. She subsequently worked as a psychotherapist at the recently opened Centre Claude Bernard. Nothing had prepared Clark-Williams, a reserved woman of charm and humor, to become the center of a sensational media affair widely reported in the French press. Major articles on the Clark-Williams Trial, as it became known, appeared in *Le Figaro*, *Paris Presse*, *Combat*, *Le Monde*, and *Libération*.

In March 1950 the official Order of Physicians brought legal action against Clark-Williams for illicit practice of medicine "due to the fact that she practices psychoanalysis and, therefore, medicine." By French law (*l'Ordonnance du 24 septembre 1945*), physicians alone had the right to diagnose and treat illness. However, at the Sorbonne in 1947 Daniel Lagache had

created a *licence* (i.e., master's degree) in psychology, and in 1950 the first graduates sought to put their education to practical use in a therapeutic context.

Meanwhile, a Gaullist cabinet member and non-medical psychoanalyst, Georges Mauco, through the intermediary of the Committees of Population and the Family, had created the Centre Claude Bernard, the first psychopedagogical institution in France, in 1945. The Center boasted two distinctive features. It took account of the fact that the role of emotions had theretofore been neglected in favor of cognitive issues, and it brought the psychoanalyst into the consulting room for the initial interviews. In France this represented the first extension of psychoanalysis into social institutions.

Clark-Williams's trial, which began on December 4, 1951, turned quickly to her advantage. Medically trained analysts attested to her competence and, although she was not a physician, they described her as perfectly qualified to practice psychoanalysis. Dr. Leuba went so far as to request that he sit with the defendant since the accused was one of his former students. Arguments quickly centered on the relationship of medicine and psychoanalysis. Clark-Williams's supporters had no difficulty explaining that, inasmuch as medicine did not officially recognize psychoanalysis, it was in no position to accuse psychoanalysts of practicing medicine illegally.

Analysts Georges Parcheminey and André Berge testified that psychoanalysis did not involve treating an illness but resembled an effort to help a person with "abnormal behavior" to adjust. Daniel Lagache and Juliette Favez-Boutonier suggested that "psychoanalysis is not a medicine but a psychological technique." Jacques Lacan, who did not take part in the trial but became involved at meetings where the issue was debated, offered his view that "it is difficult for doctors to do without the best psychologists."

When the court rendered judgment on March 31, 1952, it ruled to dismiss charges against the defendant. The Order of Physicians appealed and on July 15, 1953, a second verdict found Clark-Williams guilty and imposed the purely symbolic fine of one franc. Contrary to the plaintiffs' intentions, the trial served to advance the cause of psychologists and lay psychoanalysis in France.

## **CLAUDE, HENRI CHARLES JULES (1869–1946)**

Henri Claude was born in Paris in 1869, where he died in 1946. He was a French physician, psychiatrist, and professor of the chair of mental illness and brain disease at Saint-Anne's Hospital. He played a leading role in introducing psychoanalysis in France.

An assistant to Professor Fulgence Raymond at the Salpêtrière Hospital, he developed an interest in neuropsychiatry. Although committed to the physiological origin of mental disease, he developed an early interest in psychoanalysis. Although we may laugh, like Sigmund Freud, at his ambivalence, nonetheless he was one of the first to accept Freudian theories and to encourage the practice of psychoanalytic psychotherapy in the hospitals where he worked. He was, for example, receptive to the work of Adolf Schmiergeld and was present at the session of the Société de Neurologie on July 4, 1907, when Schmiergeld, together with P. Provotelle, presented "La méthode psychanalytique et les 'Abwehr-Neuropsychosen' de Freud," one of the first serious studies on psychoanalysis in France.

In February 1913 he authored a report on the fourth edition of *Zur Psychopathologie des Alltagslebens* (The psychopathology of everyday life), which concludes: "In short, this book, whose conception is so uncommon in the French literature (however, in this context, the work of Maeder, 1906, should be mentioned) and which is written in an accessible language, should be better known to psychologists and physicians."

When he was appointed the chair at Sainte-Anne in 1922, he apparently removed from his department Eugénie Sokolnicka, the woman Georges Heuyer had

put in charge of psychoanalysis during his tenure, to replace her with René Laforgue. Claude commented, “I ask that this psychoanalytic practice, which is so shocking in some respects, remain strictly within the scope of medicine, and I exclude from these investigations anyone who is not impregnated with the notion of responsibility felt by any physician worthy of the name. . . . The danger is carrying out the risky Freudian transference” (1924).

From August 2 to 7, 1926, Claude attended the Congrès des Médecins Aliénistes et Neurologistes de France et des Pays de Langue Française, which was held in Geneva. During the congress, at which he presented a report on what was then the focus of his psychiatric work, “Démence précoce et schizophrénie,” his young students René Laforgue, Gilbert Robin, and Adrien Borel, accompanied by Mrs. Laforgue, Raymond and Ariane de Saussure, Angélo Hesnard, and Édouard Pichon created the first Conférence des Psychanalystes de Langue Française (Conference of French-speaking psychoanalysts) on August 1, 1926. After 1931 it was in the lecture hall of the Clinique des Maladies Mentales that these conferences took place.

The department of which he was in charge welcomed psychoanalysis, whose therapeutic merits he extolled by publishing, with Laforgue, highly optimistic statistics on rates of recovery. Pierre Mâle became his medical extern in 1920. In 1927 Michel Cénac, one of the doctors who ran the clinic, along with Paul Schiff, Charles-Henri Nodet, Adrien Borel, and many others sought training with Claude. Later, Jean Delay, who was his student in 1939, continued to use psychoanalysis in his own department beginning in 1942. It was Claude who created the first laboratory of psychotherapy and psychoanalysis at the school of medicine at the University of Paris. In December 1931 he appointed Sacha Nacht to be head of the lab.

In 1926 Laforgue wrote to Freud, “I have enclosed the schedule of courses at Claude’s clinic. This will give you an idea of the importance of psychoanalysis in these courses. Starting next year the courses will be given in the main building of the school of medicine.” This was the only source of psychoanalytic training in France prior to the creation of the Institut de Psychanalyse in 1934. Departments of psychology offered no training in psychoanalysis since Georges Dumas, who had worked with Claude, was violently opposed to it.

As director of the review *L’Encéphale*, Claude was a busy editor, publishing a number of articles and

prefaces, including the preface to Roland Dalbiez’s dissertation “La Méthode psychanalytique et la Doctrine de Freud,” in 1936. But it was a preface he wrote in 1924 that later cast an unfavorable light on his character. Here he wrote “By agreeing to present to the medical public the book by Messrs. Laforgue and Allendy on *Psychanalyses et les névroses*, I have not hidden from the authors that it was not my intent to support their opinions. . . . Certain investigative procedures which shock the delicacy of intimate sentiments and of certain habitual ways of looking at things, by means of an extremist symbolism, applicable perhaps with subjects of another race, do not strike me as appropriate in a ‘clinique latine.’” Freud responded to the authors, on June 29, 1924: “I have received your book. Naturally, I haven’t yet read it but after Claude’s preface I see that it must be good, for his reservations prove to me that you have not compromised in any way and were not afraid of being contradicted.”

More serious than these reservations, the presumed eviction of Eugénie Sokolnicka, the threat of his “patronage” to the detriment of Freud’s during the creation of the *Revue française de psychanalyse* in 1927, and his attitude throughout the Occupation, when in 1941 he participated in René Laforgue’s aborted project to create a French section of the Société de Psychothérapie Nazie (Nazi society for psychotherapy), directed by Professor Matthias Göring, diminished any positive elements of his support at a time when just about all French physicians were opposed to psychoanalysis.

Yet, André Breton may have said it best when he wrote: “The essential thing is that I do not suppose there can be much difference for Nadja between the inside of a sanitarium and the outside. There must, unfortunately, be a difference all the same, on account of the grating sound of a key turning in a lock, or the wretched view of the garden, the cheek of the people who question you when you want to be left alone, like Professor Claude at Sainte-Anne, with his dunce’s forehead and that stubborn expression on his face (‘You’re being persecuted, aren’t you?’ No, monsieur. ‘He’s lying, last week he told me he was being persecuted.’ Or ‘You hear voices, do you? Well, are they voices like mine?’ No, Monsieur. ‘You see, he has auditory hallucinations.’)”

## CLAUSTROPHOBIA

Benjamin Ball introduced the term “claustrophobia” into the field of psychiatric semiology in 1879. It is derived from the Latin *claustrum* (enclosed place) and the Greek *phobos* (fear). Claustrophobia is defined as the fear of enclosed spaces. Faced with the impossibility of escape, the person suffering from claustrophobia fears being suffocated, being crushed, losing consciousness, or losing control of his actions or sphincter muscles. Avoidance techniques are then developed together with counterphobic behavior (being accompanied by another person, carrying a key) or behavioral modifications (opening doors and windows, positioning oneself near an exit).

The word is part of psychiatric semiology. Albert Pitres and Emmanuel Régis (1902) classify claustrophobia as a phobia of place, and Pierre Janet as one of the systematic anxieties constituting psychasthenia. Recent British and American clinical practice includes claustrophobia among the simple phobias, often associated with agoraphobia, which predominantly affect women and are rare in children (Freud, A., 1977).

For Sigmund Freud claustrophobia is one of the phobias of locomotion, similar to agoraphobia. Its metapsychological status evolved along with the development of his theories of anxiety and the construction of phobias. Freud first considered it as one of the chronic symptoms of neurasthenia (Manuscript B, 1893, in 1950a). Later he distinguished it, along with the other phobias, from the obsessions (“Obsessions

and Phobias,” 1895c), ultimately associating it with anxiety hysteria (1905d). In his early writings, he interpreted claustrophobia as the result of an excess of unused libido. He related it to castration anxiety, produced by the repression of oedipal desire. Here, the emergence of free anxiety was displaced and projected onto the phobic object, in this case an enclosed space.

Melanie Klein (1932/1975) believed it involved a projective identification with the dangerous body of the mother, with the anxiety of being enclosed there and castrated by the father’s penis. Bertram D. Lewin (1935) proposed a similar definition of claustrophobia, in which he refers to an unconscious fantasy of return to the maternal breast, accompanied by oral fantasies of being devoured. For Otto Fenichel (1953) the enclosed space that is feared represents the patient’s body and the sensations the patient is trying to get rid of through projection of excess excitation onto the *claustrum*. The phobogenic situation mobilizes infantile anxieties, the fear of solitude, and the temptation to masturbate. François Perrier (1956/1994) saw claustrophobia as being organized like speech, where, symbolically, a key held in the hand enables one to avoid the anxiety, thus escaping the enclosed world of the mother and making access to the father possible. Some authors explored other aspects of claustrophobia, analyzing its associations with depression (Gehl, R. H., 1965) or agoraphobia (Weiss, E. 1964).

## CLINGING INSTINCT

Imre Hermann presupposes an instinct manifest in primates and latent in human babies, namely, the drive to cling to the mother, which is frustrated from the outset by the absence of biological endowments, but is present in the form of reflexes (grasping, Moro, heat-orientation) in the early stages of development and in later pathological symptoms (e.g., hair-pulling, nail-biting).

Based on the psychoanalytical examination of comparative psychology, Hermann first expounded the theory of the clinging instinct in the study, "Sich Anklammern und Auf-SucheGehen," in 1936. He described the operation of phylogenetic heritage in the mother-child dual union, its integration into the libidinal organization, the relationship of frustrated instinct drives to castration complex, to passively endured separational trauma and active separational drive, to sadism and masochism, to destruction instinct and narcissism. In his book, *The Primeval Instincts of Man* (1943), he expanded the biosocial model theory of human devel-

opment to form the clinging theory. He conducted wide-ranging investigations, starting with primate biology, through clinical facts supported by neurological data, and through developmental psychological data he examined the relationship of the phenomenology of the clinging syndrome to love, anxiety, shame, and, through ego development, to thinking. He also studied ethnology, culture history, and social psychology.

Later ethological researchers (e.g., Harlow and Lawick-Goodall) demonstrated the verisimilitude of Hermann's theories, while John Bowlby's and René Spitz's concepts demonstrated them biosocially. Michel Balint integrated the theory into his concept of primary love.

## COCAINE AND PSYCHOANALYSIS

Cocaine is an alkaloid extracted from coca leaves, which has been used in medicine for its analgesic and anesthetic properties. Cocaine dependency is an addiction to this narcotic. The relation between cocaine and psychoanalysis goes back to Freud's research in which he used the substance as an ophthalmic anesthetic.

Cocaine was first used as an anesthetic agent in Vienna in 1884. Freud conducted research into the physiological action of the drug with a view to using it for therapeutic purposes. It was nevertheless his colleague, Carl Köller, who continued this work and to whom we attribute the discovery of the anesthetic properties of cocaine, based on its use in eye surgery.

Years later Freud described the situation in these terms: "A side interest, though it was a deep one, had led me in 1884 to obtain from Merck some of what was then the little-known alkaloid cocaine and to study its physiological action....I suggested, however, to my friend Köningstein, the ophthalmologist, that he should investigate the question of how far the anaesthetizing properties of cocaine were applicable in diseases of the eye" (1925d, pp. 14–15). Ernest Jones (1953) reports that in 1884 Freud administered injections of cocaine to his friend Ernst von Fleischl in order to wean him off his morphine addiction and to ease his terrible trigeminal neuralgia. One year later he observed that the massive doses of cocaine required by Fleischl had led to chronic intoxication. He thus discovered the toxicity of cocaine, which stood in the way of its being used medically. Coca leaves and cocaine had been used in the Americas as stimulants to fight fatigue and hunger, but their use led to neurochemical and physiological effects as well as severe addiction problems.

Psychoanalysis has studied the underlying dynamics and the unconscious fantasies that drive patients to seek out the chemical and physiological effects of cocaine in a compulsive manner. Cocaine addiction is normally difficult to cure. Classification of the pathological structures underlying cocaine addiction seems to suggest that a process of pathological mourning or manic-depressive behavior can be found in many patients. Patients sometimes seek out this toxic substance as a stimulant or an anti-depressant in order to conceal states of depression. Some drug addicts unable to work through their grief develop pathological mourning wherein they identify with the lost dead object(s), thus unconsciously putting their lives in grave danger. Their repeated risk taking allows them to feel as if they are conquering death and are being resuscitated. This fantasied resurrection represents success to these addicts, in whose mental state the psychological notions of danger, death, and suicide do not exist. The psychoanalytic interpretation therefore must direct itself to the uncovering and interpreting of their resurrection fantasies and thus lead them to give up living within a dead object or give up identifying with a dead person.

## **COGNITIVISM AND PSYCHOANALYSIS**

Ever since the 1960s, an important body of thought has developed in reaction to the presumed behaviorism according to which intellectual activity is beyond the grasp of any form of scientific investigation. Cognitivism has marked a return to a scientific approach to mental activity that has materialized in the development of the cognitive sciences.

The term refers to those sciences that study systems for representing understanding and the processing of information. Included in the term are certain areas of speculative research (philosophy of mind), artificial intelligence, semantic, syntactic, and lexical models (linguistics), the study of human activities (psychology), and the neuronal basis of those activities (neuroscience). These disciplines do not fall entirely within the field of cognitive science (social psychology or the neurobiology of development, for example).

Cognitivism originally developed as an interdisciplinary activity. The work of Jean Piaget on genetic epistemology and the work of Edward Toman on cognitive mapping opened the way in psychology long before Miller, Galanter, and Pribram's seminal work, *Plans and the Structure of Behavior* (1960). The term "artificial intelligence" was coined during a seminar by Herbert Simon.

The application of the methods of cognitive science to the field of psychopathology is more recent (M. C. Hardy-Baylé, 1996) and is based on work in the philosophy of mind and a renewed interest in phenomenology as well as on expert systems in artificial intelligence (models of paranoid thought, Parry), and especially experimental research (anomalies in the processing of information during schizophrenic states or a slowing down of the decision-making process during depressive states).

The development of cognitivism did not fail to arouse suspicion and opposition on the part of

psychoanalysts. Some of their reservations were based on a confusion with so-called cognitive therapies, which in reality have to do with the content of representations (judgment errors) and not the underlying mechanisms. They are based on the use of suggestion, which falls within the domain of behavioral therapy, which in turn draws on behaviorism. More serious reservations involve the fact that cognitivism, which is primarily concerned with understanding, has often neglected the role of affects and has not sufficiently taken into consideration the question of motivation or the role of the body.

For their part cognitive science specialists have contested the scientific value of psychoanalytic theories and, until recently, have had little interest in the area of pathology.

In fact it is easy to show that Sigmund Freud's early work clearly makes use of a cognitive approach (H. K. Pribram, M. Gill, 1968), as does chapter seven of the *Interpretation of Dreams* and a number of later texts. Gradually the emphasis on a dynamic and economic approach shifted the investigation to why rather than how. David Rapaport and, later, Georges Klein resumed the study of thought mechanisms to compare them with experimental results. Their premature deaths and the still strong influence of behaviorism on the psychology of the time explain the delay before psychoanalysts actually got around to confronting these issues directly (P. Holzman, G. Aronson, 1992, D. Widlöcher, 1993).

This confrontation appears to have shocked psychoanalysts, to the extent that they were accustomed to question these disciplines in isolation (psychology, linguistics, logic modeling) and not within an interdisciplinary framework. If psychoanalysis is to assume its place within this framework, the terms of its inclusion must be specified. It would be necessary to acknowledge that psychoanalysis is a unique form of communication and not a science. The knowledge gained from it concerns complex objects that other approaches must first break down into more simple objects.

Such an exchange can benefit the cognitive sciences by exposing them to an area of mental life that has not been explored by them. Psychoanalysis can benefit by escaping the intellectual isolation of their field. It is less obvious how psychoanalytic treatment, as the investigation of the unconscious, can benefit from a

more analytic knowledge of the complex objects it engages.

## **COLLECTED PAPERS ON SCHIZOPHRENIA AND RELATED SUBJECTS**

By the time this book was published, Harold F. Searles, M.D., was 47 years old and was already widely regarded as the world's leading authority on the intensive psychotherapy of patients with chronic schizophrenia.

His writings on schizophrenia reveal his unparalleled skill in making contact with severely ill patients, and learning from them not only about schizophrenia, but about the human condition in general. ("Research in schizophrenia has its greatest potential value in the fact that the schizophrenic shows us in a sharply etched form that which is so obscured, by years of progressive adaptation to adult interpersonal living, in human beings in general.") He consistently avoids the temptation to view the patient as the sole repository of psychopathology within the patient-analyst dyad. Thus, he continually focuses not only on the patient's

transference to the analyst, but equally on the analyst's countertransference to the patient.

His many original contributions to the topic of countertransference are among his most significant and widely recognized accomplishments—for example, in discussing dependency conflicts over his regressive dependency needs and omnipotent fantasies, and the role of these countertransference feelings in both motivating the analyst to treat schizophrenic patients, and also in interfering in the psychotherapeutic work.

Searles's papers are unusual for the candor with which he presents his own thoughts and feelings to the reader. For example, in exploring the role of defenses against grief and separation anxiety in the patient's manifest vindictiveness, he writes of a woman who fled her therapy with him to avoid facing her grief over an early loss. Searles adds, "My belief now is that I, too, contributed to the dissolution of the therapy, on the basis of my own anxiety about grief from my early life—an area which, at the time, I had not yet explored at all thoroughly in my analysis."

Another quality which pervades Searles's contributions is his deep and abiding interest in unconscious processes, including those in patient and analyst. He thus remains more faithful to Freud's work than many analysts in the United States.

Searles believes that conflicts over love rather than conflicts over hatred and rejection are more basic in the development of schizophrenia. He contends that the schizophrenic illness represents the patient's "loving sacrifice of his very individuality for the welfare of a mother who is loved genuinely, altruistically, and with... wholehearted adoration." He further maintains that this genuine love, which is mutual, can be difficult to recognize because the patient and mother are unconsciously afraid of their love for each other. He traces this conflict back to the mother's own childhood experiences, which have led her to believe that her love is destructive.

Searles emphasizes the role of symbiotic relatedness between analyst and schizophrenic patient. He believes the treatment of these patients is so prolonged partly because both patient and analyst fear and resist this symbiotic stage of the transference and countertransference. Because of the fluctuating role reversals in this phase of treatment, the analyst must be relatively accepting not only of omnipotent feelings that accompany being in the role of an infant's mother, but also accepting of the infantile dependency feelings that result

from being in the converse role of the infant. Anticipating Kohut, Searles wrote as early as 1958 of the analyst's difficulty in tolerating the patient's adoration: "It requires a sounder sense of self-esteem to be exposed to the patient's genuine admiration, of this degree of intensity, than to face his contempt towards oneself."

"Driving the other person crazy" includes reciprocal efforts to do so between parent and child, as well as between analyst and patient. Lack of integration in one person tends to have an emotionally disintegrating impact on the other person. Motives for driving another person crazy, which are largely unconscious, can include a wish to destroy that person psychologically; a wish to externalize one's own craziness in the other person; a child's wish that the parent's covert craziness would become obvious enough that others would validate the child's perceptions and share the burden of caring for this parent; a wish to individuate or help the other person individuate, which may be experienced by both parent and child as a wish to drive the other person crazy; and finally, Searles especially emphasizes the wish to attain a deeply gratifying symbiotic mode of relatedness with the other person. He notes that an important unconscious motive in the analyst's choice of profession may be the presence of reaction formations to unconscious wishes to drive other people crazy. He speculates that the irrational "schizophrenogenic mother" concept appeals to analysts who are striving to deny their own regressive urges toward symbiotic relatedness.

Searles's influence on psychoanalysis and psychotherapy worldwide has been immense. His genius at discerning and describing unconscious processes in patient and analyst has profoundly enriched our understanding of a wide range of psychopathology, and has made invaluable contributions to the understanding and use of countertransference.

## COLLECTIVE PSYCHOLOGY

Collective psychology, or human psychological behavior within communities, has been a subject of study in the Bible and among the ancient Greeks, hence since the origins of Western culture. In the nineteenth century, new fields of investigation opened up: schools of anthropology in Great Britain, folk psychology in Germany, and sociology in France. Sigmund Freud's predecessors and contemporaries within these schools of thought were his favorite interlocutors. From the outset, Freud collaborated in his works on individual and collective psychology (see his letters to Wilhelm Fliess dated December 6, 1896; January 24, 1897; and May 31, 1897 [1950a]).

This form of debate, if not actual borrowing, between psychoanalysis and collective psychology continued throughout Freud's work. A vivid and systematic picture thus emerges in which *Totem and Taboo* (1912–1913a) formed the basis for the Schreber case (1911c) and anticipated “On Narcissism: An Introduction” (1914c); in which *Group Psychology and the Analysis of the Ego* (1921c) is a response to *Beyond the Pleasure Principle* (1920g) and paves the way for *The Ego and the Id* (1923b); and in which *The Future of an Illusion* (1927c) and *Civilization and Its Discontents* (1930a [1929]) led Freud to develop and elaborate, between 1923 and 1927, his structural theory (the castration complex, the superego, and the theory of anxiety) in *Inhibitions, Symptoms, and Anxiety* (1926d [1925]).

Some other works also relate to Freud's first topography: *Jokes and Their Relation to the Unconscious* (1905c), a contribution to the study of central European Jewish culture; “Obsessive Actions and Religious Practices” (1907b), the first major analogy between individual and collective psychology; and “‘Civilized’ Sexual Morality and Modern Nervous Illness” (1908d), in which Freud proposes that society reduce cultural sexual repression as a collective

prophylaxis for neurosis. *Moses and Monotheism: Three Essays* (1939a [1937–1939]), one of Freud's last works, brought together and explained the themes developed on collective psychology and went on to analyze Jewish and Christian monotheistic cultures. Finally, there is Freud's work between 1930 and 1932 on U.S. President Thomas Woodrow Wilson (1966).

The nexus between individual and collective psychology is the family, as the origin of the Oedipus complex and of totemism, which connects the transference neuroses with collective manifestations. Previously Freud had investigated more localized analogies of the connection between individual and group, such as analogies between the observances and rituals of obsessive neurotics and those of religion. From *Group Psychology and the Analysis of the Ego* (1921c) on, he proclaimed collective psychology to be part of psychoanalysis and established his metapsychology on this basis. He discussed the libidinal dynamics of the formation and stabilization of groups in *Group Psychology and the Analysis of the Ego* (1921c) and explained the economic point of view in *The Future of an Illusion* (1927c) and *Civilization and Its Discontents* (1930a [1929]), where he related the economic point of view to hatred and fear. The topography characteristic of groups consists of reduced and simplified forms of the individual psychic agencies of the ego, ego ideal, and superego, as a result of the identifying ties that groups impose: “A primary group of this kind is a number of individuals who have put one and the same object in the place of their ego ideal and have consequently identified themselves with one another in their ego” (1921c, p. 116). Depending on the form of authority and its degree of symbolic elaboration, these reductions are more or less extreme—hence the importance of the great man, capable of representing the ideal at the highest level of elaboration. There are three paradigmatic groups: the horde, the matriarchy, and the totemic clan (in political science, they correspond to rule by one person, by a few, and by all). They differ according to type of representative of the ideal, which ranges from the flesh-and-blood leader to such symbolic forms as the totem and the stated ideal, which substitute for the leader after the greater or lesser elaboration of his murder.

Freud created or developed some core concepts in the course of this research: primal ambivalence, narcissism, the Oedipus complex (1912–1913a); identifications, the ego ideal, aim-inhibited drives, sublimation

(1921c); the superego and guilt feelings, dereliction and its consequences, the conflict between Eros and Thanatos (1927c, 1930a); and splitting of the ego, constructions in analysis (1939a).

Criticisms have abounded, impeding work on almost half of the body of Freud's work. Freud's method of analogy (between individual and collective psychic processes) has not been accepted, nor has his dynamic method. Freud's explicit Lamarckism concerning the transmission of mnemic traces in groups has been rejected. Freud has been criticized for a narrow view of religion that ignores its cultural contributions by considering it as a collective neurosis or delusion. Finally, although Freud considered matriarchy at an early stage (1911f), he neglected other similar figures of identification.

Two further qualifications were formulated by Freud himself: collective psychic processes have to be understood in isolation from any form of therapeutic activity; the analysis of these processes requires the analyst to be separated from groups, especially groups to which the subject belongs, which is difficult to achieve.

Psychoanalysis has made a clear contribution to anthropology, yet collective psychology has mainly been used with small groups in clinical practice. The metapsychological, sociological, and political dimensions of Freud's work have yet to be turned to account.

## COLLECTIVE UNCONSCIOUS (ANALYTICAL PSYCHOLOGY)

The "collective unconscious" is the part of the collective psyche that is unconscious, the other parts being

consciousness of the perceptible world and consciousness itself. The collective unconscious is different from and in addition to the personal unconscious in that it is a stratum of reality that “does not derive from personal experience and is not a personal acquisition but is inborn...universal...[and] more or less the same everywhere and in all individuals.” (Jung, 1934 [1948]).

The term collective unconscious was first introduced by Carl Gustav Jung in 1916 in a talk to the Zurich School for Analytical Psychology entitled “Über das Unbewusste und seine Inhalte.” The German manuscript for this talk was not found until 1961, after Jung’s death. The earliest written appearance of the term was found in the French translation of the Zurich talk published in 1916 in the *Archives de Psychologies* (Jung, 1916).

Jung’s notion of the collective unconscious ranges from a passive repository that records the history of all human reactions to the world to an active substratum that is the ground out of which all reality emerges. The components of the collective unconscious were first said by Jung to be primordial or ancestral images and later archetypes that manifest in consciousness through images, strong affects, and behavioral patterns. When the energies of the collective unconscious break through into consciousness, consciousness itself is altered, and reactions vary from insanity to a significant reordering of major attitudes.

The notion of the collective unconscious first came to Jung from a dream he had in 1909 on board a ship returning from the United States with Freud. The dream depicted a house that had a cellar below the normal cellar and below that a repository of prehistoric pottery, bones, and skulls. “I thought, of course, that he [Freud] would accept the cellars below this cellar [i.e., the personal unconscious], but the dreams [during the writing of his first book, from 1910 to 1912] were preparing me for the contrary” (McGuire, 1989). In fact, Freud acknowledged primordial ancestral patterns but regarded them as simply inheritable traits (Lamarckianism) posited in each individual (the biogenetic law). For Freud such experiences were phylogenetic recapitulations unrelated to a transcendent structure such as the collective unconscious, but for Jung they arise anew from the collective unconscious in each person in each instance just as they did in one’s ancestors.

By 1925 Jung had theorized that the collective unconscious and the external world are opposites between which lies the observing ego which accesses

the collective unconscious through the anima or animus and the world through the persona. The personal unconscious of Freud is regarded as the shadow of the ego. This schema remained unchanged for Jung.

Jung’s collective unconscious can be seen as a variation within the tradition of philosophical idealism. It shares characteristics with the *Apeiron* of Anaximander, the One of Parmenides, and the Forms of Plato. It also calls to mind the *Pleroma* of the Gnostics, the Categories of Emmanuel Kant, and the Will of Arthur Schopenhauer. What justifies Jung’s notion as psychology and not philosophy is his insistence that the collective unconscious is an empirical fact attested to by the common experiences of humankind over many ages and cultures. Jung’s proof is phenomenological, and he avoids claiming a priori truths whether or not he believes they exist.

In spite of his avoidance of ontological affirmations, Jung often appears to suggest that the collective unconscious is a metaphysical reality, which invites less sophisticated analysts to engage in ideological thinking and inflated claims to transcendent knowledge. In his review of Jung’s autobiography, Winnicott says that the positing of a collective unconscious results from Jung’s split psyche and “was part of his attempt to deal with his lack of contact with what could now be called the unconscious-according-to-Freud.” (Winnicott, 1964) With this criticism, Winnicott dismissed Jung’s and perhaps all efforts to speculate about and derive heuristic guidelines consonant with an ultimate ground against which lie subjectivity, consciousness, and the very mystery of life. As Jung points out, the alternative is a void (Jung, 1948).

## COLLÈGE DE PSYCHANALYSTES

The Collège de Psychanalystes was founded on November 3, 1980, by a group of psychoanalysts (roughly thirty) from different backgrounds upon the initiative of Dominique Geahchan (1925–1983), François Roustang, Jacques Sédât, Conrad Stein, and Serge Viderman, who drafted the by-laws. There were no founding members. The organization's goal, beyond that of existing analytic institutions, was to consider the role of psychoanalysis in society and defend the analytic approach against the risks of governmental regulation or the shifts in practice arising from mental health coverage. Membership was simple, and involved only approval by a majority of the members. This removed any problems associated with qualifications, which, along with training, were relegated to the various psychoanalytic organizations. Its originality lies in the way it enabled analysts from different organizations and with different backgrounds (members of the International Psychoanalytic Association, its critics, Lacanians) to work together on issues of psychoanalysis and society.

The Collège at times had more than a hundred members, including both French and a handful of Canadian members. Beginning in November 1981 it began publishing a review, *Psychanalystes*, at the request of its first president, Dominique Geahchan, who was also cofounder of *Confrontation* with René Major in 1974, and a member of the Société Psychanalytique de Paris. The review remained in print until March 1994; a total of forty-eight issues on the role of psychoanalysis in society were published.

Problems arose, however, over the question of membership, which gradually evolved into a form of

licensing, and finally the question of social issues and anti-Semitism, the offshoot of a conference devoted to Rudolf Binion's psychohistorical work on Hitler held on June 18, 1992, caused further friction within the organization. This led to a series of group and individual resignations from the Collège and engendered a climate of crisis, culminating in the dissolution of the organization in June 1994.

## COLLOQUE SUR L'INCONSCIENT

The Colloque sur l'inconscient, organized by Henri Ey and devoted to the problems associated with the concept of the unconscious, took place at the end of October 1960, at the Bonneval Psychiatric Hospital, Bonneval, France. The proceedings, published in an octavo volume of more than four hundred pages in 1966, remains one of the most important works on psychopathology of the second half of the twentieth century. Previous colloquia at Bonneval include "Neurologie et Psychiatrie" in 1943, organized by Julian de Ajuriaguerra and Henri Hécaen, and "La Psychogenèse des Névroses et des Psychoses" in 1946, organized by Lucien Bonnafé, Sven Follin, Jacques Lacan, and Julien Rouart.

The first part of the book discusses the associations between the unconscious and the drives, and includes papers by Serge Lebovici and René Diatkine and by François Perrier. Part 2 covers the unconscious and language, and contains papers by Jean Laplanche and Serge Leclair and by Conrad Stein. In the discussion Maurice Merleau-Ponty introduced his books *The Visible and the Invisible* and *The Prose of the World*, and Jacques Lacan, who has an article in the book. Just seven years after the Rome Congress (1953), he positively and polemically laid out his ideas on the central role of language in the formation of the subject (self) and the structuring of the unconscious. Part 3 includes articles on interrelations between our understanding of neurobiology and the question of the unconscious, with a paper by Claude Blanc and another by Catherine G. Lairy. There follows discussion by Paul Guiraud, René Angelergues, Maurice Dongier, Eugène Minkowski,

Jean Hyppolite, and André Green. Part 4 covers the role of the unconscious in psychiatric problems and includes articles by Henri Ey, S. Follin, and André Green, followed by discussion by Jean Hyppolite, Eugène Minowski, and Jean Laplanche. Part 5, on the unconscious and sociology, contains papers by Henri Lefèbvre and by Conrad Stein. The last part of the book concerns the relations between the unconscious and philosophical thought, and includes articles by Alphonse d'Waelhens, Georges Lantéri-Laura, and Paul Ricoeur.

According to the participants, the published texts accurately reflect the content of the actual proceedings. The event provided an opportunity to compare two different concepts of psychoanalysis and to discuss connections among mental pathology, the unconscious, the role of society, brain activity, and some epistemological issues. Although dated, none of the articles in the collection have lost any of their relevance.

## **COLOMBIA**

The history of the Colombian Psychoanalytic Society and Institute has been influenced by the scientific cultural currents of the rest of the world, especially France, England, the United States, Argentina, and Chile.

Between 1922 and 1940, some physicians and other non-physicians traveled to Europe and around Latin America, getting direct contact with Freud or being psychoanalyzed. After the Second World War, three physicians arrived from France and Chile: Drs. José Francisco Socarras (1906–1995), Arturo Lizarazo (1915–1992), and (from Venezuela) Herman Quijada, born in 1915.

By that time eight more physicians had gone to Argentina to be trained in psychoanalysis, while others went to the United States and France. The three immigrants begun to conduct studies of Freud, Numberg, and Klein, beginning analytical supervisions that differed from personal analysis.

Between 1948 and 1950, a prestigious Argentine analyst, Dr. Arnaldo Rascovsky, visited Bogotá and edited the bylaws to be followed for the formation of a Study Group recognized by the IPA. On May 6, 1956, the Study Group was officially founded and was recognized by the IPA a year later, being sponsored by France and Chile.

In 1959, an Associate Member of the Argentine Psychoanalytic Association, Dr. Carlos Plata, arrived to Bogotá who elaborated the Group bylaws. In 1960, Angel and Betty Garma visited Colombia and held a series of seminars as well as individual and collective supervisions, and later in 1961 the Society was recognized by the IPA.

In 1962 a conflict arose between the two pioneers of psychoanalysis in Colombia, which appeared to be political-ideological and ended with the resignation of Arturo Lizarazo, but he left the Colombian Psychoanalytic Association to found his own Study Group, now recognized by the IPA, which is led by M. Gonzalez, J.A. Marquez and R. De Zubiría. Also the “Sigmund Freud Psychoanalytic Group I.P.A.” is led by G. Arcila and B. Alvarez.

In Colombia there are other psychoanalytic Groups in Cali, Medellín, and Bogotá, with some leaders (O. Espinosa, A. Villar) trained at the Colombian Psychoanalytic Society, but the groups are not recognized by the IPA.

Since 1976, the *Review of the Colombian Psychoanalytic Society (Revista de la Sociedad Colombiana de Psicoanálisis)* has appeared, with 21 volumes, four numbers each year, and there is also a “Boletín” published monthly. As of 2002, the Society had four honorary members, 33 full members, 57 associate members. The Institute has 15 training analysts, 10 professors, 14 candidates; there have been 19 graduating classes from 1959–1996. The Institute requires eight semesters (four years training) with two hours daily and two individual supervisions weekly. Freud is the main author studied, but others are reviewed, especially from France, England, the United States, and Argentina, with a multi-theoretical frame of reference. There are members of the Society working in the cities of Cali and Buaramanga.

Various members of the Colombian Psychoanalytic Society have participated in the COPAL, FEPAL, and IPA boards.

Several theoretical and technical contributions have been published, mainly in the *Journal* and in books. The

practice has increased daily, and some analysts are professors at different universities. Psychoanalysis has been admitted at the National Academy of Medicine and is generally well accepted by Colombian society, as well as in scientific reviews and daily journals. Among other well-known contemporary analysts are G. Ballesteros, E. Gómez, E. Laverde, A. Sánchez, I. Villarreal, and L. Yamín.

## **COMBINED PARENT FIGURE**

The combined parent figure is an early and primitive version of Freud's concept of the primal scene. Those phantasies however were believed to supervene at a later stage of development.

In the powerful phantasies of the early Oedipus complex the infant has terrifying experiences of the parents engaged in a particularly violent and dangerous kind of intercourse (Klein, 1928/1975).

Melanie Klein discovered in the panics and night terrors of childhood the persisting of the infant's phantasies of the parents in intercourse. These have a violent tone that matches the violence the infant feels towards the parents at the sense of exclusion.

These phantasies are of pre-genital kinds. For instance the parents may be experienced as mutually feeding each other, which then, in response to the child's hatred, come to be phantasies of the parents devouring each other (Klein, 1929). The imagined mutual destruction is usually extremely worrying for the child, and exclusion may be replaced by a helplessness.

Later in development the infant experiences the parents in more realistic ways, and gains reassurance from the evidence of their survival. At the same time the infant may internalize one or other parent (or perhaps both) to keep them safe. Another primitive response is to mobilize genital feelings of a loving kind, in order to mitigate the violence in himself and perceived in the parental figure. The latter, eroticizing defense may result later in precocious and perverse sexuality.

With the onset of the depressive position, the parents are more realistically appreciated and their relationship can slowly be tolerated as a creative one in its own right. Internalization of a creative parental couple is an important basis of new developments. Tolerating the parents internally in intercourse is an achievement that allows creativity and intellectual curiosity to develop freely.

In Klein's view those later phantasies and investigations which Freud described are emotionally colored by the preceding phantasies of the combined parent figure.

Doubt has been shed on the capacity for infants to have such detailed phantasies and, it is argued, they are to be regarded as subsequent elaborations at a later stage of development when three-person situations can be conceived.

## COMPENSATION (ANALYTICAL PSYCHOLOGY)

Compensation (transcendent function) finds its origins in the delineation of dynamics of the complex.

In 1907 Carl Gustav Jung notes the pathogenic complex possesses a quantum of libido which grants it a degree of autonomy that is opposed to conscious will. Though this dynamic has a pathological cast, it conveys the essence of what Jung termed compensation; namely, the capacity of the unconscious to influence consciousness.

Jung noted the ego identifies with a preferred set of adaptive strategies, and thus tends to restrict the range of adaptive response and hamper individuation. In “The Importance of the Unconscious in Psychopathology” (1914), he introduced the idea, saying, “the principal function of the unconscious is to effect a compensation and to produce a balance. All extreme conscious tendencies are softened and toned down through a counter-impulse in the unconscious.” (1914a). This assertion ascribes a different role to unconscious dynamics, i.e. one that is purposive and intelligent, and not restricted solely to wishing.

In 1917, Jung expanded his notion of an intelligent unconscious further when he asserted the existence of a “supraordinate unconscious” as a common human inheritance, viewed as the source of compensatory activity.

Later, Jung referred to compensation as “an inherent self regulation in the psychic apparatus.” Jung’s assertion of an intelligent unconscious culminated in his concept of the self (1928a), understood as the personality’s central organizing agency that instigated and guided individuation. Paired with the concept of the self, compensation was seen as the core process in realizing selfhood.

Given this core value, Jung sought a means to maximize its efficiency and benefits. He termed this means the “transcendent function,” described as a joining of the opposing tendencies of conscious and unconscious that would produce a synthesis in the form of a “uniting symbol” in order to release compensatory contents of the unconscious. Jung, noted the transcendent function facilitated a transition from one attitude to another and held the person skilled with understanding of conscious and unconscious interaction and its symbolic products could accelerate individuation.

## COMPENSATORY STRUCTURES

Compensatory structures are complex psychological configurations that are an integral part of the overall self or the personality of an individual. As their name indicates, they compensate for certain primary structural deficits in the self, and they do this by activating another structure. Thus, when the mirroring pole, the idealizing pole, or the pole of twinship/alter ego of the self are deficient or underdeveloped, one of the other three becomes the dominant force in the functioning of the self of the person in question.

The deficiencies come from the developmental failures of early childhood concerning self-object experiences, and thus the self’s development. Compensatory structures derive from more optimal self-object relations. They are different from defensive structures, which serve merely to protect the self from any further wound. Compensatory structures go beyond this to become more or less independent of any protective purpose and thus intervene in a gratifying, vitalizing way: they become the self’s main way of orientating itself. Thus, they transcend the fragility of the original

structural deficiency, which then becomes resistant to any analytical intervention. Compensatory structures make up for the deficit, whereas defensive structures cover it over.

Though defensive structures can and must be analyzed to reach into and make up for the structural deficit that they protects, compensatory structures cannot and must not be analyzed in an attempt to bring to light the underlying deficiency. In *The Restoration of the Self*, Kohut says that a successful analysis is one that enables a compensatory structure to be fully developed and consolidated. One neither can nor should try to determine or direct the course of such an analysis, insofar as the development of the self remains a multi-potential process that draws on and chooses from the stock of available self-objects. Instead of deciding that all defenses should be analyzed, it might well be that analytical activity is not indicated for the compensatory structure.

## **COMPLEMENTAL SERIES**

In *The Language of Psychoanalysis*, Jean Laplanche and Jean-Bertrand Pontalis give the following definition of complementary series: “Term used by Freud in order to account for the aetiology of neurosis without making a hard-and-fast choice between exogenous and endogenous factors. For Freud these two kinds of factors are actually complementary—the weaker the one, the stronger the other—so that any group of cases can in theory be distributed along a scale with the two types of factors varying in inverse ratio. Only at the two extremities of such a serial arrangement would it be possible to find instances where only one kind of factor is present” (1967).

The concept is most clearly explained by Freud in the *Introductory Lectures on Psychoanalysis* (1916–17a [1915–17], p. 347 and note). The endogenous factor corresponds to the fixation points specific to each person (and determined by that person’s hereditary constitution and childhood experience), while the exogenous factor corresponds to frustration. Freud

returned to this question, apropos of trauma, in the last part of *Moses and Monotheism* (1939a [1934–38]): “In this way we reach the concept of a sliding ‘complemental series’ as it is called, in which two factors converge in fulfilling an aetiological requirement. A less of one factor is balanced by a more of the other” (p. 73).

The concept of “complemental series” thus appears in Freud’s work in relation to two key themes, neuroses and traumas, a fact that underscores its importance. It would be interesting to look at this concept from the standpoint of Freud’s renunciation of his *neurotica* in 1896, that is to say, the change he introduced in the etiology of the neuroses from the theory of a real trauma to that of an imagined trauma.

As we know, Sigmund Freud may never have abandoned the theory of the real trauma, and there is a sense in which the concept of “complemental series” testifies to the very real effort he made to reconcile internal and external factors and thus transcend the opposition between external reality and psychic reality. In a way the complemental series foreshadows our more modern and still debated polyfactorial model of pathological etiology.

## **COMPLEX**

A complex is a group of partially or totally unconscious psychic content (representations, memories, fantasies, affects, and so on), which constitutes a more or less organized whole, such that the activation of one of its components leads to the activation of others.

Freud did not coin the term “complex.” At the end of the nineteenth century, it was occasionally used in psychiatry to designate a collection of ideas belonging to a subject. Freud used it in this sense in 1892 in a sketch written in preparation for his “Preliminary Communication.” He wrote that in hysteria, “the content of consciousness easily becomes temporarily dissociated and certain complexes of ideas which are not

associatively connected easily fly apart” (1940–41 [1892], p. 149). Shortly after, he used the term again in *Studies on Hysteria* (1895d), specifically in the case of Emmy von N. Josef Breuer, coauthor of the *Studies*, wrote, “It is almost always a question of *complexes* of ideas, of recollections of external events and trains of thought of the subject’s own. It may sometimes happen that every one of the individual ideas comprised in such a complex of ideas is thought of consciously, and that what is exiled from consciousness is only the particular combination of them” (1895d, p. 215n).

In the ensuing years, the idea that at the heart of a neurosis there was a collection of ideas and affects specific to the subject and organized around a traumatic sexual experience became central to the development of psychoanalysis—even though subsequently Freud rarely used the term “complex” to designate such a set of ideas. He did add an essential modification to the previous psychiatric conception in positing that, for the most part, such a collection is made up of unconscious processes and remains unconscious itself.

In 1906 he explicitly discussed the term “complex” for the first time in an article on “Psycho-Analysis and the Establishment of Facts in Legal Proceedings” (1906c). He paid homage to Eugen Bleuler, and more particularly to Carl Gustav Jung, whom he had just met, and praised the method of “word association,” which was developed by Wilhelm M. Wundt and practiced by Jung. This experimental method consisted of giving a subject a series of “stimulus words” and asking the subject to react as quickly as possible. The time that it takes the person to respond and the nature of their response are assumed to indicate a “complex.” Freud, in this work, defined a complex as “ideational content” charged with affect (p. 104).

From then on, he used the term frequently to designate the “nuclear complex of neurosis,” that is, “the father complex” (1909d, p. 208n; p. 200ff.), which he designated as the “Oedipus complex” starting in 1910 (1910h, p. 171). Similarly, he began to speak of the “castration complex” (1909b, p. 8).

After he split with Jung, Freud withdrew the praise that that he previously bestowed upon him. Thus he wrote, in his *History of the Psycho-Analytic Movement* (1914d), that the “theory of complexes” proposed by Jung did not actually attain the status of a theory and had not “proved capable of easy incorporation into the context of psycho-analytic theory” (p. 29), even

though the term itself had become common in psychoanalytic usage. In other words, Freud adopted the term to give meaning to his own metapsychological constructions, but rejected the theory of Jung himself.

The following points should be emphasized:

1. There is an obvious difference between the popular use of the term “complex” in contemporary culture and its more specific usage in the psychoanalytic literature. In this regard, what Freud described in 1914 remains the same today: “None of the other terms coined by psycho-analysis for its own needs has achieved such widespread popularity or been so misapplied to the detriment of the construction of clearer concepts” (1914d, pp. 29–30). In contemporary psychoanalytic writings, the term is hardly ever encountered anymore except in two closely connected situations: references to the Oedipus complex and the castration complex.
2. As surprising as it may seem, there has been scarcely any coherent theoretical reflection on the notion of the “complex” as such, except insofar as it is related to other terms used to designate an organized set of mental processes and activities (“structure” and “system,” for example). The difficulty arises from the need to distinguish and yet coordinate two different levels. The first describes the structure of the psyche as being the same, at least in its broad outlines, in every human being; such features would be, at least in theory, constitutive of the psyche itself (this is the case with the Oedipus complex and its corollary, the castration complex). The other level is that of individual variations, that is, the particularities of such a fundamental structure taken as a function of personal history, of imagos, of the play of identification, etc. The study of such particularities is the very object of psychoanalytic treatment. But the temptation to group complexes into “families” led over time to the proliferation of “new complexes,” generally named after mythological figures. There was the “Electra complex,” the supposed feminine version of the Oedipus complex; the “Jocasta complex,” which designated the maternal counter-Oedipus; and even the “Ajase complex,” which referred to the guilt that is linked in Japanese culture to the desire to kill the mother (Kosawa, 1931/1954). Thus there is a danger of falling into a purely descriptive typology in which the coherence of

the Freudian metapsychology disappears and its explanatory power is lost. But in fact, not one of these proposed complexes has survived.

3. Insofar as it relates to a fundamental structure, a complex is in itself not characteristic of this or that neurosis. Only its functionally disruptive manifestations and fixations can rise to the level of pathology.

In the definitions given above, a complex is “a group of ideas.” Josef Breuer correctly noted that these ideas could be or could become conscious, but that what is “exiled from consciousness” is their “particular combination.” However, we cannot remain at the level of ideas in the strict sense: memory traces, fantasies (at every level, from conscious to unconscious), and imagos, for example, all enter into this “combination.” Moreover, what accounts for the effect of the complex is its quota of affect, and also its drive force. Thus, the study of an individual complex in the treatment leads to a topological consideration of all the related defenses and the retroactive reworkings that combined to set up a functional structure of this kind.

## COMPLEX (ANALYTICAL PSYCHOLOGY)

A complex is the more- or less-repressed standardization of emotionally strong conflictual experiences. When these experiences are triggered, either by certain themes (such as new pieces of information), or emotions (in which case they are called “constellations”), the complex produces a reaction, such that the individual perceives the situation in terms of the complex (with a distortion of perception), and responds with an emotional overreaction, which mobilizes the processes of stereotyped defense.

Carl Gustav Jung developed his concept of the complex at the same time as he was engaged in his experiments with association. It is within this context that the concept appeared for the first time, in 1904, in an essay called “*Experimentelle Untersuchungen über Assoziationen Gesunder*” (“The associations of normal subjects,” with Franz Riklin). But he had already used the term, without any particular specificity, in his thesis of 1902.

When, at the turn of the century, Jung and Riklin eagerly turned to research on association in order to construct typologies, they studied what they considered normal disturbances of experience. They showed that a test subject could not uniformly form associations with ideas that were attached to highly emotionally-charged experiences and personal difficulties. They went on to hypothesize that such complexes might constitute the background of consciousness, and that in any neurosis of psychical origin, there would be a complex characterized by a particularly strong emotional charge.

Later, in 1907, Jung established that any event charged with affect gives rise to a complex and reinforces those that are already in place. Complexes act from the unconscious and can at any moment either inhibit, or on the contrary, activate conscious behavior. They reveal conflicts, but are also defined by Jung as crucial hot points of psychic life.

In 1934, Jung summarized his theory of complexes and emphasized that, even outside of the effects of any individual constellation, complexes involve the active forces that determine the interests of everyone and thus serve as the basis for the symbol formation. This conception of complexes, which he continued to develop afterwards, led him to emphasize their creative effects. From a therapeutic perspective, this is an important aspect of his psychology and his clinical work. From it

he developed the idea of promoting creative development through the integration of complexes. This idea plays a large role in many of the techniques developed by the Jungian school. Finally, it is from this insight that Jung came to see archetypes at the heart of complexes.

The experiments in association, as well as the concepts of the complex-ego, of the symbol and the archetype, imagination and emotion, and transference and counter-transference, all refer to Jung's idea that the complex is caused by the painful confrontation of the individual with the "necessity to adapt." Thus the very concept of complexes takes on an even more dynamic dimension: each one appears as an effect of the condensation and generalization of experiences that might, at any moment, be associated by analogy with a new piece of information or emotion. This is why the concept takes on decisive importance for understanding what is at play in the transference and the counter-transference.

## **COMPROMISE FORMATION**

In dreams, just as in symptoms formation, "we find a struggle between two trends, of which one is

unconscious and ordinarily repressed and strives towards satisfaction—that is, wish-fulfillment—while the other, belonging probably to the conscious ego, is disapproving and repressive. The outcome of this conflict is a *compromise-formation* (the dream or the symptom) in which both trends have found an incomplete expression" (Freud, 1923a, p. 242).

This definition was given by Freud in an encyclopedia article called "Psycho-Analysis." In it he refers to both a dynamic process (the drive/defense conflict) and to its result. The term "compromise" emphasizes that it is a partial satisfaction that is achieved (as the mechanism of the daydream illustrates), which, within the general framework of the theory of symptom formation differentiates this concept from similar notions such as substitutive formations and reaction formations.

The term first appeared in 1896 in "Further Remarks on the Neuro-Psychoses of Defense" in relation to the mechanisms of obsessional neurosis: obsessive representations and compulsive acts are "what become conscious as obsessional ideas and affects, and take the place of the pathogenic memories as far as the conscious life is concerned. . . . [They] are structures in the nature of a *compromise* between the repressed idea and the repressing ones" (p. 170). It was later extended by Freud beyond obsessional neurosis to the entire dynamics of the psyche as a major component of the process of symptom formation (1916–17a, Lecture 23), and then reconceived within the structural theory. It was this new formulation that was taken up again in *Moses and Monotheism* (1939a).

Is every compromise formation a return of the repressed? Or could we say that compromise formation could result from other defensive mechanisms, such as negation and even disavowal? This question wasn't explicitly raised by Freud, but it could be posed in light of modern work.

## COMPULSION

Compulsion is a mental pressure of internal origin compelling the subject to think, act, or react in accordance with specific modalities that do not coincide with his habitual patterns of thought. Freud used the German term *Zwang* to describe this concept. In an article written in French in 1894 (“*Obsessions et phobies*”), Freud used an equivalent term, obsession. The word “compulsion,” attested in French as early as 1298, is derived from the Latin *compulsio* and originally signified a “constraint, a legal summons, or formal notice to pay.” “Constraint” is somewhat older (twelfth century) and has the same legal connotation found in the expression “physical constraint.” As for the term “obsession,” which appeared later, its origin is both religious (possession) and military (siege). All three terms were used in the early literature on psychoanalysis to take into account the corresponding complex phenomenon: compulsion emphasized the internal origins of the phenomenon, constraint its immediate effect, and obsession described one of the most symptomatic consequences in the subject’s life.

For Freud the German term *Zwang* is one of a series of analogous terms like drive, urge, or thrust, used to signify that the mental forces governing the human mind must be treated in the same way as other natural forces, even though their origin and meaning are radically different. The word was used in medical research in Germany at the end of the nineteenth century, and was first defined by Karl Friedrich Westphal in 1877. At the time the term corresponded to the way in which members of the Berlin Group (1840–1846), represented by Hermann von Helmholtz, approached the investigation of mental phenomena, first subjecting them to rigorous scientific observation, as they would any other phenomenon.

The term appeared in 1894 when Freud addressed what he referred to as the “psychoneuroses of defense” in a discussion of obsessional representations, to differentiate them from hysterical or phobic manifestations. Freud explains that the compulsive representation results from a “poor connection,” whereby an affect arising from a repressed representation attaches itself to

another representation (1894a). As in hysteria the repressed representation is of a sexual origin, but the compulsive representation is completely dissociated from it. In the *Studies on Hysteria* (1895d), Freud speaks of a “compulsion to associate.” And on September 25, 1895, in his “Project for a Scientific Psychology” (1950a [1895]), he uses the term “compulsion” to refer to the impression produced by “hyperinvested representations” such as those that occur during hysteria, even referring to “hysterical obsession.” The occurrence of these representations produces effects “that it is impossible to suppress or understand,” the subject being completely aware of the strangeness of the situation. During this same period, he refers to compulsive affects (*Zwangsaffekte*). In a letter to Wilhelm Fliess dated December 6, 1896, the term “compulsion” characterizes the return of the memory of a satisfying sexual experience, regardless of the clinical presentation in question. Finally, it is compulsion that pushes all human beings toward incest (letter to Fliess dated October 15, 1897, and *An Outline of Psychoanalysis*, 1940a [1938]).

The concept followed two separate paths in its evolution. Faithful to his initial intentions, Freud pursued his investigation of compulsion in obsessional neurosis, especially in his analysis of the “Rat Man” (1909d). The most symptomatic compulsion of this patient was the “rat torture,” together with its obvious connotation of anal sadism. But the analysis revealed many others, such as the compulsion to protect his lady friend, “which can signify nothing other than a reaction to the contrary, and therefore hostile, tendency.” He also refers to “two-stage compulsive acts,” where the first is cancelled by the second, and points out the ambivalence. This simultaneity of internal compulsion and the struggle against what it entails is characteristic of compulsive neurosis and is what causes the unrelenting and exhausting struggle; it is this that led Pierre Janet to speak of “psychasthenia.”

Subsequently, Freud made compulsion a key element of his metapsychology. It refers to what is ineradicable and insurmountable in the drive, the thing that must always be confronted. If it weren’t for the possibility of change, this would not be unlike the idea of some inevitable destiny or hopeless determinism. For Freud, compulsion has the following characteristics: its dystonic quality with respect to the behavior or customary activities of the subject, the conviction of a disastrous outcome if it is not obeyed, and the promise of actual relief if it is allowed to proceed unrestricted.

The notion of compulsion was adopted by Freud's early disciples, especially Alfred Adler, who saw in it a reaction to a feeling of inferiority (1907). Melanie Klein attributes it to the activity of partial primary objects, as do Donald Winnicott and Wilfred Bion. Jacques Lacan considered compulsion an "object-cause of desire," which he formulated in terms of an "object *a*." For Jean Laplanche compulsion is the effect of "messages of enigmatic origin." These are accompanied by the progressive objectification of the foundations of the compulsion, and an increasingly greater effort at translating them into objects or representations.

Concepts that are similar to compulsion in the Freudian lexicon include pressure (*Drang*), introduced by Freud in 1915 in the *Metapsychology* (1915c), which is the equivalent for each drive of what compulsion is in the totality of mental life. Similarly, an urge is the irrepressible fulfillment of an act during a moment of paroxysm, whereas the compulsion implies an internal obstacle to its fulfillment.

The Freudian idea of a constant and insistent force associated with certain thoughts is not without its drawbacks. It does reflect the speech of certain patients, especially during obsessional neurosis or cases of mental automatism (Gaëtan de Clérambault). But by emphasizing the element shared by all forms of internal compulsion, as Freud does in the *Outline*, the concept is sometimes used to justify exclusively medicinal or behaviorist approaches to treatment. The initial Freudian idea is, however, quite different. It attempts to reestablish the relational conditions that give rise to compulsion, to restore it to the internal setting in which it first took shape.

### **CONCEPT**

For Wilfred Bion, conception is the result of coupling a pre-conception, an innate a priori idea, and a realization, elements of the real that are provided by external-sensory or internal-emotional experience. The concept is derived from conception through abstraction and generalization. Language and the attribution of a name to a concept unite pre-conception and realization, preventing any loss of experience in the process. In Bion's grid conception appears in row E, below the pre-conceptions (row D). The transition from D to E occurs when a pre-conception (for example, the infant's innate expectation of the breast) encounters a negative realization (absence of the real breast).

In a key article on the theory of thought, presented during the International Congress of Psychoanalysis held in Edinburgh in 1961, Bion appears to contradict himself when discussing his theory of conceptions. In one paragraph he says that the union of the pre-conception (innate expectation of the breast) with the realization ("the breast itself") gives rise to a conception, associated with an experience of satisfaction. In the following paragraph he writes that it is only when the pre-conception is joined with frustration that a conception (thought) is produced.

There is a problem with Bion's first statement. For if there is no internal object because that object has not been thought, it is difficult to justify how the "breast itself" could make contact with the pre-conception. Bion's second statement leads us to believe that the sensation of hunger (emotion), combined with the frustration (absence of the breast), will create the conception of "no breast," a "non-object," which then, through

contact with the mother and the intervention of the container-contained mechanism, ♂♀, will be able to become a “good breast.” The presence of two innate pre-conceptions, present at the start of life: “bad” and “good” breasts, which are coupled with the realizations concerning the “absent breast” and the nourishing breast also need to be recognized. This will be the basis of the first internal object. Additionally, it is the infant’s constitution, which enables him or her to tolerate the frustration of hunger, of the “absent breast,” while preventing it from becoming prematurely the “bad breast” whose fate is then to be evacuated in the same way as feces, tears, et cetera (beta-elements).

Bion considers the concept a conception that has been assigned a name. The concept signifies a growth of the abstraction that enables us to expand the generalization of psychoanalytic theories, which, as a whole are judged to be too descriptive, too concrete. Concepts can be articulated in a deductive scientific system that functions like an *Ars combinatoria*.

## **CONDEMNING JUDGMENT.** *See Judgment of condemnation*

---

## **CONDENSATION**

Condensation, along with displacement, is an essential process in dream work and more generally in primary-process thinking. We tend to view it as a way of attributing, to a person or representative object, characteristics and properties that, from the point of view of latent thoughts, belong to other persons or objects. In reality, if we go by Freud’s text in *The Interpretation of*

*Dreams* (1900a), condensation, like displacement, does not proceed directly by modifying the content of a representation. All dreams are made up of latent dream thoughts, each of which corresponds to one or several chains of associations, with each link being initially charged with a psychic intensity. Dream work consists in changing the location of these fragmentary intensities without either increasing or reducing their global value.

In displacement, one assigns to link *A* in a chain of associations the intensity initially associated with link *B*. Condensation, in contrast, operates by bringing intensities together. When two chains of association intersect, it assigns to the common link the sum of the intensities of the two intersecting chains. This nevertheless indirectly alters the representation because, in the manifest content of the dream, a link will not figure if it does not retain an intensity. By displacing the intensities of several chains to their common link, condensation makes it possible to represent all of the chains by a single link. Hence, there is an economy of means that contributes to censorship. As a result, when one link takes the place of several chains, this makes it more difficult to read through to the wish corresponding to those chains.

Condensation thus has an indirect effect on the figurative content of representations. It does not create chimeras that bring together in one element the attributes of others. Nor does it engage in metonymy, in which one of the links represents one or several chains of association. It is a process that operates by displacing intensity, but when the intensity of several chains is brought to bear on their common link, condensation seeks to represent them all.

When explaining the effect of condensation, Freud used the metaphor of italics. A representative link whose intensity has been reinforced by condensation has a status comparable to that of a word in italics in a text. This metaphor calls for two remarks. First, the intensity added to a fragment of a representation through condensation makes it possible, like italics, to stress the importance of the representation. This added intensity indicates at the manifest level that the representation stands for the different latent chains intersecting at the link. Second, typographical emphasis warps the texture of a text and invites us to look for links other than those offered by successive statements. Typographical emphasis is an invitation to abandon linearity and search for the dreamer’s associations.

The notion of intensity is complex. The term indicates the psychic interest of a particular idea. But we may well ask whether this interest should not be extended to the affect associated with each chain of associations or the instinct that determines each association.

Although Freud studied condensation particularly in relation to dreams, especially in *The Interpretation of Dreams*, he also describes the effect of this process in other manifestations of primary-process thinking, such as jokes, forgetting names, slips of the tongue, and symptoms. In these latter domains, however, it is sometimes quite difficult to distinguish between condensation and overdetermination. In both cases, as the result of a transformation, a representation substitutes for more elaborate thought content. Both processes seem to proceed by increasing intensity, that is, by economic modification, and this results in the reorganization of the thought content. But whereas condensation can be viewed as a sum of intensities relative to forces acting in the same direction, overdetermination appears more as an appropriation of content by heterogeneous if not antagonistic forces. In fact, the content of an overdetermined representation acts as a fulcrum for opposing logics and conflicting systems (such as the preconscious and the unconscious). A thought content (or representation) resulting from the interaction of forces pushing for the fulfillment of an unconscious wish and forces opposing it (the censor) is a good example of overdetermination but not of condensation, since the censor is not part of the latent dream thoughts. However, as soon as the signifying element begins to represent conflict (as in the case of a symptom), the difference between condensation and overdetermination is more difficult to establish.

## **CONFLICT**

In psychoanalysis, the notion of conflict generally refers to intrapsychic conflict in which antagonistic forces are pitted against each other. The idea is central to psychoanalytic doctrine: It is no exaggeration to say that in light of the importance given to infantile sexuality and the unconscious, conflict is basic to the structuring of the psychic armature; further, it can be said that Sigmund Freud devoted his entire life to elaborating a theory of conflict.

Freud takes a cautious approach in his early work. He remains close to a psychology of consciousness at the beginning of his theory of repression, when he evokes, in the patient under the influence of a wish, the surging forth of “contrasting representations” and “irreconcilable ideas” that are so painful that, by an effort of “counter-will” the patient decides “to forget the thing” (1941b [1892], Notice III). From the outset, then, he posits the idea of a fundamental conflict between wishes and what opposes them. When Freud later unreservedly states that this process—repression—is essentially unconscious, that perspective, as much as the role of sexuality in wishes, becomes the basis for his parting of ways with Josef Breuer and for his ongoing opposition to such thinkers as Pierre Janet.

From that point on, it is possible to follow the stages in his elaboration of a general theory of conflict:

- as their name indicates, the neuropsychoses of defense (hysteria, obsessional neurosis, phobia) can be attributed to the conflict between wishes and obstacles to their fulfillment;
- this struggle is expressed in compromise formations in which the wish is blocked and, at the same time, finds fulfillment in disguised forms: This is the return of the repressed, in the form of symptoms, dreams, slips of the tongue, parapraxes, and so forth, and all these socially and morally acceptable substitutive formations nevertheless produce an occult satisfaction of desire, thus providing an outlet for accumulated psychic energy;
- it is thus important to distinguish manifest conflict, as it appears in the complaints of the patient and those around him or her, in symptomatology, and so on, from latent conflict, which only the work of psychoanalysis can bring to light;

- the source of conflict is always to be sought in psychosexuality. Such, at least, is the position that Freud vigorously affirms in the first part of his work. However, the status of aggression posed a problem and would remain a troublesome point<sup>44</sup> in his theory. He returned to the issue, without finding a satisfactory solution, with his second theory of the instincts and the introduction of the “death instinct,” in his attempt to find what might lie “Beyond the Pleasure Principle” (1920g) and by reframing questions related to sadism and masochism (for example, in “The Economic Problem of Masochism” [1924c]) and the like;
- the theorization of the neuropsychoses of defense explicitly posits the existence of psychopathological states that do not follow this schema in that they are not produced by a conflict between the instincts and the defenses: perversions (“the neuroses are the negative form of perversion,” Freud writes in “Three Essays on the Theory of Sexuality” [1905d, p. 238]) and actual neuroses, in which the symptom is produced by a direct flow of libidinal energy into the somatic functions, without passing through psychical working over (this latter category was taken up and extensively developed in modern studies of psychosomatic disorders). However, these distinctions, which seem to originate in a somewhat overly rigorous psychoanalytic nosography, were challenged by Freud’s successors;
- an important watershed occurred around 1910 with regard to two connected areas, when Freud began to envisage conflicts between the “two principles of mental functioning,” the pleasure principle and the reality principle (“Formulations on the Two Principles of Mental Functioning” [1911b]), and the opposition between narcissistic cathexes and object cathexes (“On Narcissism: An Introduction” [1914c]);
- at the same time, Freud’s theorization of the Oedipus complex (explicitly designated by that name for the first time in 1910, although the idea is present much earlier) brought to light the idea of conflicting identifications (first and foremost, between paternal and maternal identifications);
- from this point on, the stages in libidinal development having been established, different developmental and structural levels of psychic conflict can be distinguished. In the case of orality,

biting/not biting the breast; according to Karl Abraham, this ambivalent phase is preceded by a preambivalent phase. In the anal phase, expulsion/retention; this is where the sadistic/masochistic and active/passive oppositions are imbricated. The phallic phase is characterized by the oppositions between phallic/castrated and masculine/feminine as well as by the principal form of conflict that places desire in opposition to prohibition. As is clear from this brief summary, conflict in Freudian thought often takes the form of pairs of opposites.

There is more at issue here than merely situating conflicts in the activation of the erogenous zones. When there is conflict, it involves the putting into play of object relations (for example, in the case of anality, in the oppositions between satisfying/disappointing or giving/refusing). The love/hate opposition, which Melanie Klein posits as fundamental (working within the perspective inaugurated in Freud’s second theory of the instincts) has since undergone extensive elaboration. Finally, at the most basic level of all, the opposition between being/nonbeing should no doubt be added; its importance is apparent in the study of psychoses.

Conflict can pit the instincts themselves against one another. In his early work Freud places the sexual instinct in opposition to the instinct for self-preservation; in his second theory, he opposes the life instinct to the death instinct. Moreover, clinical practice suggests that instincts may be conflictual in themselves: It has been observed that in certain anxiety states instinctual satisfaction is fantasized as a cataclysmic explosion that would annihilate all the subject’s vital energy in a single instant and cause death. We should also recall the forms of conflict in which different agencies within the psychic apparatus are in opposition: the conscious and the unconscious in Freud’s early theory, or the Id, the Ego, and the Superego in his later work.

In all the above forms, conflict is considered in terms of its intrapsychic workings. However, it is clear we should also consider its articulation with interpersonal conflicts and, beyond that, the problem of conflicts between the individual and society, which Freud himself addressed several times, notably in *Group Psychology and Analysis of the Ego* (1921c) and *Civilization and Its Discontents* (1930a).

## **CONFRONTATION**

The seminar known as *Confrontation*, designed to foster discussion and overcome intellectual isolation engendered by institutional divisions in French psychoanalysis, was created by René Major and Dominique Geahchan in 1973. It represented an effort to develop a non-sectarian forum for discussion and debate among analysts and to bring psychoanalysis into contact with related disciplines.

At the time, four psychoanalytic institutions were operating in France. The Société Psychanalytique de Paris (SPP) and training institute was the first to be founded and the progenitor of the others; there was also the Association Psychanalytique de France (APF). Members of that organization helped Jacques Lacan to establish the École Freudienne de Paris in 1964 while a schism in that group had led five years later to the founding of what was known as the Quatrième Groupe. The various splits had precipitated considerable resentment amongst French analysts, especially after the International Psychoanalytic Association (IPA) pointedly refused to recognize Lacan or Françoise Dolto as training analysts. The resulting climate of divisiveness favored dogmatism.

Major and Geahchan belonged to the Paris society; the former was director of the training institute. Attendees at the first seminar brought Wladimir Granoff, Serge Leclair, and François Perrier before institute members, including Nicolas Abraham, Denise Braunschweig, Alain de Mijolla, Jacques Mynard, Michel Neyraud, Catherine Parat, Maria Torok, Serge Viderman; analysts from the three other groups also attended. Subsequent meetings took place at the Maison de la Chimie and at the Maison des Polytechniciens.

Thus there developed an extensive exchange of ideas, after years of relative isolation, among analysts such as Piera Aulagnier, Jean Clavreul, Jean Laplanche, Maud and Octave Mannoni, Michèle Montrelay, Jean-Bertrand Pontalis, Elisabeth Roudinesco, François Roustang, Moustapha Safouan, Conrad Stein, and Nathalie Zaltzman. Dialogue also took the form of meetings with philosophers, mathematicians, historians, and linguists—among them Jean Baudrillard, Catherine Clément, Jacques Derrida, Serge Doubrovsky, Luce Irigaray, Sarah Kofman, Philippe Lacoue-Labarthe, Jean Claude Milner, Jean-Luc Nancy, and Jean Petitot.

By 1975 these seminars became a site of intellectual exchange that considered psychoanalysis in relation to literature, politics, law, and religions through investigations of little-studied themes. Well-known analysts attended these meetings, regardless of their institutional affiliation, in an atmosphere of openness that encouraged debate on the merits of the various idioms that were then developing what might be more broadly construed as the language of psychoanalysis. The seminars also led to various publications under the imprints of Éditions Confrontation and Éditions Aubier Montaigne.

Memorable seminars included one that, for the first time in France, brought to light the situation of psychoanalysis in Argentina and Brazil during a period of dictatorship and human rights abuse. Another concerned *The Post Card*, re-igniting the dispute initiated by Lacan’s “Seminar on ‘The Purloined Letter’” and Derrida’s interpretation of it. An Anglo-French meeting debated the relationship of psychoanalysis and deconstructionism, analytic philosophy, and feminism; it brought together Hélène Cixous, Jacques Derrida, Antoinette Fouque, Serge Leclair, and Juliet Mitchell. Another seminar, in Italy with Armando Bauleo, concerned politics and society.

Neither an institute nor training program vis-à-vis clinical practice, the *Confrontation* seminars realized in embryonic form Freud’s hope, expressed in *The Question of Lay Analysis*, for new post-graduate institutions that would enable analysts to acquire a broader base of knowledge for understanding science and culture. The seminars ended in May 1983, with the death of Dominique Geahchan.

In a larger context, *Confrontation* was a first step toward a broader forum for analytic thought outside of conventional institutes. At the Collège International de Philosophie, René Major directed a colloquium on “Lacan and the Philosophers” in 1990. In 1997, after a similar meeting held upon publication of Helena Besserman Vianna’s book on Brazil, Major called for an international conference. This became the first Estates General of Psychoanalysis, held at the Sorbonne in the year 2000, with representative from thirty-three countries and the ultimate aim of creating a European-based institute of advanced studies in psychoanalysis.

## **“CONFUSION OF TONGUES BETWEEN ADULTS AND THE CHILD”**

Sándor Ferenczi’s original title for this article, prepared for the Wiesbaden Congress (September, 1932) was “The Passions of Adults and their Influence on the Development of the Character and the Sexuality of the Child.”

The change in the name of the article is indicative of Ferenczi’s new perception of the problem of traumatism; for the first time he established a clear distinction between the language and motivation (desire for tenderness, security, basic love, “passive object-love”) of childhood and the reasons for passionate language in some adults, when they are seducers, desirous of genital excitation and a domination through violence. Recalling the central Freudian thesis of the *Three Essays on the Theory of Sexuality* (1905d), Ferenczi expounded most eloquently in this text the notion of the hypnotizing and the terrorizing effects of suffering, which, because they are passionate punishments coming from the adult, allow the child to feel even more attached to that person: “The same anxiety, however, if it reaches a certain maximum, compels them to subordinate themselves like automata to the will of the aggressor, to divine each one of his desires and to gratify these; completely oblivious of themselves they identify themselves with the aggressor. Through the identification, or let us say, introjection of the aggressor, he disappears as part of the external reality, and becomes intra- instead of extra-psyche” (1932/1955, p. 162).

This is how Ferenczi describes the introjection of the adult’s guilt by children, followed by confusion, loss of confidence in their own perceptions, and fragmentation of the personality, particularly devastating when the traumatic shock has been incestuous. In this text he created his daunting metaphor for post-traumatic precocious maturity: “The precocious maturity of the fruit that was injured by a bird or insect” (p. 165).

The conclusions he came to on the basis of this pathological model had a bearing also on the practice of analysis; while they were not very well received at the time, some have turned out to be quite pertinent. A good number of these notions, articulated in his *Clinical Journal*, have influenced other prominent psychoanalysts, including Sacha Nacht in France; Michael Balint, his student and friend, in Great Britain; and Harold Searles and his students, Elizabeth Severn,

Clara Thompson, Sándor Lorand, and Sándor Radó, in the United States.

## CONGRÈS DES PSYCHANALYSTES DE LANGUE FRANÇAISE DES PAYS ROMANS

On July 19, 1926, Freud mailed René Laforgue a little card announcing the first in a series of meetings. It read, “Dear Master, Gathered together on the occasion of the Geneva psychiatric congress, the members of our little Paris group and our Swiss friends send you our best wishes. The beautiful countryside allows us to rest from complicated discussions concerning schizophrenia, the superego, and the id.” Signatures: René Laforgue, Dr Robin, Mme Laforgue, Raymond de Saussure, Angélo Hesnard, Ariane de Saussure, Édouard Pichon, Adrien Borel. These meetings are still held regularly today; only their name has changed over the years.

The Congrès des psychanalystes de langue française des pays romans (Congress of Psychiatrists and Neurologists of France and French-Speaking Countries [also called “Congress of Alienists and Neurologists of France and French-Speaking Countries”]) was held in Geneva from August 2 to 7, 1926. The congress was organized around a paper by Henri Claude, “Dementia praecox and Schizophrenia.” Claude’s students came to listen to their “leader.” In this very psychiatric atmosphere, without anyone being aware of the preparations for the innovation, Claude’s followers, by associating with their Swiss colleagues—then more enthusiastic than the

French about psychoanalysis—held the first Conference of French-Speaking Psychoanalysts on Sunday, August 1, 1926. They also founded the Linguistic Commission for the Unification of French Psychoanalytic Vocabulary. In the morning session, presided over by Raymond de Saussure (of Geneva), René Laforgue (of Paris) presented a paper titled “Schizophrénie et schizonoïa” (Schizophrenia and schizonoïa; 1926). The afternoon session, presided over by A. Hesnard, was devoted to a paper by Charles Odier (of Geneva) titled “Contribution à l’étude du surmoi et du phénomène moral” (A contribution to the study of the superego and the phenomenon of morality; 1927).

Édouard Pichon, the new secretary, stated, “It has been decided to hold the conference every year in the same city as the Congress of Psychiatrists and on the eve of the opening of that congress.” This plan was followed for the second conference, held in Blois, France, on July 27, 1927. The conference focused on Charles Odier’s paper “La névrose obsessionnelle” (Obsessional neurosis; 1927). And it opened up to physicians other than psychiatrists. The third meeting, now separate from the Congress of Psychiatrists, was held in Paris in July 1928 on the subject of “psychoanalytic technique.” Thereafter, conferences were held in the amphitheater of the mental health clinic of Saint-Anne’s Hospital, thus facilitating a mandatory show of reverence for the resident master Henri Claude.

In the conference two cliques formed. On one side were the “orthodox” Freudians, grouped around Marie Bonaparte and including Eugénie Sokolnicka, Rudolph Loewenstein, and two Swiss members, Raymond de Saussure and Charles Odier. On the other side were the partisans of a “French psychoanalysis,” associated with the medical and institutional hierarchy. They had Édouard Pichon as their bellicose herald, along with Angélo Hesnard, René Allendy, Georges Parcheminey, Henri Codet, and later René Laforgue.

One of the themes of the latter group was a distinction between a suspect psychoanalytic doctrine and a method whose success was undeniable but whose mode of application needed to be adapted to French sensitivities. An example of this distinction is President René Allendy’s address on the occasion of the sixth Conference of French-Speaking Psychoanalysts on October 30, 1931: “Psychoanalysis is not just some kind of a theory. It has a more precious and less debatable claim to fame: it has cured morbid states that hitherto resisted all therapeutic treatments.” As a result

of the distinction, later meetings saw the presentation of two distinct papers, one theoretical and one clinical. This dichotomy was maintained until 1960, when, on the occasion of the twenty-first Congress of Romance-Language Psychoanalysts in Rome, the congress bureau, encouraged by a suggestion from Nicola Perotti, decided to abolish the distinction.

The success of the conference and an abundance of contributions on the subject of “conversion hysteria” (including those by Georges Parcheminey and Blanche Jouve-Reverchon) led in 1931 to the sixth conference being held, for the first time, over a two-day period. It was also the first conference to receive a good-will telegram from Max Eitingon, president of the International Psychoanalytical Association (IPA). This custom was regularly maintained by Ernest Jones and continued after the war until it was replaced in 1974, during the presidency of Serge Lebovici, by a representative of the IPA attending the conferences.

The eighth conference, on “genetic psychology and psychoanalysis,” brought Jean Piaget and Raymond de Saussure face to face in December 1933. Among the speakers we find, for the first time, the name of then thirty-two-year-old Jacques Lacan. There were no conferences in 1932 and 1934, but two were held in 1933. There followed the mystery of two “ninth” conferences, this figure being applied both to the conference held in Paris on February 2, 1935, on Paul Schiff’s paper “Les paranoïas et la psychanalyse” (Paranoia and psychoanalysis; 1935), and to the conference held in Nyons on April 10 and 11, 1936.

The tenth conference, in reality the eleventh, was held in Paris on February 21 and 22, 1938. Sacha Nacht delivered a paper titled “Le masochisme: étude historique, clinique, psychogénique et thérapeutique” (Masochism: an historical, clinical, psychogenetic, prophylactic, and therapeutic study; 1938). Rudolph Loewenstein, speaking on “L’origine du masochisme et la théorie des pulsions” (The origin of masochism and the theory of the instincts; 1938), opposed his former analyst on the notion of a death instinct, which Nacht rejected. This was the last conference of French-speaking psychoanalysts before the Second World War.

The conferences, which were just as political as they were theoretical or clinical, were not held for the duration of the war. Their resumption after ten years marked the renewal of psychoanalysis in both France and Europe. This eleventh conference, held in Brussels between

May 14 and 17, 1948, was organized around Sacha Nacht’s paper “Les manifestations cliniques de l’agressivité et leur rôle dans le traitement psychanalytique” (Clinical manifestations of aggression and their role in psycho-analytic treatment; 1948) and Jacques Lacan’s paper “L’agressivité en psychanalyse” (Aggression in psychoanalysis; 1948). The following year, at the twelfth conference held in Paris, John Leuba and H. G. Van des Walls dealt with narcissism. This conference was distinguished most of all by the presence of Melanie Klein, who, however, failed to make converts among French psychoanalysts. Relations with neighboring countries improved, and on October 16, 1951, the conference changed its name to the Conference of Romance-Language Psychoanalysts, an extension attributed to Jacques Lacan. The conference thus made official its increasingly close collaboration with Belgian, Spanish, Italian, and Swiss societies of psychoanalysis.

In 1953 a sixteenth special conference was held in Rome. The division of the Société psychanalytique de Paris (Paris Psychoanalytic Society) (SPP) in June divided the conference into two parts. In one, the members of the society listened to Emilio Servadio, Francis Pasche, René Spitz (who came from New York), Serge Lebovici, and René Diatkine. They then departed, and members of the new Société française de psychanalyse (French Society of Psychoanalysis) entered to listen to Jacques Lacan’s paper “Fonction et champ de la parole et du langage en psychanalyse” (The function and field of language in psychoanalysis). Jealously simmering in the Paris Psychoanalytic Society tore the two rival societies apart for more than a decade, and the following conferences of French-speaking psychoanalysts fit into the general strategy of the two societies’ struggle for influence.

Yet the conferences were also the scene of original theoretical elaborations marking the evolution and deepening of the psychoanalytic thinking of members of the Paris Psychoanalytic Society. This can be seen from a sample of papers presented at the conferences: Sacha Nacht and Serge Lebovici, “Indications et contre-indications de la psychanalyse chez l’adulte” (Indications and contraindications for psychoanalysis for adults; 1954); René Diatkine and Jean Favreau, “Le caractère névrotique” (The neurotic character; 1956); Francis Pasche, “Le génie de Freud” (The genius of Freud; 1957); Béla Grunberger, “Essai sur la situation analytique et le processus de guérison” (The analytic situation and the process of healing; 1956); Sacha Nacht and Paul-Claude

Racamier, "La théorie psychanalytique du délire" (The psychoanalytic theory of delusions; 1958); Maurice Bouvet, "Dépersonnalisation et relations d'objet" (Depersonalization and object relations; 1960); P. Bofill and P. Folch-Mateu, "Problèmes cliniques et techniques du contre-transfert" (Clinical and technical problems with counter-transference; 1963); Michel Fain and Christian David, "Aspects fonctionnels de la vie onirique" (Functional aspects of dream life; 1962); Angel Garma, "L'intégration psychosomatique dans le traitement psychanalytique des maladies organiques" (Psychosomatic integration in the psychoanalytic treatment of organic illnesses); Michel Gressot, "Psychanalyse et psychothérapie: leur commensalisme" (Psychoanalysis and psychotherapy: their compatibility; 1963); René Held, "Rapport clinique sur les psychothérapies d'inspiration psychanalytique freudienne" (Clinical report on psychotherapies inspired by Freudian psychoanalysis; 1963); Franco Fornari, "La psychanalyse de la guerre" (The psychoanalysis of war; 1964); Evelyne Kestemberg and Jean Kestemberg, "Contribution à la perspective génétique en psychanalyse" (Contribution to the genetic perspective in psychoanalysis; 1965); Rudolph Loewenstein, "Rapports sur la psychologie psychanalytique de H. Hartman, E. Kris, et Rudolf Loewenstein" (Report on the psychoanalytic psychology of H. Hartmann, E. Kris and Rudolf Loewenstein; 1965); Olivier Flournoy, "Du symptôme au discours" (From symptom to discourse; 1967); André Green, "L'affect" (The affects; 1970); and to end this list, Didier Anzieu (of the Association psychanalytique de France [French Psychoanalytic Association]), the first such contributor since the split in 1953), "Éléments d'une théorie de l'interprétation" (Elements of a theory of interpretation; 1970).

In 1955 the conferences became known as congresses. In 1956 Pierre Luquet was appointed permanent secretary for the congresses, a position he occupied for thirty-three years until 1989, when he was replaced by Augustin Jeanneau, assisted by Pearl Lombard. He handled the arrival and departure of societies from neighboring countries, administrative matters concerning their participation, relations with the French Psychoanalytic Association, and relations with the European Federation for Psychoanalysis, created in 1966. In addition, he negotiated publication of the first large annual volumes of congress proceedings.

The locale of the congresses alternated between Paris and a neighboring country. This international character is reflected in its changes of name to Congress of

French-Speaking psychoanalysts from Romance-language countries and then to French-speaking psychoanalysts. The days of didactic reports gave way to much more audacious presentations of clinical and theoretical research, as shown by the few examples mentioned. Moreover, the choice of subjects and contributors traces the history of psychoanalysis in France, including the tensions and alliances that characterized the division of the French psychoanalytic movement in relation to the International Psychoanalytical Association.

## **CONGRÈS INTERNATIONAL DE L'HYPNOTISME EXPÉRIMENTAL ET SCIENTIFIQUE, PREMIER**

Organized by Doctor Edgar Bérillon, founder and director of the *Revue de l'hypnotisme*, the Premier congrès international de l'hypnotisme expérimental et scientifique (First international congress on scientific and experimental hypnotism) was held at the city hospital in Paris on August 12, 1889, and chaired by Doctor Victor Dumontpallier. The discussions were heated, especially between those who maintained the existence of a link between hypnosis and hysteria (École de la Salpêtrière) and those who saw it as a form of suggestion that could be therapeutically useful (École de Nancy). There were further disagreements between Gilles de la Tourette (École de la Salpêtrière), who felt the power of suggestion of the hypnotist presented no danger to society, since the patient would resist any orders that challenged his morality, and the lawyer Jules Liégeois, who feared the consequences of such behavior. Additionally, some participants felt that hypnosis in public should be banned and hypnosis placed under medical supervision (Ladame, de Genève), and those who held a more liberal position (Joseph Delboeuf, de Liège), who believed that hypnosis should be practiced freely, although responsibly,

further claiming that a medical degree was not alone sufficient (given the level of medical education at the time) to ensure competence in the area of hypnosis.

The proceedings of the congress were sent to all active members. These included “Dr. Sigmund Freud, doctor, Vienna.” Early in his career Freud made use of hypnotic suggestion. He spent several weeks in Nancy to perfect his technique with Ambroise Auguste Liebeault and Hippolyte Bernheim. Freud left directly from Nancy to attend two congresses in Paris—the first on physiological psychology (August 5–10), the second on hypnotism (August 8–12). If it is true, as Ernest Jones noted, that Freud left Paris the evening of August 9, he could not have been present for the controversy between Ladame and Delboeuf during the second congress. Although he may have not been present for the discussions, he would have been able to read the various presentations in the published proceedings.

## **CONSCIOUS PROCESSES**

Conscious processes comprise all phenomena, organized in time, linked to the individual's intuitive and immediate knowledge of his own mental life.

If, as Freud stressed, “in the  $\Psi$ -systems memory and the quality that characterizes consciousness are mutually exclusive” (1900a, p. 540), consciousness is thus indissolubly linked to perception and to the qualitative changes brought about by the *Pcs.-Cs.* system, on the one hand with respect to the outside world, by means of the sense organs, and on the other with

respect to the most superficial as to the deepest layers of the psyche. This system responds to the perception of pleasure and unpleasure, releases of which thus “automatically regulate”—at all levels, including the conscious one—“the course of cathectic processes” (p. 574). “But it is quite possible that consciousness of these [perceived] qualities may introduce in addition a second and more discriminating regulation, which is even able to oppose the former one, and which perfects the efficiency of the apparatus by enabling it, in contradiction to its original plan, to cathect and work over even what is associated with the release of unpleasure” (p. 616). “Thought-processes are in themselves without quality, except for the pleasurable and unpleasurable excitations which accompany them, and which, in view of their possible disturbing effect upon thinking, must be kept within bounds. In order that thought-processes may acquire quality, they are associated in human beings with verbal memories, whose residues of quality are sufficient to draw the attention of consciousness to them and to endow the process of thinking with a new cathexis from consciousness” (p. 617).

By virtue of the qualities thus acquired by the *Pcs.* system, now governed by secondary processes, “consciousness, which had hitherto been a sense organ for perceptions alone, also became a sense organ for a portion of our thought-processes” (p. 574), whereas feelings for their part pass directly from the unconscious into consciousness. Hence it is thanks to the mediation of word-presentations that “internal thought-processes are made into perceptions,” which is to say that they “are *actually* perceived—as if they came from without—and are consequently held to be true” (1923b, p. 23).

Such a hypercathexis of thought, which enables it to pass into consciousness, should be seen as analogous to what occurs at the level of the perception of the outside world thanks to the part played by attention, which Freud is just as insistent upon, and which is reinforced by the function of the *Cs.* system's protective shield against stimuli (1920g, p. 28). Whereas the sense organs process only a minimal proportion of external stimuli, “cathectic innervations are sent out and withdrawn in rapid periodic impulses from within into the completely pervious system *Pcpt.-Cs.*... It is as though the unconscious stretches out feelers, through the medium of the system *Pcpt.-Cs.*, towards the external world and hastily withdraws them as soon as they have sampled the excitations coming from

it”—a process that in Freud’s view “lies at the bottom of the origin of the concept of time” (1925a, p. 231).

A subtle dialectic may be observed here between the pleasure principle and the reality principle, a dialectic that facilitates the gradual institution and development of the functions of consciousness—attention, judgment, memory, and thought—in parallel with the shift from free energy to bound energy.

Over and above spontaneous conscious processes, it behooves psychoanalysis to offer an account of the processes involved in the passage into the conscious that occurs during treatment, among them displacement; the mastery of excitation; the transference of the analysand’s internal objects onto the analyst (for later return to the former); the transformation of unconscious traces into ideational representations; and working-through, meaning the transition from the spontaneous work of the psyche to an uninterrupted working-out activity, during the treatment, within and by means of the *Pcpt.-Cs.* system. Upon all of this is predicated the possibility of the past being effectively transformed into memory, and repetition into meaning; it is worth noting, however, that today the main concern would seem to be less the acknowledgment of transferred content than the work of transformation itself.

## **CONSCIOUSNESS**

In psychology, consciousness is the subject’s immediate apprehension of mental activity. Although Freud thought that conscious processes are “the same as the consciousness of the philosophers and of everyday opinion” and “a fact without parallel, which defies all explanation or description” (1940a [1938], pp. 159, 157), he argued that they could not be considered the

“essence” of mental life. Rather, consciousness has a fugitive quality and does not “form unbroken sequences which are complete in themselves” (p. 157). “The psychical, whatever its nature may be, is in itself unconscious and probably similar in kind to all the other natural processes of which we have obtained knowledge” (1940b [1938], p. 283). Freud stressed, however, that consciousness still plays an importance role; indeed, it is “the one light which illuminates our path and leads us through the darkness of mental life” (p. 286).

The work of psychoanalysis, as Freud saw it, is “translating unconscious processes into conscious ones, and thus filling in the gaps in conscious perception” (p. 286). Consciousness is the qualitative perception of information arising both from the external world and from the internal world: an external world that is unknowable in itself and to which we have access only via subjective elements collected by our sense organs and an internal world that consists of unconscious mental processes and that we are aware of solely through sensations of pleasure/unpleasure and revived memories. According to Freud, “A person’s own body, and above all its surface, is a place from which both external and internal perceptions may spring” (1923b, p. 25).

From the beginning Freud treated consciousness and perception as indissolubly linked, indeed, so much so that throughout his work he deemed them to constitute a single structure, the perception-consciousness system. Freud also drew a distinction, within nonconscious phenomena, between latent states susceptible of becoming conscious at any moment and repressed psychic processes inaccessible to consciousness. This led him to differentiate the unconscious system proper from a preconscious system, cut off from consciousness by censorship but also controlling access to consciousness. In this sense, the preconscious and the conscious are very close: both are governed by secondary processes and both draw on a bound form of psychic energy. In *The Interpretation of Dreams* (1900a), Freud spoke of the preconscious-conscious system, and in “The Unconscious” (1915e), he described the preconscious as “conscious knowledge” (p. 167), even though it provides access to unconscious contents and processes, provided that they have been transformed.

From his earliest writings on, Freud saw the link between consciousness and the ego as very close. And although by 1920 Freud viewed the ego as in large part unconscious in its defensive activities, he continued to attach consciousness to it as both the “nucleus” and the “surface of the mental apparatus” (1923b, p. 19).

By the early twenty-first century, the problem of perception had become increasingly complex. Freud’s near conflation of perception and consciousness, which required him to postulate that perceptual phenomena and the laying down of memory traces are incompatible, has come in for serious reconsideration. It is worth noting, though, that Freud himself, in his last years, was given pause on this issue by the problem of fetishism, apropos of which it was apparent that perceptions and mnemonic traces could be caught up in one and the same conflict. This line of thinking has led to a reevaluation of all psychopathologies where disavowal and splitting predominate, such as borderline conditions, and more generally, to a review of all states involving the relationship between perception and hallucination (see Donald W. Winnicott’s notions of the subjective object and of transitionality [1953]).

**CONSTANCY.** *See* Principle of constancy

---

### **CONSTITUTION**

Constitution is all the characteristics and tendencies, both somatic and psychic, that an individual brings into life at the time of birth. It is those parts of the individual that are innate, inherited, or genetically determined. Classically, it stands in opposition to all that is accidental, things acquired in the course of life. Certain doctrinal trends in the field of psychopathology rely on the notion of constitution in order to define personality types that are predisposed to specific psychiatric affections, particularly psychosis.

The notion of a constitutional factor is Freud’s, and he elaborated the theory in two distinct periods. Before 1905, he conflated it with hereditary disposition, referring to a general and universal condition in the pathogenic determinism of all affections, particularly neurotic affections. In the etiology of these affections, the hereditary disposition is associated with specific causes of a sexual nature in accordance with the rules of a complementary series. Thus, “the same specific causes acting on a healthy individual produce no manifest pathological effect, whereas in a predisposed person their action causes the neurosis to come to light, whose development will be proportionate in intensity and extent to the degree of the hereditary precondition” (1896a, p. 147).

After 1905, the Freudian conception of constitution became inseparable from the sexual doctrine resulting from his identification of infantile sexuality in all human beings. In *Three Essays on the Theory of Sexuality* (1905d), Freud traces the origin of infantile sexuality to component instincts that are perverse because they seek satisfaction independently of each other and thus define, for all individuals, a “polymorphously perverse disposition” (1905d, p. 191). “The conclusion now presents itself to us that there is indeed something innate lying behind the perversions but that it is something innate in *everyone*, though as a disposition it may vary in its intensity and may be increased by the influences of actual life” (1905d, p. 171). Sexual constitution thus came to replace general hereditary disposition.

In lecture twenty-three of *Introductory Lectures on Psychoanalysis* (1916–17a), entitled “The Paths to the Formation of Symptoms,” Freud enriched the notion of sexual constitution with that of fixation of the libido. These fixations represent the individual’s constitutional past toward which the libido regresses as a result of the repression imposed on it by the neurosis. According to Freud, these fixations are partly the traces of the phylogenetic heritage.

## **CONSTRUCTION DE L'ESPACE ANALYTIQUE (LA-) [CONSTRUCTING THE ANALYTICAL SPACE]**

This work has had and continues to have great importance for French psychoanalysis. It sheds an original light on a central question in Freud’s work, that of constructions in analysis.

Serge Viderman proposes to extend this notion very broadly and make it the basis of a metapsychological line of thought. He draws a distinction between the certainties we may derive from reconstructing a past

lost to repression and the uncertainty that must always attend constructions of the original nucleus. But he adds that “any thoroughgoing interpretation does not reconstruct the subject’s history, rather, it invents a story” (p. 27).

Much more than a discovery or a recovery, what is involved here is conjecture: to reconstruct a history is in fact to construct it. A metaphor nevertheless illustrates moments of certainty that occur in analysis: “Imagine two lighthouses turning in opposite directions with their beams crossing periodically. It is when transference and counter-transference intersect that the moments of greatest brilliance occur. Privileged moments when the truth of interpretation shines through” (p. 52).

Viderman keeps his distance from his contemporary Jacques Lacan, specifically writing: “The unconscious is structured as a language only because language structures it,” as well as from certain psychoanalytical clichés, especially “listening with the third ear.” In a sense, Viderman’s theory is built on the whole question of historical reality in analysis, a debate that began in 1897 when Freud declared that he no longer believed in his *neurotica*. For Viderman, “the historic illusion of psychoanalysis is still the trauma theory—*fons* and *origo* of pathogenesis—an infantile disorder of psychoanalysis that we may never have recovered from” (1970). Starting from the analysis of the counter-transference, he centers his theoretical approach to the analytic treatment on the analyst’s ability to construct—or rather to invent, based on what he hears, and on what he knows about analysis from his own analytic experience and theoretical knowledge.

The work of analysis, as he presents it, consists in trying to link the unknowable aspect of the instinct with the idea that denotes the instinct, an idea that, in turn, suffers the effect of interpretation, of what the analyst says about it. Viderman’s book closes with this thought: “Hegel had a presentiment that we would have to fabricate truth” (p. 344).

**CONSTRUCTION/RECONSTRUCTION**

Constructions are conjectures that the analyst couches in the form of stories concerning a part of the analysand's childhood history and bases on previous partial interpretations. A construction is meant to compensate for absent or insufficient memory, but it may itself stimulate recollection.

Freud spoke of construction in connection with the "Rat Man" (1909d) and, more specifically, in connection with the Rat Man's wish for his father's death, with the circumstances, and approximate date of its emergence. He also spoke of it in relation to the punishment the patient's father apparently inflicted on him for a reason connected with masturbation. This childhood scene, or rather the mother's account of it, was recalled as a result of a construction.

But it was in the case of the "Wolf Man," apropos of the authenticity of the primal scene, that the notion of construction really came to the fore. Freud emphasized in this connection that if primal scenes were simply fantasies, they would never become the basis for recovered memories. But since these dreams that frequently confirmed the self-same content were in his view "absolutely equivalent to a recollection," a patient's conviction of a scene's reality was "in no respect inferior to one based on recollection." Indeed, scenes "which date from such an early period and exhibit a similar content, and which further lay claim to such an extraordinary significance for the history of the case,

are as a rule not reproduced as recollections, but have to be divined—constructed—gradually and laboriously from an aggregate of indications" (1918b [1914], p. 51).

The issue came up once more in Freud's discussion of a young homosexual woman, where he expressed the view that the analyst's reconstruction of the origins of a patient's disorder belongs to the beginning of an analysis, before the analysand takes charge him or herself (1920a, p. 152).

Only in Freud's late paper on "constructions in analysis" (1937d) does he deal with the matter fully. Here again he stressed the preliminary nature of the analyst's work of construction in the two-step process of analysis, arguing that "the work of analysis consists of two different portions, that it is carried out in two separate localities, that it involves two people, to each of whom a distinct task is assigned" (1937d, p. 258). The analyst's job is to divine or rather to reconstruct what has been forgotten, based on clues that have escaped from oblivion. This work precedes that of the analysand, but this does not mean that "the whole of it must be completed before the next piece of work can be begun" (1937d, p. 260). In fact, "both kinds of work are carried on side by side, the one kind being always a little ahead and the other following upon it" (p. 260). The patient's work thus consists in accepting or refusing to accept the analyst's constructions, confirming them or failing to confirm them by means of recollections.

This is far removed from certain later deviations in analytic practice that promote the idea that the analyst be silent. Here we see a kind of practice that takes risks. Freud distinguishes the different meanings of the analysand's "Yes" and "No" and notes that although the "Yes" has no value unless it is followed by indirect confirmations, reciprocally the "No" can mean the incompleteness but not necessarily the inaccuracy of the construction. He goes even further, noting that "the false construction drops out, as if it had never been made; and, indeed, we often get an impression as though, to borrow the words of Polonius, our bait of falsehood had taken a carp of truth" (1937d, p. 262).

The epistemological status of constructions is illuminated by means of two analogies. The first is a comparison to the archeologist's "work of construction, or, if it is preferred, of reconstruction." The analyst and the archaeologist, Freud writes, "have an indisputed

right to reconstruct by means of supplementing and combining the surviving remains” (1937d, p. 259). The first, however, “works under better conditions and has more material at his command to assist him since what he is dealing with is not something destroyed but something that is still alive” (p. 259). The second analogy is more unexpected and in Freud’s discussion it follows an image of destruction, that of psychotic anxiety bound to an inaccessible memory of a terrifying event that actually happened. Freud suggests a parallel between constructions in analysis and delusions: “The delusions of patients appear to me to be the equivalents of the constructions which we build up in the course of an analytic treatment—attempts at explanations and cure, though it is true that these, under the conditions of the psychosis, can do no more than replace the fragment of reality that is being disavowed in the present by another fragment that had already been disavowed in the remote past” (1937d, p. 268). The distinct nature of truth in psychoanalysis is thus suggested by the notion of construction/reconstruction.

In 1937 Freud regretted that construction had not been the subject of as much later work as interpretation. It has been explored since, however, particularly in the work of Serge Viderman (1970), who developed the question of levels of certitude in relation to the deformations caused by repression, and adopted the notion from Hegel and Freud of a truth that must be constructed and not merely found.

## “CONSTRUCTIONS IN ANALYSIS”

Freud’s “Constructions in Analysis” was written in 1937 and appeared in print at the end of the year. It appears that Freud wrote this technical article in response to criticisms of the interpretations offered by analysts to their patients. The article begins with the question of evaluating the “yes” and “no” of the patient in response to an interpretation and with a justification of a technique intended to take into account the defensive value of negation. The goal of analysis is to expose repressed elements and enable the person to experience reactions that are commensurate with their level of maturity and to restore a more accurate image of a forgotten past. To achieve this the analyst has recourse to various signs and indicators: fragmentary and distorted memories that arise in dreams, ideas alluding to repressed elements, and the repetition in transference of repressed affects. Analysis proceeds on two levels—manifest and latent.

The analyst’s job is to use the indications provided by the patient to construct what has been forgotten and communicate it at an opportune moment. Unlike the work of the archeologist, psychoanalysis benefits from the fact that mental formations are not completely destroyed; however, the work of interpretation is more complex and preliminary since it also relies on the motivations of the analyst.

Construction covers an entire period of the analyst’s forgotten prehistory, while interpretation involves only a particular aspect of the analytic material. But how can its validity be evaluated? An incorrect construction, if it is isolated, does not cause any damage or provoke a reaction from the patient. The risk of suggestion is negligible however. The patient’s reactions to a construction are important indicators. The “yes” is equivocal and only has value when additional confirmation becomes available. The “no” only informs us about the incomplete nature of the construction. Indirect modes of response such as “I never thought of that” indicate that the analyst has touched an unconscious idea and are more reliable, but these are more a question of interpretation than construction. Equally valuable are the associations

and parapraxes that corroborate the construction; as is the case with a negative therapeutic reaction, a correct construction results in an aggravation of the clinical state.

However, constructions are only suppositions that await confirmation. When the construction is correct the patient will have a sense of conviction; even though the memory may not have been recalled, the construction will have the same therapeutic effect. Occasionally, a construction leads to very clear memories in the vicinity of what was constructed. Defensive displacement contributes to the quasi-hallucinatory quality of such recollections.

Based on the foregoing, it is possible that even in psychosis hallucinations are a return of forgotten events (seen or heard) from the first years of life, which have been distorted or subjected to other forms of defensive activity such as displacement. Thus, the upward pressure during psychosis would involve both desire and the repressed, distorted as in dreams. Delusions would also be constructions containing “a kernel of historical truth,” denied originally and drawing their strength of conviction from their infantile source. The analysand, like the hysterical patient, suffers from reminiscences. Basically, the compelling force of the analyst’s construction is similar to the delusion: the restoration of a piece of lived history. More generally, humanity’s beliefs are inaccessible to criticism since they contain an element of historical truth concerning a forgotten primitive past.

Although considered a technical article, Freud’s essay later helped elevate the term “construction” to the rank of a psychoanalytic concept. The emphasis is on repetition and the relationship between conviction and historical truth. Memory traces become more important than desire or fantasy, which leads to rich possibilities for the treatment of psychotic delirium. A dialectic process can be identified between the rediscovered past and the construction as a creation associated with the treatment.

## CONTACT AND PSYCHOANALYSIS

Josef Breuer was known in Vienna as the “man with hands of gold” because he “made contact” in a friendly, non-objectifying way with his patients. It was with him that Bertha Pappenheim invented the psychoanalytic method. Sigmund Freud began as Breuer’s student and Breuer sent him patients and “monitored” the evolution of their treatment. When Freud began to distance himself, the shift from chair to couch was gradually promoted: “Don’t touch me! Keep quiet!” as Emmy von N. said.

In *Totem and Taboo* (1912–13a), a festival of “touching,” *die Berührung*, appears more than seventy times in sixty pages in Part II, entitled “Taboo and Emotional Ambivalence.” In Laplanche and Pontalis’s *The Language of Psycho-Analysis*, however, the word

does not appear. In chapter 3 of *Totem and Taboo*, “Animism, Magic, and the Omnipotence of Thoughts,” Freud refers to Frazer’s distinction between magic based on similarity—we destroy a statue representing the being whose death we desire—and magic based on contiguity—we spread grease on the weapon that produced the wound (1912–13a, pp. 81–83). Roman Jakobson (1963) pointed out that the very essence of speech, the Freudian holy of holies, is directly bound up with *Totem and Taboo*: metaphor and metonymy are at work in Freud’s dream analysis as they are in Frazer’s magic.

“The two principles of association—similarity [*Ähnlichkeit*] and contiguity [*Kontiguität*—are both included in the more comprehensive concept of ‘contact,’” Freud writes. “Association by contiguity is contact in the literal sense, association by similarity is contact in the metaphorical sense [*im übertragenen Sinne*]. The use of the same word for the two kinds of relation is no doubt accounted for by some identity in the psychical processes concerned which we have not yet grasped” (1912–13a, p. 85).

The realm of touching permeates these writings of Freud’s. It takes in touching that is prescribed, essential from the very beginning of life, beneficial, soothing, healing. And it also includes proscribed touching, the touch of evil, the touch that kills. The realm of touch is par excellence a social realm.

But how does contact differ from touch? Touch is objectifying, it manipulates the body or objects. Contact is emotional; it establishes a relationship with a living being. By promoting “benevolent neutrality” in place of *freundlich* and *Wohlwollen* (to amicably desire what is Good and Gratifying for the other), analysts have distorted the Freudian message in a very particular way. To say “I’m listening” is to acknowledge the existence of the patient; to say “I understand” is to emphasize the reality of his or her thoughts, which the “haptonomy” of Franz Veldman (1998) describes as “existential affirmation” and “rational confirmation” of existence. But without real emotional contact, it is impossible to help a human being develop his or her sense of “basic security,” affective confirmation being essential to the growth of every individual. In Velman’s terms, it is the mobilization of “*philia*” that “unveils the Good of the other, recognizes him in the Good he can be.” Some have said that recognizing the other is the Supreme Good, “because where love awakens, the self, that

somber despot, dies” (Giordano Bruno, cited in 1911c [1910]).

## CONTACT-BARRIER

Bion first used the term “contact-barrier,” which he borrows from Freud, in *Learning from Experience* (1962, p.17):

I shall now transfer all that I have said about the establishment of conscious and unconscious and a barrier between them to a supposed entity, that I designate a ‘contact-barrier’; Freud used this term to describe the neurophysiological entity subsequently known as a synapse. In conformity with this my statement that the man has to ‘dream’ a current emotional experience whether it occurs in sleep or in waking life is reformulated thus: The man’s alpha-function whether in sleeping or waking transforms the sense-impressions related to an emotional experience, into alpha-elements, which cohere as they proliferate to form the contact-barrier. This contact-barrier, thus continuously in process of formation, marks the point of contact and separation between conscious and unconscious elements and originates the distinction between them. The nature of the contact barrier will depend on the nature of the supply of alpha-elements and on the manner of their relationship to each other.

This contact-barrier, like a number of other concepts in psychoanalysis, can be seen as a structural concept, an area between conscious and unconscious, or as a function, a constant transformation of beta-into alpha-elements. It would result in what Freud saw as a permeable repressive barrier, in which the

conscious and unconscious are in constant symbolic communication. Bion also compares it to a continuous dream in interaction with conscious rational experience. An alpha-element *contact-barrier* gives emotional meaning, and resonance in communication with an external object, where the *contact-barrier* may be transformed into an impermeable beta-screen, and the internal communication between the conscious and unconscious is blocked.

## **CONTAINER-CONTAINED**

In *Elements of Psycho-Analysis* (1963), W. R. Bion writes that psychoanalytic theories contain a twofold defect: "on the one hand, description of empirical data is unsatisfactory as it is manifestly what is described in conversational English as a 'theory' about what took place rather than a factual account of it and, on the other, the theory of what took place cannot satisfy the criteria applied to a theory as that term is employed to describe the systems used in rigorous scientific investigation" (p. 1).

It is therefore necessary to "formulate an abstraction, to represent the realization that existing theories purport to describe" (pp. 1–2). As elements in psychoanalysis, these abstractions operate like alphabetical letters in the formation of words: through many different combinations, they offer the analyst an infinite number of possible adaptations and interpretations for understanding the vicissitudes of the transference through thought and, of course, through words.

By contrast, the classical model of psychoanalytic theory, like the ideogram in relation to the word, ultimately allows of only one possible form of thought.

Insofar as the analytic situation establishes the conditions for a new realization in the transference, the

elements of psychoanalysis need to be capable of representing the realization that they were originally used to describe and of being articulated like letters with other similar elements and, having been articulated, to be capable of forming a scientific deductive system.

Bion's first element, represented as ♀♂, can be defined as a dynamic relationship between the container and the contained, deriving from Klein's concept of projective identification. To become a psychic object, the projected element has to encounter a container, or a thinking function. The intrusive projected element is thereby associated with a masculine symbolism, and the containing receptive element with a feminine symbolism. This therefore establishes a model that represents the transference-countertransference dynamics between patient and analyst, without any starting assumptions as to the qualities that may emerge there.

Wilfred Bion thus returns to his original hypothesis, which relates to finding an element that can simultaneously define a realization in the treatment and the original realization relating to the patient's psychic life, past memories and the intense, even pathological, mechanisms of projective identification that can be associated with these. For him, the ♀♂ element also represents the apparatus of thought in which certain aspects can carry out an ♀ (or ♂) function for other ♂ (or ♀) aspects. Psychic growth therefore results from the integration of this mechanism when projective identification is operating normally. In the treatment of psychotic patients, the violence of the projective mechanisms hinders the ♀♂ "interlocking," which then creates a sense of dislocation.

W. R. Bion locates the container/contained dimension in the vertical axis of his grid. It represents the positive growth of thought; this element operates through its F part that is equivalent to the preconception, which is immersed in the M part that corresponds to realization and gives access to meaning. It only finally becomes operative if, through the integration of the container-contained element, the subject tolerates a primary bisexuality, with the beginnings of triangulation that accompany it.

## **CONTRADICTION**

In its primary meaning, contradiction is the act of contradicting, of opposing oneself to someone by saying the opposite of whatever he or she says. The term is used in mathematics and philosophy. In mathematical logic, a contradiction is a statement whose truth function has only one value: false. In philosophy it is the relation that exists between the affirmation and the negation of a proposition. A term that embodies incompatible (contrary or contradictory) elements is also called a contradiction.

Contradicting the fears and feelings of a patient under hypnosis was the first therapeutic intervention that Freud described in his early article on “A Case of Successful Treatment by Hypnotism” (1892–93a). He showed that the etiology of the symptom depended on “antithetic ideas” (p. 121) opposed to the individual’s intentions. The formal element in the etiology was thus contradiction, which also applied to repression: “For these patients whom I analysed had enjoyed good mental health up to the moment at which *an occurrence of incompatibility took place in their ideational life*—that is to say, until their ego was faced with an experience, an idea or a feeling which aroused such a distressing affect that the subject decided to forget about it because he had no confidence in his power to resolve the contradiction between that incompatible idea and his ego by means of thought-activity” (Freud 1894a, p. 47).

*The Interpretation of Dreams* and the “first topography” increased the places in Freud’s theory where contradictory oppositions could be found within a single agency, between agencies, or between psychical reality and external reality. As early as 1900, Freud noted that “Thoughts which are mutually contradictory make no attempt to do away with each other, but persist side by side. They often combine to form condensations, just as though there were no contradiction between them, or arrive at compromises such as our conscious thoughts would never tolerate, but such as are often

admitted in our actions” (1900a, p. 596). The absence of contradiction, *Widerspruchslosigkeit*, at first an attribute of the primary process, later became a feature of the unconscious:

The nucleus of the Ucs. consists...of wishful impulses. These instinctual impulses are co-ordinate with one another, exist side by side without being influenced by one another, and are exempt from mutual contradiction. When two wishful impulses whose aims must appear to us incompatible become simultaneously active, the two impulses do not diminish each other or cancel each other out, but combine to form an intermediate aim, a compromise. There are in this system no negation, no doubt, no degrees of certainty: all this is only introduced by the work of the censorship between the Ucs. and the Pcs. Negation is a substitute, at a higher level, for repression” (Freud, 1915e, pp.186–187).

Freud used similar language apropos of the id, adding that “The logical laws of thought do not apply to the id, and this is true above all of the law of contradiction” (1933a [1932], p. 73). Ambivalence is the final dynamic factor necessary for understanding the ubiquity of contradiction in the expression of psychic processes.

Thus, all products of the unconscious—dreams, slips, jokes, symptoms—simply disregard “the category of contraries and contradictories... Dreams feel themselves at liberty, moreover, to represent any element by its wishful contrary; so that there is no way of deciding, at first glance, whether any element that admits of a contrary is present in the dream-thoughts as a positive or as a negative” (Freud, 1900a, p. 318). Freud compared these psychic creations to the antithetical meanings of primal words (1910e), which he again analyzed in his study of taboos (1912–1913), and then in his essay on “The Uncanny” (1919h). The term “compromise formation,” a feature of all defenses, demonstrates the extension of contradiction across the whole of mental life.

Contradiction intersects with negation and with the formal referential binary true/false. But Freud was especially interested in dynamic processes that allow contradictory mental positions to be maintained simultaneously. In addition to those already mentioned, he also referred to negation linked to repression, disavowal, splitting, and repudiation (or foreclosure, in Lacanian terms). Thus the contradiction between wish and reality

is systematic in relation to the difference between the sexes.

The notion of contradiction implies the formal expression of an opposition and its relation to truth. Mathematicians such as Kurt Gödel have shown that its domain of relevance is restricted. Structuralist linguists have distinguished oppositions based on contraries from those based on exclusion. Contradiction would appear to be a very rudimentary formal instrument for investigating psychic conflicts. Freud did not rely much on it, preferring the more dynamic terms “opposite” and “contrary.”

## **“CONTRIBUTIONS TO THE PSYCHOLOGY OF LOVE”**

“Contributions to the Psychology of Love” is the title given collectively to three articles by Sigmund Freud: “A Special Type of Choice of Object Made by Men,” published in 1910; “On the Universal Tendency to Debasement in the Sphere of Love,” published in 1912; and “The Taboo of Virginity,” published in 1918. It was Freud himself who, believing they formed a whole, decided to publish them under a single title.

In “A Special Type of Choice of Object Made by Men,” Freud considers men who are interested only in women over whose affections they must compete with another man; women who by virtue of their sexual life have something of the prostitute about them

and for that reason are more exciting. The lover of this type proposes to save the woman he desires, though he readily accepts the presence of his rival. Freud explains this behavior by reference to the Oedipus complex (a term he used for the first time in the same year, 1910, that this article was published). What is involved here is a desire to steal the mother from the father, or at least share her with him. The mother has first been compared to a prostitute when, at puberty, the boy was obliged to acknowledge, after the idealization of childhood, that she too has had sexual relations. Thenceforward he feels he must save her from degradation. This pattern, Freud adds, is repetitive, because it can only result in disappointment.

In “On the Universal Tendency to Debasement in the Sphere of Love,” Freud discusses male impotence. This problem arises for the most part from an “incestuous fixation on mother or sister” (p. 180). Freud distinguishes two “currents” in erotic life: the “affectionate” and the “sensual.” The affectionate current is the older, as it was directed towards the infant’s earliest caretakers, that is, towards the primary object-choice, typically the mother. The sensual current reaches its acme during puberty but, coming into conflict with the oedipal prohibition, turns to other objects, while often remaining fixated to the first. It “can happen that the whole of a young man’s sensuality becomes tied to incestuous objects in the unconscious, or to put it another way, becomes fixated to unconscious incestuous phantasies. The result is then total impotence” (p. 182). But, Freud wonders, why is this relatively uncommon? His answer is that in many cases where the same factors are at work the upshot is sexual relations unaccompanied by pleasure. For the two currents to combine and produce complete satisfaction is unusual, and the solution that consists in directing each current to a different woman is very frequent. But, Freud adds, it is no doubt in the very nature of the instinct to remain ever unsatisfied in the choice of object. The gain, perhaps, is to be found in the processes of sublimation, the motor of the development of civilization.

In “The Taboo of Virginity,” the last of this set of three papers, Freud returns to some of the ideas concerning women briefly referred to in the previous article. He cites ethnologists according to whom, in certain so-called primitive peoples, a person other

than the husband deflowers the fiancée. This practice, according to Freud, is followed in order to protect the husband from danger. He then examines a number of causes for fear in this connection. The bleeding that results from the loss of virginity is associated with physical wounds and death. In a number of so-called primitives, all of sexual life is wrapped in taboos. The woman is feared because of the assumed loss of virility that occurs through physical contact with her and this activates the fear of castration, especially as a result of her first sexual intercourse. But these general considerations are inadequate in Freud's view. The analysis of female frigidity, he argues, leads us to consider such other factors as the Oedipus complex, penis envy, the desire to obtain a child from the father as reparation, and hostility towards any man who appears as a poor substitute for the true object of this ancient desire. Thus the husband who avoids deflowering his wife acts thus because he fears losing his penis and, like Holofernes, his life.

## CONTROVERSIAL DISCUSSIONS (ANNA FREUD-MELANIE KLEIN)

The title, *Controversial Discussions*, refers to the protracted discussions between Anna Freud, Melanie Klein, their followers and members of the indigenous group of British analysts which took place in the British Psycho-Analytical Society between 1941 and 1946.

The Discussions involved scientific, educational, and administrative problems and had the aim of deciding whether the new views concerning child development and psychoanalytic technique to treat both children and adults proposed by Klein and her followers: Susan Isaacs, Paula Heimann, Joan Riviere, and others, were compatible with the classical view of psychoanalysis as understood by Anna Freud and her Viennese and Berliner colleagues: Willie Hoffer, Kate Friedlander, Barbara Lantos, Dorothy Burlingham, and others, or whether Klein should be expelled from the psychoanalytical community. The indigenous group of British psychoanalysts, composed of Ernest Jones, Sylvia Payne, James Strachey, Ella Sharpe, Marjorie Brierley, and others, tried to mediate between the two contenders and to reach a compromise which in the end managed to hold the British Psycho-Analytical Society together and led to the formation of three groups: the so called Freudians, the so-called Kleinians and the so-called Independents.

The *Controversial Discussions* were at the same time the peak and the symptom of longstanding tensions and disagreements between the British way of looking at psychoanalysis, mainly but not exclusively influenced by Klein, and that represented by the Continental analysts, gathered mainly around Freud and his daughter Anna. Those disagreements had already expressed themselves in the late twenties and the late thirties.

The tensions and divergences exploded when Freud and his family had to emigrate to London as a result of the Nazi persecutions and, after Freud's death in London, Anna and many Continental analysts decided to stay in England.

One should consider the various factors which contributed to the *Controversial Discussions*: longstanding personal rivalries, the difficult situation of Klein, whose daughter, Melitta Schmideberg, was in analysis with Edward Glover. Schmideberg became, together with Glover, one of Klein's fiercest critics, joining the group of Anna Freud. Also significant were the "prima

**CONTROL CASE.** *See* Supervised analysis

donna” types of personalities of both Anna Freud and Melanie Klein, the objective tensions created by the war, the difficulties of mourning Freud’s death for Anna and her group in those circumstances, but also the cultural background of the indigenous members of the British Psycho-Analytical Society, which allowed the debate to take place without it degenerating into a catastrophic ending.

In order to defend their views, the Kleinians were required to present four papers to an ad hoc committee of the British Psycho-Analytical Society made up of Edward Glover, Marjorie Brierley, and James Strachey, and chaired by Ernest Jones. The first paper was that of Susan Isaacs, “On the Nature and Function of Unconscious Phantasy” on January 27, 1943. Paula Heimann then read her paper on June 23, “Some Aspects of the Role of Introjection and Projection in Early Development.” A third paper was given on December 17, 1943, by Isaacs and Heimann, called “On Regression.” Finally, on March 1, 1944, Klein read her paper “The Emotional Life and the Ego Development of the Infant with Special Reference to the Depressive Position.”

Also very important were the papers on technique which were written by Anna Freud, Klein, Sylvia Payne, Ella Sharpe, and Marjorie Brierley, to illustrate different approaches to the handling of the transference and the way to interpret the defenses of the patients.

The Controversial Discussions are now considered one of the most important documents of the history of psychoanalysis (King and Steiner, 1992). Indeed, they allow the study in vivo of the conscious and unconscious complexities of the emotional, personal, cultural, institutional, and political tensions of what on the surface appeared to be only a scientific disagreement between different ways of approaching the study of psychic development.

## **CONVENIENCE, DREAM OF**

The “dream of convenience” is a dream described by Freud as fulfilling two of a dream’s essential functions: satisfying a wish and safeguarding sleep.

He first mentioned this type of dream in a letter to Wilhelm Fliess dated March 4, 1894 (letter 22): A young doctor (Josef Breuer’s nephew) is awakened early one morning so that he can go to work at his hospital ward. However, he immediately falls back to sleep and, in his dream, has “a hallucination of a notice-board over a hospital bed with [his] name on it” (p. 213); in the dream the thought comes to him that he does not need to wake up, since he is already in the hospital.

In *The Interpretation of Dreams* (1900a), Freud twice referred to “Herr Pepi’s dream”: in chapter 3, where he discussed the fulfillment of wishes in dreams, and in chapter 5, where he mentioned the dream’s role as “guardian of sleep” (p. 233). In chapter 3 he gave other examples of what he explicitly called “dreams of convenience”: for example, dreaming that he is drinking saves the dreamer the trouble of having to wake up to quench his thirst.

Freud did not especially develop a theory of this type of dream, which only represents a specific type of wish-fulfillment in dreams. In his last mention of this topic in “An Outline of Psycho-Analysis” (1940a), he illustrated this theme by again citing the case of the doctor who can continue to sleep by dreaming that he is already at the hospital, and two other dreams that fulfill wishes, one involving hunger and the other sexual desire. He reminded readers that dreams are in fact compromise formations (between renunciation and satisfaction).

Clinical practice often provides examples of dreams of convenience. Their interpretation cannot be limited

to “decoding” the meaning only within a particular category of dreams, because the dream involves the entire dynamic theory (conflicts between the instincts and the defenses).

## **CONVERSION**

The term “conversion” and its definition appear for the first time in an 1894 article by Freud titled “The Neuro-Psychoses of Defense.” “In hysteria the incompatible idea rendered innocuous by its *sum of excitation* being transformed into something somatic, for this I should like to propose the name of *conversion* . . . . By this means the ego succeeds in freeing itself from the contradiction [with which it is confronted]; but instead, it has burdened itself with a mnemonic symbol which finds a lodgement in consciousness, like a sort of parasite, either in the form of an unresolvable motor innervation or as a constantly recurring hallucinatory sensation” (1894a, p. 49). In the Freudian terminology of the time, an “irreconcilable” idea is a desire that is incompatible with the subject’s moral ideals and consequently condemned and most often rendered unconscious.

Consequently, the concept is, from the beginning, located along the three axes that will structure all Freudian metapsychology: dynamic through the reference to “contradiction,” which will later be theorized as “conflict”; topographical through the reference to the unconscious, which is still only allusive but will quickly assume major importance; and economic through the idea of a displacement of the energy (this will later become the libido) of the mind to the body. From this Freud draws a therapeutic conclusion: “Breuer’s cathartic method lies in leading back the excitation in this way from the somatic to the psychical

sphere deliberately, and in then forcibly bringing about a settlement of the contradiction by means of thought-activity and a discharge of the excitation by talking” (1894a, p. 50).

Freud initially considered the mechanisms of conversion to be specific to hysteria, unlike the other defensive psychoneuroses (obsessions and phobias). There would be a predisposition to hysteria for reasons he believes are probably constitutional, through what he refers to as “somatic compliance” in the Dora case (1905e). However, the “choice of neurosis,” a problem to which he often returned, here finds only its modalities of realization; to these fundamental conditions must be added “trigger factors” rooted in personal history (childhood traumas such as early “seduction” experiences, that is, sexual assaults initiated by adults). This is Freud’s position during the first period of his career. Later, in 1915, he distinguished “conversion hysteria,” which used this mechanism to produce symptoms, from “anxiety hysteria,” dominated by phobic mechanisms but without being accompanied by any conversion phenomena (1915d). He also acknowledged that minor conversion phenomena can be found in situations other than so-called conversion hysteria (1916–17a).

It is important to remember that Freud quickly established the necessity of distinguishing psychoneuroses—to which hysteria belongs—from actual neuroses (neurasthenia, anxiety neurosis, hypochondria), whose source is not found in infantile conflicts but in current disturbances of the sexual function (1898a). In such cases the accumulation of sexual excitation that has not been released or has been released by unsatisfactory means (*coitus interruptus*, masturbation, and so on) is reflected in anxiety and somatic symptoms (these views were modified in *Inhibitions, Symptoms, and Anxiety*, 1926d), but without the symbolic dimension inherent in conversion phenomena.

While the notion “actual neurosis” went into a long decline, modern work in psychosomatic medicine has given it new currency. It is used to describe somatic disturbances, often serious, that appear to arise from a form of interaction between mind and body where energy “passes directly” from the mind to somatic functions without symbolic mediation, that is, without “mentalization” of the psychoneuroses (Marty, 1980).

## COPROPHILIA

The term “coprophilia” is used to describe a predilection for fecal and related matters. On January 4, 1898, Freud wrote to Wilhelm Fliess: “Today I am sending you No. 2 of the “dreckological” reports . . .” (1985, p. 291). In creating this neologism from the German word *Drek*, meaning mud, filth, excrement, he was, according to Max Schur (1975), testifying to the abundant amount of anal material in his self-analysis at the time.

Food can remind children of excrement: “He protests loudly—in the form of overcompensation—the successful overcoming of his coprophiliac inclinations,” Freud explained to his pupils (*Wiener Psychoanalytische Vereinigung, 1962–1975*, p. 177). Repression of an olfactory coprophilic pleasure can determine the choice of a fetish (*Three Essays on the Theory of Sexuality*, 1905d). In the same vein, on February, 24, 1910, he wrote to Karl Abraham: “I regard coprophilic olfactory pleasure as being the chief factor in most cases of foot and shoe fetishism” (1965a, p. 87).

He later indicated, in his article *On the Universal Tendency to Debasement in the Sphere of Love* (1912d), that when man changed to the erect position he raised his smelling organ above ground level. It was then that “the coprophilic instinctual components [ . . . ] proved incompatible with our aesthetic standards of culture” (p. 189). Reflecting in the same article on sexual

impotence of a psychic origin, he stated: “The excremental is all too intimately and inseparably bound up with the sexual; the position of the genitals—*inter urinas et faeces*—remains the decisive and unchangeable factor” (p. 189).

Coprophilia takes on an entirely different meaning in the light of work on mourning and the notion of loss. Reflecting on the subject of mourning, Karl Abraham (1924) detected in certain rites the link between loss and attachment to the content of the intestines. Given the specific features of the two opposite pleasures of anal eroticism, retention and expulsion, he distinguished the same opposition in the sadistic instincts. There would then be a link between the expulsion of the anal object and the melancholy that results from the expulsion of a person. Psychoanalysis thus facilitated the establishment of a link between melancholy, obsessional neuroses, and coprophilia. Abraham went on to write: “The coprophagic instinct seems to me to conceal a symbolism that is typical of melancholy” (1924, p. 444). The motion of introjection can then be considered as a psychic mechanism that is of central importance for melancholics.

## COQ-HÉRON, LE

The review *Le Coq-Héron* includes essays on psychoanalysis, education, and the social sciences in general. It is published four to six times a year and there are several special issues for the presentation of “working documents.” The print run is between eight hundred and two thousand. The review was founded in 1969 by a group from the Centre Étienne-Marcel to make available to researchers at the center texts that were inaccessible (original articles or translations from English, German, Spanish, or Hungarian) and thereby promote dialogue among scholars.

After three private issues were distributed within the center, the review went public. Supported by the Centre National des Lettres, it maintained its special relationship with the Centre Étienne-Marcel. By June 2001, 165 issues had been published. The review is characterized by the fact that its editorial committee includes analysts from various schools who work together in a collegial environment. Participating in the review does not require that they abandon their differences or convictions, and the editorial committee tries to ensure that all psychoanalytic orientations are represented. To this end the review's bylaws stipulate that if even one of the editors wants an article published, it must be published, the other editors having the right to include their comments and criticisms.

The review has published articles by well-known authors (Freud, Ferenczi, Dolto, Balint, Lacan, Mannoni, Mahler, Hermann) as well as lesser known or even unknown authors in psychoanalysis and related fields. It has also published several full-length books including *Mes adieux à la maison jaune* by István

## CORRAO, FRANCESCO (1922–1994)

Francesco Corrao was an Italian physician, psychoanalyst, president of the Società Psicoanalitica Italiana (SPI) [Italian Psychoanalytic Society] from 1969 to 1974, and founder of psychoanalytic centers in Rome and Palermo. He was born in Palermo on December 14, 1922, and died in Rome on April 23, 1994.

Corrao studied medicine but was also interested in philosophy, especially epistemology and Greek thought. He studied psychoanalysis with Alessandra Wolf Stomorse, Princess of Lampedusa, who, after her marriage, moved to Palermo during the late thirties. It was Corrao, a member of the SPI from 1952 and a training analyst at the institute founded by Nicola Perrotti, who was entrusted with the task of bringing psychoanalysis to Sicily when Lampedusa settled in Rome.

Introduced by Lampedusa to the work of Melanie Klein, Corrao became interested in her ideas as expressed in the work of Wilfred Bion, especially their application to the psychoanalysis of group activities. Convinced of Bion's importance, he had him translated into Italian and worked to introduce his ideas in Italy, organizing seminars in Rome during the seventies. In 1969, colleagues and students met with Corrao in Rome, forming the “Pollaiolo” circle to train members in analysis. The Pollaiolo circle published a review entitled *Gruppo e Funzione Analitica*, which has recently been replaced by *Koinos*.

Corrao's writings have been collected into a volume entitled *Modelli psicoanalitici: Mito, Passione, Memoria*. He devoted much time to the institutional renewal of the SPI, introducing new bylaws (1974) while he was president and creating regional centers

for psychoanalysis, including one in Palermo (1976), where he organized the annual scientific seminars, Colloquia of Palermo.

## **COUNTER-IDENTIFICATION**

The term “counter-identification” has two different uses. For English-speaking authors, it refers to an analyst’s unconscious identification with his or her patient and thus designates a counter-transferential attitude. For certain French authors, it designates the subject’s adoption of character traits, drive tendencies, or of defensive modes that are opposite to those of an object that the subject fears or with which he refuses to identify.

The first meaning is generally recognized by Anglophone authors. Robert Fliess defined it specifically as an irregularity in the counter-transference that must become a topic of the analyst’s self-analysis if it is to be overcome. Such a distortion of empathy results in a part of the analyst’s ego identifying with a part of the patient’s ego, causing the analyst to no longer observe the patient with the necessary analytic attitude. In consequence, the analyst might fail to recognize psychotic factors in the patient (Fliess, 1953). León Grinberg similarly described a “projective counter-identification” as “the result of an excessive projective identification that is not consciously perceived by the analyst, who consequently is ‘led’ by it. Thus the analyst conducts himself as if he had actually and concretely acquired, by assimilation, the features that were projected onto him” (Grinberg, 1962).

The other, less common meaning of the term characterizes the claims of certain patients who try to organize their lives opposite to those of their parents or intensely invested objects from their early childhood. A statement such as “I just don’t want to be like them” indicates a tactic that belongs to the domain of consciousness. This tactic is most often an attempt at negating an unconscious identification. The analysis

of such an identification remains one of the fruitful moments of the treatment.

## **COUNTER-INVESTMENT.** *See* Anticathexis

---

## **COUNTER-OEDIPUS**

The term “counter-Oedipus” generally designates the complete set of parental displays of the father’s or mother’s own oedipal conflict. Thus in these displays we can expect to find themes of incest and murder.

In numerous passages Freud discussed how parents replay their infantile Oedipus complex in the present, yet he never used the term “counter-Oedipus” to refer to these displays.

In 1979 Francis Pasche, returning to themes in Freud’s article “The Acquisition and Control of Fire” (1932a), analyzed the relationship of Zeus, Prometheus, and humankind in terms of a positive counter-Oedipus and a negative counter-Oedipus: Zeus, the “father of the gods,” subdued and mistreated Prometheus even though he belonged to a later generation. Prometheus, who revolted against Zeus, played a paternal role in relation to humankind.

In this perspective, the father is ambivalent toward the son when he is confronted with homosexual desires (as illustrated by Alain Fine’s myth of Laius the pedophile [1993]) and the desire to murder (Laius tried to kill Oedipus twice, once by exposure on

Cithaeron and then again later when he met him at the crossroads). Jacques Bril (1989) revealed the theme of murder of the son in Christ's passion. In fathers' relationships with daughters, we frequently encounter actual incest and tyrannical jealousy, as when fathers prohibit their daughters from having any sexual life.
