

Regional Ecosystem Technical Descriptions

Technical descriptions provide a detailed description of the full range in structure and floristic composition of regional ecosystems (e.g. 9.10.3) and their component vegetation communities (e.g. 9.10.3a, 9.10.3b).

The descriptions are compiled using site survey data from the Queensland Herbarium's CORVEG database. Distribution maps, representative images (if available) and the pre-clearing and remnant area (hectares) of each vegetation community derived from the regional ecosystem mapping (spatial) data are included. The technical descriptions should be used in conjunction with the fields from the regional ecosystem description database (REDD) for a full description of the regional ecosystem. Quantitative site data from relatively undisturbed sites are extracted from CORVEG and summarized to provide information specific to each vegetation community.

Technical descriptions include the attributes: tree canopy height and cover and native plant species composition of the predominant layer, which are used to assess the remnant status of vegetation under the *Vegetation Management Act 1999*. However, as technical descriptions reflect the full range in structure and floristic composition across the climatic, natural disturbance and geographic range of the regional ecosystem, local reference sites should be used where possible (Neldner *et al.* 2012 section 3.3.1).

The technical descriptions are subject to review and are updated as additional data becomes available.

When conducting a BioCondition assessment, these technical descriptions should be used in conjunction with [BioCondition benchmarks](#) for the specific regional ecosystem, or component vegetation community.

Field definitions

Description	Description of the species, structural formation and habitat of the vegetation community (this is not the Regulation description)
Area of pre-clearing regional ecosystem	The area of the regional ecosystem vegetation community before clearing in hectares
Area of remnant RE and percentage remaining	The area of the remnant regional ecosystem vegetation community in hectares and as a percentage of pre-clearing extent
Species recorded	Total number; number of woody species; number in the ground layer (some species can be both woody and occur in the ground layer); average number of species per site (using only sites where a completed species list was recorded); standard deviation; number of sites used to calculate the average species number.
Basal area	Site average, range and standard deviation ($m^2/hectare$)
Structural Formation	Percentage of sites by structural formation. For example: Woodland: 39%; open-forest: 39%; open-woodland: 22%, 23 site(s)
Representative CORVEG sites	Site (id) numbers used in the description
For each stratum present: <ul style="list-style-type: none"> • Emergent (E) • Canopy (T1), Sub-canopy (T2) and Low tree layers (T3) • Shrub (S1) and Sub-shrub layers (S2) • Ground (G) 	<ul style="list-style-type: none"> • <i>Height</i> - average canopy height in metres, range in metres and number of sites values are based on. • <i>Cover</i> - Average percentage canopy cover of the layer, range and number of sites values are based on. • <i>Average stem density</i> (stems per hectare), range and number of sites values are based on.
Dominant species (relative cover, frequency):	Relative cover (mean of cover of species / total cover of all species in that stratum for all values > zero) and frequency (percent of total sites) ordered by decreasing relative abundance. Up to five most dominant species with frequency > 20% listed for each stratum. For example: <i>Abutilon albescens</i> (78, 46%), means this species occurs in 46% of all sites and when it occurs comprises 78% of total cover (of the stratum)
Frequent species (cover, frequency):	Frequent species: Cover (mean of all values > zero) and frequency (percent of total sites) of all species occurring in more than 5% of sites ordered by decreasing frequency. For example: <i>Abutilon albescens</i> (10, 46%), means this species occurs in 46% of all sites and when it occurs has a mean cover of 10% Ground layer species are listed as either graminoid or forbs. Naturalised species have an asterisk (*) after the scientific name. <i>indet.</i> after listed name = indeterminate species or genus

Conditions of use

Technical descriptions have been developed from information published by the State of Queensland (acting through the Department) and remain the property of the State of Queensland. Technical descriptions are not to be included on internet sites other than the Queensland Government website.

Users should reference information contained in the technical descriptions as: Addicott, E.P. and Newton, M. (ed.) (year*) Technical Descriptions of Regional Ecosystems of the Einasleigh Uplands, (month, year*) (Queensland Herbarium, Department of Science, Information Technology, Innovation and the Arts: Brisbane). * Date shown in footnote of individual descriptions.

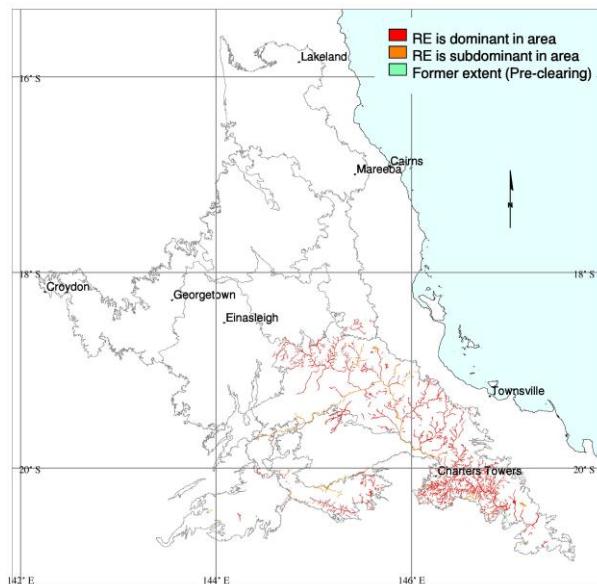

While every effort has been made to ensure the information presented is as reliable as possible, the State of Queensland accepts no liability and gives no assurance in respect of its accuracy and shall not be liable for any loss or damage arising from its use.

Technical descriptions are based on a combination of quantitative and qualitative information and should be used as a guide only. Technical descriptions are not to be used as a substitute for reference sites. Descriptions are subject to review and are updated as additional data becomes available.

Stratum: S1

Height avg. = 1.8m, range 1.5-2m, 4 sites

Crown cover avg. = 0.9%, range 0.0-2.9%, 4 sites

Stem density/ha avg. = 1890, range 1600-2180, 2 sites

Dominant species (relative cover, frequency): Melaleuca citrolens (99, 25%), Melaleuca viridiiflora (57, 50%), Petalostigma banksii (51, 50%), Dolichandrone heterophylla (23, 50%), Acacia holosericea (16, 25%)

Frequent species (cover, frequency): Alphitonia pomaderroides (50%), Dolichandrone heterophylla (50%), Melaleuca viridiiflora (1, 50%), Petalostigma banksii (50%), Acacia bidwillii (25%), Acacia holosericea (25%), Acacia julifera (25%), Corymbia polycarpa (25%), Gardenia vilhelmii (25%), Melaleuca citrolens (3, 25%), Pandanus indet. (25%)

Stratum: G

Height avg. = 0.4m, range 0.3-0.5m, 3 sites

PFC avg. = 70.3%, range 61-83%, 3 sites

Dominant species (relative cover, frequency): Capillipedium parviflorum (84, 25%), Schizachyrium indet. (44, 75%), Eriachne indet. (15, 25%), Alphitonia pomaderroides (15, 25%), Aristida indet. (12, 25%)

Frequent species (cover, frequency): GRAMINOIDs: Schizachyrium indet. (34, 75%), Aristida indet. (8, 25%), Aristida jerichoensis var. subspinulifera (25%), Brachyachne convergens (25%), Capillipedium parviflorum (52, 25%), Cyperus indet. (25%), Eragrostis indet. (4, 25%), Eriachne armitii (5, 25%), Eriachne indet. (10, 25%), Heteropogon contortus (5, 25%), Heteropogon triticeus (25%), Panicum indet. (25%), Perotis rara (1, 25%), Rhynchospora indet. (3, 25%), Setaria indet. (2, 25%), Themeda triandra (25%)

FORBS: Alphitonia pomaderroides (10, 25%), Asteraceae indet. (1, 25%), Blumea indet. (2, 25%), Buchnera linearis (1, 25%), Desmodium indet. (25%), Evolvulus indet. (1, 25%), Fabaceae indet. (25%), Indigofera indet. (25%), Malvastrum americanum var. americanum (25%), Melaleuca viridiiflora (1, 25%), Mitrasacme indet. (25%), Pimelea indet. (25%), Polycarpaea indet. (1, 25%), Pouteria pohlmaniana (25%), Spermacoce indet. (25%), Stylosanthes scabra* (2, 25%), Zornia adenophora (25%)*

Dominant species: Relative cover (mean of cover of species / total cover of all species in that stratum for all values > zero) and frequency (percent of total sites) ordered by decreasing relative abundance. Up to five most dominant species with frequency > 20% listed for each stratum.

Frequent species: Cover (mean of all values > zero) and frequency (percent of total sites) of all species occurring in more than 5% of sites ordered by decreasing frequency. Ground layer species are listed as either graminoid or forb.

Naturalised species have an asterisk (*) after the name. indet. after listed name = indeterminate species or genus
