Regional Ecosystem Technical Descriptions

Technical descriptions provide a detailed description of the full range in structure and floristic composition of regional ecosystems (e.g. 12.3.5) and their component vegetation communities (e.g. 12.3.5a).

The descriptions are compiled using site survey data from the Queensland Herbarium's CORVEG database. Distribution maps, representative images (if available) and the pre-clearing and remnant area (hectares) of each vegetation community derived from the regional ecosystem mapping (spatial) data are included. The technical descriptions should be used in conjunction with the fields from the regional ecosystem description database (REDD) for a full description of the regional ecosystem. Quantitative site data from relatively undisturbed sites are extracted from CORVEG and summarized to provide information specific to each vegetation community.

Technical descriptions include the attributes: tree canopy height and cover and native plant species composition of the predominant layer, which are used to assess the remnant status of vegetation under the *Vegetation Management Act 1999*. However, as technical descriptions reflect the full range in structure and floristic composition across the climatic, natural disturbance and geographic range of the regional ecosystem, local reference sites should be used where possible (Neldner *et al.* 2005 section 3.3.3).

The technical descriptions are subject to review and are updated as additional data becomes available.

When conducting a BioCondition assessment, these technical descriptions should be used in conjunction with [BioCondition benchmarks](#) for the specific regional ecosystem, or component vegetation community.

Field definitions

Description	Description of the species, structural formation and habitat of the vegetation community (this is not the Regulation description)
Area of pre-clearing regional ecosystem	The area of the regional ecosystem vegetation community before clearing in hectares
Area of remnant RE and percentage remaining	The area of the remnant regional ecosystem vegetation community in hectares and as a percentage of pre-clearing extent
Species recorded	Total number; number of woody species; number in the ground layer (some species can be both woody and occur in the ground layer); average number of species per site (using only sites where a completed species list was recorded); standard deviation; number of sites used to calculate the average species number.
Basal area	Site average, range and standard deviation ($m^2/\text{hectare}$)
Structural Formation	Percentage of sites by structural formation. For example: Woodland: 39%; open-forest: 39%; open-woodland: 22%, 23 site(s)
Representative CORVEG sites	Site (id) numbers used in the description
For each stratum present: <ul style="list-style-type: none">• Emergent (E)• Canopy (T1), Sub-canopy (T2) and Low tree layers (T3)• Shrub (S1) and Sub-shrub layers (S2)• Ground (G)	<ul style="list-style-type: none">• <i>Height</i> - average canopy height in metres, range in metres and number of sites values are based on.• <i>Cover</i> - Average percentage canopy cover of the layer, range and number of sites values are based on.• <i>Average stem density</i> (stems per hectare), range and number of sites values are based on.
Dominant species (relative cover, frequency):	Relative cover (mean of cover of species / total cover of all species in that stratum for all values > zero) and frequency (percent of total sites) ordered by decreasing relative abundance. Up to five most dominant species with frequency > 20% listed for each stratum. For example: <i>Abutilon albescens</i> (78, 46%), means this species occurs in 46% of all sites and when it occurs comprises 78% of total cover (of the stratum)
Frequent species (cover, frequency):	Frequent species: Cover (mean of all values > zero) and frequency (percent of total sites) of all species occurring in more than 5% of sites ordered by decreasing frequency. For example: <i>Abutilon albescens</i> (10, 46%), means this species occurs in 46% of all sites and when it occurs has a mean cover of 10% Ground layer species are listed as either graminoid or forbs. Naturalised species have an asterisk (*) after the scientific name. <i>indet.</i> after listed name = indeterminate species or genus

Conditions of use

Technical descriptions have been developed from information published by the State of Queensland (acting through the Department) and remain the property of the State of Queensland. Technical descriptions are not to be included on internet sites other than the Queensland Government website.

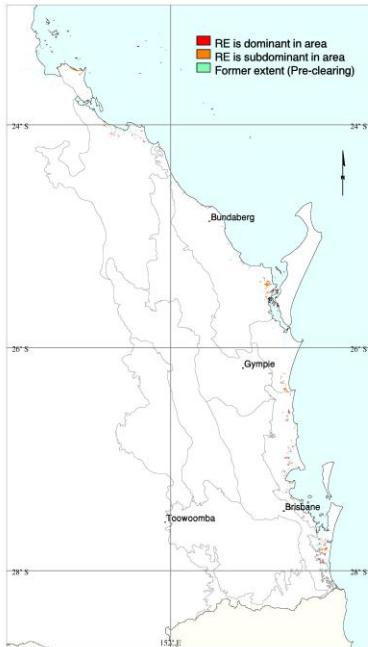

Users should reference information contained in the technical descriptions as: Ryan, T.S. (ed.) (year*) Technical Descriptions of Regional Ecosystems of Southeast Queensland, (month, year*) (Queensland Herbarium, Department of Science, Information Technology, Innovation and the Arts: Brisbane). * Date shown in footnote of individual descriptions.

While every effort has been made to ensure the information presented is as reliable as possible, the State of Queensland accepts no liability and gives no assurance in respect of its accuracy and shall not be liable for any loss or damage arising from its use.

Technical descriptions are based on a combination of quantitative and qualitative information and should be used as a guide only. Technical descriptions are not to be used as a substitute for reference sites. Descriptions are subject to review and are updated as additional data becomes available.

Dominant species (relative cover, frequency): Lophostemon confertus (27, 83%), Eucalyptus propinqua (24, 83%), Corymbia intermedia (23, 100%), Eucalyptus acmenoides (19, 50%), Eucalyptus siderophloia (15, 50%)

Frequent species (cover, frequency): Corymbia intermedia (17, 100%), Eucalyptus microcorys (10, 83%), Eucalyptus propinqua (16, 83%), Lophostemon confertus (18, 83%), Eucalyptus acmenoides (11, 50%), Eucalyptus siderophloia (10, 50%), Eucalyptus biturbinata (1, 17%), Eucalyptus carnea (24, 17%), Eucalyptus tereticornis (3, 17%), Lophostemon suaveolens (1, 17%)

Stratum: T2

Height avg. = 9.8m, range 8-14m, 6 sites

Crown cover avg. = 40.3%, range 5.0-80.0%, 6 sites

Stem density/ha avg. = 813, range 420-1600, 6 sites

Dominant species (relative cover, frequency): Allocasuarina littoralis (43, 33%), Allocasuarina torulosa (33, 50%), Lophostemon confertus (29, 50%), Eucalyptus propinqua (26, 50%), Lophostemon suaveolens (16, 33%)

Frequent species (cover, frequency): Corymbia intermedia (4, 67%), Eucalyptus microcorys (5, 67%), Allocasuarina torulosa (12, 50%), Eucalyptus propinqua (5, 50%), Lophostemon confertus (18, 50%), Allocasuarina littoralis (13, 33%), Angophora subvelutina (5, 33%), Eucalyptus acmenoides (2, 33%), Lophostemon suaveolens (5, 33%), Melaleuca quinquenervia (1, 33%), Acacia disperrima subsp. disperrima (5, 17%), Acacia penninervis var. penninervis (5, 17%), Banksia integrifolia (2, 17%), Cryptocarya microneura (15, 17%), Eucalyptus tereticornis (2, 17%), Melaleuca salicina (20, 17%), Polyscias elegans (5, 17%)

Dominant species: Relative cover (mean of cover of species / total cover of all species in that stratum for all values > zero) and frequency (percent of total sites) ordered by decreasing relative abundance. Up to five most dominant species with frequency > 20% listed for each stratum.

Frequent species: Cover (mean of all values > zero) and frequency (percent of total sites) of all species occurring in more than 5% of sites ordered by decreasing frequency. Ground layer species are listed as either graminoid or forb.

Naturalised species have an asterisk (*) after the name. indet. after listed name = indeterminate species or genus

Technical Description

Regional ecosystem: 12.12.15

Stratum: T3

Height avg. = 3.5m, range 3-4m, 2 sites

Crown cover avg. = 8.5%, range 5.0-12.0%, 2 sites

Stem density/ha avg. = 400, range 320-480, 2 sites

Dominant species (relative cover, frequency): *Acacia disparrima* subsp. *disparrima* (17, 33%)

Frequent species (cover, frequency): *Acacia disparrima* subsp. *disparrima* (2, 33%), *Acacia penninervis* (1, 17%), *Acacia penninervis* var. *penninervis* (1, 17%), *Allocasuarina littoralis* (1, 17%), *Corymbia intermedia* (1, 17%), *Guioa semiglauca* (1, 17%), *Lophostemon confertus* (5, 17%), *Lophostemon suaveolens* (1, 17%), *Melaleuca quinquenervia* (1, 17%), *Melaleuca salicina* (3, 17%), *Polyscias elegans* (1, 17%)

Stratum: S1

Height avg. = 1.8m, range 1.5-2m, 6 sites

Crown cover avg. = 6.2%, range 1.0-11.0%, 6 sites

Stem density/ha avg. = 1227, range 80-4200, 6 sites

Dominant species (relative cover, frequency): *Lophostemon confertus* (41, 67%), *Alphitonia excelsa* (24, 83%), *Allocasuarina torulosa* (23, 33%), *Lantana camara** (20, 50%), *Clerodendrum floribundum* (13, 33%)

Frequent species (cover, frequency): *Alphitonia excelsa* (2, 83%), *Lophostemon confertus* (2, 67%), *Lantana camara** (1, 50%), *Allocasuarina torulosa* (1, 33%), *Banksia integrifolia* (1, 33%), *Clerodendrum floribundum* (2, 33%), *Hovea acutifolia* (1, 33%), *Rhodamnia rubescens* (33%), *Acacia disparrima* subsp. *disparrima* (1, 17%), *Acacia melanoxylon* (2, 17%), *Acacia penninervis* var. *penninervis* (1, 17%), *Allocasuarina littoralis* (1, 17%), *Alpinia caerulea* (1, 17%), *Astrotricha latifolia* (17%), *Callicarpa pedunculata* (17%), *Denhamia celastroides* (17%), *Eucalyptus carnea* (17%), *Eucalyptus microcorys* (17%), *Eucalyptus propinqua* (17%), *Eucalyptus siderophloia* (17%), *Eupomatia laurina* (1, 17%), *Glochidion sumatranum* (1, 17%), *Jagera pseudorhus* (1, 17%), *Ligustrum sinense** (1, 17%), *Melaleuca quinquenervia* (1, 17%), *Melaleuca salicina* (17%), *Melastoma malabathricum* subsp. *malabathricum* (1, 17%), *Notelaea longifolia* (1, 17%), *Opercularia aspera* (17%), *Pittosporum undulatum* (17%), *Polyscias elegans* (3, 17%), *Psychotria daphnoides* (17%), *Psychotria loniceroidea* (1, 17%), *Schefflera actinophylla* (1, 17%), *Trochocarpa laurina* (3, 17%), *Zieria smithii* (17%)

Dominant species: Relative cover (mean of cover of species / total cover of all species in that stratum for all values > zero) and frequency (percent of total sites) ordered by decreasing relative abundance. Up to five most dominant species with frequency > 20% listed for each stratum.

Frequent species: Cover (mean of all values > zero) and frequency (percent of total sites) of all species occurring in more than 5% of sites ordered by decreasing frequency. Ground layer species are listed as either graminoid or forb.

Naturalised species have an asterisk (*) after the name. indet. after listed name = indeterminate species or genus

Stratum: G

Height avg. = 0.5m, range 0.4-0.7m, 6 sites

PFC avg. = 40.8%, range 15-65%, 6 sites

Dominant species (relative cover, frequency): Imperata cylindrica (31, 100%), Themeda triandra (29, 50%), Blechnum cartilagineum (17, 33%), Oplismenus imbecillis (17, 33%), Doodia aspera (17, 33%)

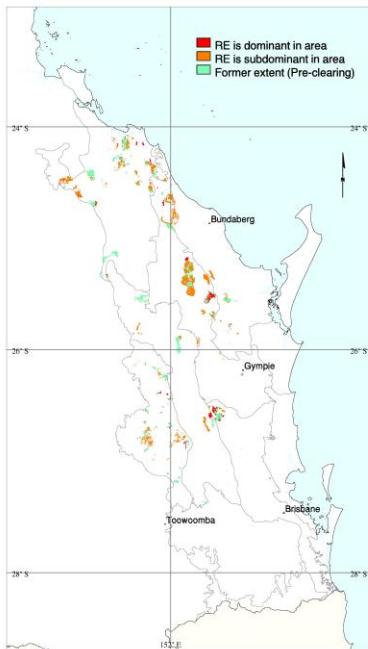

Frequent species (cover, frequency): GRAMINOIDs: Imperata cylindrica (14, 100%), Entolasia stricta (2, 67%), Oplismenus aemulus (50%), Panicum effusum (1, 50%), Sporobolus laxus (1, 50%), Themeda triandra (17, 50%), Cyperus laevis (33%), Digitaria parviflora (33%), Lepidosperma laterale (1, 33%), Microlaena stipoides (33%), Oplismenus imbecillis (2, 33%), Ottochloa gracillima (33%), Alloteropsis semialata (1, 17%), Cymbopogon refractus (1, 17%), Melinis minutiflora (2, 17%), Ottochloa nodosa (5, 17%), Paspalum scrobiculatum (1, 17%), Poa indet. (6, 17%)*

FORBS: Lomandra longifolia (1, 100%), Cyathillium cinereum (83%), Desmodium rhytidophyllum (83%), Smilax australis (1, 83%), Desmodium gunnii (67%), Dianella caerulea (67%), Eustrephus latifolius (67%), Pteridium esculentum (3, 67%), Bidens pilosa (50%), Breynia oblongifolia (50%), Hybanthus stellaroides (50%), Lobelia purpurascens (50%), Astrotricha latifolia (33%), Blechnum cartilagineum (5, 33%), Calochlaena dubia (1, 33%), Centratherum riparium (33%), Cheilanthes tenuifolia (1, 33%), Cissus hypoglauca (33%), Dioscorea transversa (33%), Doodia aspera (2, 33%), Geitonoplesium cymosum (33%), Geranium solanderi (33%), Glycine clandestina (33%), Hibbertia stricta (33%), Lantana camara* (33%), Myrsine variabilis (33%), Phyllanthus virgatus (33%), Plectranthus parviflorus (1, 33%), Rubus moluccanus (33%), Rubus parvifolius (1, 33%), Sigesbeckia orientalis (33%), Viola hederacea (33%), Acacia maidenii (17%), Acacia penninervis var. penninervis (1, 17%), Adiantum hispidulum (2, 17%), Ageratum houstonianum* (17%), Anisomeles malabarica (17%), Archidendron grandiflorum (17%), Austrosteanisia blackii (17%), Baccharis halimifolia* (17%), Billardiera scandens (17%), Cassytha glabella (2, 17%), Cayratia clematidea (17%), Centella asiatica (17%), Cissus antarctica (17%), Conyzza bonariensis* (17%), Cordyline congesta (17%), Crassocephalum crepidioides* (17%), Cryptocarya microneura (17%), Davallia pyxidata (17%), Denhamia celastroides (17%), Doodia caudata (17%), Doodia heterophylla (1, 17%), Flagellaria indica (1, 17%), Goodenia rotundifolia (2, 17%), Guioa semiglaucha (17%), Gymnostachys anceps (17%), Hardenbergia violacea (17%), Hibbertia dentata (17%), Hibbertia scandens (1, 17%), Hibbertia vestita (1, 17%), Hovea acutifolia (17%), Hydrocotyle acutiloba (17%), Indigofera australis (17%), Jagera pseudorhus (17%), Kennedia rubicunda (1, 17%), Lobelia trigonocaulis (17%), Lomandra confertifolia subsp. pallida (1, 17%), Lomandra laxa (1, 17%), Lomandra multiflora (17%), Lomandra multiflora subsp. multiflora (1, 17%), Marsdenia fraseri (1, 17%), Melastoma malabathricum subsp. malabathricum (17%), Melodinus australis (1, 17%), Myrsine angusta (17%), Ochna serrulata* (17%), Oxalis rubens (1, 17%), Parsonsia straminea (1, 17%), Passiflora foetida* (1, 17%), Platylobium formosum (17%), Polymeria calycina (17%), Polyscias sambucifolia (17%), Pseuderanthemum variabile (17%), Pterostylis nutans (17%), Rhodamnia rubescens (1, 17%), Rubus moluccanus var. trilobus (17%), Senecio pinnatifolius (17%), Trochocarpa laurina (17%), Verbena rigida* (17%), Viola banksii (3, 17%), Xanthorrhoea latifolia (1, 17%), Zieria minutiflora (17%), Zieria smithii (17%)*

Dominant species: Relative cover (mean of cover of species / total cover of all species in that stratum for all values > zero) and frequency (percent of total sites) ordered by decreasing relative abundance. Up to five most dominant species with frequency > 20% listed for each stratum.

Frequent species: Cover (mean of all values > zero) and frequency (percent of total sites) of all species occurring in more than 5% of sites ordered by decreasing frequency. Ground layer species are listed as either graminoid or forb.

Naturalised species have an asterisk (*) after the name. indet. after listed name = indeterminate species or genus

Eucalyptus moluccana open-forest on Mesozoic to Proterozoic igneous rocks

Pre-clearing area (ha), remnant area (ha) and per cent remaining: 54,529 17,251 32%

Species recorded: Total: 85; woody: 19; ground: 68; Avg. spp./site: 41.5; std dev.: 11.5, 3 site(s)

Basal area: Avg./site: 16.0 m²/ha, range: 14.0 - 17 m²/ha, std. deviation: 1 m²/ha, 3 site(s)

Structural formation: Open-forest: 67%; woodland: 33%, 3 site(s)

Representative sites: 13889, 14054, 40451.

Stratum: T1

Height avg. = 25.0m, range 23-28m, 3 sites

Crown cover avg. = 62.3%, range 50.0-72.0%, 3 sites

Stem density/ha avg. = 250, range 120-380, 2 sites

Dominant species (relative cover, frequency): Eucalyptus moluccana (78, 100%), Corymbia citriodora subsp. variegata (31, 33%), Eucalyptus tereticornis (20, 33%), Eucalyptus crebra (7, 67%)

Frequent species (cover, frequency): Eucalyptus moluccana (50, 100%), Eucalyptus crebra (4, 67%), Amyema bifurcata (33%), Corymbia citriodora subsp. variegata (20, 33%), Eucalyptus tereticornis (10, 33%)

Stratum: T2

Height avg. = 15.7m, range 15-17m, 3 sites

Crown cover avg. = 11.0%, range 5.0-23.0%, 3 sites

Stem density/ha avg. = 110, range 100-120, 2 sites

Dominant species (relative cover, frequency): Lophostemon suaveolens (100, 33%), Eucalyptus moluccana (100, 33%), Eucalyptus exserta (60, 33%), Angophora leiocarpa (40, 33%)

Frequent species (cover, frequency): Angophora leiocarpa (2, 33%), Eucalyptus exserta (3, 33%), Eucalyptus moluccana (23, 33%), Lophostemon suaveolens (5, 33%)

Dominant species: Relative cover (mean of cover of species / total cover of all species in that stratum for all values > zero) and frequency (percent of total sites) ordered by decreasing relative abundance. Up to five most dominant species with frequency > 20% listed for each stratum.

Frequent species: Cover (mean of all values > zero) and frequency (percent of total sites) of all species occurring in more than 5% of sites ordered by decreasing frequency. Ground layer species are listed as either graminoid or forb.
