Table S1. Microsatellite diversity indices for *Hephaestus fuliginosus* and *H. tulliensis*

n, sample size; A_T , total number of alleles; H_O , observed heterozygosity; H_e , expected heterozygosity; HWE, significant level of HWE expectation; –, insufficient sample size; values that are significant value after Bonferroni correction are indicated as: *, $P < 0.0001$

| Locus | Measure of diversity | <i>H. fuliginosus</i> | | | | <i>H. tulliensis</i> | | | | |

Table S3. Pairwise genetic differentiation index (F_{ST}) estimates among sampling locations of eastern *Hephaestus fuliginosus* and *H. tulliensis*

Pairwise F_{ST} -values between samples of *Hephaestus fuliginosus* from different rivers were mostly large and ranged between –0.0350 to 0.1788, with the Burdekin River population differing from the Herbert and Tully rivers, and the Herbert River differing from the North Johnstone and Tully rivers. All *H. tulliensis* populations were significantly different from *H. fuliginosus* populations except the Murray River, which, due to a low sample size, had very low power. Additionally, *H. tulliensis* populations from the Daintree were significantly different from *H. tulliensis* populations in both the North Johnstone and Tully rivers. Below diagonal: F_{ST} (θ); above diagonal: P -value: bold formatting indicates $P < 0.001$; italic formatting indicates $P < 0.05$

| Species and location | Burdekin | Herbert | <i>H. fuliginosus</i> | | | <i>H. tulliensis</i> | | | |
|-----------------------|---------------|---------------|-----------------------|---------------|--------|----------------------|---------------|---------------|--------|

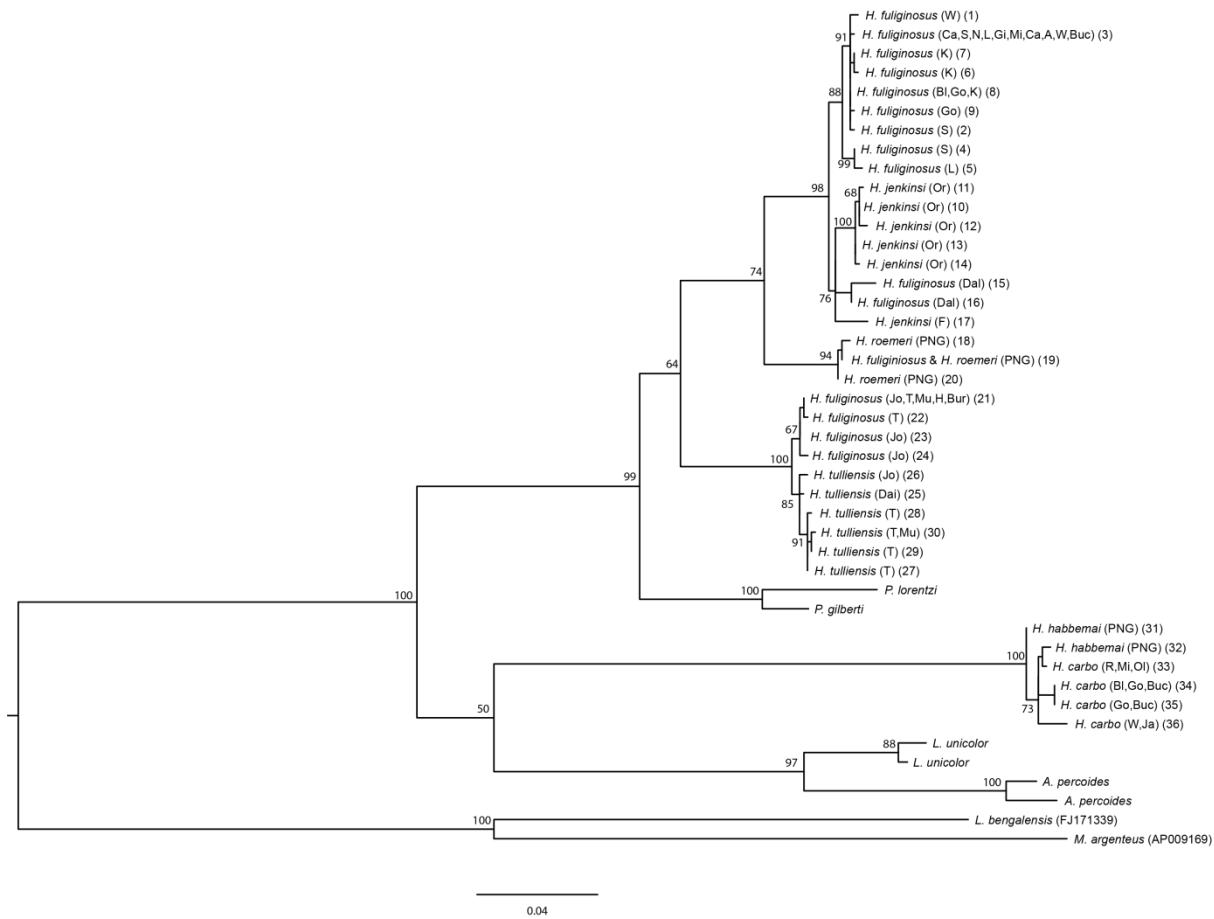

Fig. S1. Maximum likelihood phylogram of ATP sequence data for species within the genus *Hephaestus* and other terapontid genera. Each haplotype is labelled with its species and river of origin, with each river denoted by first initial or first and following intitial(s) when first initials are shared. River of origin is not listed for species used as outgroups or for species from Papua New Guinea, which are labelled as PNG only. GenBank acquisition numbers are also shown for outgroup species (i.e. not within Terapontidae).

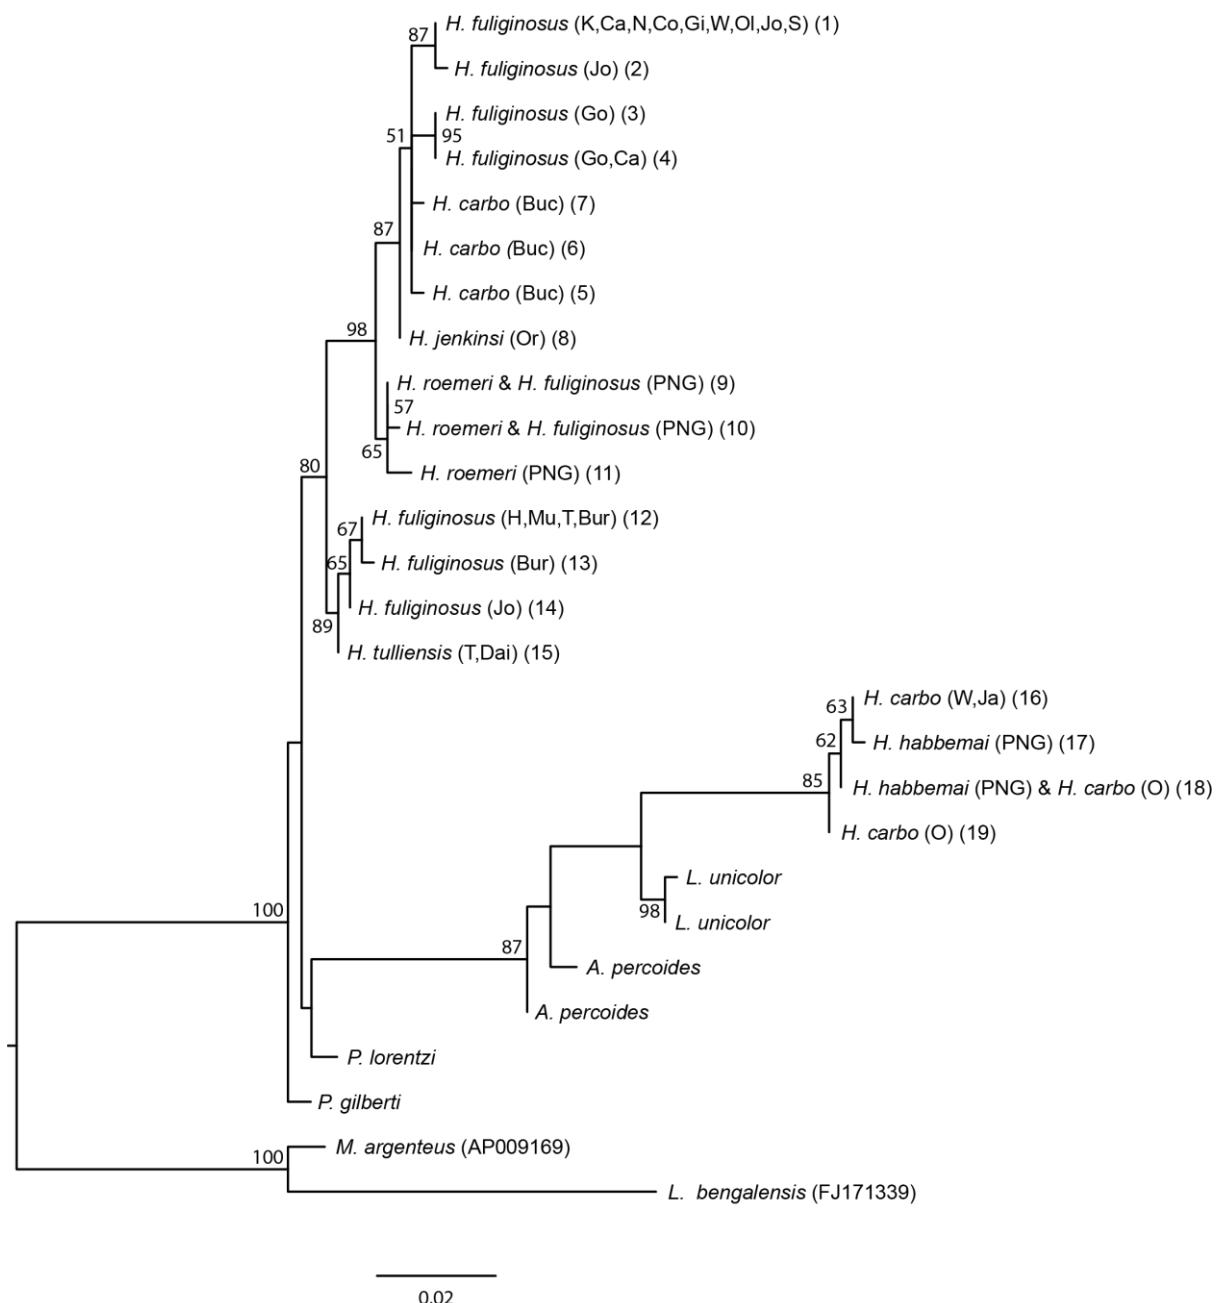

Fig. S2. Maximum likelihood phylogram of 16S sequence data for species within the genus *Hephaestus* and other terapontid genera. Location abbreviations as per Fig. S1.

Fig. S3. Maximum likelihood phylogram of S7 sequence data for species within the genus *Hephaestus* and other terapontid genera. Location abbreviations as per Fig. S1.
