**Fig. S1.** Strict consensus of the Bayesian inference (BI) and maximum likelihood (ML) phylogenograms based on analyses of the 16S dataset including GenBank sequences of *Trachiopsis strangulata* and *Eurytrachia mucosa*. Numbers above branches indicate nodal support (%) by Bayesian posterior clade probabilities (BPP; only values  $\geq 90\%$  are shown). Numbers below branches indicate nodal support (%) by ML bootstrapping (BTSP; only values  $\geq 70\%$  are shown). Congeneric outgroup taxa are shown as collapsed.
