### Abstract

A report is made on the capture of five male specimens of *Paralomis otsuae* Wilson on the continental slope off the coast of Corral, Chile (39°50'S). This finding significantly extends the southern latitudinal geographic range of the species. The specimens measured between 89 and 115 mm in cephalotoracic length excluding the rostral spine, and between 94 and 118 mm in cephalothoracic width excluding the lateral spines. Some morphological characteristics and morphometric dimensions were noteworthy. Discussion is presented on the significance of the characteristics of this species and its' geographic distribution.

### Keywords

Lithodidae, *Paralomis otsuae*, geographic distribution, Chile
