# FOREWORD

It gives me great pleasure to see the publication of this Checklist of the Fungi of Malaysia as it is nearly a century since a similar checklist was last produced by T.F. Chipp in 1921. Many changes have occurred since that time; the most significant being the separation of the fungi from the Plant Kingdom into their own kingdom, and this change only occurred quite recently in 1969. Another significant milestone in the fungal kingdom has been the advent of molecular techniques in the 1990s which produced revolutionary changes in fungal classification.

The taxonomic status of many of the fungi listed by Chipp has since been revised, many of the names changed, and the list is now long outdated. In addition, many other fungi have been reported and new discoveries made over the last 90 years. Efforts to produce a new checklist of the fungi of Malaysia first began at the University of Malaya (UM) in 2002 but progress was slow. In 2009, FRIM researchers working on the FRIM and Malaysian government funded project, Inventory and Research of Macrofungi in Peninsular Malaysia, decided to combine efforts with UM researchers to produce this checklist.

The Inventory and Research of Macrofungi in Peninsular Malaysia is part of a larger FRIM project, Survey, Inventory and Documentation of the Flora and Fauna Biological Diversity which was funded from 2006 until 2010. Apart from this checklist, the Macrofungi Project has also published two fungal guidebooks, one on the macrofungi of Tasik Bera and another on the macrofungi of Fraser's Hill, and also the Checklist of Literature on Malaysian Macrofungi, numerous articles and posters. Experience from the project shows the importance and benefits of collaboration, both nationally and internationally.

In the present checklist more than 3000 species of fungi are listed in comparison to the 861 species in Chipp's list. This new list covers the 'true' fungi, i.e., members in the Basidiomycota, Ascomycota, Mitosporic Fungi, Mucoromycotina, and Chytridiomycota, and the fungal-like Oomycetes, and slime moulds, Myxomycota. Although traditionally the latter two groups were studied by mycologists, based on evidence from molecular studies they are now placed in the separate kingdoms, Stramenopila/Chromista and Protozoa, respectively.

With this checklist we now have updated data and a better idea of the fungal diversity of Malaysia. This checklist is therefore a very important and significant contribution to our knowledge of Malaysia's rich biodiversity. However, much more sustained research is needed to fully evaluate our rich fungal diversity; there is little doubt that many more fungi will be discovered, and to be added to the checklist in the future.

I congratulate the authors on the timely publication of this landmark volume.

Dato' Dr Abd Latif Mohmod  
Director-General  
Forest Research Institute Malaysia

## **ACKNOWLEDGEMENTS**

We are greatly indebted to the Forest Research Institute Malaysia (FRIM), Kepong, the Ministry of Natural Resources and Environment Malaysia (NRE), and the University of Malaya for providing the funds and support to undertake this project which enabled us to publish this checklist. We are also grateful to the Ministry of Plantation Industries and Commodities for partial financial support to publish this checklist.

Special thanks are due to T. Hattori, Kansai Forestry and Forest Products Research Institute (FFPRI), Kyoto, Japan for his assistance with the taxonomy of many members of the Polyporales.

We thank Dr. Theresa Kwong for photographs in Plate 7A–D, Dr. Mohd Farid Ahmad for the photograph in Plate 7F and Thi B.K. for photographs in Plate 16B&C. Plates 8B–D and 9 are reproduced from “Mucoraceous fungi from Malaysia” by L.S. Loh, A. Nawawi and A.J. Kuthubutheen and published by University of Malaya. Plates 6C and 10 are reproduced from “Malaysian Fungal Diversity” published by the Mushroom Research Centre, University of Malaya and Ministry of Natural Resources and Environment Malaysia.

We thank B. Aslina for her competent, error-free page-setting of the checklist.

## 1. INTRODUCTION

Malaysia is recognized as one of the 17 mega diverse countries in the world with an estimated 15,000 species of vascular plants. However, despite many decades of research, its flora is still not completely known. Generally, the flora of Peninsular Malaysia is better known than those of the states of Sabah and Sarawak on the island of Borneo (Saw *et al.*, 2009). The diversity of mosses and algae in Peninsular Malaysia is known from various published monographs but information for Sabah and Sarawak is generally still lacking and a comprehensive checklist for the mosses and algae for Malaysia has yet to be compiled. In comparison, the fungal diversity of Malaysia is much less well known while that of Sabah and Sarawak, very poorly known.

Recognising this gap in our biodiversity information, the Malaysian government under the Ninth Malaysia Plan provided funds to the Forest Research Institute Malaysia (FRIM) to conduct a survey and inventory of the biota of Peninsular Malaysia, including the fungi. This long-term project was envisaged to be undertaken over several phases. The first phase was from 2006 until 2010 and an application for an extension until the end of 2012 was agreed upon in mid-2010. However, due to budget cutbacks, funding for the extension did not materialise. In view of the limited resources and fungal taxonomic expertise available in the country, it will therefore not be possible to obtain a complete inventory of the fungi of Peninsular Malaysia in this given time frame. Experience from other projects which involve numerous expert fungal taxonomists and equipped with better resources has shown that such an endeavour needs to be conducted over several decades, e.g. the INBIO project in Costa Rica, the Great Smoky Mountains All Taxa Biodiversity Inventory (ATBI).

Efforts had been underway on a part-time basis at the University of Malaya since 2002 to compile a checklist of all Malaysian fungi. At the beginning of that project, Dr. Siti Aisyah Alias contacted local scientists working on fungi for information on Malaysian fungi but the response was very poor. In 2008, researchers from FRIM jointly published the Checklist of Literature of Malaysian Fungi online with researchers from the University of Malaya and others (<http://www.chm.frim.gov.my/Resources/Publications/Checklist/Fungi.aspx>). During the preparation of that checklist it was found that information on Malaysian fungi was scattered in many different publications, many already out of print. FRIM and University Malaya researchers thus decided to pool resources to produce this present Checklist of Fungi of Malaysia so that all fungi ever recorded from Malaysia could be easily found in a single publication. This information is important not only for an accurate record and better appreciation of Malaysian fungal diversity but also as a source of reference for other researchers working on other aspects of the fungi, such as in plant pathology, pest and disease control, biological control, fungi for food and medicine, and biotechnology.

The fungi listed in the main checklist (Chapter 10) are sourced from published articles, reports and books, but do not include those listed in the grey literature, conference proceedings, students' theses or fungarium specimens. These include members in the Ascomycota, Basidiomycota, Mitosporic fungi, Chytridiomycota and Neocallimastigomycota, Mucoromycotina, Kickxellomycotina and Zoopagomycotina, Glomeromycota, and the fungal-like Oomycetes, Stramenopiles/Chromista, and the Protista: Mycetozoa, Myxomycetes or Myxomycota. However, this does not imply that members of the other phyla are absent in Malaysia; it only means that they have not been reported in the available literature. We are

aware that we may have left out some fungi, especially those reported in some of the older and more obscure publications or in publications that we overlooked.

All fungal names used in the list have been checked with those listed in Index Fungorum <http://www.indexfungorum.org> and/or Mycobank <http://www.mycobank.org> and also with mycologists working with specific groups: Dr. T. Hattori for the polypores and Dr. M. Whalley for the Xylariaceae. The most current names are used; where the fungus is not listed in either of the two databases, the name is listed according to the authority who published it.

## A Brief History of Fungal Collecting in Malaysia

The earliest known collections of fungi, mainly the fleshy, larger fungi, from the regions that make up Malaysia today, i.e., Peninsular Malaysia and the states of Sabah and Sarawak on the island of Borneo, were made by Odoardo Beccari between 1865 and 1879 and by Rev. Father Benedetto Scortechini in 1885 (Chipp, 1921). H.H. Kunstler who was engaged through the influence of Sir Hugh Low was another early collector who collected mainly in Perak (Van Steenis, 1950). Many of his collections, particularly of plants are labeled “King’s collector”. Many of the early fungi collections were deposited in *Herb. Kuala Lump.* (Van Steenis, 1950) which one assumes stands for Herbarium Kuala Lumpur. The actual identity of this herbarium is, however, not known but no such herbarium exists today. Nothing is known of the fate of those early collections that were deposited in *Herb. Kuala Lump.* and they are now probably all lost or destroyed.

Many of the early fungal collections were made in Singapore, most likely due to the existence of the Singapore Botanic Gardens and its associated staff. H.N. Ridley, the father of rubber in Malaysia, and Mrs. Ethel M.M. Burkhill, the wife of I.H. Burkhill, the well-known economic botanist, were prolific collectors of the larger fungi in Singapore. Although an amateur, Mrs. Burkhill’s mushroom collections were made into herbarium collections complete with notes and water colour paintings. She prepared 164 coloured drawings which were sent together with the specimens and notes to the Royal Botanic Gardens, Kew, for identification but few of these remain today (Kiew, 2004). H.N. Ridley the first Director of the Singapore Botanic Gardens (1888–1912), systematically collected macrofungi from the Gardens and commissioned Charles de Alwis to make water colour paintings of the fresh specimens before they were dried (Kiew, 2002). Ridley’s collections were kept in Singapore and duplicates were sent to Kew for identification. Slime moulds were collected by C.F. Baker and A.R. Sanderson (Chipp, 1921). C.F. Baker’s collections from Penang and Singapore were deposited in *Herb. Kuala Lump.* while his large private fungal collection was willed to the city of Manila, the Philippines. He also presented 15,000 Malayan fungi to the Department of Pathology, Los Baños, the Philippines (Van Steenis, 1950). The fate of the fungi in Los Baños is unknown but the other collections are now lost. Baker also had a good collection of the imperfect fungi from Singapore which he sent to Saccardo who subsequently described them in his *Sylloge Fungorum* (Kiew, 2002). Sanderson was the mycologist at the Rubber Growers’ Association in Malaya and some of his collections may have been taken to England.

The most influential and important mycologist in Malaysia and Singapore was E.J.H. Corner. His contributions to tropical ecology, botany and conservation are well known (see Ashton and Hadley, 2001; Dransfield, 2001) but it is his contributions to tropical mycology that laid the groundwork to our understanding of the tropical Basidiomycota and the taxonomic framework for the huge diversity of the macrofungi in Southeast Asia (Watling, 2001). Corner was the first mycologist to be employed by the Singapore Botanic Gardens

(1923–1942) and he collected extensively from the forests of both Singapore and Malaysia. He is commemorated by the genus *Corneromyces* and several species are named after him.

Some of the specimens collected by Ridley, Ethel Burkill, Baker and Corner from the Singapore Botanic Gardens Rain Forest can be found in the herbarium of the present day Singapore Botanic Gardens. The Gardens is also an important type site since several specimens new to science were first collected and described from these forests (Kiew, 2002).

## Checklists

The earliest list of fungi from the then Malaya was published by M.C. Cooke in 1878 in the journal *Grevillea*. This was followed in 1913 by K. Bancroft who published a “List of fungi identified in the Federated Malay States with notes on their occurrence” in the *Agricultural Bulletin of the Federated Malay States*. In this list, he mentioned 105 species to which A. Sharples added another five species later in the same year (Chipp, 1921). In 1921, T.F. Chipp published a list of 861 fungi from the Straits Settlements and the Federated and neighbouring Malay states. The Straits Settlements consisted of the settlements of Malacca, Penang (the present day Malaysian states of Melaka and Penang), Singapore (with Christmas Island and the Cocos Islands) and Labuan (the present day Malaysian Federal Territory of Labuan) while the Federated and neighbouring Malay states consisted of the remaining present day states of the Malay Peninsula ([http://en.wikipedia.org/wiki/Straits\\_Settlements](http://en.wikipedia.org/wiki/Straits_Settlements)). The taxonomic status of many of the fungi listed by Chipp has since been revised and many of the names changed, and the list is long outdated. Checklists of plant diseases, and of hosts and diseases in Malaysia which included mainly fungal pathogens were published in the 1950s and subsequent years (Thompson and Johnston, 1953; Johnston, 1960; Singh 1973, 1980) and a list of numerous new fungal species found in Malaysia was published more recently (Jones *et al.*, 2007). Many new species of macrofungi or larger fungi consisting of what is more commonly known as mushrooms and bracket fungi were described by Corner who left a strong mycological legacy to Singapore and Malaysia. Surprisingly, however, he did not publish a fungal checklist. This is, therefore, the first comprehensive and up-to-date checklist of Malaysian fungi to be produced since Chipp’s 1921 publication.

## Summary of the chapters

There are a total of ten chapters in this book with an Appendix (accompanying CD) listing all the Malaysian fungal specimens deposited in the CAB International Collection (formerly the International Mycological Institute) which is now located in the Royal Botanic Gardens, Kew, United Kingdom. Chapter 1: Introduction, explains the background and rationale for the publication of this checklist and provides a brief history of fungal collecting in Malaysia. This is followed by eight chapters on the major taxonomic groups, namely, individual chapters on the Ascomycota, Basidiomycota, the anamorphic or Mitosporic Fungi, Chytridiomycota and Neocallimastigomycota, Mucoromycotina, Kickxellomycotina and Zoopagomycotina, Glomeromycota, and the fungal-like organisms and Protista, respectively. Each of these chapters begins with a short introduction followed by an alphabetical listing of the fungi according to their most up-to-date or current names. The final chapter in tabular form consists of the complete checklist where the fungi are listed alphabetically according to name and authorities, substrate and/or host from which they were reported, the location where they were observed and/or collected, and the related reference(s). Where “Unspecified” is stated in the table, in particular for the substrate and/or location of the collection, indicates that the

relevant information was not provided in the original publication. A total of 3804 fungi and fungal-like organisms are recorded in this checklist according to the original published name. Where the original name of the fungus has been changed, the current or most up-to-date name is given in bold script. The term “misapplied” is used when the fungus may be a temperate taxon not found in the tropics. Representative examples of the fungi in each chapter are illustrated by a series of plates and line drawings (Plates 1–20) after the main checklist and all the literature cited in this publication are listed under References.

We would like to emphasise that these approximately 4,000 fungi are not all the fungi to be found in Malaysia. We have only scratched the surface and it is likely that many more fungi will be found if systematic inventories, surveys and studies are conducted over a long-term and the results properly documented and published.

## 2. ASCOMYCOTA

The Ascomycota are primarily microfungi, often not discernable to the naked eye (e.g. perithecial: *Neurospora*, *Nectria* spp.), and thus attract less attention than members of the agarics and bracket basidiomycetes. However, a few form spectacular macro-fruit bodies, e.g. *Cookeina*, *Daldinia*, *Peziza* spp. (Plate 5). Ascomycetes are to be found in practically all habitats and on a wide range of substrates.

The Ascomycota is the largest group of fungi comprising 15 classes, 68 orders, 327 families, 6,355 genera and circa 64,163 species (Kirk *et al.*, 2008). They include saprobes, parasites, endophytes and lichens, and are cosmopolitan in distribution. The latest classification of the group is by Hibbett *et al.* (2007), and the classes most often collected in Malaysia are the Dothideomycetes and Sordariomycetes. Malaysian ascomycetes have not been as intensively studied as the basidiomycetes (largely due to the work of Corner) and anamorphic fungi (many of which are plant pathogens of economic importance). Despite that, a wide range of Ascomycota has been documented for the country. Most taxa belong to the Hypocreomycetidae and include the orders Halosphaerales, Hypocreales, Melanosporales and Xylariales. The Halosphaerales is an order of aquatic fungi that occur in both freshwater, marine and mangrove habitats, however, most genera are marine: four *Aniptodera* species were collected on wood in freshwater (Hyde, 2007) with six species from marine habitats (Alias and Jones, 2009).

The Xylariales are primarily a tropical group of lignicolous ascomycetes (Whalley, 1996). They have been intensively studied in Malaysia by Margaret Whalley (Whalley *et al.*, 2000b) who documented 22 species in nine genera. New species described by her include *Camillea malaysiensis*, *C. selangorensis*, *Xylaria fraseri* and *X. maraca*. Xylariaceous species found in Malaysia constitute the most specious group of ascomycetes with over 110 species. These species have also been collected in Malaysian mangroves with *Halorosellinia oceanica* being one of the core mangrove fungi (Alias and Jones, 2009). The Xylariales are also of special interest for the bioactive compounds they produce (Stadler and Hellwig, 2005, e.g. cytochalasins). However, the ability of Malaysian xylariaceous fungi to produce novel compounds has not been investigated.

Circa 1141 ascomycetes are listed here for Malaysia, in 179 families (or taxonomical units) and 408 genera. Over 95 have their holotypes from the country (Jones *et al.*, 2007). Of new taxa described from Malaysia, aquatic ascomycetes predominate and this reflects local research interests (Hyde *et al.*, 1999; Alias and Jones, 2000a, b). The most specious families include the Xylariaceae (113 species), Laboulbeniaceae (69), Parmeliaceae (69), Meliolaceae (63), Thelotremaeaceae (55), Halosphaeriaceae (37), Nectriaceae (35), Mycosphaerellaceae (32), Hypocreaceae (22) and Rhytismataceae (21). Genera with the greatest number of species found in Malaysia include *Meliola* (55), *Xylaria* (47), *Laboulbenia* (29), *Mycosphaerella* (26), *Hypotrachyna* (19), *Cladonia* (18), *Hypoxyylon* (17), *Phyllachora* (17), *Rickia* (17), *Gibberella* (14), *Guignardia* (13) and *Nectria* (11). Some of these taxa are pathogens of various host plants of economic value. Frequent saprobes include *Xylaria* (47 species). Genera with fewer species recorded for Malaysia include: *Chaetomium* (12), *Asterina* (11), *Cocomyces* (10) and *Leptosphaeria* (9). Lichens that have been collected in Malaysia include *Myriotrema* (22) and *Ocellularia* (16). The orders Rhytismatales and Laboulbeniales are represented by 10 (*Cocomyces*) and 29 (*Laboulbenia*) species,

respectively. Although many ascomycete orders are well documented for Malaysia, others have hardly been studied, such as the Leotiales and Verruculariales. Similarly, there has been no systematic study of yeasts in Malaysia.

Habitats that have been surveyed for ascomycetes include: wood inhabiting species, marine and freshwater taxa, and plant pathogens. Habitats and ecological groups poorly surveyed for ascomycetes include soils, dung, lower aquatic fungi, human pathogens and arthropod inhabiting fungi. Many insect fungi have been reported for Malaysia, including 69 Laboulbeniales species, while Kwong (2003), in a preliminary study, recorded 11 species, of which four were ascomycetes: *Cordyceps*, *Gibellula*, *Hypocrella* and *Torrubiella* (See Plate 7).

Mangrove ascomycetes have been widely studied in Malaysia (Jones and Tan, 1987, Jones and Kuthubutheen, 1990; Alias *et al.*, 1995; Hyde *et al.*, 1999; Alias and Jones, 2000) with the description of a number of new genera: *Halorosellinia* (Whalley *et al.*, 2000a), *Tirisporella* (Jones *et al.*, 1996) and species: *Fasciatispora lignicola* (Alias *et al.*, 1994), *Corollospora besarispora* (Sundari *et al.*, 1996) and *Trematosphaeria malaysiana* (McKeown *et al.*, 2001). Hyde *et al.* (1999) described 11 new species from the brackish water palm *Nypa* in Malaysia, including 9 ascomycetes. These studies have been reviewed in the monograph on Malaysian mangrove fungi by Alias and Jones (2009).

An ecological group that surprisingly has attracted little attention in Malaysia is plant endophytes. These are fungi that inhabit plants but do not cause disease symptoms. Although most are anamorphic fungi, some ascomycete genera are well represented in studies in other countries: *Botryosphaeria*, *Guignardia*, *Mycosphaerella* and *Xylaria* (Kumaresan and Suryananyanan, 2001).

A summary of the Ascomycota documented for Malaysia: 179 families or taxonominal units in 408 genera and 1141 species is given below.

## Species of Ascomycota reported from Malaysia: (?= uncertain taxonomy)

### **Acarosporaceae**

*Pleopsidium oxytonum*

### **Agilaceae**

*Aigialus grandis*  
*Aigialus mangrovis*  
*Aigialus parvus*  
*Ascocratera manglicola*  
*Rimora mangrovei*

### **Alectoriaceae (Parmelliaceae?)**

*Oropogon salazinicus*

### **Aliquandostipitaceae**

*Jahnula aquatica*  
*Jahnula bipolaris*  
*Jahnula systyla*

### **Amphisphaeriaceae**

*Amphisphaeria enteroxantha*  
*Pestalosphaeria elaeidis*

### **Annulatasaceae**

*Annulatascus velatispora*  
*Annulusmagnus triseptatus*  
*Aquasphaeria dimorphospora*  
*Cataractispora appendiculata*  
*Cataractispora bipolaris*  
*Cataractispora viscosa*

### **Apiosporaceae**

*Apiospora campotospora*  
*Apiospora montagnei*

### **Arthoniaceae**

*Arthonia cyanea*  
*Arthonia lividofusca*  
*Arthonia lividula*  
*Arthonia ramosii*  
*Arthonia trilocularis*  
*Catarraphia dictyoplaca*  
*Cryptothecia candida*  
*Eremothecella calamicola*  
*Tania lanosa*

### **Arthrorhaphidaceae**

*Arthrorhaphis citrinella*

### **Ascobolaceae**

*Ascobolus cenangioides*

### **Ascomycota Incertae sedis**

*Dryosphaera tropicalis*  
*Ernakulamia cochinensis*  
*Ilyonectria radicicola*  
*Saccardoella mangrovei*  
*Saccardoella marinospora*  
*Saccardoella rhizophorae*  
*Thelonectria jungneri*  
*Thelonectria lucida*  
*Thelonectria olida*

### **Aspidotheliaceae**

*Aspidothelium fugiens*

### **Asterinaceae**

*Asterina anomala*  
*Asterina aporosae*  
*Asterina borneensis*  
*Asterina dallasica*  
*Asterina lawsoniae*  
*Asterina manihotis*  
*Asterina piperina*  
*Asterina pouzolziae*  
*Asterina sodalis*  
*Asterina sponiae*  
*Asterina venustula*  
*Cirsosia transversalis*  
*Lembosia eugeniae*  
*Lembosia glonioidea*  
*Morenoella euopla*  
*Morenoella transversalis*  
*Morenoina palmicola*  
*Trichasterina polyalthiae*

### **Aulographaceae**

*Aulographum spilomoide*

### **Bacidiaceae (Tephromellataceae?)**

*Tephromela atra*

**Baeomycetaceae**

- Baeomyces crenulatus*  
*Baeomyces placophyllus*

**Baeomycetales Incertae sedis**

- Ainoa mooreana*

**Bionectriaceae**

- Bionectria ochroleuca*  
*Bionectria subquaternata*  
*Kallichroma glabrum*  
*Kallichroma tethys*

**Botryosphaeriaceae**

- Botryosphaeria rhodina*  
*Botryosphaeria stevensii*  
*Guignardia alternantherae*  
*Guignardia camelliae*  
*Guignardia citricarpa*  
*Guignardia cocogena*  
*Guignardia cocoicola*  
*Guignardia coffeae*  
*Guignardia dyerae*  
*Guignardia heveae*  
*Guignardia mangiferae*  
*Guignardia manokwaria*  
*Guignardia musae*  
*Guignardia perseae*  
*Guignardia piperis*  
*Montagnellina pithecellobii*  
*Phaeobotryosphaeria plicatula*

**Brigantiaeaceae**

- Brigantiae leucoxantha*

**Byssolomataceae**

- Bapalmia palmularis*  
*Byssolecania deplanata*  
*Byssoloma leucoblepharum*  
*Byssoloma subdiscordans*  
*Byssoloma vanderystii*  
*Byssoloma vezdanum*  
*Fellhanera rhipidophylli*  
*Fellhanera semecarpi*

**Caliciaceae**

- Calicium tricolor*  
*Gassicurzia coccinea*

**Candelariaceae**

- Candelariella vitellina*

**Capnodiaceae**

- Aithaloderma citri*  
*Aithaloderma clavatisporum*  
*Aithaloderma setosum*  
*Capnodium citri*  
*Capnodium fuliginodes* var. *grandisporum*  
*Phaeochaetia annonicola*  
*Phragmocapnia betle*  
*Scorias spongiosa*  
*Trichomerium coffeicola*  
*Trichomerium crotonis*  
*Trichomerium grandisporum*

**Catabotrydaceae**

- Catabotrys deciduum*

**Ceratocystidaceae**

- Ceratocystis fimbriata*  
*Ceratocystis paradoxa*

**Chaetomiaceae**

- Chaetomium aureum*  
*Chaetomium cristatum*  
*Chaetomium cupreum*  
*Chaetomium funicola*  
*Chaetomium globosum*  
*Chaetomium gracile*  
*Chaetomium indicum*  
*Chaetomium malaysiense*  
*Chaetomium spirale*  
*Chaetomium thermophilum* var. *coprophilum*

### 3. BASIDIOMYCOTA

The microfungi which are not visible to the naked eye make up the vast majority of described fungal species. In contrast, most of the macrofungi which produce large, showy reproductive structures (Plates 11–20) commonly known as mushrooms, puffballs, stinkhorns, jelly fungi, coral fungi, bracket fungi, rusts and smuts, are members of the Basidiomycota which make up less than one percent of the described fungi. The visible structures or fruiting bodies of the Basidiomycota are composed of organized mycelia (except for those forming yeasts), and the fungi reproduce sexually by forming specialized microscopic club-shaped cells called basidia which normally bear four external spores (basidiospores).

The Basidiomycota are divided into three subphyla, the Pucciniomycotina, Ustilaginomycotina and Agaricomycotina (Hibbett *et al.*, 2007). The majority of the Pucciniomycotina are plant parasitic rust fungi and the Ustilaginomycotina or the smut fungi are also important plant parasites. Fungi in these two families have not been well studied in Malaysia and only a small number of species have been reported so far. In contrast, the Agaricomycotina, particularly the class Agaricomycetes, have been much better studied largely due to the research of E.J.H. Corner. The Agaricomycetes are widespread in nearly all terrestrial ecosystems and they are the most conspicuous of the fungi since they produce a diverse range of visible fruiting bodies such as mushrooms, brackets, etc. They play important roles as decayers, pathogens, parasites, and mutualistic symbionts of both plants and animals.

Worldwide the Basidiomycota is represented by 31,515 species in 1,589 genera, 177 families, 52 orders and 16 classes (Kirk *et al.*, 2008). So far, 1820 species in 358 genera and 90 families including 19 species in 16 genera *incertae sedis* of the Basidiomycota have been recorded for Malaysia. It is therefore clear that many more members of the Basidiomycota have yet to be discovered and described, especially since it is well recognised that the tropical rain forests harbour a considerable degree of yet undiscovered fungal diversity.

The largest number of published records for members of the Basidiomycota in Malaysia is of the Polyporaceae, with 327 species in 42 genera, largely arising from the comprehensive studies of E.J.H. Corner and the more recent studies of T. Hattori. The polypores are mainly saprophytes but some are also important plant pathogens, e.g. *Ganoderma*, *Phellinus*, *Rigidoporus*. Recent studies have shown that polypore diversity is high in Malaysian lowland forests (Hattori and Lee, 1999; 2003) and that species composition is different in lowland and highland forests (Corner, 1983, 1984, 1987, 1989a, b, 1991a). With many collections still awaiting identification and further study and the lack of collections from many parts of the country, particularly Sabah and Sarawak, there is no doubt that many more species are likely to be found in the future.

Records of the Marasmiaceae are the next most numerous, with 186 species in 13 genera. However, it is highly likely that many more species of the Marasmiaceae have yet to be discovered as this is a very large cosmopolitan family with 1590 species in 54 genera worldwide (Kirk *et al.*, 2008). A recent study revealed that of the 50 species of *Marasmius sensu stricto* recognised from Peninsular Malaysia, no less than one third were new to science (Tan *et al.*, 2007).

The Boletaceae are close behind the Marasmiaceae with 162 species in 18 genera. In comparison, 787 species of boletes in 35 genera have been described worldwide (Kirk *et al.*, 2008). Like the polypores, the bolete records for Malaysia are largely due to the pioneering

research of E.J.H. Corner who described 100 new species out of the 140 compiled in his *Boletus* in Malaysia (Corner, 1972). He remarked that 300 species of boletes may be found in Malaysia in view of the large area of forests that have yet to be explored mycologically. For example, only three species of *Heimioporus* are presently known and described from Malaysia, while a minimum of at least 6 species are likely to be present (Halling *et al.*, 2007).

Seventy-five species of the Entolomataceae have been reported from Malaysia but this number is very likely to increase with recent discoveries of previously unreported and most likely new species which have yet to be published (E. Horak, pers. comm.). Moreover, the Entolomataceae is a very widely distributed species-rich family with over 1500 species worldwide (Co-David *et al.*, 2009).

The very large Tricholomataceae family was traditionally a “dumping ground” for white-spored fungi that could not be identified as members of the Amanitaceae, Lepiotaceae, Hygrophoraceae, Pluteaceae or Entolomataceae. There are 73 recorded Malaysian species but as with the majority of the other Basidiomycota families, the likelihood of discovering many more species in this very large family is extremely high because no systematic collecting or taxonomic studies have been carried out.

Thirty-five species in two genera of the Amanitaceae have been recorded in Malaysia, largely resulting from the systematic and detailed studies of Corner and Bas (1962). Like the Boletaceae, studies and records of the Amanitaceae could probably be considered quite complete for Malaysia. Yet some of our recent collections could not be identified using the existing keys to Malaysian species showing that there are still new species awaiting discovery. There are very few records for the majority of the other basidiomycete families, but this does not imply that these fungi are absent in Malaysia. It only emphasises the need for further mycological exploration and there is no doubt that these numbers will increase with further collecting and study as so little research has been conducted on Malaysian fungi.

Below is a list of the basidiomycete fungi, their families, genera and species that have been reported from Malaysia. Further details can be found in Chapter 10 of this Checklist.

## **Species of Basidiomycota reported from Malaysia:**

### **Agaricales Incertae sedis**

*Anellaria antillarum*

### **Agaricaceae**

*Agaricus actinorachis*  
*Agaricus arvensis*  
*Agaricus bisporus*  
*Agaricus crocopeplus*  
*Agaricus earoachrous*  
*Bovista nigrescens*  
*Catastoma juglandiforme*  
*Clarkeinda trachodes*  
*Coprinus coffeeicola*  
*Coprinus levipes*  
*Cyathus byssisedus*  
*Cyathus sphaerosporus*  
*Cyathus striatus*  
*Enteromyxa cerebrina*  
*Heinemannomyces splendidissima*  
*Hymenagaricus alphitochrous*  
*Lepiota cf. spongodes*  
*Lepiota goossensiae*  
*Leucoagaricus ferruginosus*  
*Leucocoprinus birnbaumii*  
*Leucocoprinus fragilissimus*  
*Lycoperdon echinatum*  
*Lycoperdon lignicola*  
*Macrolepiota excoriata*  
*Macrolepiota procera* var. *procera*  
*Micropsalliota arginophaea*  
*Micropsalliota brunneola*  
*Micropsalliota erythrosipa*  
*Micropsalliota ochracea*  
*Micropsalliota roseipes*  
*Tulostoma pusillum*  
*Tulostoma ridleyi*

### **Agaricostilbaceae**

*Agaricostilbum pulcherrimum*

### **Albatrellaceae**

*Albatrellus borneensis*  
*Albatrellus cochleariformis*  
*Scutiger pes-caprae*

### **Amanitaceae**

*Amanita alauda*  
*Amanita angustilamellata*  
*Amanita centunculus*  
*Amanita cinctipes*  
*Amanita demissa*  
*Amanita duplex*  
*Amanita elata*  
*Amanita elephas*  
*Amanita eriophora*  
*Amanita fritillaria*  
*Amanita fritillaria f. malayensis*  
*Amanita gymnopus*  
*Amanita hemibapha*  
*Amanita hemibapha* subsp. *similis*  
*Amanita mira*  
*Amanita modesta*  
*Amanita obsita*  
*Amanita ovalispora*  
*Amanita pausiaca*  
*Amanita perpasta*  
*Amanita pilosella*  
*Amanita princeps*  
*Amanita privigna*  
*Amanita rubrovolvata*  
*Amanita sculpta*  
*Amanita sychnopyramis*  
*Amanita timida*  
*Amanita tjibodensis*  
*Amanita tristis*  
*Amanita vaginata*  
*Amanita vestita*  
*Amanita virginea*  
*Amanita xanthogala*  
*Amanita xanthomargaros*  
*Limacella singaporeana*

### **Anthracoideaceae**

*Cintractia axicola*  
*Cintractia spicularum*  
*Leucocintractia leucoderma*  
*Leucocintractia scleriae*

### **Aphelariaceae**

*Aphelaria dendroides*  
*Aphelaria tropica*

*Rigidoporus microporus* var. *platensis*  
*Stecchericum aggregatum*  
*Trametes sacer* var. *sacer*  
*Trametes sericea*

## 4. MITOSPORIC FUNGI (ANAMORPHIC, DEUTEROMYCOTA, FUNGI IMPERFECTI)

Most mitosporic fungi are the asexual stages of Ascomycota (e.g. *Colletotrichum* anamorphic *Glomerella*) and a few Basidiomycota (e.g. *Chaetospermum* linked to the Sebacinales at the molecular level). Hyde *et al.* (2011) concluded that fewer than 40% of mitosporic fungi are linked to their teleomorphs. Currently some 1,810 genera and 10,187 species of mitosporic fungi have been described (Kirk *et al.*, 2008). Mito sporic fungi, also known as anamorphic fungi, Deuteromycotina, Deuteromycetes, Fungi Imperfecti, asexual fungi or conidial fungi, are common, widespread in distribution, saprobic, endophytic or parasitic of higher plants, fungi, lichens, and vertebrates/invertebrates. They have been recovered from a wide range of ecological habitats ranging from terrestrial soils and sediments, freshwater, marine, deep-sea water vents, and are active as biodeteriogens and in the decomposition of organic material. Circa 728 species (circa 7.2% of the world estimate) have been documented for Malaysia with the following genera being the most numerous: *Cercospora* (50 species), *Pseudocercospora* (25), *Pestalotiopsis* (21), *Dictyochaeta* (19), *Phoma* (19), *Aspergillus* (18), *Colletotrichum* (18), *Phyllosticta* (18), *Fusarium* (16), and *Curvularia* (12). It is not surprising that these are the most frequently cited genera as they are plant pathogens of economically important crops: cotton wilt, basal rots, while others are toxicogenic or cause human diseases (Noorlidah, 2007; Salleh, 2007; Zainal and Sijam, 2007).

One of the most extensive studies of mitosporic fungi in Malaysia has been that on *Fusarium* by Salleh Baharuddin who has isolated some 4,500 strains from various substrates provisionally identified to 43 species (Salleh, 2007). Many plant diseases of economically important crops in Malaysia are caused by *Fusarium* species, e.g. rice (bakanae), *F. fujikuroi*; crown and root rot of asparagus, *F. oxysporum*; sugarcane rots, *F. sacchari*. Another fungal genus that is the cause of plant diseases of many crops (e.g. chilli, mango, rubber, papaya, orchids) in Malaysia is *Colletotrichum* with the species *C. gloeosporioides* (current name *Glomerella cingulata*), *C. capsici* and *C. truncatum*, common (Zainal and Sijam, 2007). Most anamorphic fungi in Malaysia are known because they cause diseases of important crops: rice (*Drechslera*, *Cercospora*, *Phoma*, *Pyricularia*, *Sclerotium* spp.), and rubber (leaf disease, *Corynespora cassicola*). Sooty molds are also prevalent on fruit trees, such as mango (*Tripospermum* sp., *Limacinula* sp.) (Zainal and Sijam, 2007).

Mitosporic fungi are also important contaminants of food and animal feeds, leading to mycotoxin production. The primary genera involved are *Aspergillus*, *Fusarium* and *Penicillium* species, especially of starch-based foods. The most common species documented for Malaysia include *Aspergillus candidus*, *A. flavus*, *A. niger*, *A. terreus*, and *Penicillium chrysogenum* (Noorlidah, 2007).

Many of the mitosporic fungi listed here are from freshwater habitats, growing on decaying leaves and include Ingoldian and aeroaqueous fungi (Hyde, 2007). Nawawi (1985a-e) and Nawawi and Kuthubutheen (1988a-g) carried out most work on the Ingoldian fungi while Ho *et al.* (2001) reported 20 taxa from a stream in Hutan Lipur Lentang, Pahang. Over 146 new mitosporic fungi have been described from holotypes in Malaysia, 94 by Nawawi and Kuthubutheen, most of them freshwater species (Jones *et al.*, 2007). They also described no fewer than 17 *Dictyochaeta* species from Malaysia (Jones *et al.*, 2007). Freshwater fungi

have also been recorded on submerged wood, with Hyde (2007) listing 24 mitosporic species.

Another substrate that has been surveyed for mitosporic fungi is palms. Turner (1971b) lists 150 taxa from the oil palm (*Elaeis guinensis*) while Hyde (2007) lists circa 80 mitosporic fungi from various palms, many collected at Pasoh Forest Reserve, Negeri Sembilan. Although many of these were common species, such as *Aspergillus*, *Fusarium*, *Penicillium* and *Pestalotiopsis*, others were novel taxa described for Malaysia, e.g. *Cytoplea hysterioides* (current name *Roussella hysterioides*, Ascomycotina), *Nakatopsis skittleus*, and *N. malaysiana*.

Hyde (2007) concludes that Malaysian saprobic mitosporic fungi are poorly known with the exception of studies of pathogenic, palm and aquatic fungi. Indeed much more needs to be done to document the mitosporic fungi of the country.

## Mitosporic fungi reported from Malaysia

The following 728 species of mitosporic fungi have been reported from Malaysia and are included in this Checklist:

### *Acremonium charticola*

<i>Acremonium implicatum</i>	<i>Aschersonia placenta</i>
<i>Acremonium kiliense</i>	<i>Ascochyta abelmoschi</i>
<i>Acremonium zonatum</i>	<i>Ascochyta asteris</i>
<i>Acrodictys fimicola</i>	<i>Ascochyta capsici</i>
<i>Acrophialophora fusispora</i>	<i>Ascochyta dahliicola</i>
<i>Alatospora acuminata</i>	<i>Ascochyta dolichi</i>
<i>Alternaria brassicae</i>	<i>Ascochyta gossypii</i>
<i>Alternaria brassicicola</i>	<i>Ascochyta heveae</i>
<i>Alternaria citri</i>	<i>Ascochyta pisi</i>
<i>Alternaria dauci</i>	<i>Ascochyta socia</i>
<i>Alternaria dianthi</i>	<i>Ashtaangam sundaram</i>
<i>Alternaria dianthicola</i>	<i>Aspergillus awamori</i>
<i>Alternaria longipes</i>	<i>Aspergillus candidus</i>
<i>Alternaria porri</i>	<i>Aspergillus carneus</i>
<i>Alternaria ricini</i>	<i>Aspergillus clavatoflavus</i>
<i>Alternaria solani</i>	<i>Aspergillus flavipes</i>
<i>Alternaria tenuissima</i>	<i>Aspergillus flavus</i>
<i>Alternaria zinniae</i>	<i>Aspergillus flavus</i> var. <i>flavus</i>
<i>Ampelomyces quisqualis</i>	<i>Aspergillus fumigatus</i>
<i>Ampullifera foliicola</i>	<i>Aspergillus giganteus</i>
<i>Amerosympodula malaysiana</i>	<i>Aspergillus glaucus</i>
<i>Anguillospora filiformis</i>	<i>Aspergillus japonicus</i>
<i>Angulospora aquatica</i>	<i>Aspergillus niger</i>
<i>Annellophora phoenicis</i>	<i>Aspergillus niger</i> var. <i>niger</i>
<i>Apiosporium atrum</i>	<i>Aspergillus restrictus</i>
<i>Aquaphila albicans</i>	<i>Aspergillus sydowii</i>
<i>Arthrinium phaeospermum</i>	<i>Aspergillus tamarii</i>
<i>Arthrobotrys dendroides</i>	<i>Aspergillus terreus</i>
<i>Arthrobotrys oligospora</i>	<i>Aspergillus versicolor</i>
<i>Arthrobotrys stilbacea</i>	<i>Asperisporium mikaniigena</i>
<i>Aschersonia marginata</i>	<i>Aureobasidium pullulans</i>

<i>Bactrodesmium linderi</i>	<i>Cercospora chrysanthemicola</i>
<i>Bahusutrabeeja dwaya</i>	<i>Cercospora duddiae</i>
<i>Basauxia pulchra</i>	<i>Cercospora eupatorii-odorati</i>
<i>Belemnospora fuliginea</i>	<i>Cercospora fukuii</i>
<i>Beltrania malaiensis</i>	<i>Cercospora fukushiana</i>
<i>Beltrania rhombica</i>	<i>Cercospora gerberae</i>
<i>Beltraniella nilgrica</i>	<i>Cercospora grandissima</i>
<i>Berkleasmium moriforme</i>	<i>Cercospora hydrangeae</i>
<i>Beverwykella cerebriformis</i>	<i>Cercospora hydrangeana</i>
<i>Bipolaris heveae</i>	<i>Cercospora ipomoeae-pedis-caprae</i>
<i>Bipolaris incurvata</i>	<i>Cercospora jatrophicola</i>
<i>Bipolaris sacchari</i>	<i>Cercospora kikuchii</i>
<i>Blastophorum fusarioides</i>	<i>Cercospora lactis f. parastica</i>
<i>Blastophragma subulatum</i>	<i>Cercospora longissima</i>
<i>Botryodiplodia excipuloides</i>	<i>Cercospora malayensis</i>
<i>Botryodiplodia palmarum</i>	<i>Cercospora mangiferae</i>
<i>Botryosporium longibrachiatum</i>	<i>Cercospora menthicola</i>
<i>Botrytis cinerea</i>	<i>Cercospora mikaniicola</i>
<i>Brachiosphaera tropicalis</i>	<i>Cercospora mori</i>
<i>Brachydesmiella verrucosa</i>	<i>Cercospora muntingiae</i>
<i>Caldariomyces fasciculatus</i>	<i>Cercospora nicotianae</i>
<i>Camposporidium cristatum</i>	<i>Cercospora phyllanthicola</i>
<i>Campylospora chaetocladia</i>	<i>Cercospora piperata</i>
<i>Campylospora filicladia</i>	<i>Cercospora pulcherrima</i>
<i>Canalisporium caribense</i>	<i>Cercospora richardiicola</i>
<i>Canalisporium elegans</i>	<i>Cercospora ricinella</i>
<i>Canalisporium pulchrum</i>	<i>Cercospora sesami</i>
<i>Candelabrum brocchiatum</i>	<i>Cercospora solani-melongenae</i>
<i>Candida albicans</i>	<i>Cercospora sorghi</i>
<i>Cenococcum geophilum</i>	<i>Cercospora taccae</i>
<i>Ceratosporella disticha</i>	<i>Cercospora ternateae</i>
<i>Cercoseptoria plumeriicola</i>	<i>Cercospora volkameriae</i>
<i>Cercospora alpiniae</i>	<i>Cercospora wellesiana</i>
<i>Cercospora althaeina</i>	<i>Cercospora zinniae</i>
<i>Cercospora angustata</i>	<i>Cercosporella ipomoeae</i>
<i>Cercospora apii</i>	<i>Cerebella andropogonis</i>
<i>Cercospora arachidicola</i>	<i>Chaetendophragmia triangularis</i>
<i>Cercospora asparagi</i>	<i>Chaetosticta leersiae</i>
<i>Cercospora averrhoae</i>	<i>Chloridium lignicola</i>
<i>Cercospora begoniae</i>	<i>Chloridium lunulatum</i>
<i>Cercospora beticola</i>	<i>Chloridium microsporum</i>
<i>Cercospora bidentis</i>	<i>Chrysosporium tropicum</i>
<i>Cercospora brassicicola</i>	<i>Circinoconis paradoxa</i>
<i>Cercospora canescens</i>	<i>Circinotrichum maculiforme</i>
<i>Cercospora capsici</i>	<i>Cirrenalia basiminuta</i>
<i>Cercospora cassiae-nodosae</i>	<i>Cirrenalia pseudomacrocephala</i>
<i>Cercospora celosiae</i>	<i>Cladosporium cladosporioides</i>
<i>Cercospora celosiarum</i>	<i>Cladosporium colocasiae</i>

<i>Cladosporium herbarum</i>	<i>Cryptophiale aristata</i>
<i>Cladosporium occultum</i>	<i>Cryptophiale caudata</i>
<i>Cladosporium oxysporum</i>	<i>Cryptophiale cucullata</i>
<i>Cladosporium sphaerospermum</i>	<i>Cryptophiale enormis</i>
<i>Cladosporium spongiosum</i>	<i>Cryptophiale kakombensis</i>
<i>Cladosporium tenuissimum</i>	<i>Cryptophiale manifesta</i>
<i>Clathrosphaerina zalewskii</i>	<i>Cryptophiale udagawae</i>
<i>Clathrosporium intricatum</i>	<i>Cryptophialoidea fasciculata</i>
<i>Clavarihana aquatica</i>	<i>Cryptophialoidea secunda</i>
<i>Clavariopsis aquatica</i>	<i>Cryptophialoidea uncispora</i>
<i>Clavariopsis azlanii</i>	<i>Curvularia affinis</i>
<i>Clavatospora bulbosa</i>	<i>Curvularia andropogonis</i>
<i>Clavatospora filiformis</i>	<i>Curvularia boreriae</i>
<i>Clavatospora longibrachiata</i>	<i>Curvularia clavata</i>
<i>Clavatospora tentacula</i>	<i>Curvularia fallax</i>
<i>Clonostachys rosea</i> f. <i>catenulata</i>	<i>Curvularia oryzae</i>
<i>Clonostachys rosea</i> f. <i>rosea</i>	<i>Curvularia penniseti</i>
<i>Coleodictyospora micronesiaca</i>	<i>Curvularia prasadii</i>
<i>Colispora curvata</i>	<i>Curvularia senegalensis</i>
<i>Colletotrichum brachytrichum</i>	<i>Curvularia trifolii</i>
<i>Colletotrichum capsici</i>	<i>Curvularia unicolorospora</i>
<i>Colletotrichum circinans</i>	<i>Curvularia verruciformis</i>
<i>Colletotrichum coccodes</i>	<i>Cylindrocarpon candidum</i>
<i>Colletotrichum coffeatum</i>	<i>Cylindrocarpon lichenicola</i>
<i>Colletotrichum corchori</i>	<i>Cylindrocladiella camelliae</i>
<i>Colletotrichum crassipes</i>	<i>Cytospora eucalypticola</i>
<i>Colletotrichum dematium</i>	<i>Cytospora rhizophorae</i>
<i>Colletotrichum derridis</i>	<i>Deightoniella torulosa</i>
<i>Colletotrichum ficus</i>	<i>Dendrosporium lobatum</i>
<i>Colletotrichum heveae</i>	<i>Dendrosporomyces prolifer</i>
<i>Colletotrichum higginsianum</i>	<i>Dendrosporomyces splendens</i>
<i>Colletotrichum nigrum</i>	<i>Dendryphiella arenariae</i>
<i>Colletotrichum orbiculare</i>	<i>Dendryphiella salina</i>
<i>Colletotrichum piperis</i>	<i>Dendryphiella vinoso</i>
<i>Colletotrichum pisi</i>	<i>Dendryphiosphaera parvula</i>
<i>Colletotrichum theae</i>	<i>Dictyochaeta aliformis</i>
<i>Colletotrichum truncatum</i>	<i>Dictyochaeta assamica</i>
<i>Condylospora flexuosa</i>	<i>Dictyochaeta daphnioides</i>
<i>Condylospora gigantea</i>	<i>Dictyochaeta dendroidea</i>
<i>Condylospora spumigena</i>	<i>Dictyochaeta fertilis</i>
<i>Conioscypha bambusicola</i>	<i>Dictyochaeta guadalcanalensis</i>
<i>Coniothyrium obiones</i>	<i>Dictyochaeta gyrosetula</i>
<i>Coniothyrium olivaceum</i>	<i>Dictyochaeta macrospora</i>
<i>Coniothyrium trabuti</i>	<i>Dictyochaeta malaysiana</i>
<i>Cordana musae</i>	<i>Dictyochaeta pluriguttulata</i>
<i>Corynespora cassiicola</i>	<i>Dictyochaeta ramulosecula</i>
<i>Corynespora heterospora</i>	<i>Dictyochaeta sampahia</i>
<i>Coryneum myristicae</i>	<i>Dictyochaeta simplex</i>

<i>Dictyochaeta stipitocolla</i>	<i>Fusarium oxysporum</i> f. <i>cubense</i>
<i>Dictyochaeta subfuscospora</i>	<i>Fusarium oxysporum</i> f. <i>lycopersici</i>
<i>Dictyochaeta tumidoseta</i>	<i>Fusarium oxysporum</i> f.sp. <i>vasinfectum</i>
<i>Dictyochaeta tumidospora</i>	<i>Fusarium oxysporum</i> f.sp. <i>zingiberi</i>
<i>Dictyochaeta variabilis</i>	<i>Fusarium proliferatum</i>
<i>Dictyochaeta vittata</i>	<i>Fusarium redolens</i>
<i>Dictyochaetopsis gonytrichoides</i>	<i>Fusarium sacchari</i> var. <i>sacchari</i>
<i>Dictyochaetopsis hamata</i>	<i>Fusarium sporotrichioides</i>
<i>Dictyochaetopsis pahangensis</i>	<i>Fusicatena macrospora</i>
<i>Dictyosporium pelagicum</i>	<i>Geotrichum candidum</i>
<i>Didymostilbe australiensis</i>	<i>Gliocephalotrichum simplex</i>
<i>Dinemasporium oryzae</i>	<i>Gliocladiopsis tenuis</i>
<i>Diplocladiella appendiculata</i>	<i>Gliocladium virens</i>
<i>Diplocladiella scalaroides</i>	<i>Gliomastix luzulae</i>
<i>Diplocladiella tricladoides</i>	<i>Gloeocercospora sorghi</i>
<i>Diplodia sedicola</i>	<i>Gloeosporium colubrinum</i>
<i>Diplozythiella bambusina</i>	<i>Gloeosporium heveae</i>
<i>Distocercospora pachyderma</i>	<i>Gloeosporium musarum</i>
<i>Drechslera frumantacei</i>	<i>Grallomyces portoricensis</i>
<i>Drechslera halodes</i> var. <i>elaeicola</i>	<i>Graphium putredinis</i>
<i>Drechslera musae-sapientium</i>	<i>Halenospora varia</i>
<i>Drechslera ocella</i>	<i>Hansfordia canescens</i>
<i>Dwyaangam cornuta</i>	<i>Haplobasidion musae</i>
<i>Dwyaangam dichotoma</i>	<i>Helicomyces roseus</i>
<i>Ellisembia atrobrunnea</i>	<i>Helicomyces torquatus</i>
<i>Ellisembia paravaginata</i>	<i>Helicorhoidion nypicola</i>
<i>Endocalyx melanoxanthus</i>	<i>Helicosporium griseum</i>
<i>Endophragmiella bigena</i>	<i>Helicosporium pannosum</i>
<i>Epicoccum nigrum</i>	<i>Helicoubisia coronata</i>
<i>Eriomycopsis minima</i>	<i>Heliscella stellata</i>
<i>Exosporium stilbaceum</i>	<i>Heliscella stellatacula</i>
<i>Exserticlava triseptata</i>	<i>Helminthosporium alphoniae</i>
<i>Exserticlava vasiformis</i>	<i>Helminthosporium decorum</i>
<i>Filospora aquatica</i>	<i>Helminthosporium foveolatum</i>
<i>Flabellocladia gigantea</i>	<i>Helminthosporium kyllingae</i>
<i>Flabellocladia tetracladia</i>	<i>Helminthosporium mauritianum</i>
<i>Flabellospora crassa</i>	<i>Helminthosporium obovatum</i>
<i>Flabellospora multiradiata</i>	<i>Helminthosporium panici</i>
<i>Flabellospora verticillata</i>	<i>Helminthosporium spirotrichum</i>
<i>Flagellospora penicillioides</i>	<i>Hemibeltrania malaysiana</i>
<i>Fusarium arthrosporioides</i>	<i>Hemisynnema malayasanum</i>
<i>Fusarium concolor</i>	<i>Hendersonia coffea</i>
<i>Fusarium culmorum</i>	<i>Hendersonia zingiberis</i>
<i>Fusarium fujikuroi</i>	<i>Henicospora longissima</i>
<i>Fusarium incarnatum</i>	<i>Hiospira hendrickxii</i>
<i>Fusarium javanicum</i>	<i>Humicola fuscoatra</i>
<i>Fusarium longipes</i>	<i>Humicola grisea</i>
<i>Fusarium oxysporum</i>	<i>Humicola grisea</i> var. <i>thermoidea</i>

<i>Hydea pygmea</i>	<i>Nakatopsis skittleus</i>
<i>Idriella lunata</i>	<i>Nawawia malaysiana</i>
<i>Ingoldiella fibulata</i>	<i>Nawawia nitida</i>
<i>Ingoldiella hamata</i>	<i>Neojohnstonia colocasiae</i>
<i>Isariopsis acanthacearum</i>	<i>Neoscytalidium dimidiatum</i>
<i>Isthmolongispora geniculata</i>	<i>Nidulispore quadrifida</i>
<i>Isthmophragmospora verruculosa</i>	<i>Nigrospora panici</i>
<i>Isthmotrichidia gombakensis</i>	<i>Nigrospora sacchari</i>
<i>Isthmotrichidia laeensis</i>	<i>Nimbya gomphrenae</i>
<i>Iyengarina asymmetrica</i>	<i>Nodulisporium africanum</i>
<i>Iyengarina furcata</i>	<i>Nodulisporium gregarium</i>
<i>Javonarxia quadrisepata</i>	<i>Nodulisporium indicum</i>
<i>Javonarxia triseptata</i>	<i>Nypaella frondicola</i>
<i>Jerainum triquetrum</i>	<i>Obeliospora triappendiculata</i>
<i>Kiliophora fusispora</i>	<i>Oidium heveae</i>
<i>Kionochaeta nanophora</i>	<i>Oidium nephelii</i>
<i>Kionochaeta pugillii</i>	<i>Oidium tingitanum</i>
<i>Kionochaeta ramifera</i>	<i>Paecilomyces lilacinus</i>
<i>Kostermansinda magna</i>	<i>Paecilomyces variotii</i>
<i>Lambdasporium viridense</i>	<i>Papulaspora halima</i>
<i>Lasiodiplodia theobromae</i>	<i>Paraceratocladium malaysianum</i>
<i>Lateriramulosa uni-inflata</i>	<i>Paracryptophiale kamaruddinii</i>
<i>Leprocaulon arbuscula</i>	<i>Parapyricularia musae</i>
<i>Leprocaulon pseudoarbuscula</i>	<i>Paraulocladium fabisporum</i>
<i>Leptoxyphium fumago</i>	<i>Passalora bataticola</i>
<i>Lunulospora curvula</i>	<i>Passalora capsicicola</i>
<i>Lunulospora cymbiformis</i>	<i>Passalora fulva</i>
<i>Macrohomina phaseolina</i>	<i>Passalora gliricidae</i>
<i>Malbranchea cinnamomea</i>	<i>Passalora koepkei</i>
<i>Mariannaea elegans</i> var. <i>elegans</i>	<i>Passalora nattrassii</i>
<i>Matsusporium tropicale</i>	<i>Passalora omphacodes</i>
<i>Melanconium elaeidis</i>	<i>Passalora vaginae</i>
<i>Melanconium palmarum</i>	<i>Passalora vexans</i>
<i>Melanographium citri</i>	<i>Penicillium brevicompactum</i>
<i>Metulocladosporiella musae</i>	<i>Penicillium chrysogenum</i>
<i>Microsphaeropsis paliformis</i>	<i>Penicillium chrysogenum</i> var. <i>chrysogenum</i>
<i>Microsporum gypseum</i>	<i>Penicillium citrinum</i>
<i>Monacrosporium tentaculatum</i>	<i>Penicillium corylophilum</i>
<i>Monochaetia karstenii</i>	<i>Penicillium digitatum</i>
<i>Monodictys pelagica</i>	<i>Penicillium dodgei</i>
<i>Myceliophthora thermophila</i>	<i>Penicillium duclauxi</i>
<i>Mycoleptodiscus terrestris</i>	<i>Penicillium dupontii</i>
<i>Mycovellosiella oryzae</i>	<i>Penicillium funiculosum</i>
<i>Mycovellosiella phaseoli</i>	<i>Penicillium italicum</i>
<i>Myrothecium cinctum</i>	<i>Penicillium klebahnii</i>
<i>Myrothecium roridum</i>	<i>Penicillium kloeckeri</i>
<i>Myrothecium verrucaria</i>	<i>Penicillium miczynskii</i>
<i>Nakatopsis malaysiana</i>	<i>Penicillium nalgiovense</i>

<i>Penicillium novae-zeelandiae</i>	<i>Phaeotrichoconis crotalariae</i>
<i>Penicillium ochrochloron</i>	<i>Phalangispora constricta</i>
<i>Penicillium purpurogenum</i>	<i>Phalangispora nawawii</i>
<i>Penicillium roqueforti</i>	<i>Phlyctema muroiana</i>
<i>Penicillium simplicissimum</i>	<i>Phoma adianticola</i>
<i>Penicillium variable</i>	<i>Phoma aequivoca</i>
<i>Penzigomyces malayensis</i>	<i>Phoma camelliae</i>
<i>Periconia abyssa</i>	<i>Phoma coffaeicida</i>
<i>Periconia byssoides</i>	<i>Phoma destructiva</i>
<i>Periconia digitata</i>	<i>Phoma eupyrena</i>
<i>Periconia prolifica</i>	<i>Phoma exiqua</i> var. <i>exiqua</i>
<i>Periconia sacchari</i>	<i>Phoma glomerata</i>
<i>Periconia shyamala</i>	<i>Phoma herbarum</i>
<i>Periconiella cocoës</i>	<i>Phoma hibiscicola</i>
<i>Periconiella heveae</i>	<i>Phoma minutispora</i>
<i>Periconiella mucunae</i>	<i>Phoma piperis</i>
<i>Pestalotia heterocornis</i>	<i>Phoma pomorum</i> var. <i>pomorum</i>

## 5. CHYTRIDIOMYCOTA and NEOCALLIMASTIGOMYCOTA

Following the high-level phylogenetic classification of the fungi (Hibbett *et al.* (2007) the chytrid-like fungi have been referred to two phyla: Chytridiomycota and Neocallimastigomycota.

Numerically the Chytridiomycota is a phylum with few species and comprises four orders, 13 families, 99 genera and circa 686 species (Kirk *et al.* 2008). Few taxa have been documented for Malaysia. Chytrids are aquatic saprobes or parasites of decaying and living organic matter, in freshwater and soils, while a few are marine; circa 19 species are anaerobes on cellulosic substrates in the guts of herbivores. Generally, they are isolated by baiting with snake skins, seeds, leaves, pollen, and human hair. Singh (1980) reported *Synchytrium psophocarpi* as causing false rust in four-angled bean (*Psophocarpus tetragonolobus*), but there is no further data on the occurrence of this fungus (Zainal and Sijam, 2007).

The Neocallimastigomycota comprise one order, one family, six genera and circa 20 species. In Malaysia this group has been studied by Ho and her co-workers and a review published in 2007 (Ho, 2007). Malaysian anaerobic rumen “chytrids” include both uniflagellate (e.g. *Piromyces*) and polyflagellate (e.g. *Neocallimastix*) taxa that occur as motile flagellated zoospores in the rumen fluid and as non-motile thalli (bearing sporangia) attached to the rumen digest materials (Ho, 2007). These fungi have been little studied in Malaysia, with the exception of the pioneering work of Yin-Wan Ho, at Universiti Putra Malaysia (Ho *et al.* 1990, 1993, 1994). Rumen “chytrids” play a major role in the degradation of fibrous material in the gut of rumen animals.

Currently 11 Neocallimastigomycetes in five genera are known for Malaysia: *Neocallimastix* (*N. frontalis*, *N. variabilis*), *Piromyces* (*P. communis*, *P. mae*, *P. rhizinflatus*, ***P. minutus***, ***P. spiralis***), *Caecomyces* (*C. communis*), *Oprinomyces* (*O. joyonii*, ***O. intercalaris***) and *Anaeromyces* (***A. elegans***). Five new species have been described from Malaysia and are listed in bold in the above list.

Members of the Chytridiomycota and Neocallimastigomycota that have been recorded from Malaysia are listed below:

### Chytridiomycota

*Synchytrium psophocarpi*

### Neocallimastigomycota

*Anaeromyces elegans*

*Caecomyces communis*

*Neocallimastix frontalis*

*Neocallimastix variabilis*

*Oprinomyces joyonii*

*Oprinomyces intercalaris*

*Piromyces communis*

*Piromyces mae*

*Piromyces minutus*

*Piromyces rhizinflatus*

*Piromyces spiralis*

## 6. MUCOROMYCOTINA, KICKXELLOMYCOTINA and ZOOPAGOMYCOTINA

This group of taxa comprises 3 orders, 11 families, 61 genera and 325 species (Kirk *et al.* 2008) and the best known group are the Mucorales. They are all microscopic, although they can be prominent when they occur on certain substrates, e.g. pin mold of bread. The Mucoromycotina is a small group in comparison to the Basidiomycota and Ascomycota and not widely studied in Malaysia. The most significant contribution for Malaysia has been the monograph published by Loh, Nawawi and Kuthubutheen (2001) entitled “Mucoraceous fungi from Malaysia”. In the foreword to this monograph, Professor Haji Mohamed bin Abdul Majid comments “this volume was prompted by the distinct lack of information of any kind on their mycology”. Sadly, 10 years later nothing much has changed and there is little new information of Malaysian Mucorales.

Members of 13 mucoraceous families in three orders (Dimargaritales, Kickxellales, Mucorales) are documented in this Checklist with 69 species in 27 genera. Three new genera are described: *Nawawiella*, *Kirkiana*, *Tortumyces*, along with 16 new species: *Mucor cornutus*, *M. delicatus*, *M. eugenii*, *M. ravidus*, *M. recurvus* var. *aspinosus*, *M. sarawakiensis*, *M. sympodialis*, *M. tanatus*, *M. verticilliatus*, *Backusella granulispora*, *B. johoriensis*, *Nawawiella apophysa*, *Kirkiana ramosa*, *Tortumyces cameronensis*, *T. fimicola*, and *Thermomucor humicolus*. *Mucor* was the most common genus encountered with 24 species followed by *Rhizopus* (6 species).

Most mucoraceous fungi are isolated from soil, while other substrates include flowers, dung, fruits, leaves, other fungi, root bark, wood, palm oil mill effluent and compost. However, *Choanephora*, *Rhizopus* and *Mucor* may be weak plant parasites, especially of flowers and fruits damaged during storage and in transit. Some species are thermophilic (*Absidia corymbifera*, *Rhizomucor pusillus*, *Rhizopus microsporus*, *Thermomucor humicolus*) especially in composted material (Kuthubutheen, 1981a, 1982, 1983). Although not numerically numerous, they play a significant role in the ecology of soils and decomposition of organic matter. Commercially they are important in bioremediation, protein digestion, fermentation and use as food (e.g. tempeh) and in the scarification of steamed, milled rice to produce sweet alcoholic drinks.

Currently few mucoraceous species have been documented for Malaysia (circa 6% of all described species) and this in part can be attributed to the lack of literature on tropical species. Some rarely collected species have been reported for Malaysia, including *Circinella simplex*, *Dispira simplex*, *Linderina pennispora*, *Mucor minutus* and *Saksenaea vasiformis*. Loh *et al.* (2001) point out that many tropical mucoraceous fungi differ from temperate species and that more new species are yet to be found in the tropics. Further studies are warranted into this ecologically important group, especially at the molecular level.

Some mucroaceous species have been reported as plant pathogens in Malaysia: *Rhizopus artocarpi* (current name *R. stolonifer*) (immature fruit rot of jackfruit, *Artocarpus heterophyllus*) and *Choanephora cucurbitarum* (shoot blight and fruit rots of vegetable crops). Various *Rhizopus* species have been reported to cause contamination of foods and feeds in Malaysia, e.g. *R. arrhizus* and *R. microsporus* (Noorlidah, 2007). A summary of the Mucoromycotina recorded in Malaysia is given below:

**Choanephoraceae**

- Blakeslea trispora*
- Choanephora cucurbitarum*
- Choanephora infundibulifera*
- Poitrasia circinans*

**Cunninghamellaceae**

- Absidia corymbifera*
- Absidia cylindrospora* var. *cylindrospora*
- Absidia glauca*
- Absidia graminea*
- Absidia macrospora*
- Cunninghamella blakesleeana*
- Cunninghamella echinulata*
- Cunninghamella elegans*
- Cunninghamella polymorpha*
- Gongronella butleri*

**Dimargaritaceae (Kickxellomycotina)**

- Dispira simplex*

**Kickxellaceae (Kickxellomycotina)**

- Linderina pennispora*

**Lichtheimiaceae**

- Lichtheimia corymbifera*
- Lichtheimia hyalospora*
- Rhizomucor miehei*
- Rhizomucor pusillus*
- Thermomucor humicolus*

**Mucoraceae**

- Backusella granulispora*
- Backusella johoriensis*
- Circinella simplex*
- Hyphomucor assamensis*
- Kirkiana ramosa*
- Mucor circinelloides* f. *janssenii*
- Mucor circinelloides* f. *lusitanicus*
- Mucor cornutus*
- Mucor delicatus*
- Mucor eugenii*
- Mucor hiemalis*
- Mucor hiemalis* f. *hiemalis*
- Mucor inaequisporus*
- Mucor lausannensis*
- Mucor luteus*

*Mucor minutus*

- Mucor oblongiellipticus*
- Mucor racemosus*
- Mucor ravidus*
- Mucor recurvus* var. *aspinosus*
- Mucor recurvus* var. *indicus*
- Mucor recurvus* var. *recurvus*
- Mucor sarawakiensis*
- Mucor silvaticus*
- Mucor subtilissimus*
- Mucor sympodialis*
- Mucor tanatus*
- Mucor varians*
- Mucor verticilliatus*
- Nawawiella apophysa*
- Tortumyces cameronensis*
- Tortumyces fimicola*
- Zygorhynchus moelleri*

**Mucorales incertae sedis**

- Lentamyces zychae*
- Rhizopus arrhizus*
- Rhizopus arrhizus* var. *arrhizus*
- Rhizopus microsporus*
- Rhizopus microsporus* var. *oligosporus*
- Rhizopus microsporus* var. *rhizopodiformis*
- Rhizopus stolonifer*

**Pilobolaceae (Zoopagomycotina)**

- Pilobolus crystallinus* var. *crystallinus*

**Piptocephalidaceae**

- Piptocephalis indica*
- Piptocephalis lepidula*

**Saksenaceae**

- Saksenaea vasiformis*

**Syncephalastraceae**

- Syncephalastrum racemosum*

**Thamnidиaceae**

- Thamnostylum piriforme*

**Umbelopsidaceae**

- Umbelopsis isabellina*
- Umbelopsis ramanniana*

## 7. GLOMEROMYCOTA

Members of this phylum are arbuscular mycorrhizal fungi and are soil-borne, forming an obligate mutualistic symbiosis with many plants. This is a relatively small group with the genus *Glomus* the most specious with circa 85 species (Kirk *et al.* 2001). They form arbuscules inside cortical cells of plant roots, and spores are generally asexual. Only one species (*Xenomyces ochraceus*), is recorded from Malaysia and described by Cesati (1879) from Borneo. It has been referred to other genera, e.g. *Sclerocystis* and *Ackermannia*, but has been little reported since the early description by Cesati.

Many studies on arbuscular mycorrhizal fungi were conducted in Malaysia in the 1990s, ranging from surveys to inoculation studies but there are few published reports. Fungi obtained from field surveys were usually only identified to genus, e.g. *Acaulospora* sp., *Gigaspora* sp., *Glomus* sp. or to tentative species, while imported species were used for inoculation studies. Presently, a few local companies are using local Glomeromycota strains to produce arbuscular mycorrhizal inocula commercially but the actual species of fungi present in their products is a trade secret. Thus, although numerous species of the Glomeromycota are known to be found in Malaysia, the only reported species is *Xenomyces ochraceus*.

### *Incertae sedis*

*Xenomyces ochraceus*

## 8. FUNGAL-LIKE ORGANISMS: OOMYCETES, STRAMENOPILA/ CHROMISTA

Oomycetes are a group of filamentous protists that resemble true fungi and often referred to as water moulds. They are microscopic, reproduce both sexually with oospores and antheridia, and asexually with biflagellate zoospores. A few species produce aerial spores that are dispersed by wind. They are to be found in water or under conditions of high humidity, including marine and mangrove habitats. Oomycetes occur as saprobes of both plant and animal material or as aggressive parasites, often of economically important crops, e.g. potato blight, root rots and damping-off of seedlings. The class contains six orders, 13 families, 106 genera and circa 960 species. Oomycetes are morphologically very diverse, and four key groups can be recognized. The first group consists of *Phytophthora* species that cause diseases of economically important plants, e.g. potato blight, rhododendron root rot; nine species are recorded for Malaysia and these are mainly pathogens of chilli, tobacco and potato plants (Zainal and Sijam, 2007). The second group consists of *Pythium* species which generally are the cause of damping-off in seedlings in greenhouses with 17 recorded in this checklist. The third group, the downy mildews occur on the underside of leaves, with the genus *Albugo* the most common; three species are listed here. The fourth group is *Saprolegnia* species or true water molds and important pathogens of fish and their eggs, while *Aphanomyces* is a destructive parasite on roots of economically important plants such as peas, radishes and sugar beet. Surprisingly, there is no published record of this group for Malaysia. That this group of fungal-like organisms is understudied in Malaysia is an understatement, with only 33 species listed in this checklist (less than 4% of the world total). Further species known to occur in Malaysia based on culture collections and fungarium records are listed in the Appendix.

Most of the Oomycetes reported for Malaysia are those of economical importance such as species of *Phytophthora* that cause black stripe and leaf fall of rubber, canker and black pod of cocoa (Tay and Bong, 1992), stem cankers of durian (Lim and Chan, 1986) and cocoa (Tay and Bong, 1992). *Phytophthora* species also cause root rots of pepper, papaya, guava and citrus (Lim and Khoo, 1990).

A summary of the Oomycetes reported for Malaysia, that is a total of 33 species in seven genera and three families is given below.

### **Albuginaceae**

- Albugo candida*  
*Albugo ipomoeae-aquatica*  
*Albugo ipomoeae-panduratae*  
*Wilsoniana bliti*

### *Phytophthora citrophthora*

- Phytophthora colocasiae*  
*Phytophthora infestans*  
*Phytophthora meadii*  
*Phytophthora nicotianae*  
*Phytophthora palmivora*  
*Plasmopara viticola*  
*Pseudoperonospora cubensis*

### **Peronosporaceae**

- Hyaloperonospora parasitica*  
*Phytophthora botryosa*  
*Phytophthora capsici*  
*Phytophthora cinnamomi*

### **Pythiaceae**

- Pythium acanthicum*

<i>Pythium adhaerens</i>	<i>Pythium graminicola</i>
<i>Pythium aphanidermatum</i>	<i>Pythium helicooides</i>
<i>Pythium arrhenomanes</i>	<i>Pythium irregulare</i>
<i>Pythium butleri</i>	<i>Pythium middletonii</i>
<i>Pythium debaryanum</i>	<i>Pythium myriotylum</i>
<i>Pythium deliense</i>	<i>Pythium splendens</i>
<i>Pythium dissotocum</i>	<i>Pythium vanterpoolii</i>
<i>Pythium echinocarpum</i>	<i>Pythium vexans</i>

## 9. PROTISTA: MYCETOZOA, MYXOMYCETES or MYXOMYCOTA

Myxomycetes, or slime molds, have been traditionally studied by mycologists as they were thought to be fungi. Recent molecular phylogenetic studies however, place them in the Protista; they are not true fungi and are thus excluded from the fungal kingdom. We include them here as they were studied as fungi and documented in Malaysia by Sanderson (1922), Emoto (1931) and Nawawi (1973c). However, in keeping with the current convention, these microorganisms are not included in our total count of the fungi of Malaysia.

Phylogenetically slime molds as a group, are polyphyletic, and have been divided between several supergroups: myxomycetes, dictyostelids and protostelids. There are six orders of myxomycetes with circa 700 species of which 77 are reported for Malaysia. Myxomycetes are phagotrophic in their nutrition with many stages in their life cycles: uninucleate cells which may be flagellate, a multinucleate phase referred to as a plasmodium, a resting stage consisting of a sclerotium and a reproductive stage with walled spores that are variously dispersed by wind, water or arthropods. They occur on decaying logs, dead leaves and are worldwide in distribution. The plasmodia and reproductive phases are often brightly coloured.

The Myxomycetes reported for Malaysia are listed below:

<i>Arcyria cinerea</i>	<i>Diderma arboreum</i>
<i>Arcyria denudata</i>	<i>Diderma effusum</i>
<i>Arcyria ferruginea</i>	<i>Diderma hemisphaericum</i>
<i>Arcyria insignis</i>	<i>Didymium clavus</i>
<i>Arcyria nutans</i>	<i>Didymium leoninum</i>
<i>Arcyria oerstedii</i>	<i>Didymium nigripes</i>
<i>Arcyria punicea</i>	<i>Fuligo aurea</i>
<i>Arcyria virescens</i>	<i>Fuligo cinerea</i>
<i>Badhamia affinis</i>	<i>Fuligo septica</i> var. <i>septica</i>
<i>Badhamia orbiculata</i>	<i>Hemitrichia clavata</i>
<i>Calomyxa metallica</i>	<i>Hemitrichia serpula</i>
<i>Ceratiomyxa fruticulos</i> a	<i>Licea retiformis</i>
<i>Ceratiomyxa fruticulos</i> a var. <i>flexuosa</i>	<i>Lycogala epidendrum</i>
<i>Collaria arcyronema</i>	<i>Metatrichia vesparium</i>
<i>Comatricha irregularis</i>	<i>Perichaena chrysosperma</i>
<i>Comatricha laxa</i>	<i>Perichaena corticalis</i>
<i>Comatricha pulchella</i>	<i>Perichaena depressa</i>
<i>Craterium minutum</i>	<i>Perichaena vermicularis</i>
<i>Cibraria cancellata</i> var. <i>cancellata</i>	<i>Physarella oblonga</i>
<i>Cibraria intricata</i>	<i>Physarum auriscalpium</i>
<i>Cibraria intricata</i> var. <i>dictydioides</i>	<i>Physarum columbinum</i>
<i>Cibraria microcarpa</i>	<i>Physarum compressum</i>
<i>Cibraria splendens</i>	<i>Physarum lateritium</i>
<i>Cibraria violacea</i>	<i>Physarum melleum</i>
<i>Diachea leucopoda</i>	<i>Physarum nicaraguense</i>
<i>Dictydiaethalium plumbeum</i>	<i>Physarum nucleatum</i>

<i>Physarum nutans</i>	<i>Stemonitis fusca</i> var. <i>fusca</i>
<i>Physarum pezizoideum</i>	<i>Stemonitis herbarica</i>
<i>Physarum psittacinum</i> var. <i>fulvum</i>	<i>Stemonitis pallida</i>
<i>Physarum pusillum</i>	<i>Stemonitis splendens</i>
<i>Physarum reniforme</i>	<i>Stemonitopsis typhina</i>
<i>Physarum virescens</i>	<i>Sympylocarpus longus</i>
<i>Physarum viride</i> var. <i>aurantium</i>	<i>Trichia affinis</i>
<i>Physarum viride</i> var. <i>incanum</i>	<i>Trichia persimilis</i>
<i>Physarum viride</i> var. <i>rigidum</i>	<i>Tubifera bombarda</i>
<i>Physarum viride</i> var. <i>viride</i>	<i>Tubifera ferruginosa</i>
<i>Reticularia lycoperdon</i>	<i>Tubifera stipitata</i>
<i>Stegasma pallidum</i>	<i>Willkommlangea reticulata</i>
<i>Stemonitis ferruginea</i>	

## 10. CHECKLIST (?= uncertain or questionable)

## **PLATES**

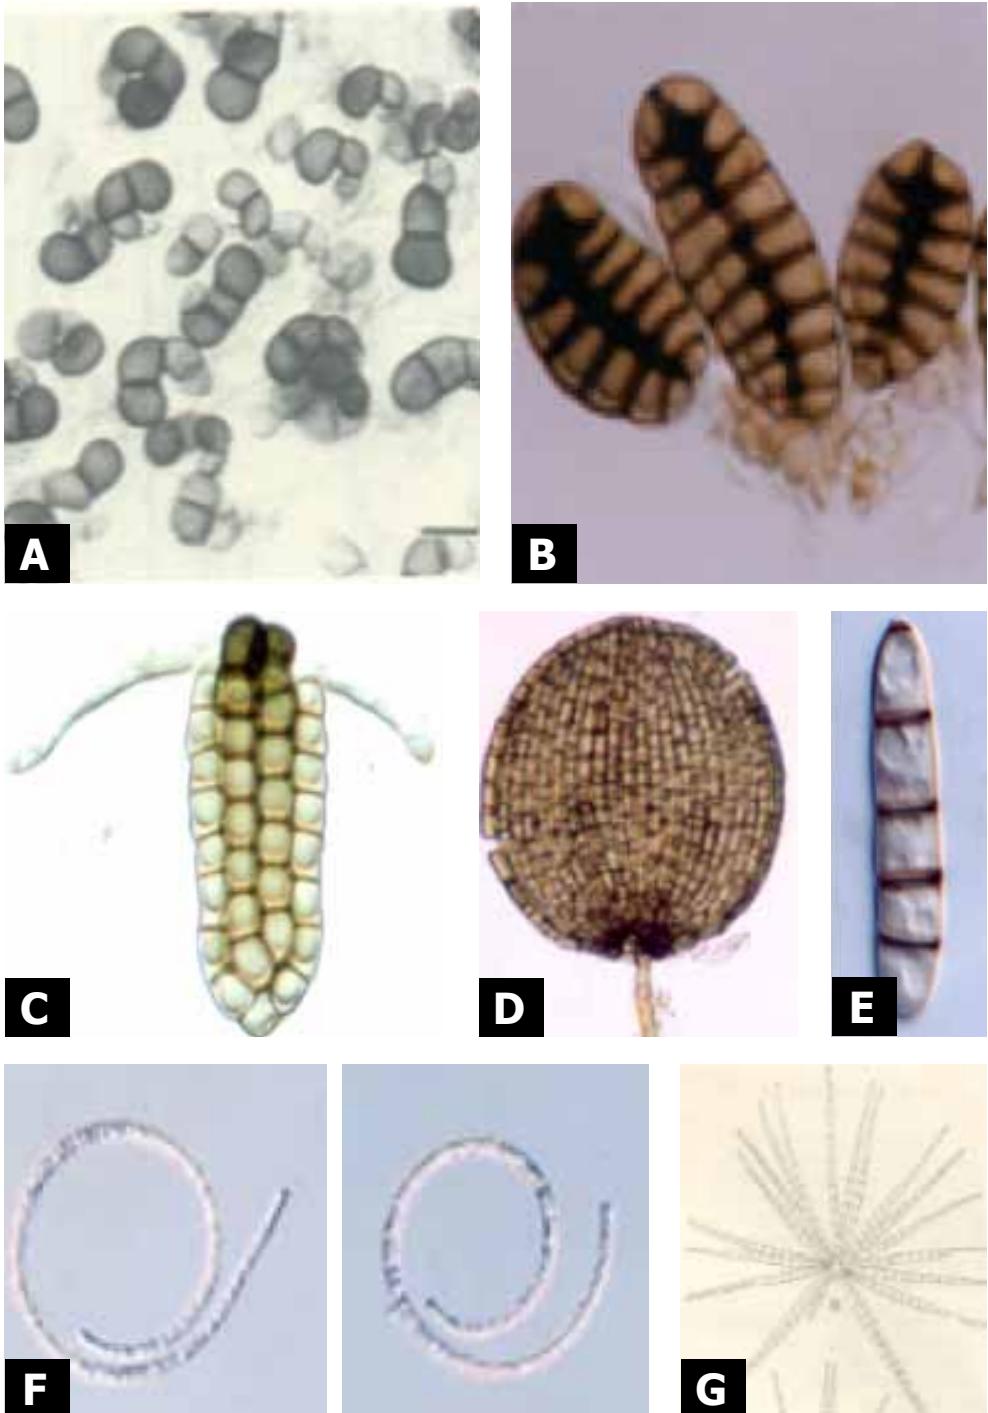

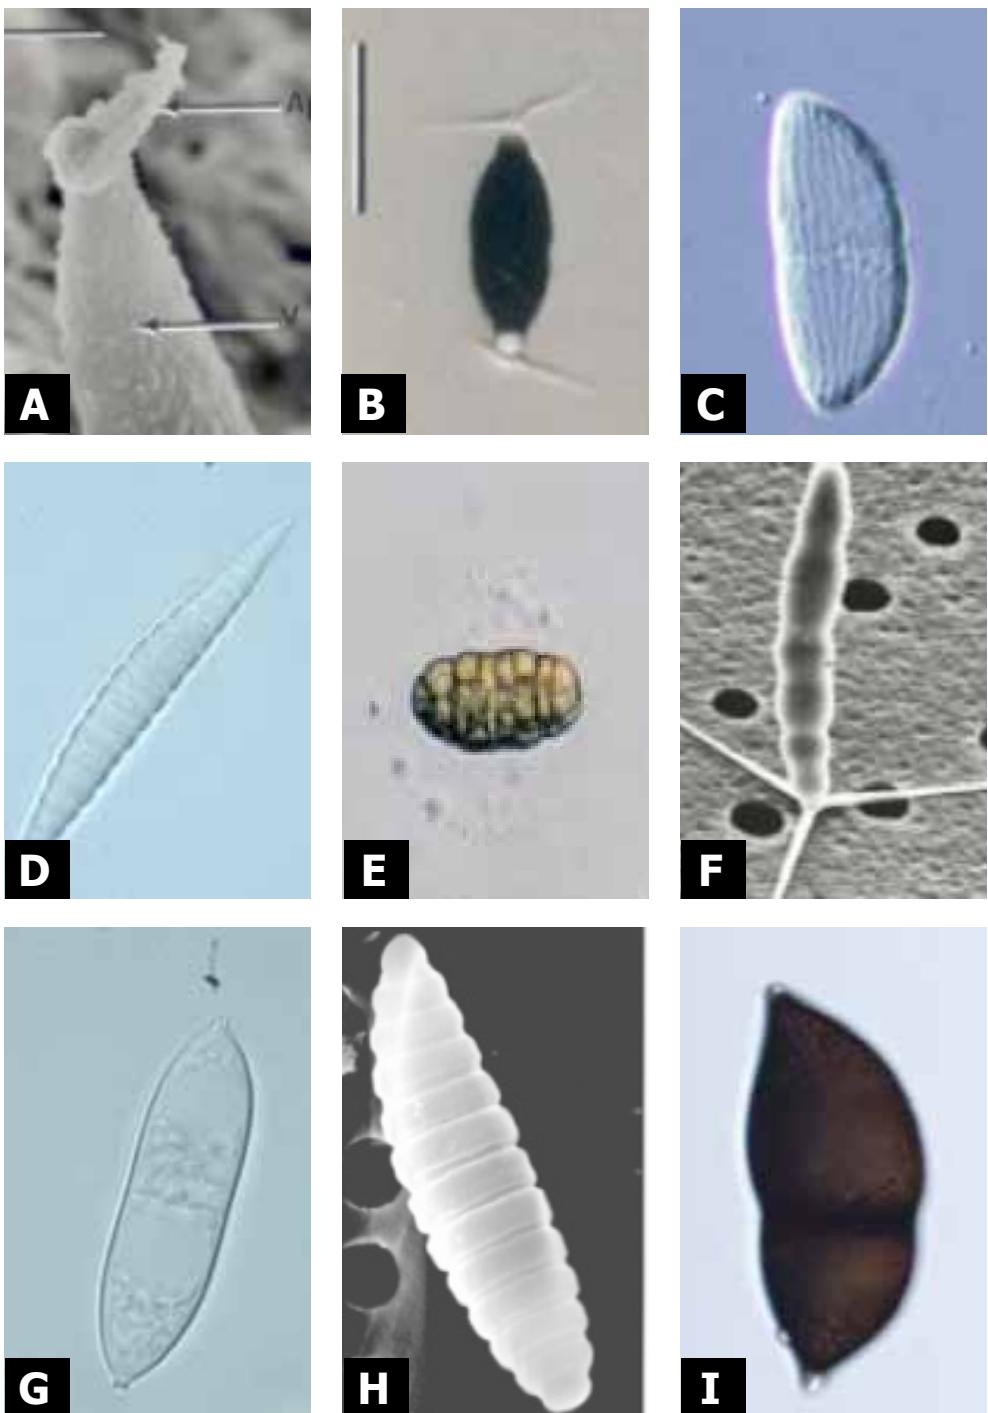

**Plate 1.** A, Ascospores and asci of *Pyrenographa*. B, Ascus, spores and paraphyses of *Quintaria lignatilis*. C, Three ascospores of *Helicascus kanaloanus*. D, Hyaline ascospore of *Quintaria lignatilis*. E. Appendaged ascospore of *Antennospora quadriremis*.

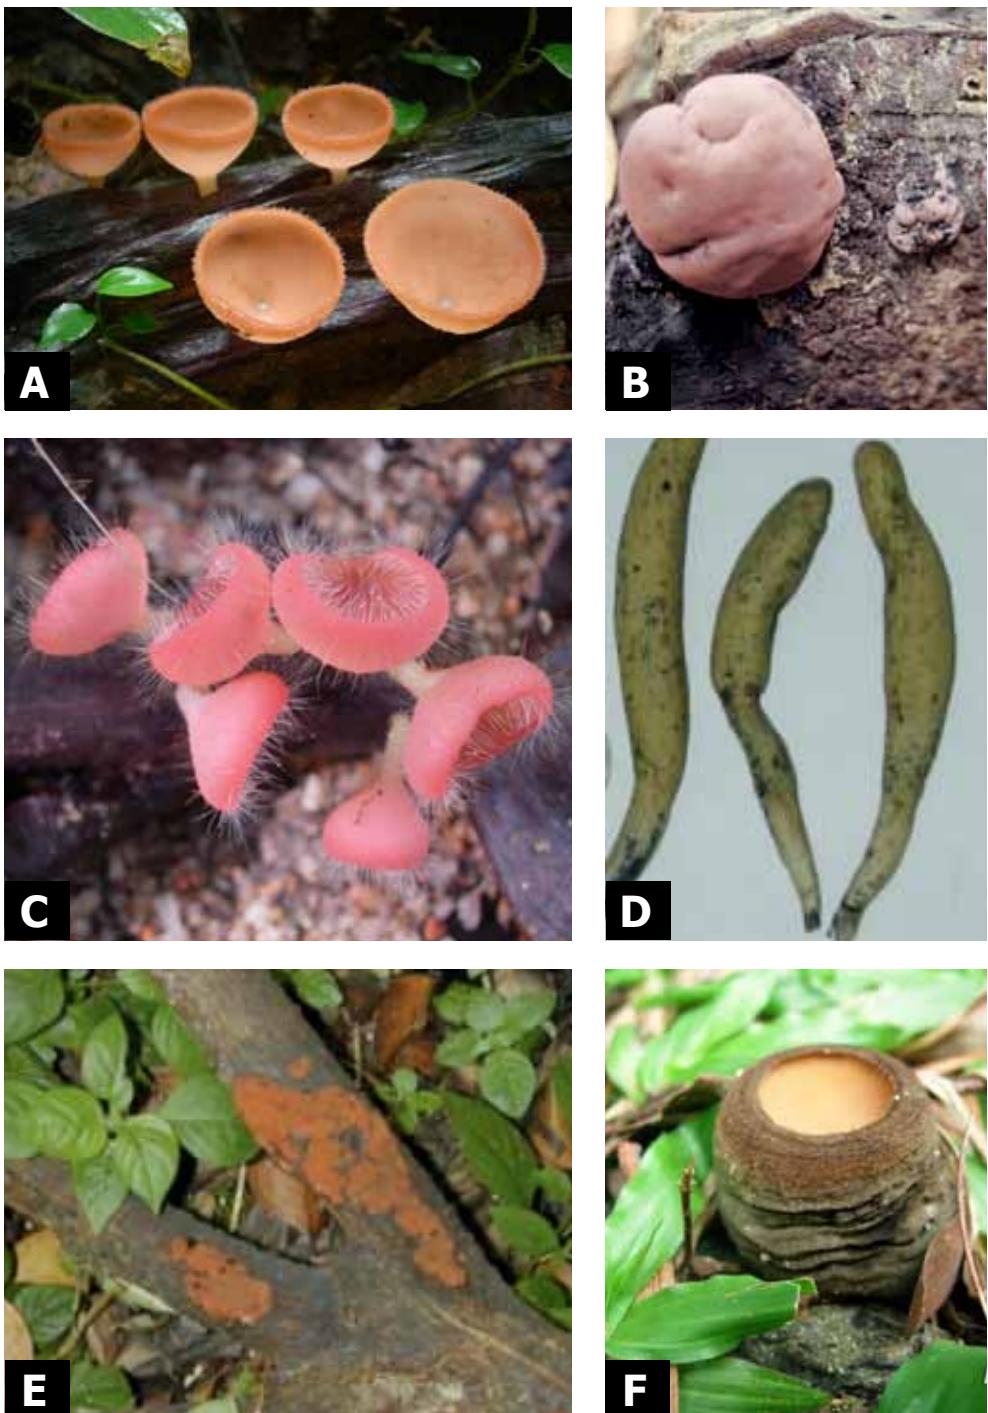

**Plate 2.** Conidial head of *Aspergillus* sp. B, Sigmoid fresh water conidium (SEM). C, Septate conidia of *Dendryphiella salina*. D, Helicoid conidium of *Hydea pygmea*.

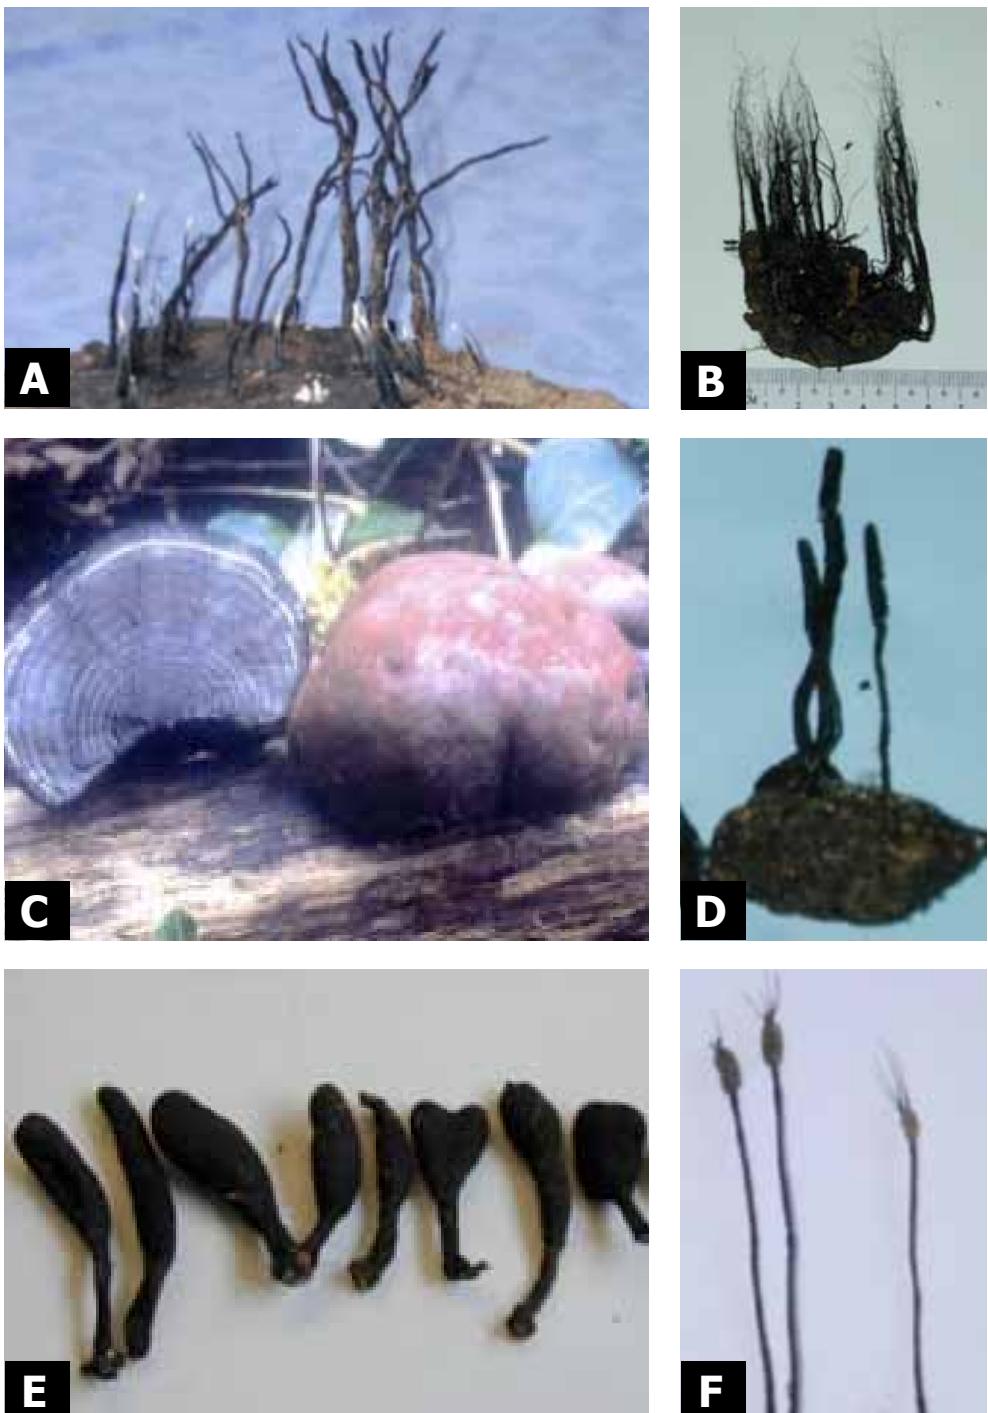

**Plate 3.** A, Conidia of *Cirrenalia* sp. B, Conidia of *Canalisporium caribense*. C, Conidium of *Dictyosporium nigroapice*. D, Conidium of *Cancellidium appanatum*. E, Septate conidium of *Dendryphiella salina*. F, Conidia of *Helicomyces roseus*. G, Branched conidium of *Flabelllospora* sp.

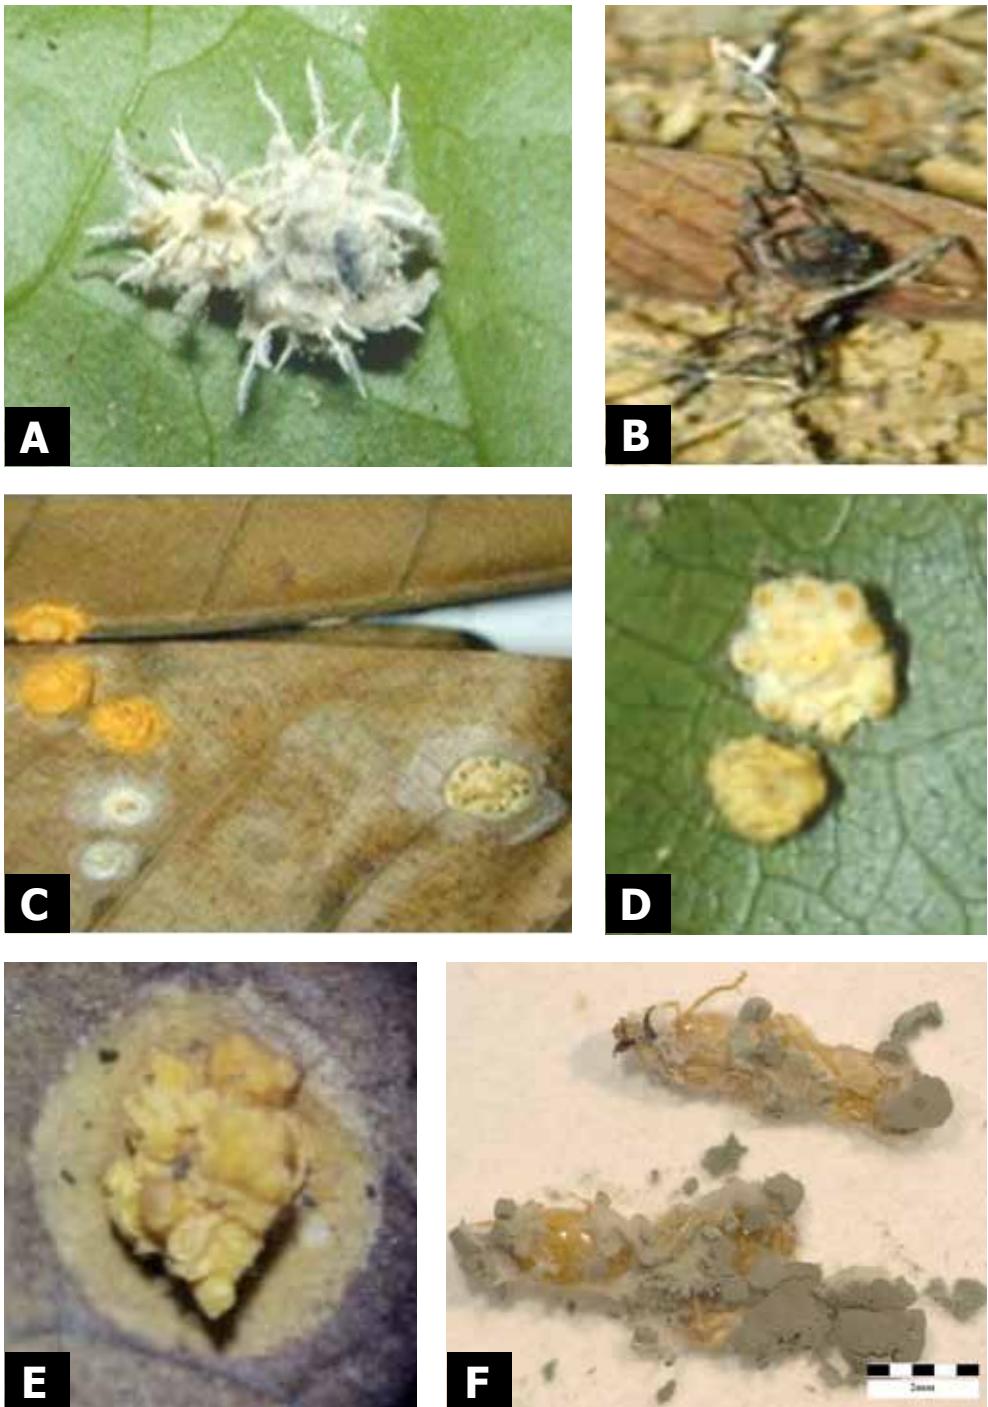

**Plate 4.** A, SEM of polar appendage of *Tirisporella beccariana* ascospore. B, Appendaged ascospore of *Savyella appendiculata*. C, Striated hyaline ascospore of *Cosmospora* sp. D, Septate ascospore of *Saccardoella* sp. E, Ascospore of *Julella avicenniae* with sheath. F, SEM of appendaged ascospore of *Torpedospora radiata*. G, Ascospore of *Cucullospora mangrovei*. H, SEM of *Mauritiana rhizophorae* ascospore. I, Ascospore of *Helicascus kanaloanus* with polar germ pores.

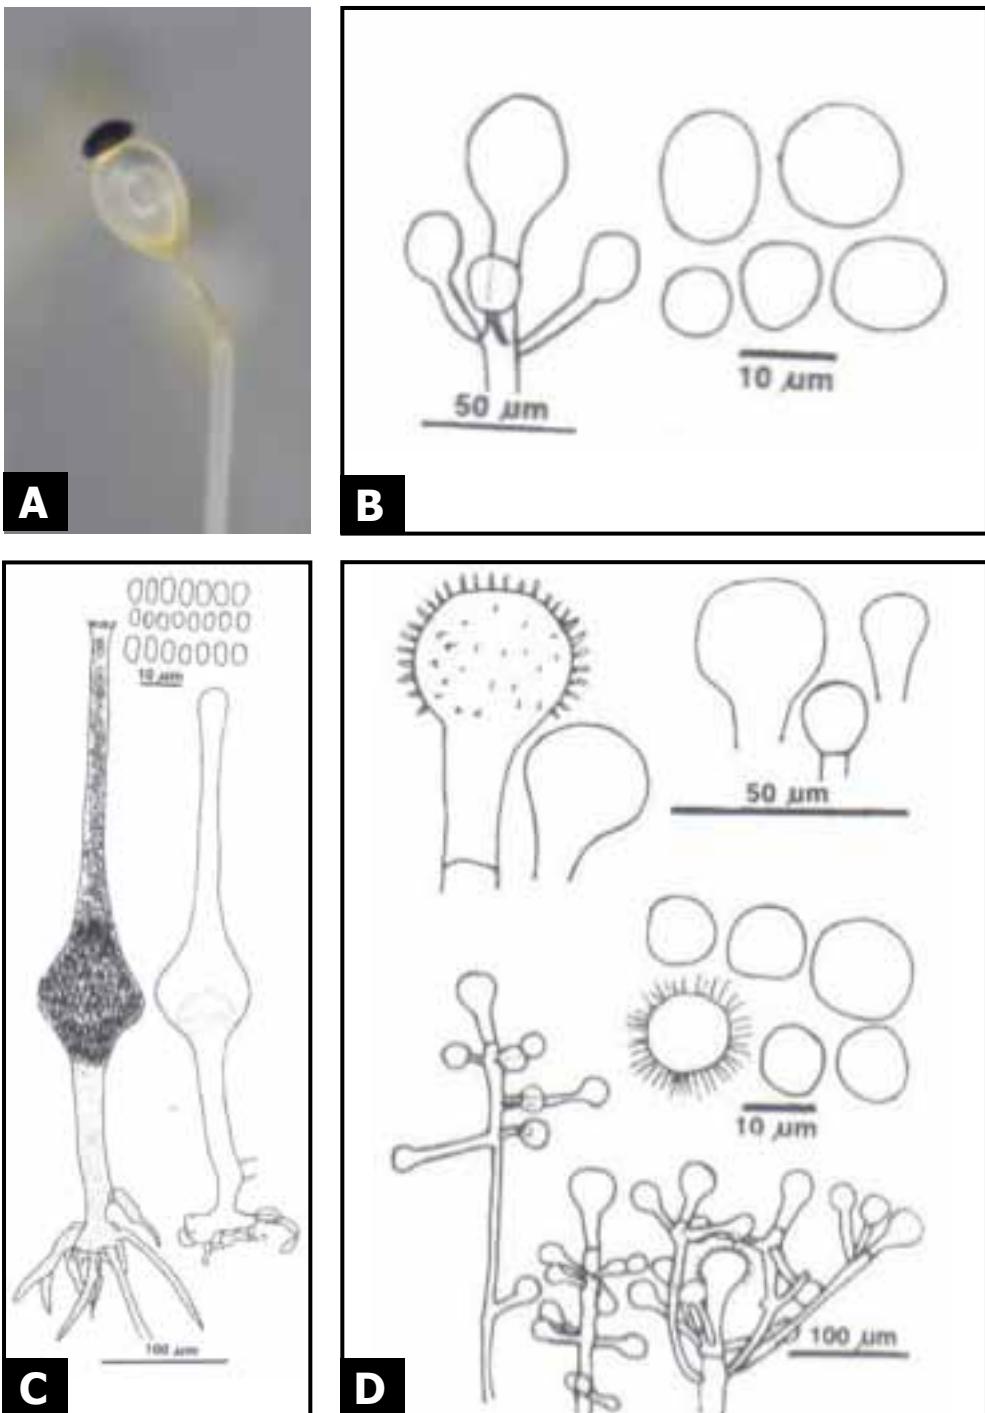

**Plate 5.** Selected lignicolous ascomycetes. A, *Cookenia sulcipes*. B, *Daldinia eschscholtzii*. C, *Cookenia trichloma*. D, *Xylaria* cf. *grammica*. E, *Hypoxylon haematostroma*. F, *Galiella* sp.

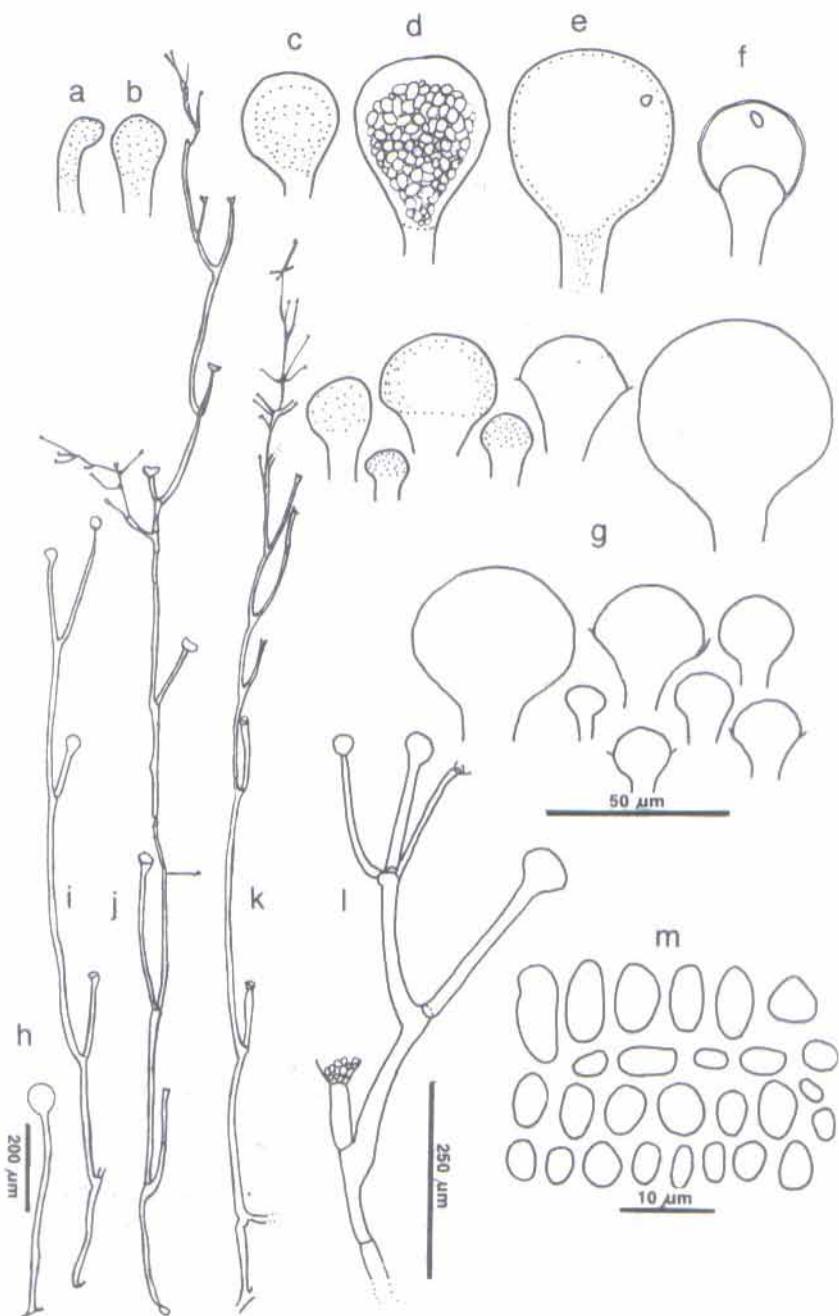

**Plate 6.** Selected xylariaceous species on wood and seeds. A & B, *Xylaria ianthinovelutina*. C, *Daldinia eschscholtzii* cross-section to show concentric rings characteristic of the genus. D, Unidentified *Xylaria* sp. on seed at Kuala Selangor. E, *Xylaria obovata*. F, *Xylaria aristata*.

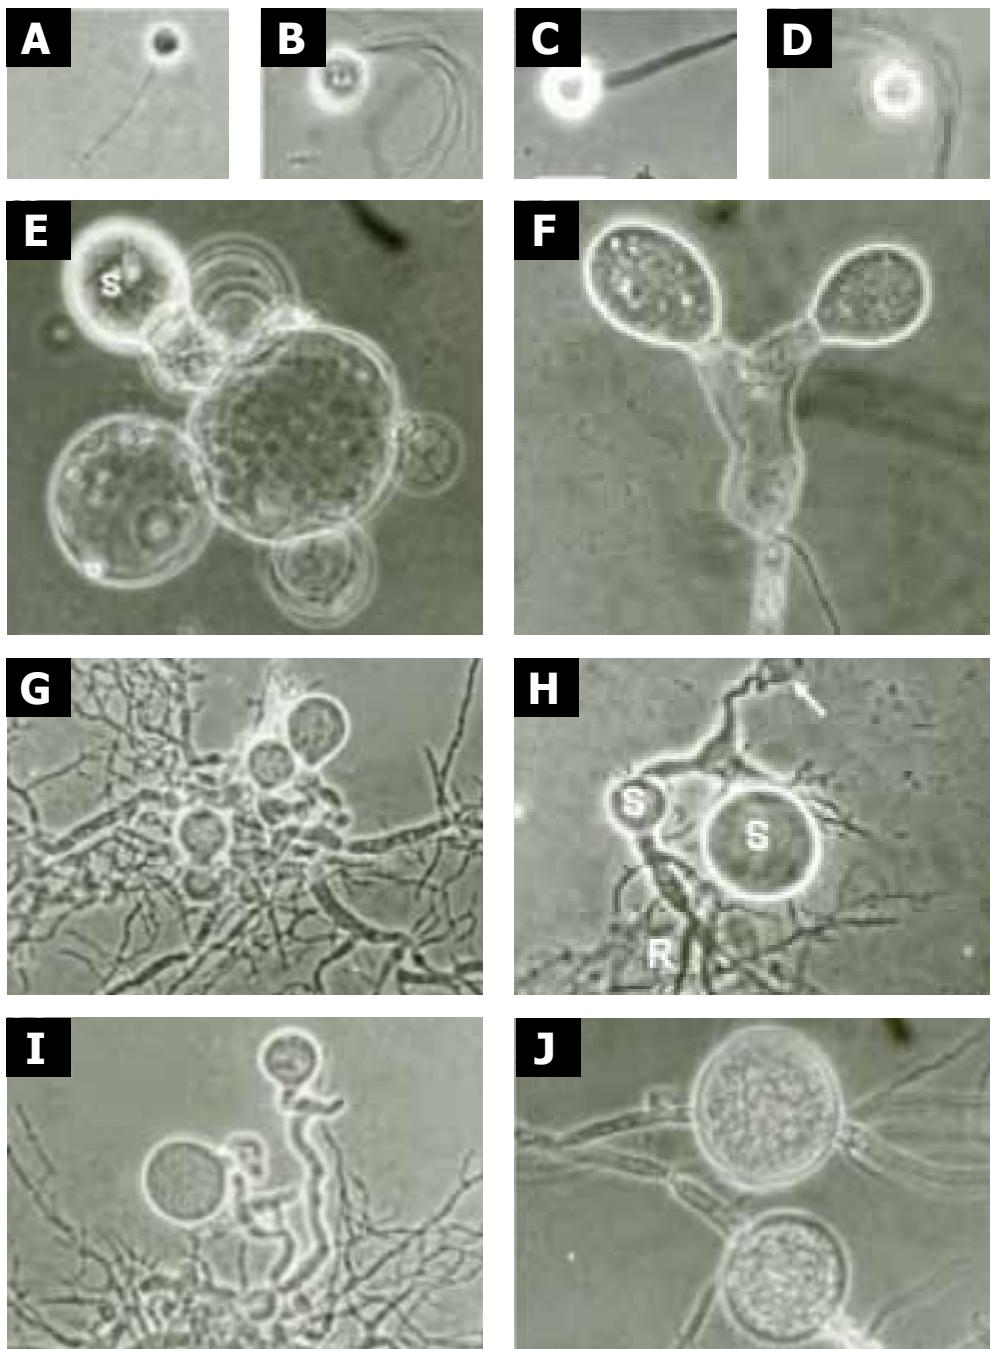

**Plate 7.** Entomopathological fungi on selected host insects. A, *Gibellula pulchra*. B, *Stilbella* cf. *buguetii*. C, *Hypocrella* sp. D, *Aschersonia placenta*. E, *Hypocrella raciborskii*. Photos A-E courtesy Dr Theresa Kwong. F, *Metarhizium anisopliae* on *Coptotermes curvignathus*. Photo courtesy of Dr. Mohd Farid Ahmad.

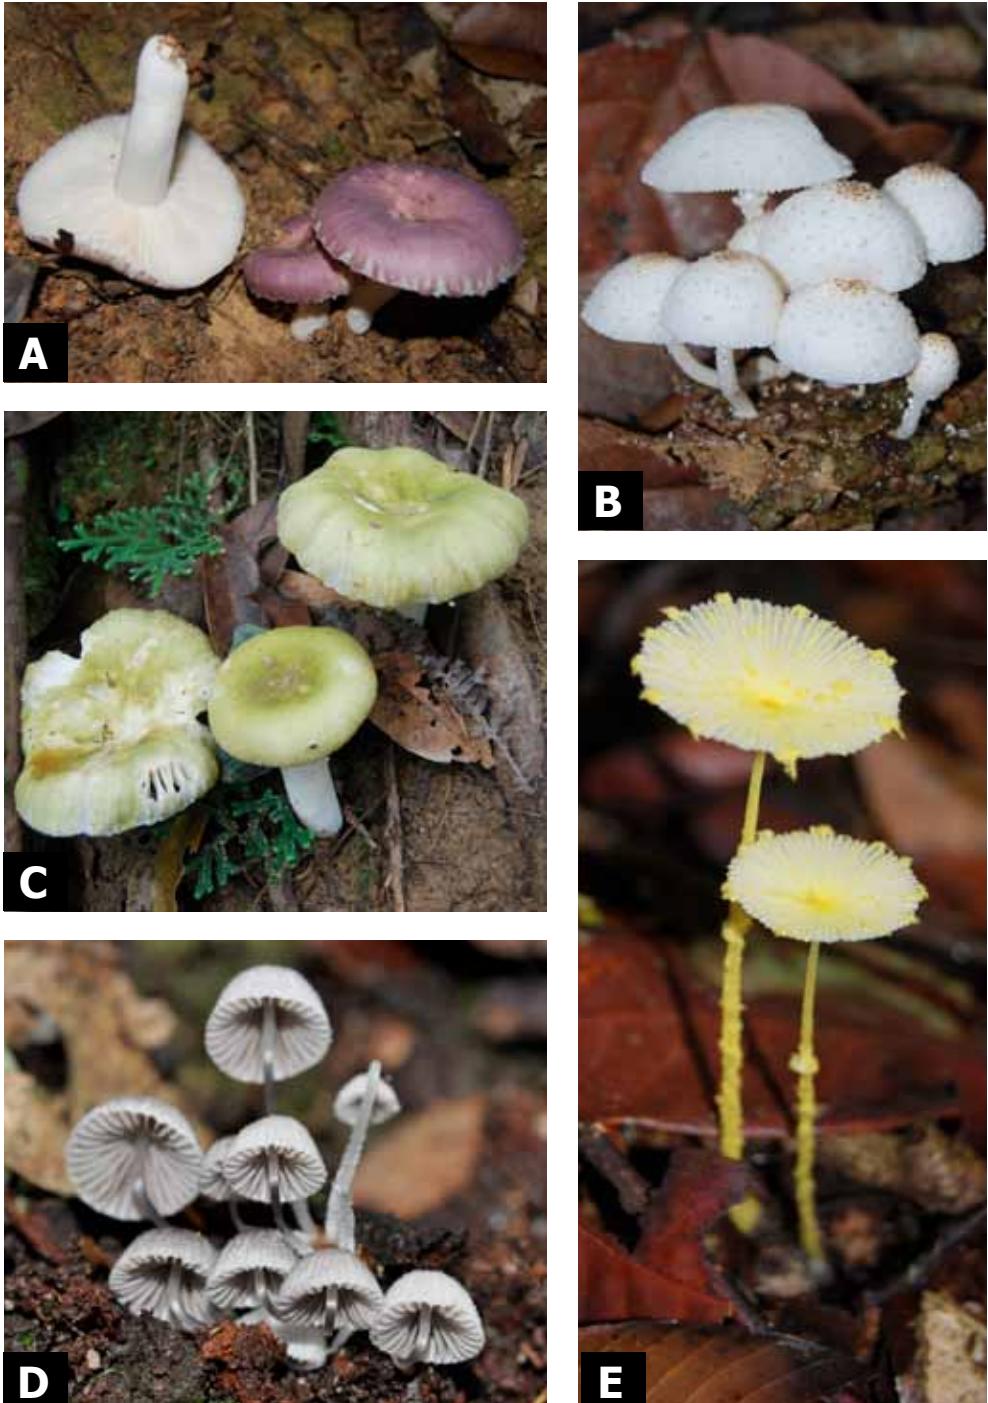

**Plate 8.** A, *Pilobolus crystalinus*, sporangium and subsporangial swelling at the tip of the sporophore. Common species on dung. B, Sporophores and sporangiola of *Cunninghamella echinulata*. C, *Saksenaea vasiformis*. D, Fertile terminal, fertile vesicles, sporangiola and sporophores of *Cunninghamella blakesleeana*. After Loh *et al.*, 2001 (with permission of University of Malaya).

**Plate 9.** *Thermomucor humiculus*. a – c, Immature sporangia with dense cytoplasm. d – f, Relative size and shape of sporangia, columellae and sporangiospores. The double-lined drawing of e indicates the thickness of the sporangial-wall. d, Some empty space is found in the sporangium. e, Columella is obscured by the sporangiospores. g, Columellae. h – k, young to old sporangiophores. l, A magnified drawing of upper end of k. The upper row are aged 3 days and the lower row are of age 8 days. m, Sporangiospores. Scale bar – 20  $\mu$ m. After Loh *et al.*, 2001 (with permission of University of Malaya).

**Plate 10.** Diversity of chytrid zoospores. A. Uniflagellate zoospore of *Piromyces minutus*. B. Polyflagellate zoospore of *Orpinomyces joyonii*. C. Polyflagellate zoospore of *Neocallimastix frontalis*. D. Zoospore with shed flagella (*Neocallimastix frontalis*). E. Thallus with bulbous rhizoids (*Caecomyces communis*). F. Thallus with two sporangia (*Piromyces rhizinflatus*). G. Polycentric thallus with many sporangia (*Orpinomyces joyonii*). H. Persistent cyst (*Orpinomyces intercalaris*). I. ## **The Authors:**

Su See Lee obtained her doctorate in plant science in 1992 from the University of Aberdeen and has worked at FRIM for more than 20 years as a researcher in forest pathology, ectomycorrhizas and macrofungal diversity. She is currently Head of the Forest Health and Conservation Programme, Biodiversity Division, FRIM.

Siti Aisyah Alias obtained her doctorate in Marine Mycology from the University of Portsmouth in 1995 and returned to University Malaya as Associate Professor. She is deputy director of UM Antarctic Institute and the co-author of the IOES volume on “Marine Fungi from Mangroves of Malaysia”.

E.B. Gareth Jones holds the D.Sc. degree of the University of Wales and is currently visiting Professor in the Institute of Ocean and Earth Sciences, University Malaya. He has studied tropical fungal diversity in Hong Kong, Singapore, Malaysia, Philippines, and Thailand.

Nazura Zainuddin and Agnes Chan are both M.Sc. graduates of the University of Malaya, and were research assistants on the project, Inventory and Research of Macrofungi in Peninsular Malaysia, of which this book is one of the main outputs.

# APPENDIX

CABI UK Centre (Egham),  
Bakeham Lane,  
Egham, Surrey, TW20 9TY,  
United Kingdom

The CABI collection (IMI) was started in the early 1940's by E.W. Mason (IMI 1 has an accession date of 16/07/1945) and contains well over 400,000 specimens. It is particularly rich in material from the former British Empire and the Commonwealth, for obvious reasons; Malaysia ranks fifth in terms of numbers of specimens with nearly 12,000 surpassed only by the UK, India, USA and Australia. The most prolific collector is Anthony Johnston (with over 10% of the total) who spent well over a decade in Malaysia as the government Plant Pathologist in the 1950's and early 1960's. The collection was relocated to the Royal Botanic Gardens, Kew in 2008 as part of a CABI-Kew collaboration; it is databased and on the web at [www.herbimi.info](http://www.herbimi.info).

IMI number	Name	Substratum/Associated Organism	Year	Current Name	Locality
<b>Kingdom: Chromista</b>					
<b>Phylum: Oomycota</b>					
<b>Class: Peronospora</b>					
<b>Family: Albuginaceae</b>					
37812	<i>Albugo bliti</i>	<i>Amaranthus gangeticus</i>	1949	<i>Wilsoniana bliti</i>	Unspecified
