Introduction

1

“SAP Device Driver for SATO printers” is an SAP Smart Forms printing solution to SATO printers. It allows users to use a driver for a Page Description Language (PDL) that is implemented in Advanced Business Application Programming (ABAP) and resided in the SAP environment to print SATO printer without 3rd party solutions. With this device driver, SATO Barcode Printer Language (SBPL) is sent to the SATO printer directly from the SAP system — providing greater performance and efficiency.

This document explains the necessary environment and configuration to use such a solution.

SAP Environment

2

The following SAP environment supports the ABAP based PDL drivers:

- SAP_BASIS Release 6.20:
Support Package SAPKB62064 + attached correction instructions or
Support Package SAPKB62065 + attached correction instructions
or Support Package SAPKB62066
Kernel 6.40 patch level 222
- SAP_BASIS Release 6.40:
Support Package SAPKB64022 + attached correction instruction
or Support Package SAPKB64023
Kernel 6.40 patch level 222
- SAP_BASIS Release 7.00:
Support Package SAPKB70014 + attached correction instruction
or Support Package SAPKB70016
Kernel 7.00 patch level 148
- SAP_BASIS Release 7.01:
supported from the beginning
- SAP_BASIS Release 7.10:
not supported in 7.10
- SAP_BASIS Release 7.11 and higher:
supported from the beginning

Please refer to the [SAP Notes: 1097563](#) for the updated information about the overview of the SAP PDL driver.

Overview of Solution

3

This solution is primarily for Smart Forms printing. It requires 2 components from the printer providers, such as SATO.

- ABAP Based PDL device driver
- Device Type files

After uploading the components into the SAP system, users will

- Use Smart Styles to define the available printing items in the device type,
- Use Smart Forms to design the label
- Define Output Device that points to the given Device Type
- Print the Smart Forms through the output device.

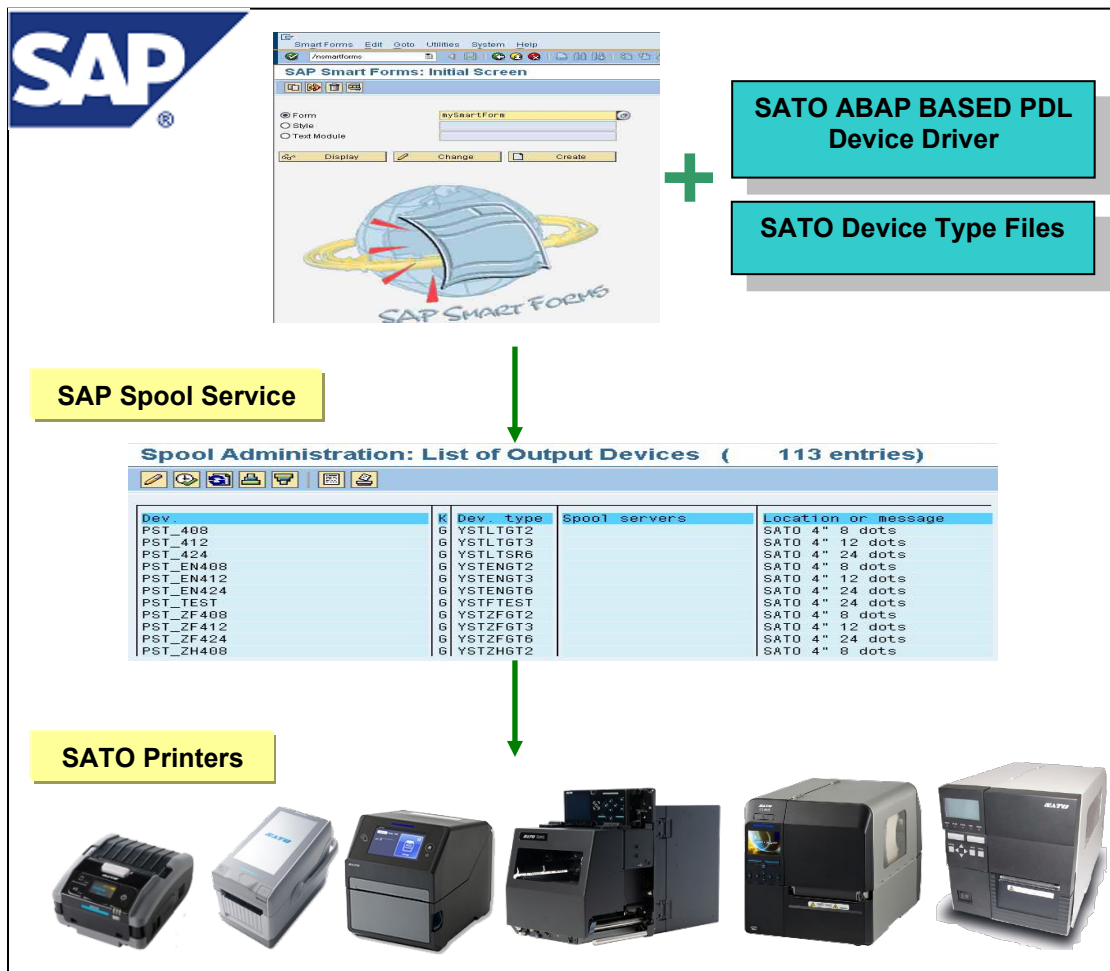

Figure 1 Overview of solution

Please refer to the [SAP Notes: 1135106](https://www.sap.com/help/notes/1135106) for the updated information about the SATO PDL Driver.

Using SATO Device Type

4

The following device types for SATO PDL Driver are available:

Codepage	Name of Device Type	Resolution	Supported Models
Latin1 (ISO8859-1)	YSTLTGT2	203dpi	GT408e S8408 LT408 MB400i **S84-ex 203dpi **S86-ex 203dpi

Table 1 Device Types

Note: * denotes Japanese models

Note: ** denotes printer models that should have the LABEL_SIZE value described in Smart Forms when printing. For finding out more regarding filling out the label's width and height, please refer to [Section 6.5.2](#) and [Figure 60](#) of this document. The label width value using YSTCPCL2 device type should be 1216 and the value needs to be 1824 when using YSTCPCL3 device type when printing using the 6-inch label.

Table 2 Supported Languages of Device Types

Note: * denotes Japanese models (YSTJAx_{xx} version also support English ASCII font)

The following printer models support RFID Gen2 Barcode printing with SATO PDL Driver:

- CL4xxe
- CL6xxe
- GL4xxe
- GT4xxe/SR4xx
- M84xxSE
- S-84xx

* Ultra-High-Frequency (UHF) is used for the RFID encoding for the above printer models.

To print Asian languages from GT/SR or GL printer, a language memory cartridge is needed:

Language Pack	Part Number
GT Korean Memory Cartridge	WWGT0590C
GT Simplified and Traditional Cartridge	WWGT0590K
GL Simplified Chinese Memory Cartridge	WWGL159BC
GL Traditional Chinese Memory Cartridge	WWGL159DC
GL Korean Memory Cartridge	WWGL159FK
SR Japanese Cartridge	WSR401910

Table 3 Memory Cartridge and Part No.

The instruction of importing the PDL Device Driver can be found in the SAP Wizard Note: [Note 1103422 - SAP Printer Vendor program: Installing device types, etc.](#)

Copy the transport files to the proper locations in the SAP system:

- a. Copy the K*.PDT to the Cofile folder located at \usr\sap\trans\cofile
- b. Copy the R*.PDT to the Data folder located at \usr\sap\trans\data

Logon to the SAP ECC Dev System and open transaction STMS (Browse or type “STMS” in the transaction code area)

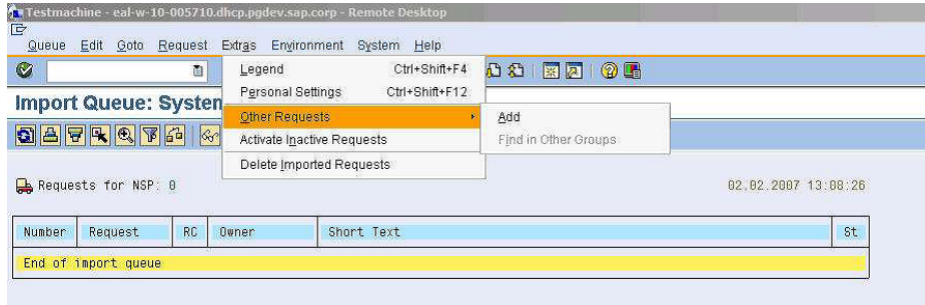

Figure 2 Adding transport request for PDL Device Driver

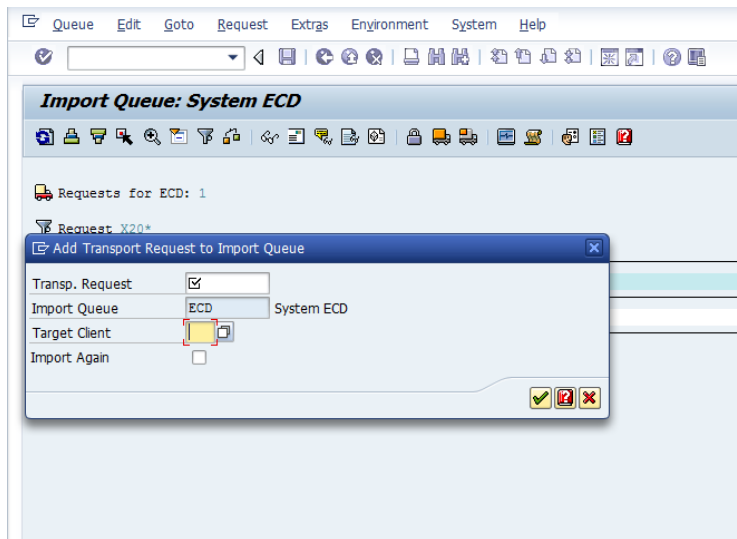

Figure 3 Enter target client and search for transport request

Search for the desired transport using the *wildcard selection and the transport file name (do not include the .PDT extension)

Figure 4 Search for transport file name

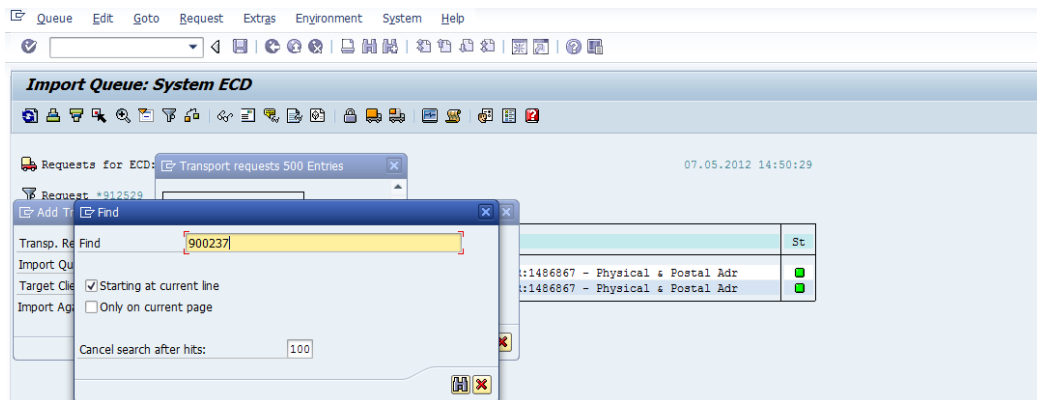

Figure 5 Identify desire transport number

Figure 6 Verify transport request

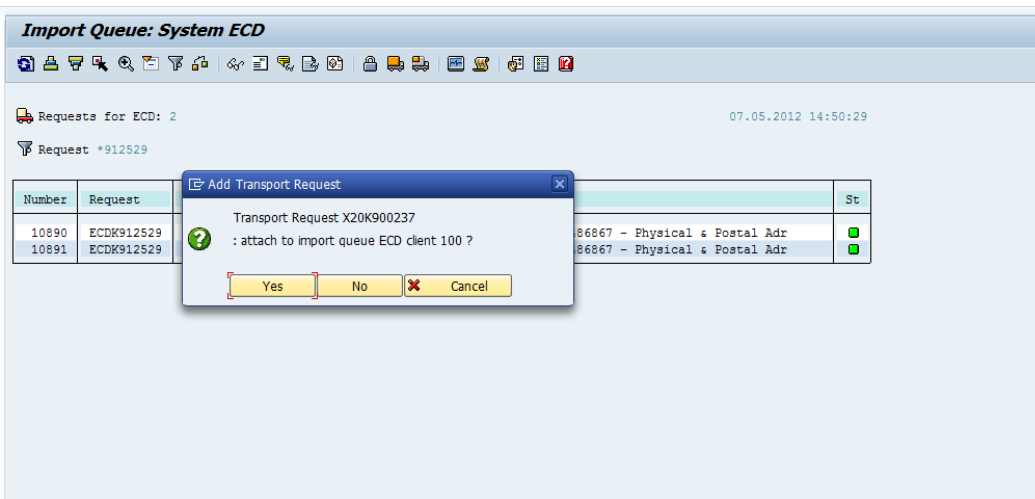

Figure 7 Confirm the transport request by click on the Yes button

The SATO Device Type has to be uploaded into the SAP system by using the program '*RSTXSCR*P' in the transaction code '*se38*'.

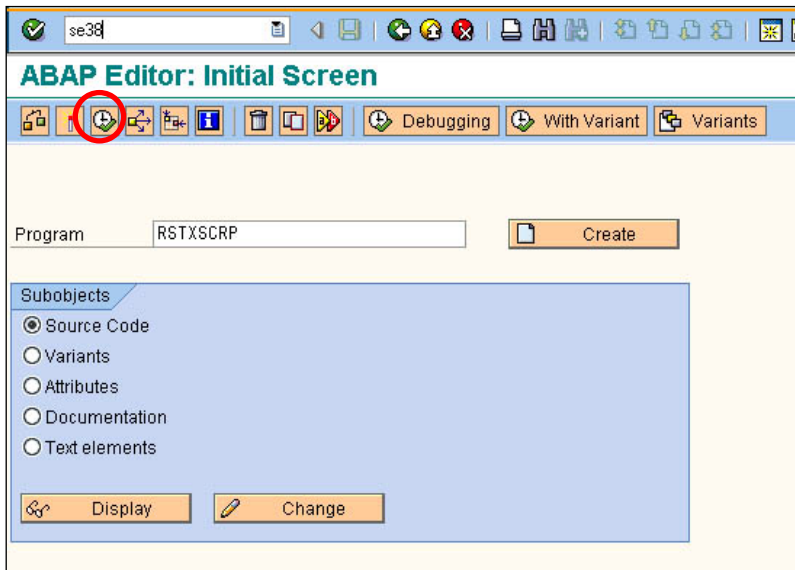

Figure 8 Uploading SATO Device Type

Click 'F8' to execute the command. The following screen will be displayed:

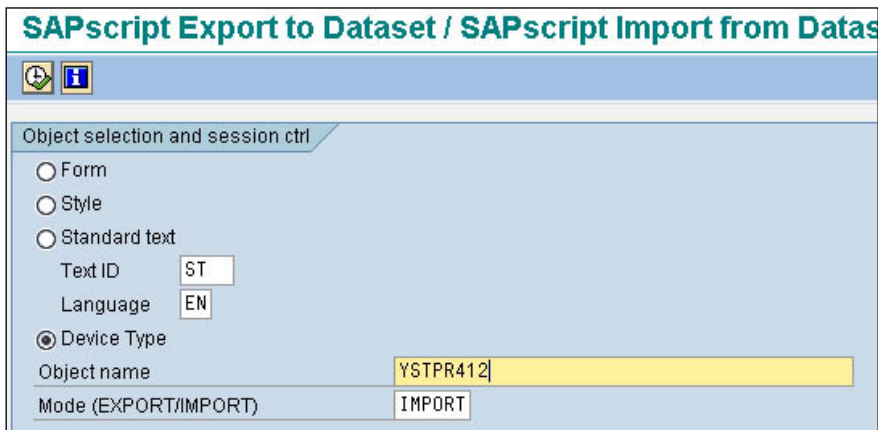

Figure 9 Importing Device Type file

Click on the radio button on 'Device Type'. Change the Mode (EXPORT/IMPORT) to 'IMPORT'. Then key in a name to represent the Device Type.

Note: The name must start with 'YST'. It should contain 8 characters. The object name must match with the file name of the device type (without the extension).

Click the Execute button (F8) to continue.

Figure 10 Selecting device type file

Creating Output Device

5

Enter '/nspad' transaction code to go to the Spool Administration application.

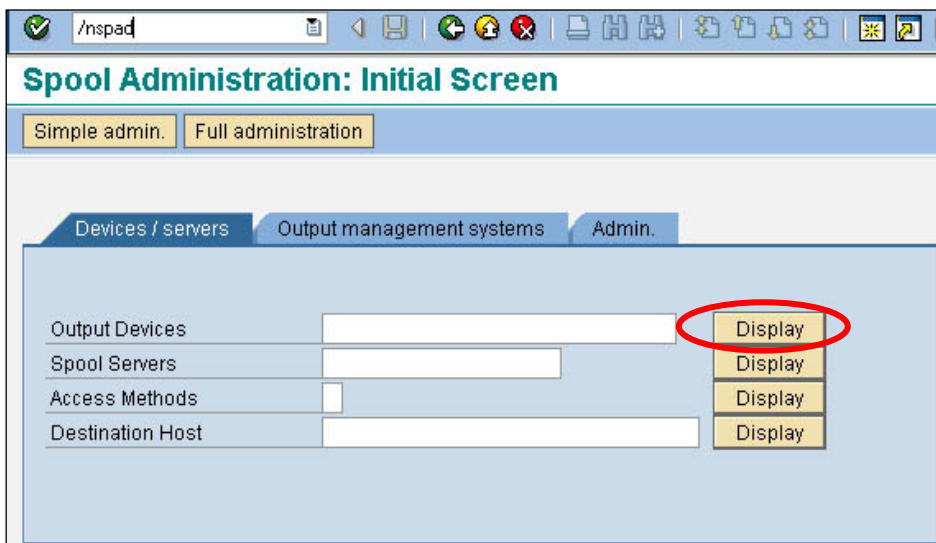

Figure 11 Creating Output Device

Under the Devices/Servers tab, click on the "Display" button for 'Output Devices'.

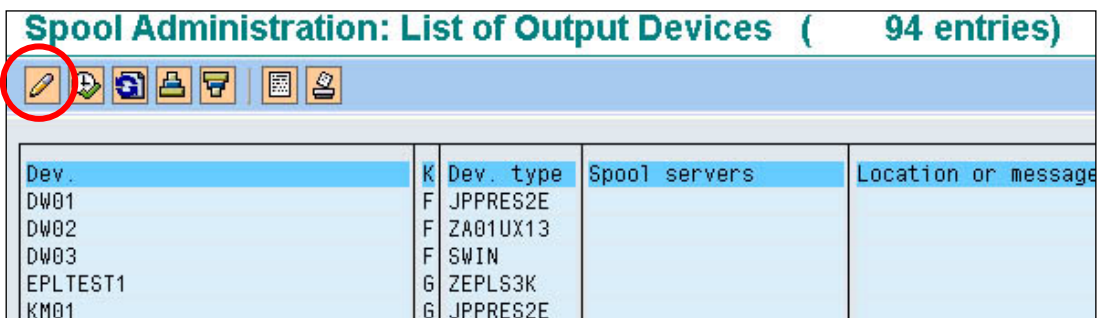

Figure 12 Click on the 'Edit' button to change the Edit mode

Figure 13 Edit Mode buttons

Click on the 'Create' button to create a new Output Device.

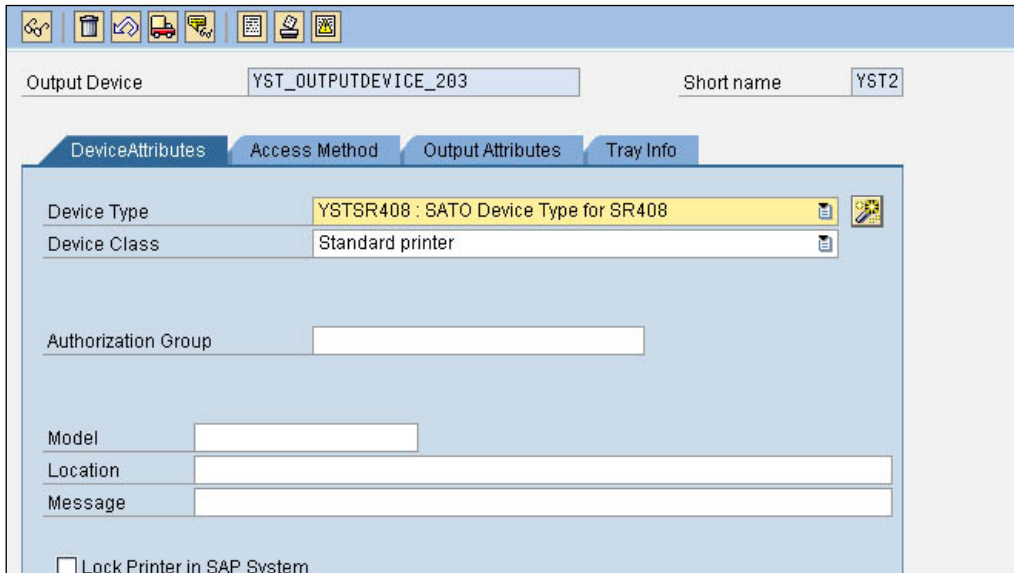

Figure 14 Defining Output Device

Enter a meaningful name in the textbox for Output Device. In the drop-down list of Device Type, select the Device Type you have previously uploaded into the SAP system.

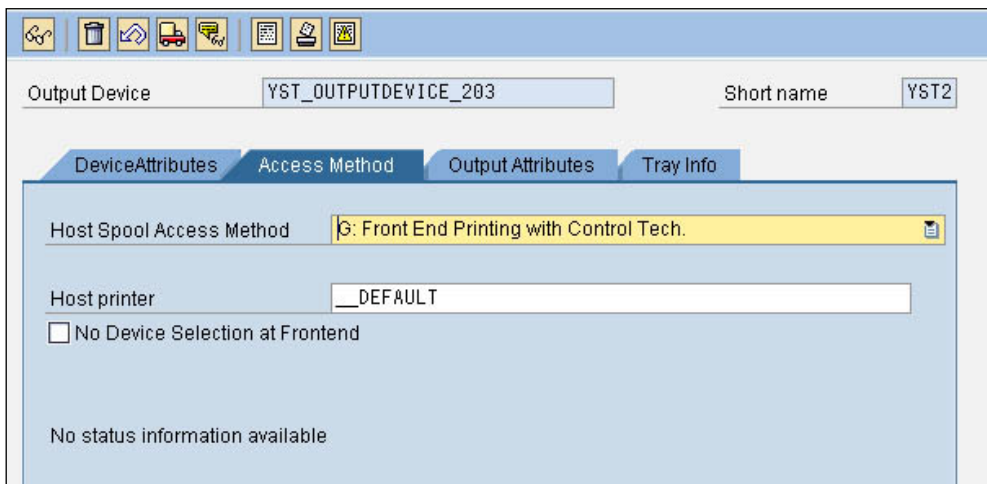

Figure 15 Defining Printing Method

Under the 'Access Method', define your Host Spool Access Method. In the above example, method "G: Front End Printing with Control Tech" will prompt the user to select a list of installed printer drivers under the 'Printer and Faxes' in your Windows platform.

Note: Method G is used here just for simplicity during testing.

Save the setting once the necessary information has been entered.

Functionalities of SATO-SAP Printer Driver

6

'SAP ABAP-Based Printer Driver for SATO printers' provides the following printing features:

6.1 Barcode

Both SAP traditional and new barcode symbology are supported. (Please refer to SAP notes: 430887 and 645158 for more information about the barcode symbology).

For New Barcode Technology (NBT), the user only needs to define the barcode in the SE73 transaction as System Barcode. The NBT supports the following barcodes:

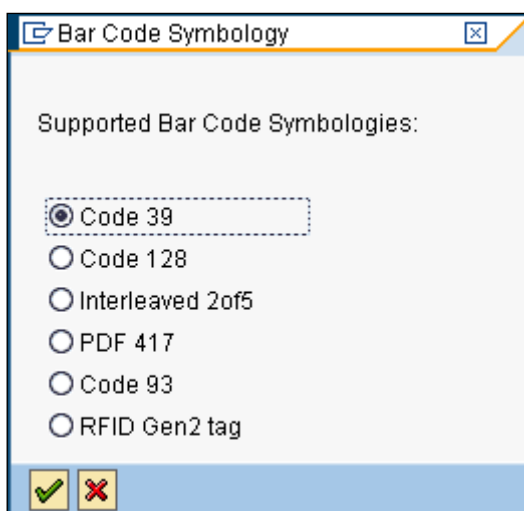

Figure 16 Barcodes in New Barcode Technology

For the Traditional (old) Barcode, the user needs to create the required barcode definition as System Barcode in SE73. Then link the barcode definition to the print control as Printer Barcode. The following shows the provided Print Control in SATO Device Types:

Barcode Type	SAP Print Control	SBPL command
Postnet	SBP07	ESC+BP
UUC/EAN128	XB012	ESC+BI
NW-7 (Codabar, Ratio 1:3)	XB101-XB112	ESC+B0<module width>
Interleaved 2 of 5 (Ratio 1:3)	XB121-XB132	ESC+B2<module width>
JAN/EAN13 (Ratio 1:3)	XB141-XB152	ESC+B3<module width>
JAN/EAN8 (Ratio 1:3)	XB161-XB172	ESC+B4<module width>
UPC-A (Ratio 1:3)	XB181-XB192	ESC+BH<module width>

Figure 18 System Barcode screen

Click the 'Create' button or press the 'F5' key to create a new System Barcode definition.

Figure 19 Create Button

6.1.2 New Barcode Technology

The following describes how to create a barcode with new Barcode Technology.

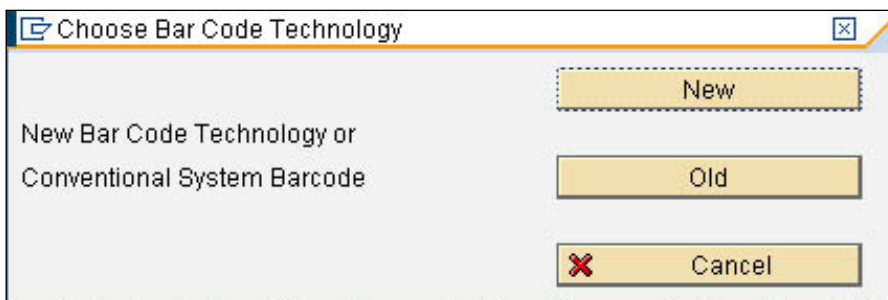

Figure 20 Choosing Barcode Technology

The 'New Barcode Technology' supports the following barcodes:

- Code39
- PDF417
- Code93
- 2 of 5 Interleaved
- Code128

Click on the 'New' button to enter the following screen.

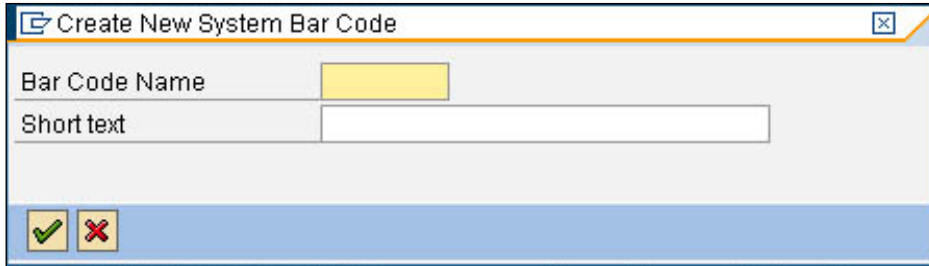

Figure 21 Entering Barcode information

For SATO barcode, it is recommended to define a Barcode name with the prefix 'YST'. For example, to define a new Code39 barcode, the following Barcode name can be used:

YSTCd39

Enter some description on the textbox for 'Short text'. Click the tick button to continue.

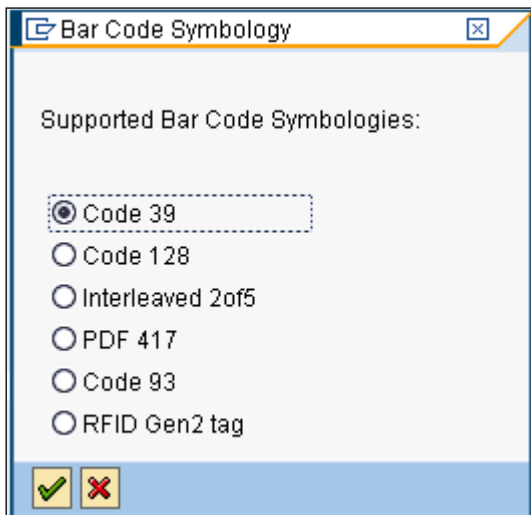

Figure 22 Selecting the Barcode Type

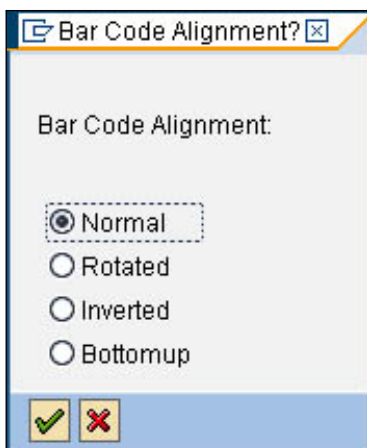

Figure 23 Choosing the Barcode alignment

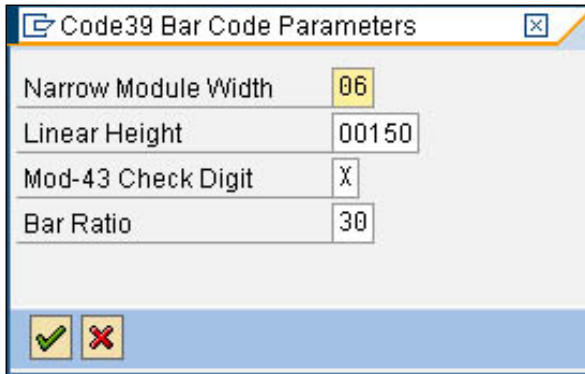

Figure 24 Entering Barcode Information

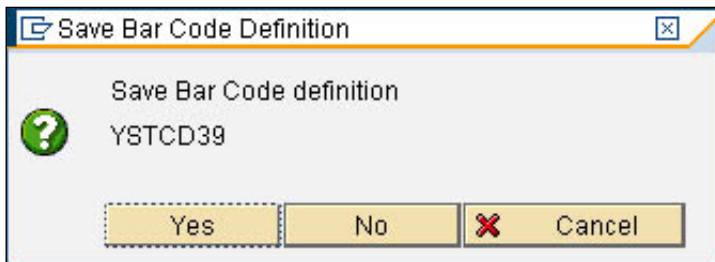

Figure 25 Saving the Barcode definition

Figure 26 Saving the definition to the workspace

That is all for the System Barcode definition. The next step will be defining the Printer Barcode to link the System Barcode to the Printer Control in the device type.

6.1.3 New Technology Barcode

For more information about the SATO Barcode printing command, please refer to the printer command specifications.

Code 39

This barcode is to start and end with '*' characters. If the given data is not started and ended with the '*' character, then the SATO-SAP printer driver will add the characters to the data automatically.

The printer will generate a 'beep' sound if invalid data is given.

Code 93

The maximum number of data for this barcode is 99. The printer, not the printer driver, will generate a check digit when the data is printed on the printer.

Code 128

For example, if the data '123456' was given, the following SBPL command will be generated by the printer driver: ... **BG03158>H123456**.

Please refer to [SAP Note: 645158](#) for the input approach for the Barcode Code 128. If unexpected values were received by the SATO PDL Driver, the barcode might not be printed.

Interleaved 2 of 5

The given data of this barcode must be an even number. If odd number data is given, the SATO-SAP printer driver will generate a '0' in front of the given data.

For example,

If '12345' was given, the barcode with the value '012345' will be printed.

PDF 417

Minimum module width can be set to 01 and 02; however, this may not be read properly.

Note: For rotated PDF417 Barcode, the printed location on the label might differ from what is shown on the print preview. The user might want to adjust the position in the Smart Forms to get the required positioning.

RFID Gen2 Tag

The user has to enter the necessary data based on the following descriptions:

RFID Attribute:	Representation in barcode field data:
EPC value	EPC:xxxxxxxxxxxxxxxxxxxxxxxxxxxx; (xxxxxxxxxxxxxxxxxxxxxxxxxxxx is 24 digit hex value representing 12 bytes)
PC value	PC:xxxxxxxxxxxxxxxxxxxxxxxxxxxx; (xxxxxxxxxxxxxxxxxxxxxxxxxxxx is 24 digit hex value representing 12 bytes) (SATO Device Driver does not support this feature)
USR value	USR:xxxxxxxxxxxxxxxxxxxxxxxxxxxx; (xxxxxxxxxxxxxxxxxxxxxxxxxxxx is 24 digit hex value representing 12 bytes)
ACS passcode	ACS:yyyyyyyyy; (yyyyyyyyy is 8 digit hex value representing 4 bytes)
LOCKMASK	LM:yy; yy is 2 digit hex value representing 1 byte: 0x01 – Lock EPC+PC 0x02 – Perma-lock EPC+PC 0x04 – Lock USR 0x08 – Perma-lock USR (only Lock EPC and Lock USR are supported by SATO Device Driver)
KILL passcode	KILL:yyyyyyyyy; (yyyyyyyyy is 8 digit hex value representing 4 bytes)

Table 5 RFID Attributes

Examples:

Barcode data field contents:	Meaning:
EPC:F2A07895C1710708090A0B0C;	Numerical (hexadecimal) data for EPC
USR:F2A07895C171010203040506;EPC:019975F3ABB0010203040506;	Numerical data for USR and EPC banks
EPC:112233445566010203040506;ACS:1224489F;LM:01;	Numerical data for EPC bank, ACS passcode for LOCK operation is 1224489F, Memory banks EPC+PC are locked
EPC:1122334455660708090A0B0C;USR:0112248D8F060708090A0B0C;ACS:1234567A;LM:0A;	Numerical data for EPC and USR banks, ACS passcode for PERMALOCK operation is 1234567A, Memory banks EPC+PC and USR are perma-locked
EPC:123456789ABC0708090A0B0C;KILL:1234567F;	Numerical data for EPC, KILL passcode is 1234567F

Table 6 RFID input examples

6.1.4 Old Barcode Technology (Conventional System Barcode)

Click the 'Old' button (as in [Figure 20 Choosing Barcode Technology](#)) to define a Barcode with Old Barcode Technology.

The screenshot shows a dialog box titled "SAPscript Font Maintenance: Create/Change System Bar C...". It contains a table with the following fields and values:

Bar code	YSTEAN8
Description	SATO EAN 8 Barcode Ratio 1:3
Bar code type	EAN8
Min.character number	7
Max.character number	8
Bar code width	5.00
Unit of measurement	CM
Bar code height	1.30
Unit of measurement	CM
Rotation at output	

At the bottom of the dialog box, there are two buttons: a green checkmark and a red 'X'.

Figure 27 Defining Barcode with Old Barcode Technology

* In Old Barcode Technology, there is no way to define the Barcode Module Width. Thus, print controls with such information have been defined. The user has to select the print control which carries the required Barcode Module Width.

6.1.5 Old Technology Barcode

Interleaved 2 of 5

The given data of this barcode must be an even number. If odd number data is given, the SATO-SAP printer driver will generate a '0' in front of the given data.

For example,

If '12345' was given, the barcode with the value '012345' will be printed.

CODABAR

The barcode includes start and stop characters: A,B,C,D,E,N,T,a,b,c,d,e,n,t. If the given data is not started and ended with the start/stop characters, then the SATO-SAP printer driver will embed the data with Start/Stop character 'A'.

POSTNET

The SATO-SAP printer driver supports the US Postal Service POSTNET barcode with the following formats:

- 5 digits (Postnet-32 format)
- 6 digits (Postnet-37 format)
- 9 digits (Postnet-52 format)
- 11 digits (Postnet-62 Delivery Point format)

If data with other formats than above was given, the SATO printer will generate a 'beep' sound to indicate invalid data.

UPC Barcode Type A

The data of this barcode should be 11 digits + 1 check digit. If the user supplies 12 digits data, then the SATO-SAP printer driver will assume the last digit is the given check digit. Else, the driver will generate the check digit.

EAN 8 Barcode

The data of this barcode should be 7 digits + 1 check digit. If the user supplies 8 digits data, then the SATO-SAP printer driver will assume the last digit is the given check digit. Else, the driver will generate the check digit based on Modulo 10 formula.

EAN 13 Barcode

The data of this barcode should be 12 digits + 1 check digit. If the user supplies 13 digits data, then the SATO-SAP printer driver will assume the last digit is the given check digit. Else, the driver will generate the check digit based on Modulo 10 formula.

Code 39

Code39 is an alphanumeric code that can represent the following characters in the bar code data:

Numbers: 1234567890

Capital letters: ABCDEFGHIJKLMNOPQRSTUVWXYZ

Special characters: - . \$ / + %

Blank characters (space characters)

The start and stop character for the Code39 bar code is represented by an asterisk (*) in the text view of the bar code data (also called "human-readable text" or "interpretation line").

If the given data is enclosed in asterisk (*), no check digit will be generated by the driver.

Code 93

Code93 is an alphanumeric code that can represent the following characters directly in the bar code data:

Numbers: 1234567890

Capital letters: ABCDEFGHIJKLMNOPQRSTUVWXYZ

Special characters: - . \$ / + %

Blank characters (space characters)

6.1.6 Defining Printer Barcodes

Once the System Barcode (Old Technology) has been defined, then proceed to define the printer barcode. **Note: This step is not required for barcode defined with New Barcode Technology.**

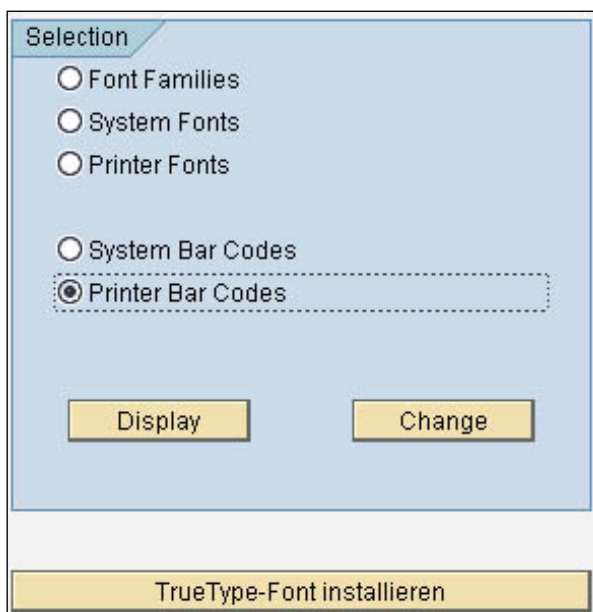

Figure 28 Printer Barcode Definition

Choose the 'Printer Barcodes' and then click the 'Change' button to create a Printer Barcode definition.

Figure 30 Printer Barcode List in the device type

Click on the 'Create' button or 'F5' key to create a new definition of Printer Barcode.

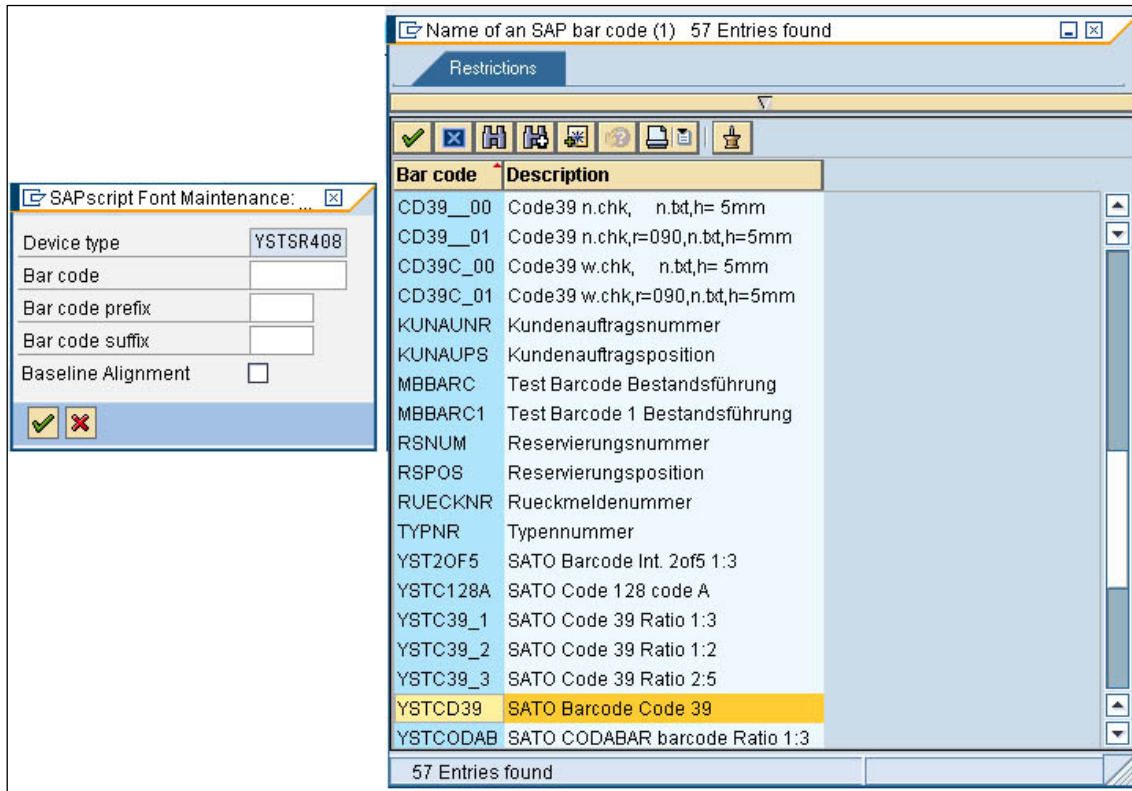

Figure 31 Defining Printer Barcode

Select the System Barcode which has been defined previously from the entry list. Then key in the required Print Control. Note: Key in the same print control for both 'Bar code prefix' and 'Bar code suffix'.

Refer to [Table 4 Barcode Print Controls](#) for the available print control definition in the device type.

6.1.7 Customized Barcode With UNDEF

Note that this task should only be performed by advanced users. Please contact SATO technical team at <https://sato-globalhelp.zendesk.com/hc/en-001/requests/new> should you have any queries.

If the printer-resident (such as GS1-128) is not supported in the SAP system, customized print control can be added to the device type and the “UNDEF” barcode type can be used to map to the print control.

UNDEF is only in Old Barcode Technology. To start with UNDEF, go to SE73->System Bar codes to define a Barcode using the Conventional System Barcode (choose ‘Old’)

6.1.7.1 GS1-128 Barcode With UNDEF

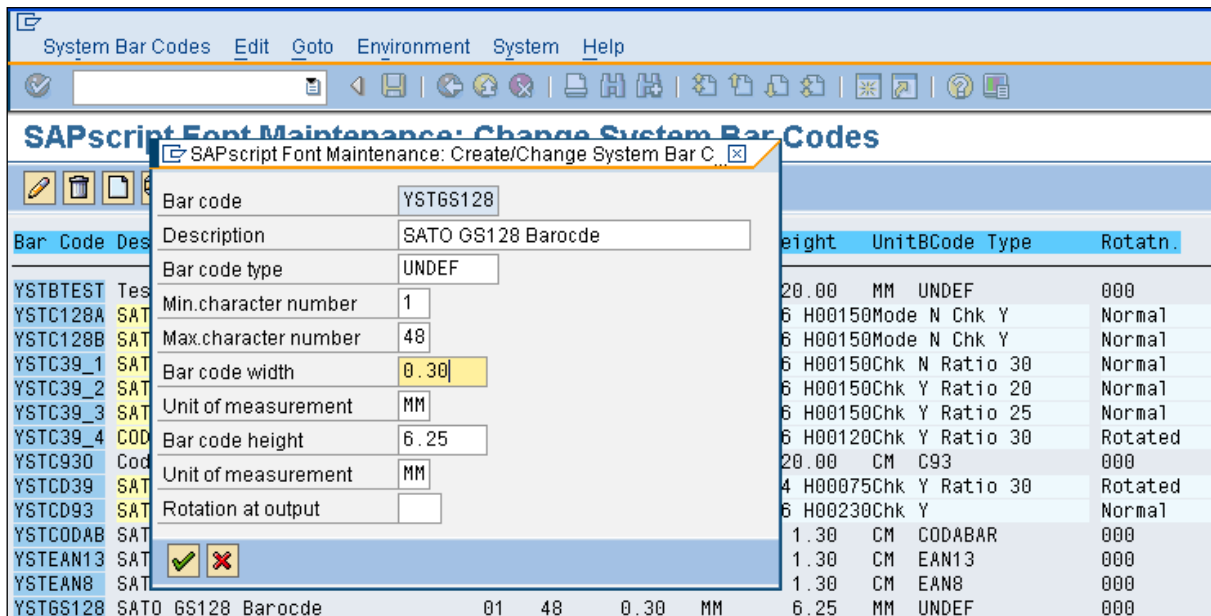

Figure 32 Customized Barcode Definition

- i. Create Customized Barcode Definition
Go to SE73->System Bar Codes to create a GS1-128 Barcode definition (Figure 32 Customized Barcode Definition). Use “UNDEF” as the Bar code type. Note that the “Bar code width” of the above definition will not be used.

- ii. Create Print Control in device type

Figure 33 Defining Print Control in Device type

Use [SPAD->Full Administration->Device Types](#) to open the Print Controls tab of the device type. Add a new barcode print control (Prefix SB) and input the hex value of the Control Character Sequence. In this example, the hex value of "<Esc>EU1203" is entered for Print Control SB012.

This print control defines SATO Barcode commands for GS1-128 (UCC/EAN128) with CC-C with Narrow Barcode with = 3 dots. The Barcode Height will be extracted from the Barcode Definition ([Figure 32 Customized Barcode Definition](#)). The Barcode Data will be supplied from Smart Forms or SAP Database.

- iii. Mapping of Barcode Definition to Print Control

Go to [SE73->Printer Bar Codes](#)

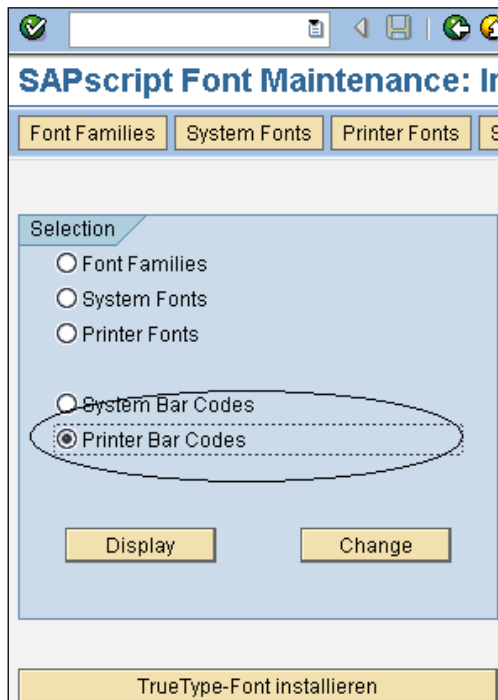

Figure 34 Mapping of Print Control

Click on the Device Type to add the barcode mapping to Print Control.

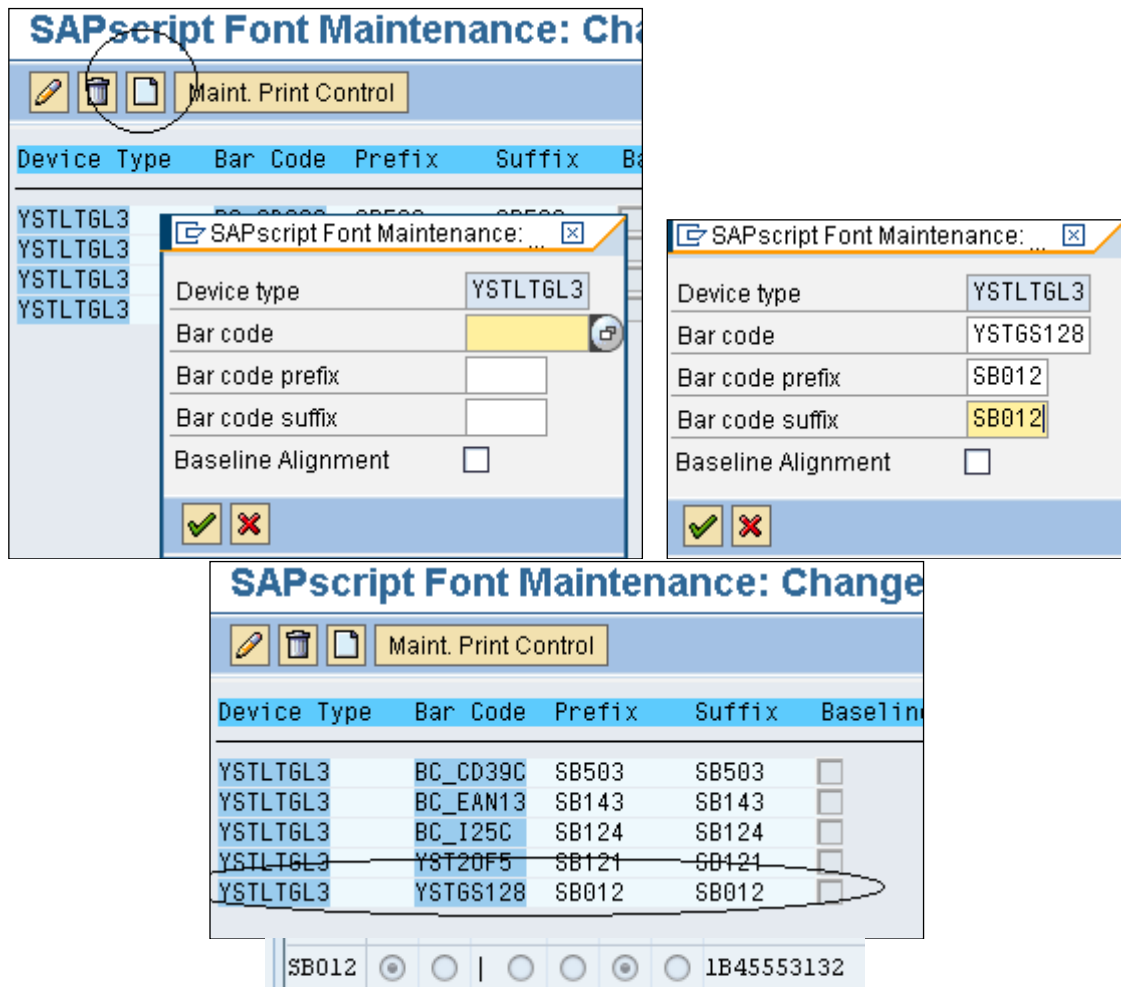

Figure 35 Mapping of Print Control

6.1.7.2 GS1 Datamatrix Barcode With UNDEF

6.1.7.2.1 Create a New Barcode Definition

Note:

1. The name of the Barcode must start with "YSTDMX". This is how the SATO Device Driver identifies this as the Barcode Definition for Datamatrix.
2. The Barcode Type must be **UNDEF**.
3. The rest of the parameters (except Rotation) will not be used by SATO Device Driver for the Datamatrix barcode. Those parameters have to be defined inside the Print Control as below.

6.1.7.2.2 Define the Print Control Information in the Device Type

Spool Administration: Device Type (Change)

Device type: YSTLT6L2 Name: SATO GL 203dpi ISO8859-1

Attributes **Print Controls**

Print Control Selection

Name	Di	Ex	U	C	H	Ac	Control Character Sequence	Ref.
SABLD	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>		
SAOFF	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>		
SB011	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>	1B45553131	
SB012	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>	1B45553132	
SB013	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>	1B4258303131303032303230303030303030311B4443	
SB014	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>		
SB101	<input checked="" type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input type="radio"/>	<input checked="" type="radio"/>	1B42303031	

SB013 defines the prefix which carries the following SATO Print Commands:

Font ID: 01

Error correction level: 20 (ECC200)

Cell width: 02

Cell pitch: 02

No. of cells per line: 000

No. of cell lines: 000

Mirror image: Normal (Standard print)

<ESC> B X 0 1 **20** 0 2 0 2 0 0 0 0 0 0 0 0 1

<ESC> D C

The height and the width of the barcode are controlled by the cell width and pitch:

Example 1)

Cell width: 05, Cell pitch 05

<Esc> B X 0 1 **20** 0 5 0 5 0 0 0 0 0 0 0 0 1

Output:

Example 2)

Cell width: 09, Cell pitch 09

<Esc> B X 0 1 **20** 0 9 0 9 0 0 0 0 0 0 0 0 1

Output:

Example 3)

Cell width: 09, Cell pitch 15

<Esc> B X 0 1 2 0 0 9 15 0 0 0 0 0 0 0 1

Output:

The data of the Barcode will be appended to the Prefix print control (in this case, SB013). If there is any special code (such as the FNC1 code), you can append it here (as a hex value). SB014 defines the suffix. If there is no data for the Suffix, you can leave the print control empty.

The diagram shows a hex input field containing the string: 1B42583031323030363036303030303030303030311B4443. A box labeled 'Click this for "Hex" input' points to the first character '1'. Another box points to the entire string. A third box below explains the string: '1B42583031323030363036303030303030303030311B4443' followed by '<Esc> B X 0 1 2 0 0 6 0 6 0 0 0 0 0 0 0 0 0 1<Esc>DC'. Arrows point from the '06' values in the string to a box labeled 'Cell Width: 06' and 'Cell Pitch: 06'.

6.1.7.2.3 Mapping the Barcode Definition to Print Control

Go to SE73->Printer Bar codes. Create the mapping in the device type.

The screenshot shows the 'SAPscript Font Maintenance: Change Printer Bar Codes' dialog. It features a table with columns: Device Type, Bar Code, Prefix, Suffix, and Baseline Alignment. The table lists several barcode definitions for device type YSTLTGL2. A pop-up window on the right shows the configuration for a specific barcode: Device type: YSTLTGL2, Bar code: YSTDMX01, Bar code prefix: SB013, Bar code suffix: SB014, and Baseline Alignment: unchecked. There are 'OK' and 'Cancel' buttons at the bottom of the pop-up.

Device Type	Bar Code	Prefix	Suffix	Baseline Alignment
YSTLTGL2	BC_CD39	SB503	SB503	<input type="checkbox"/>
YSTLTGL2	BC_CD39C	SB502	SB502	<input type="checkbox"/>
YSTLTGL2	BC_EAN13	SB142	SB142	<input type="checkbox"/>
YSTLTGL2	YST20F5	SB124	SB124	<input type="checkbox"/>
YSTLTGL2	YSTCODAB	SB104	SB104	<input type="checkbox"/>
YSTLTGL2	YSTEAN13	SB144	SB144	<input type="checkbox"/>
YSTLTGL2	YSTEAN8	SB165	SB165	<input type="checkbox"/>
YSTLTGL2	YSTUPCA	SB184	SB184	<input type="checkbox"/>

Select the Barcode Definition created previously and map it to the print controls.

6.1.7.2.4 FNC Special Characters in GS1 Datamatrix Command

The logic applied in order to produce the command containing the FNC special character(s) is the same as this paragraph states doing that originally for the command not having the special character within but:

- The name of the Barcode must start with “**YSTQDM**”.
- The Smart Form’s tag generating the final FNC special character must be the “***FNC***”

- The example Hex string generating the <ESC>2D51,10,10,000,000<ESC>DN command might look like: "1B324435312C31302C31302C3030302C3030301B444E".

Command Format

<2D51>,aa,bb,ccc,ddd

Parameters:

- a [Horizontal cell size] = Valid Range : 01 to 99 dots
- b [Vertical cell size] = Valid Range : 01 to 99 dots
- c [Number of cell in one line] = Valid Range : 010 to 144000 : (Auto-setting)
- d [Number of cell lines] = Valid Range : 008 to 144 000 : (Auto-setting)

Data part

<DN>mddd,n~n

Parameters:

- m [Number of data] = Valid Range : 1 to 3116
- n [Print data] = Data

6.1.7.3 QR Code With UNDEF

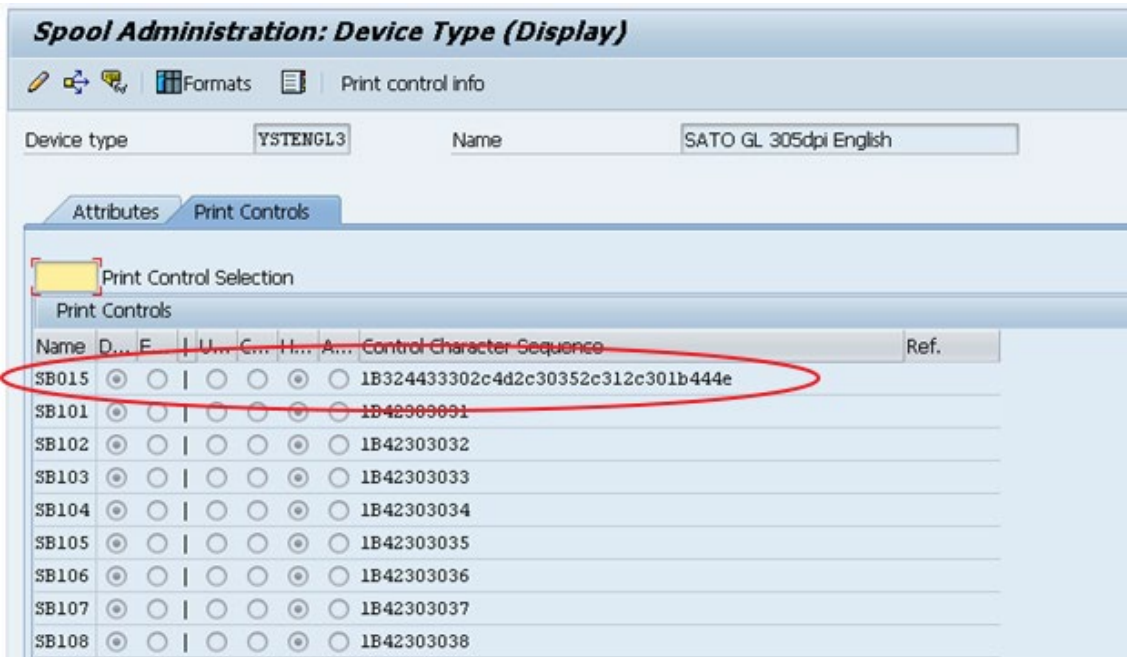

6.1.7.3.1 Create a New Barcode Definition.

Note:

1. The name of the Barcode must start with “**YSTQR_**”. This is how the SATO Device Driver identifies this as the Barcode Definition for QR Code.
2. The Barcode Type must be **UNDEF**.
3. The rest of the parameters (except Rotation) will not be used by SATO Device Driver for the QR Code. Those parameters have to be defined inside the Print Control as below.

6.1.7.3.2 Define the Print Control Information in the DeviceType

SB015 defines the prefix which carries the following SATO Print Commands:

Entered command in

Hex: 1B324433302c4d2c30352c312c301b444e

ASCII: 2D30,M,05,1,0DN

Command Format: <2D30>,a,bb,c,d

SBPL Command: <ESC>2D30

Parameters:

- a Error Correction = L: 7%, M: 15%, Q: 25%, H: 30%
- b Cell Size= 01 to 32 dots
- c Data Setting Mode = 0: Manual, 1: Auto
- d Concentration Mode = 0: Normal, 1 Concentration Mode (using 1 required more parameters)

For Data Part

Command Format : <DN>mmmm,n~n

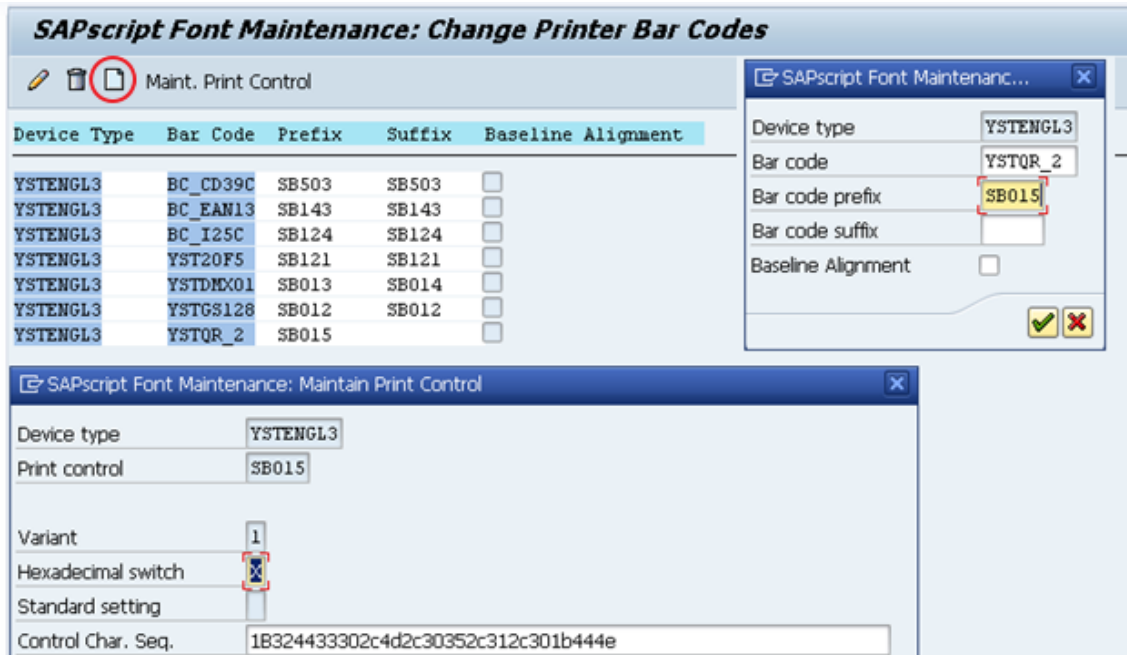

SBPL Command : <ESC>DN

Parameters:

- m No of data = 1 to 2953
- n data = Print Data

6.1.7.3.3 Mapping the Barcode Definition to Print Control

Go to SE73->Printer Bar codes. Create the mapping in the device type.

Select the Barcode Definition created previously and map it to the print controls.

6.1.7.4 RFID "ESC+IP0e:h,epc:" Command

The old barcode technology barcode "IP0_1" must be created - the barcode's name must start with the "IP0_" value and it must be "UNDEF" type as similar actions are already described in this document. The following hexadecimal "1B411B495030653A682C6570633A" string representing "ESC+AESC+IP0e:h,epc:" value is located in the print control of the chosen device type. If you wish to achieve "ESC+IP0e:h,epc:" only, you must remove the first two hex values of the print control's hex string.

The 44 length string placed in a Smart Form:

```
"31004A00440041003100370031003400350037003600;"
```

Generated the RFID command section sent to the printer:

```
"ESC+AESC+IP0e:h,epc:31004A00440041003100370031003400350037003600;"
```

6.2 Fonts

SATO-SAP Printer Driver supports the following fonts:

Latin 1 (ISO8859-1 codepage) device types:

SAP Font	SATO Font	Type	SBPL Command

LETGOTH	SATO Fixed Size XM Font	Bitmap, fixed size	ESC+XM
LNPRINT	SATO Fixed Size XS Font	Bitmap, fixed size	ESC+XS
COUR_17	SATO Fixed Size XU Font	Bitmap, fixed size	ESC+XU

Korean (Wangsung Encoding/Unicode) device types:

SAP Font	SATO Font	Type	SBPL Command
KPBATANG Proportional	HYR Gothic-Medium	Scalable	ESC+RDK

Simplified Chinese (GB2312/Unicode) device types:

SAP Font	SATO Font	Type	SBPL Command
CNSONG Proportional	MKaiSO-Medium-U	Scalable	ESC+RDC

Traditional Chinese (Big 5/Unicode) device types:

SAP Font	SATO Font	Type	SBPL Command
TWSONG Proportional	MHeiS-Bold -U	Scalable	ESC+RDc

Japanese (Shift-JIS) + English ASCII device types:

SAP Font	SATO Font	Type	SBPL Command
DBGothic, DBMincho, JPMincho	SATO Japanese resident bitmap font	Bitmap, fixed size	ESC+K
HELVETICA ^	CG Triumvirate	Scalable	ESC+RDB
TIMES ^	CG Times	Scalable	ESC+RDA
COURIER BOLD * (optional Italic)	Helvetica Outline Font, fixed character pitch	Scalable	ESC+\$B, ESC+\$=

Note: * YSTJAPT_x not supported, ^ YSTJALP_x not supported

Table 7 Supported font in SATO-SAP Printer Driver

For Fixed size SATO Resident Font, please refer to the Font Appendix for a list of the supported size of the font.

Note:

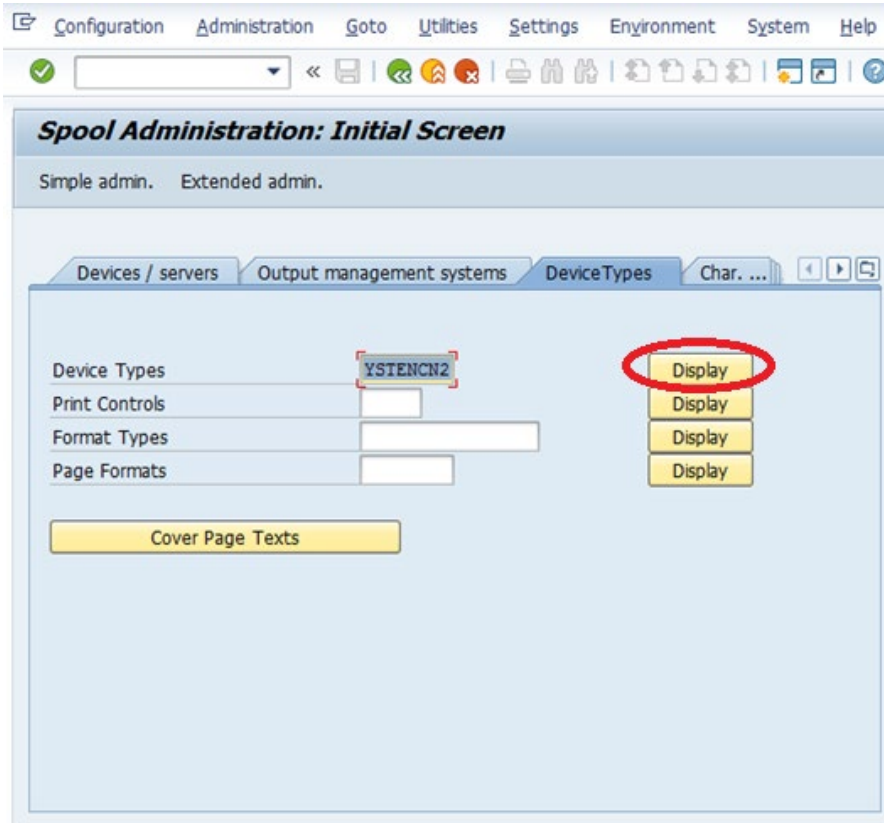

1. SATO 203dpi printer does not support printing of 8 points or lower Courier Font (ESC+\$A, ESC+\$B, ESC+\$=). It will be printed in a slightly larger size instead.
2. There could be some discrepancies between the string length shown on Smart Forms and what printed from the printer. This is because when converting the SAP font point size into SATO font dot size for a specific resolution, there is a rounding up of fractions in the calculation.
3. For Japanese device types that offer SATO Resident Bitmap fonts, the Japanese text will appear shorter than what is shown on the print preview of Smart Forms. This is because the width of the 1-byte characters in the SAP Japanese fonts is 0.5 times of the 2-byte characters. But in SATO Japanese fonts, the width of the 1-byte characters is slightly larger, about 0.6 times, of the 2-byte characters.

6.2.1 Unicode Printing for NX Series

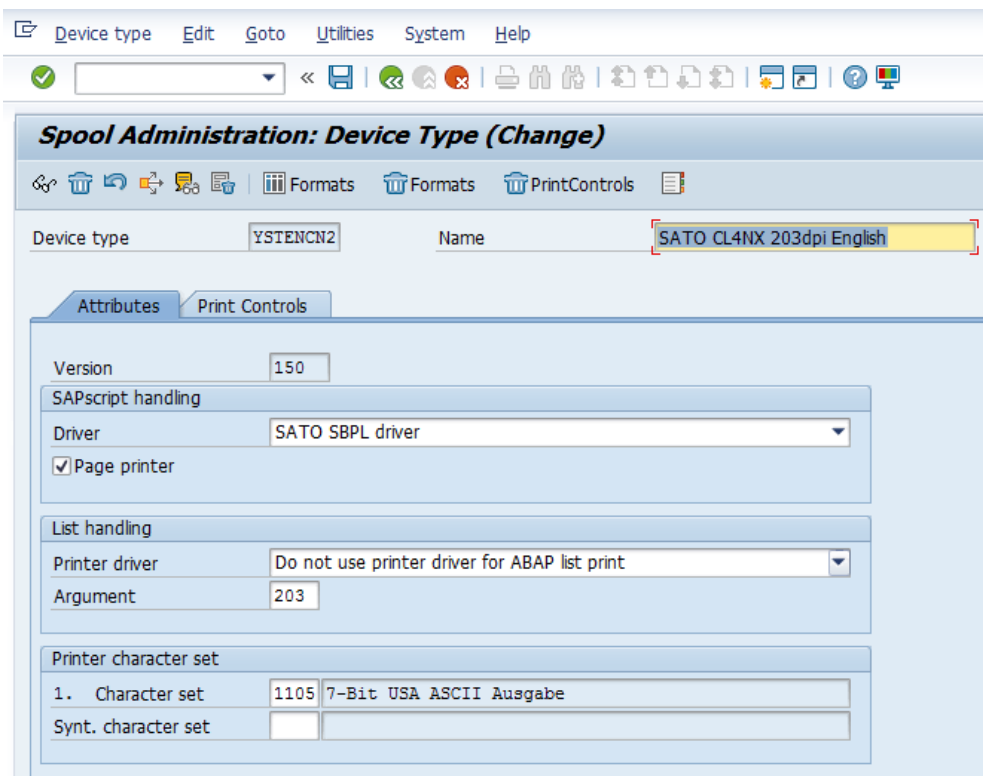

This section is about making of the device type Unicode printing for NX Series printers.

Creating Printer Font

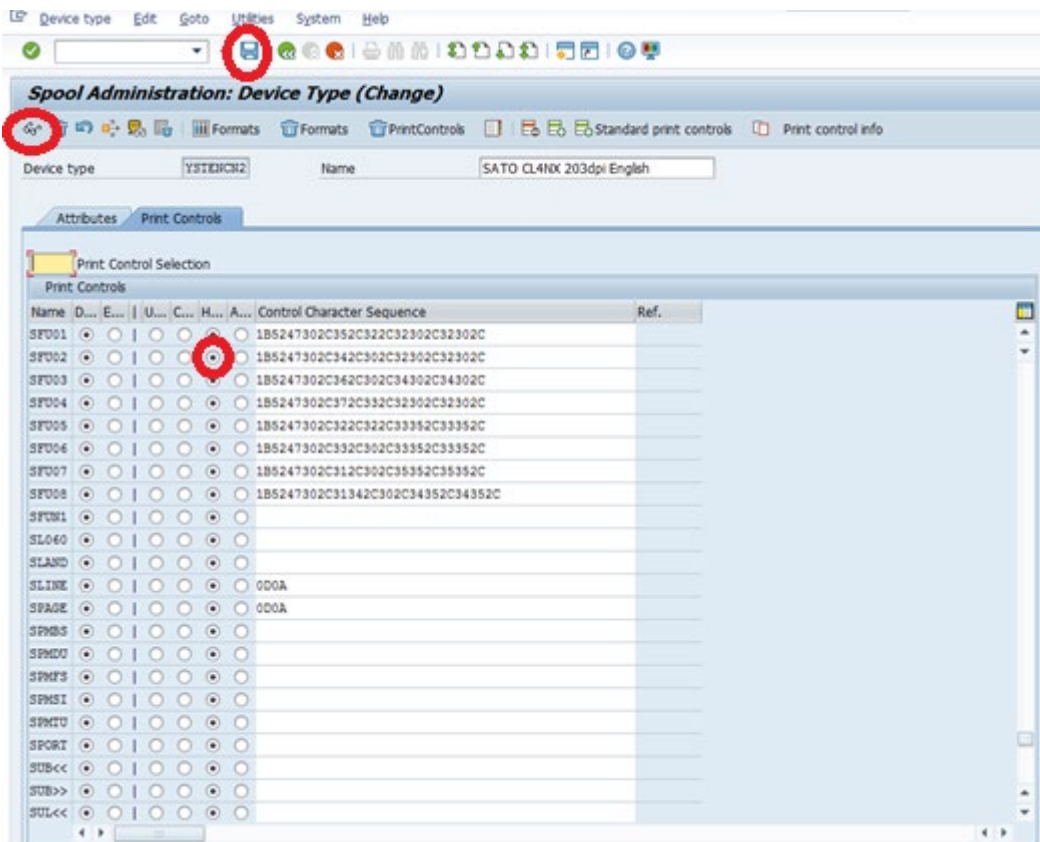

Please go to Spool Administration and choose the correct device type which you would like to use.

Select a "Print Controls" tab

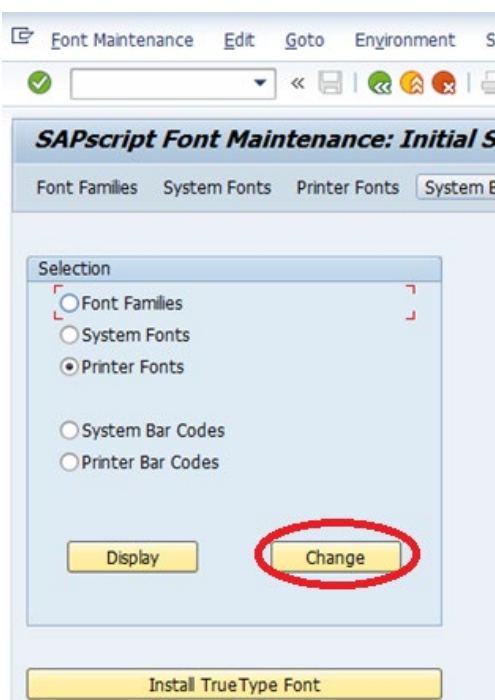

Click on the “Change” button to edit the values, key-in the new e.g SFU01 into the “Name” row section, check the “Hexadecimal” radio button, type the correct value into the “Control Character Sequence” and click the “Save” button. The meaning of HEX values has been elaborated further in this chapter.

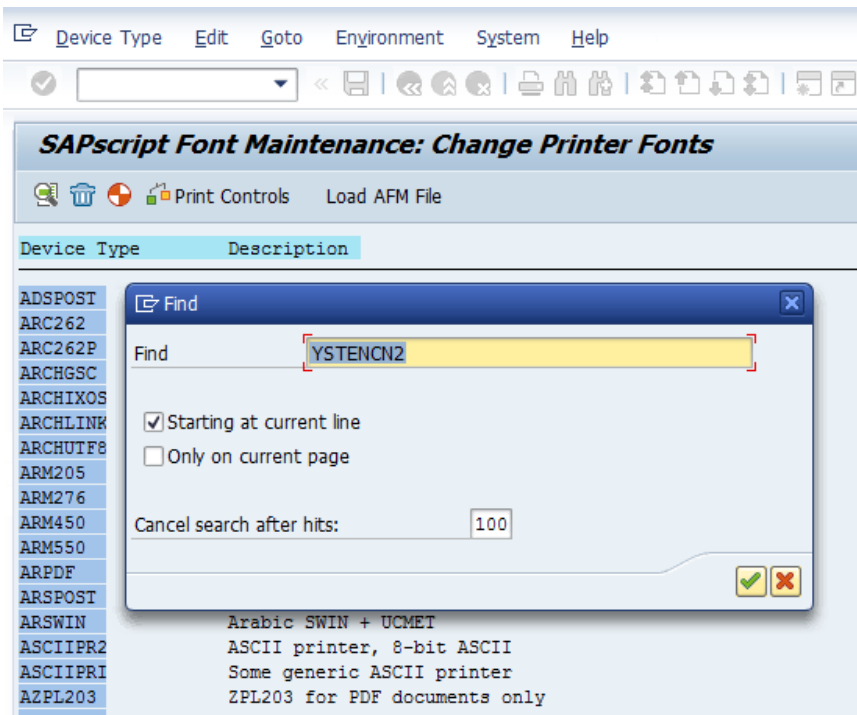

The control character sequence name *must* start with the “SFU” prefix containing two-digit numbers only at its end, for example: “SFU01”, “SFU02”, “SFU15” etc.

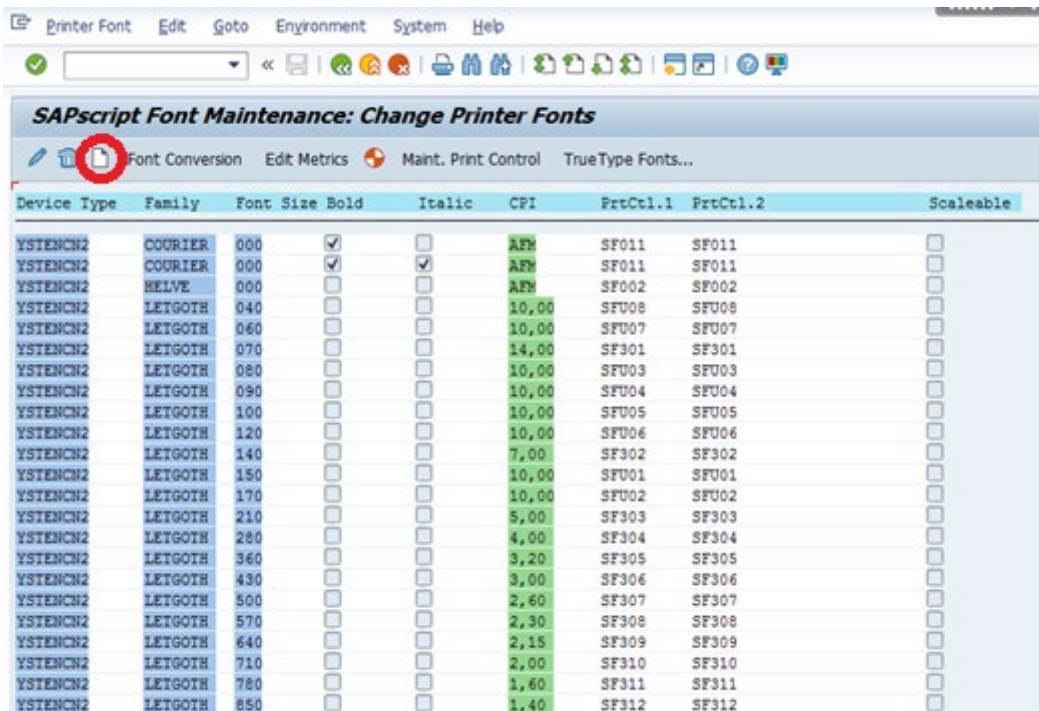

Please use SE73 transaction, select “Printer Fonts” and click on the “Change” button.

Use CTRL+F keys combinations to find your device type and click on the device type later.

Create a new font.

Fill out all necessary details and confirm your choice. Important – deselect “Font is Scalable”, provide a “Font Size” (180=18, this is the size we will be referring to in Smart Styles later), key-in the correct Print Controls name representing Unicode command (e.g. “SFU01” etc.) have used before and select the Font Family. The Font Family we use is LETGOTH but it can also be a different built-in font such as COURIER etc.

The entire idea to make Unicode (2-Byte) characters work is about calling a correct and previously created Smart Style’s tag in the Smart Form, configuring that Smart Style’s calling font tag by selecting a correct font and its size in the Smart Style (calling a font - making a reference to the just created on the below screen font, font passing the command parameters in SFU tag to the driver). There must be font’s identification (among many fonts having the same parameters) in the Smart Style’s tag, the Smart Style must know to call the correct/original font referring to the SFU print control user wants – there can’t be two the same fonts having the same parameters as the situation for the new tag on the Smart Form will be ambiguous if let’s say we want use LETGOTH 150. That is why we must use the “original” font for the new Smart Style’s tag as below.

In brief, the Smart Form calls your newly created Smart Style’s tag, that tag calls the original/unique device type’s font which kind of refers to the printer control (HEX command passing the command to the driver) being under that particular device type. When printing the Smart Form, the Smart Form calls the correct tag and the output device refers to that mentioned device type finally getting our final label having Unicode charters printed.

Figure 39 Defining Font Printing item in Smart Styles

After defining the necessary Barcode and Fonts as printing items, check and activate the Smart Styles.

Figure 40 Check and Activate the Smart Styles

6.4 Smart Forms

Enter transaction code `/nsmartforms` to run the Smart Forms application.

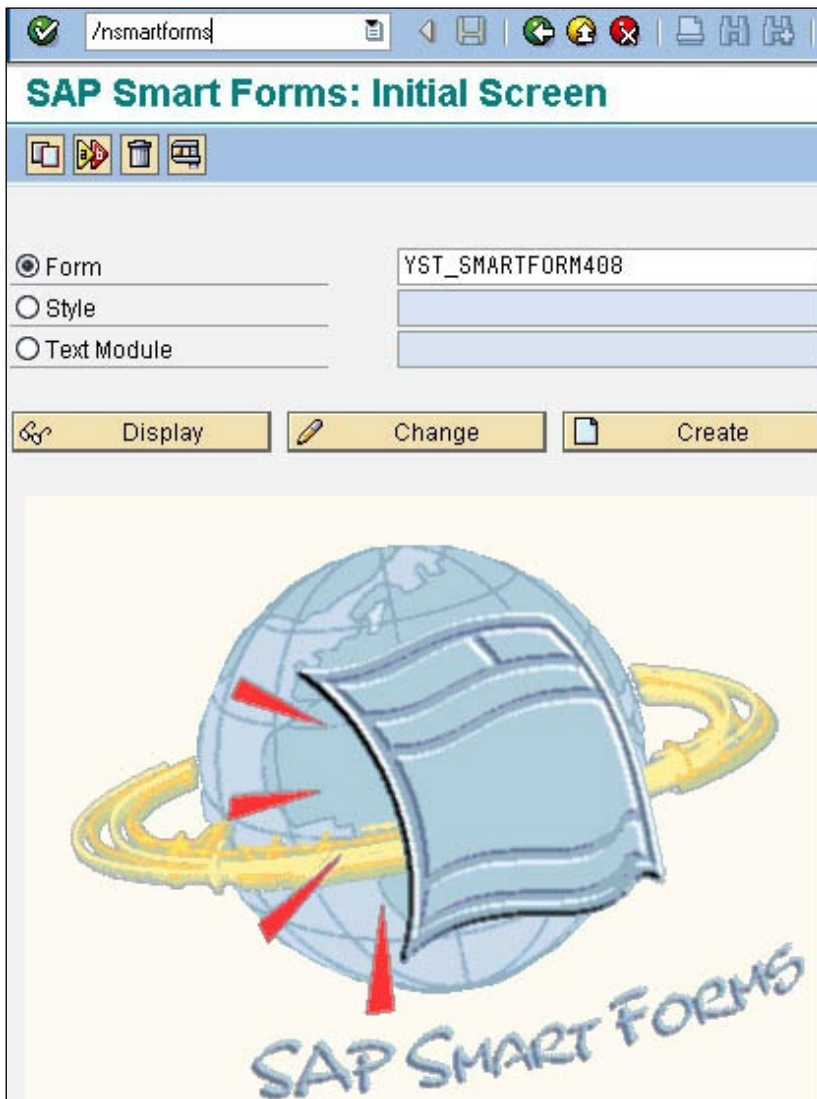

Figure 41 Smart Forms application

Create or edit a Smart Forms in which the name is prefixed with 'YST'.

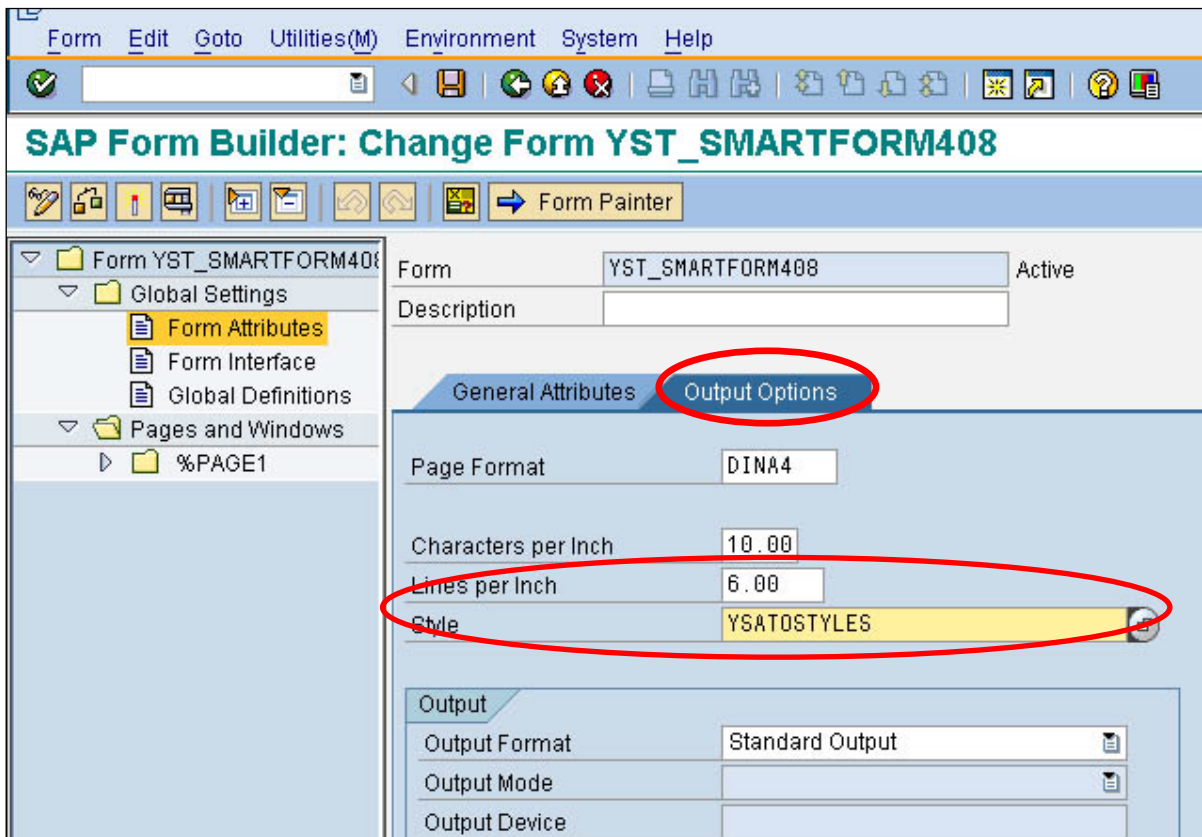

Figure 42 Applying the Smart Styles

Click on the 'Global Settings'->'Form Attributes', in the 'Output Options', apply the Smart Styles defined previously.

6.4.1 Adding Text

Right-click on the 'Page1', choose 'Create'->'Window'.

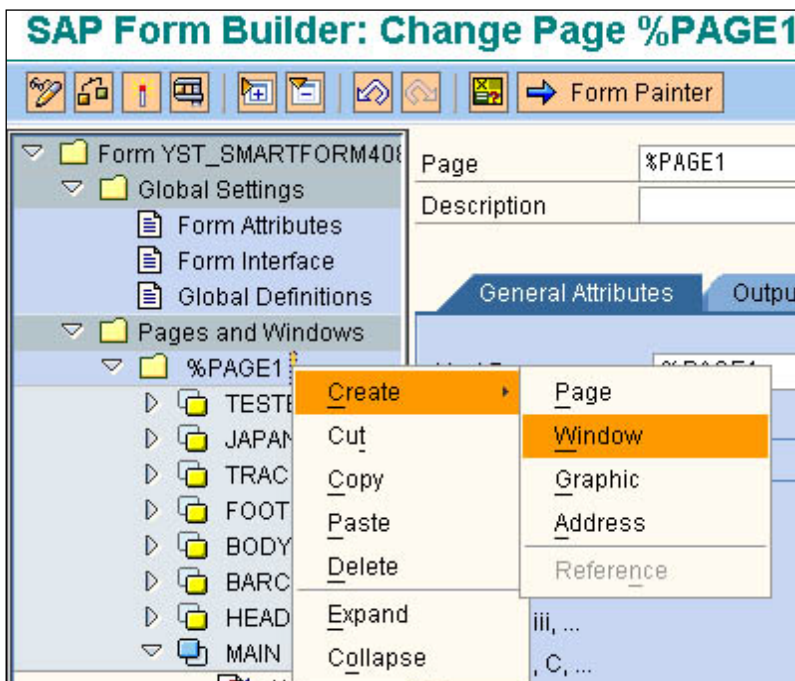

Figure 43 Creating Window

Give the Window component a meaningful name. Then right-click on it and create a 'Text' component.

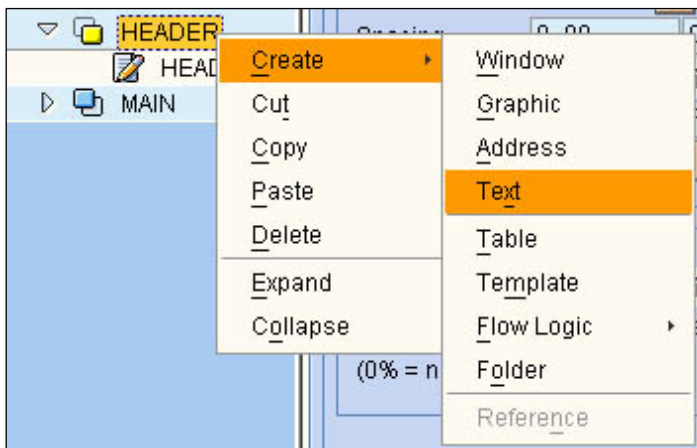

Figure 44 Creating Text Component

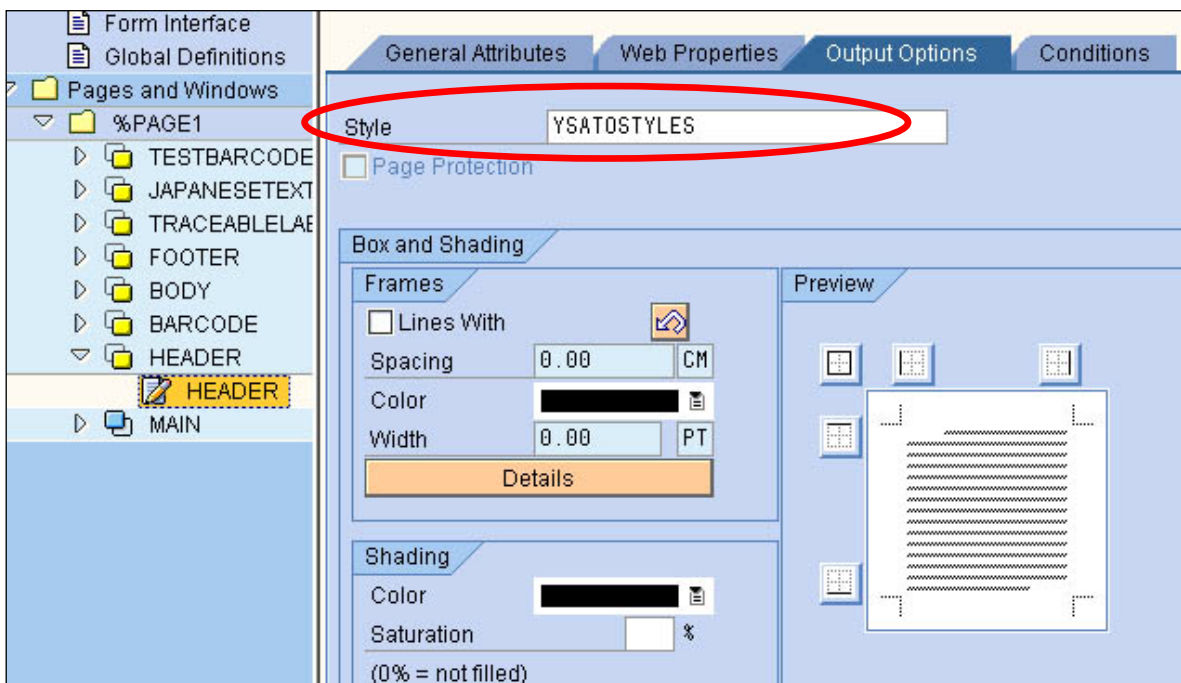

Figure 45 Defining Text Component

Under the 'Output Options' tab, select the Smart Styles which previously defined. So that the text printing item can be available to use.

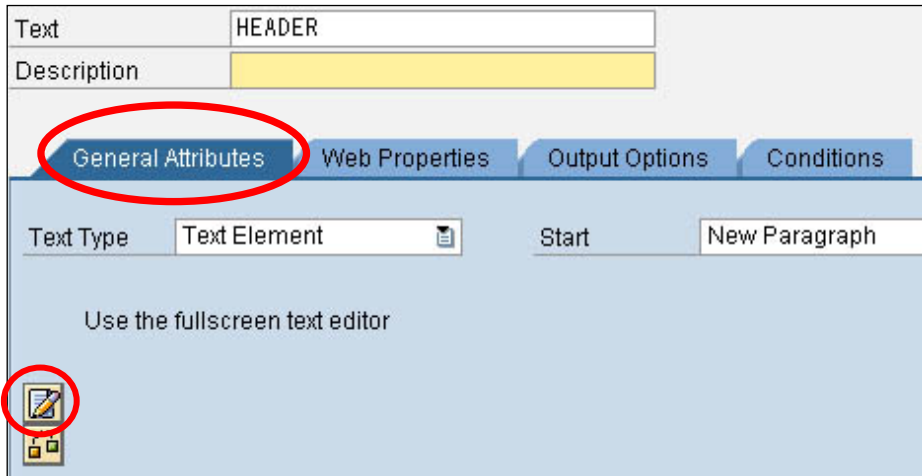

Figure 46 Adding Text

Click on the 'General Attributes' tab and click on the 'Editor' button to insert the text. Note: This procedure could be varied depending on the editor mode.

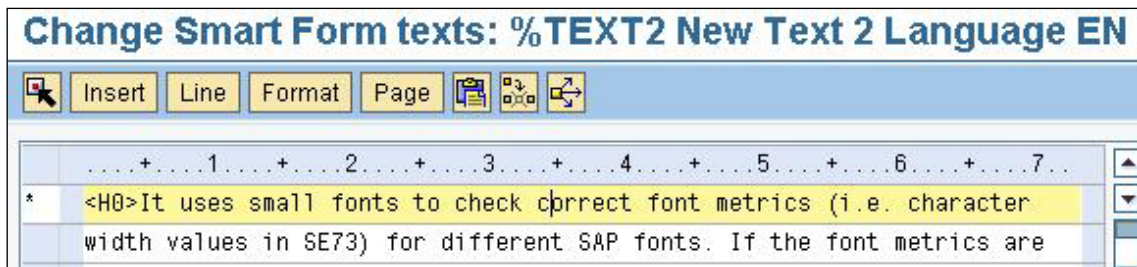

Figure 47 Entering the text with format

The message is embedded in format tags. In the above example, the message is included in **<H0>** and **</>** format tags which specify the SATO CG Triumvirate Font (ESC+RD). Format **H0** is a text printing item defined in the Smart Styles.

6.4.2 Adding Barcode

Define a 'Window' component under 'Page1' and give it a meaningful name. From this new window create a 'Text' component.

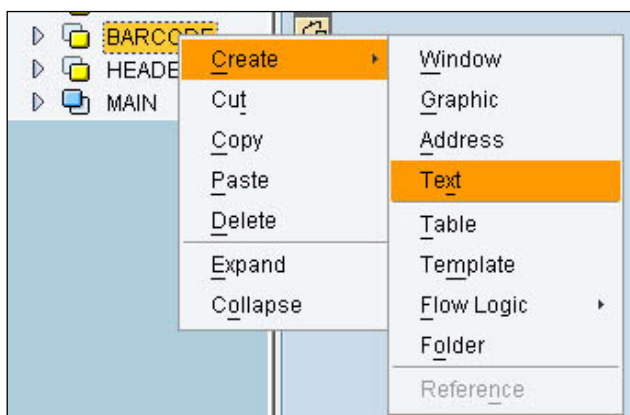

Figure 48 Creating Barcode component

Apply the Smart Styles in the 'Output Options'. Then in the Editor under 'General Attributes', type the Barcode value, and apply the Barcode printing format.

Figure 49 Entering Barcode value

The message is embedded in format tags. In the above example, the message is included in **<B2>** and **</>** format tags which specify the SATO Code 128A Barcode. Format **B2** is a Barcode printing item defined in the Smart Styles.

6.4.3 Adding Images

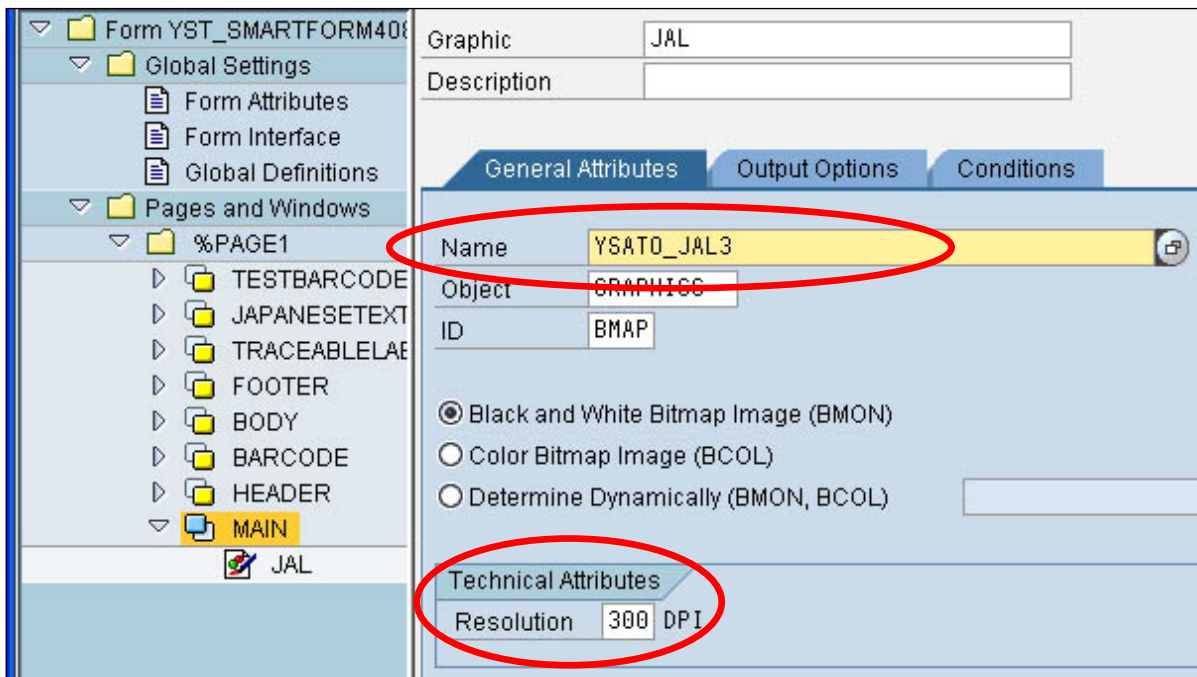

Figure 50 Creating Image component

All images must be imported to the SAP system through the **SE78** command before attaching them to the smart form. Select the required image from the Name drop-down list under the General Attributes. Then key in the Resolution information for the image. For example, if the image is to be printed in a 300 resolution printer, then select 300 from the Resolution field.

Currently, the images supported by SATO-SAP Printer Driver have the following constraints:

- Only 'Black and White Bitmap Images' are supported and they should be limited to 1bpp (bit per pixel) color deepness
- The images cannot be 'compressed' when uploaded using Transaction code **SE78**.

6.4.4 Positioning Printing Components

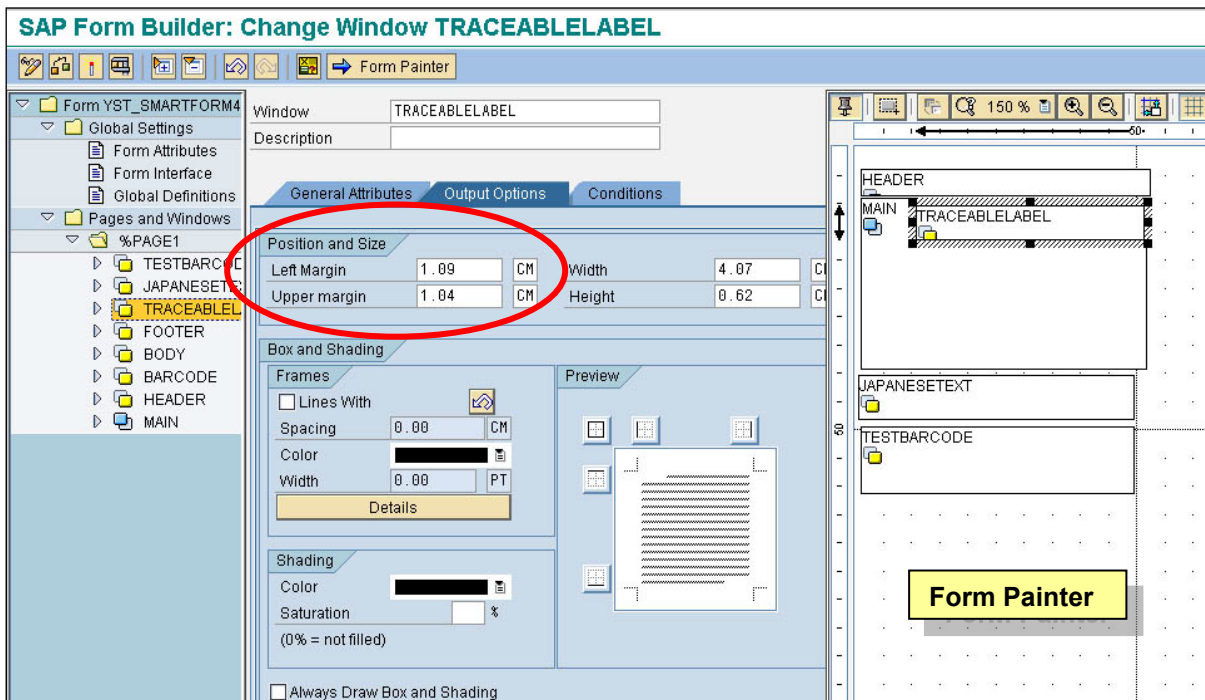

Figure 51 Positioning printing items

The positions of the printing items can be adjusted by drag & drop the components in the 'Form Painter'. Alternatively, it can be done by manipulating the values in the Left and Upper margin fields under the 'Output Options' tab of the window component.

6.4.5 Printing the Smart Forms

After the Smart Forms has been made, it must be checked and activated before it can be printed.

Figure 52 Check and Activate the Smart Forms

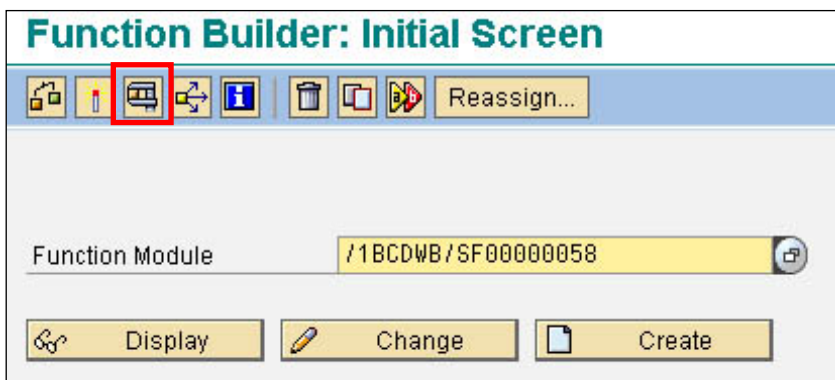

Figure 53 Printing Smart Forms

Click the 'Print' button to continue.

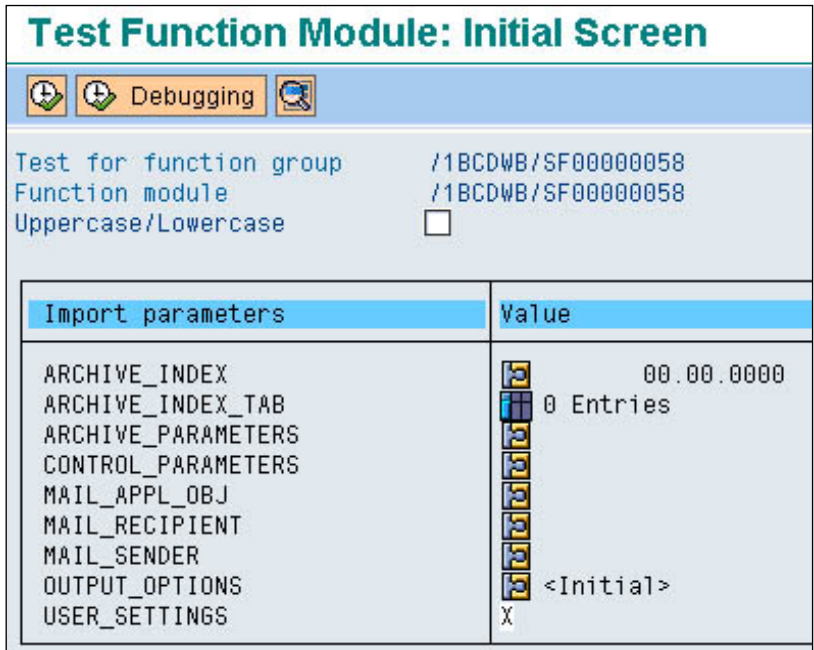

Figure 54 Printing Screen

Click the 'Execute' button to continue.

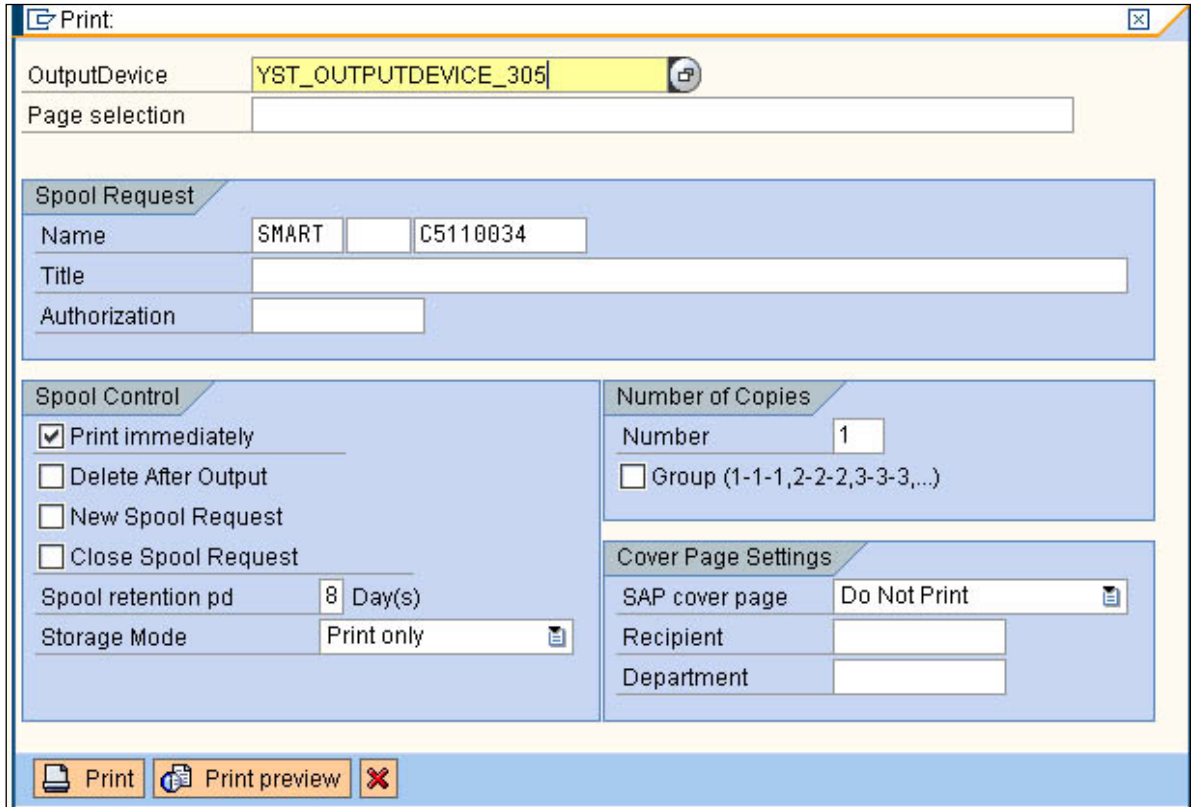

Figure 55 Printing Screen - Select the output device

Select the required Output Device and check on the 'Print Immediately' checkbox. Then click the 'Print' button to print.

6.5 System Commands

Users can specify the System Commands of SBPL in the Smart Forms label by using the Command nodes.

Right-click on the Window node->Create->Flow Logic->Command to display the Command node feature.

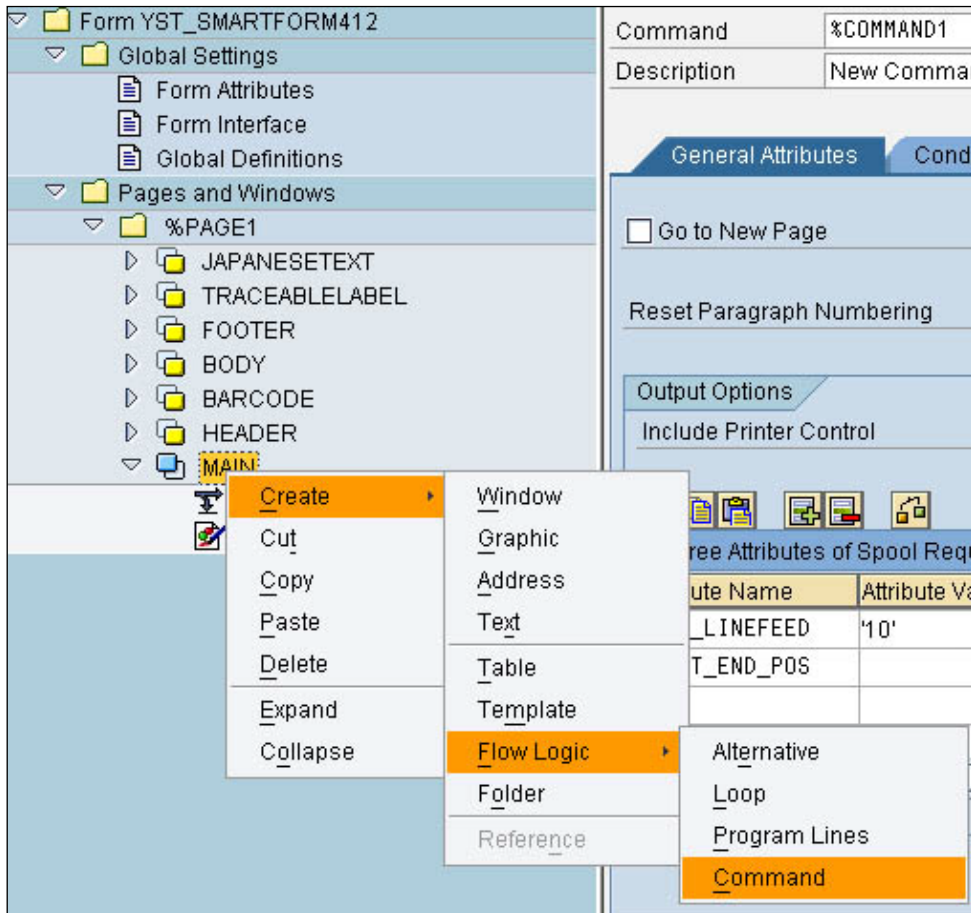

Figure 56 Defining System Command using Command node

Under the 'Output Options', the user is to define the System Command in the Name-Value pairs format. **The value must be enclosed within the single quote character (') or empty, depending on the command.**

Figure 57 Name-Value pairs information

The following are the available system commands:

Function	Command Name	Command Value	SBPL Command	Remarks
Print Speed	PRINT_SPEED	1~11	ESC+CS	
Print Darkness	PRINT_DARKNESS	ab, a: 1~ 5 b: A~F	ESC+#E	
Label Size	LABEL_SIZE	Refer to the command specification	ESC+A1	The printer driver will generate a default ESC+A1 command, based on the label size of designed Smart Forms if this System command is not specified.
Start Print Correction	START_POINT	Refer to the command specification	ESC+A3	The printer driver will generate a default ESC+A3 command, based on the position of the designed Smart Forms if this System command is not specified.
Enlargement of Print Area	ENLARGEMENT_AREA	No value is needed	ESC+AX	
Standard Print Area	STANDAR_AREA	No value is needed	ESC+AR	
Print End Position	PRINT_END_POS	No value is needed	ESC+EP	
Multiple Cutting	MULTIPLE_CUT	0~9999	ESC+~(Null)	This command is valid only when the printer is equipped with cutter
No. of Labels per Cut Segment	CUT_SEGMENT	0~9999	ESC+~A	This command is valid only when the printer is equipped with cutter
Cutting Operation	CUT_OPERATION	No value is needed	ESC+~B	This command is valid only when the printer is equipped with cutter
Cut Number Unit	CUT_CTCOMMAND	0~9999	ESC+CT	This command is valid only when the printer is equipped with cutter
Eject and Cut	CUT_NCCOMMAND	No value is needed	ESC+NC	This command is valid only when the printer is equipped with cutter
Auto Linefeed	AUTO_LINEFEED	0~999	ESC+E	

90 degree Text Rotation	ROTATE_90_x	Name of Window to be rotated	ESC+% 1	x is any number to make sure the command name is not repeated in the Smart Forms
180 degree Text Rotation	ROTATE_180_x	Name of Window to be rotated	ESC+% 2	x is any number to make sure the command name is not repeated in the Smart Forms
270 degree Text Rotation	ROTATE_270_x	Name of Window to be rotated	ESC+% 3	x is any number to make sure the command name is not repeated in the Smart Forms
Page Number	PRINT_QUANTITY	Number of pages to print	ESC+Q	It is print command is not specified, the page is printed once. Example of the value: '%PAGE2:4' This means the page with the name "%PAGE2" will be printed 4 times. The subsequent page number can be added with a comma separator. For example, '%PAGE2:4,%PAGE3:3' This means page '%PAGE2' is printed 4 times and page '%PAGE3' is printed 3 times
Inverse Print	INVERSE_PRNTAREA	vvvv,hhhh,aaaa,b bbbb v: vertical position h: horizontal position a: length of vertical b: length of horizontal	ESC+(It can specify multiple inverse print area by using a semicolon ';' as the separator
Print Darkness (#F command)	PRINT_DARKNESS_F	ab, a: 1~ 10 b: A~F	ESC+#F	This commands for supported models SG400R-ex, SG600R and SG112R/ex.
Print Motion Mode	PRINTMOTION_MODE	0-8	ESC+P M	To specify motion mode temporarily.
Print Off-set	LABELSTOP_OFFSET	abcc, a: 0~3 b: +/- c:00~99(dot)	ESC+P O	To specify adjustment of label stop position during every motion temporarily.

Table 8 System Commands

It is important to refer to the command specification of the printer models to understand the correct range of value can be used for the Command values. Note that the Command Names are case-sensitive.

System command should be used carefully. Invalid input may result in an unexpected outcome of the

printout.

The table below shows the supported System Commands on models.

Table 10 Cutting Commands on Models

*: Only possible when the Cutter unit is installed.

6.5.1 Text and Image Rotation

To rotate a text or an image on Smart Forms, the user is to create a command in the window to be rotated. The name of the parameter (e.g., ROTATE_180_x) should not be repeated. The image below is an example of how the rotated text can be setup:

Figure 58 Text Rotation

Rotation Result:

Figure 59 Rotation result

Please refer to the command specification for the behavior of the rotation.

There are a few restrictions on the Rotation functions:

- Smart Form will not display the rotated text on the print preview. The user is to adjust the position of the window by checking the actual printout.
- The rotated text should not have more than 1 line.
- Each rotated window should have only 1 line of text or only 1 image.

6.5.2 Setup Label Size Using Command

This is the alternative method to setup custom label size using SATO Printer Language, A1 command. This will overwrite the standard Label size value by Page Format setting of Smart Forms. Users should consult the SBPL manual for the A1 command before using it in Smart Forms. As described in [Table 8 System Commands](#), add the **LABEL_SIZE** command with the Parameter of label height follow by label width with the correct number of digits as described in the SBPL manual for a specific printer.

Note: GL printer could not accept a longer length than the height of label for label width. Thus, the Landscape Orientation setup on the printer (using LCD Menus and Buttons) should utilize (that means the shorter length of the label is the width and the longer length is height.)

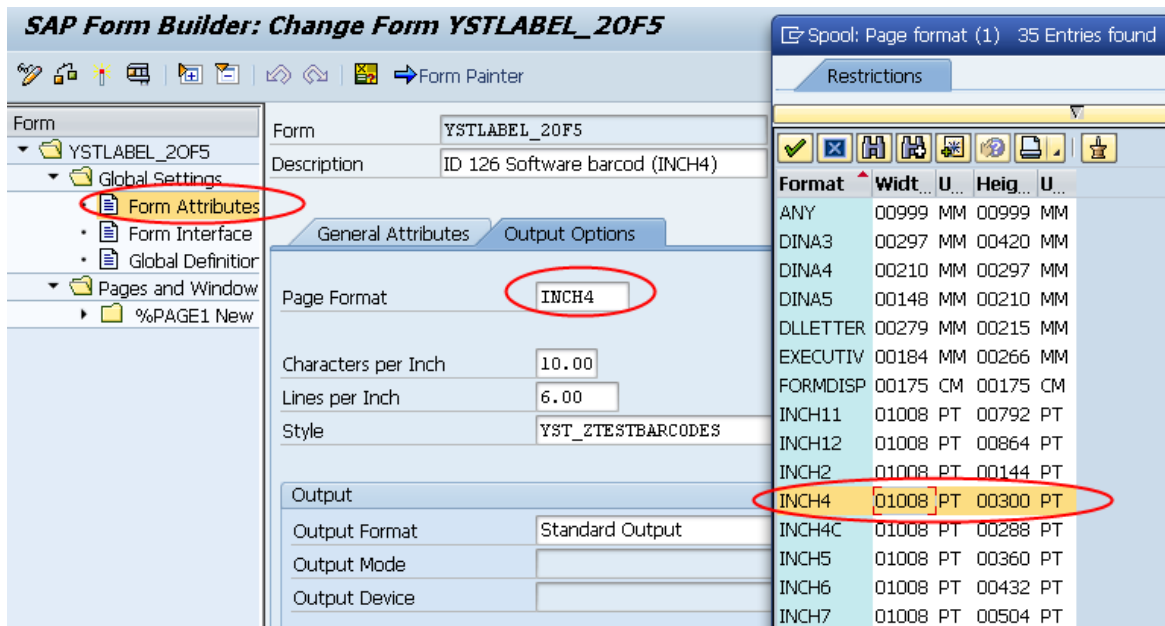

Figure 60 Standard Label Size Setup with an appropriate Page Format setting

Figure 61 Custom Label Size Setup with Command

6.5.3 Inverse Color Print Area Setup

To define the inverse print area in Smart Form, the user is to create a command in the window. The name of the parameter (INVERSE_PRNTAREA) should be placed. The image below is an example of how to setup the inverse print area.

Figure 62 Inverse print area Setup. (Example print two Inverse area, V100H100 length 200 height 50 and V50H50 length 200 height 70)

[Note]
For setting, keep the black print area under 30% of overall label.

Limitations

7

Please note the following are not supported by the SATO PDL Driver:

- Compressed graphics and color bitmap
- Underlined, superscript and subscript text
- There could be some slight variations of font size in Smart Forms and the actual font size printed from the SATO printer. This is due to the size conversion and rounding up issues.
- Courier Font (which will be mapped to SATO Fixed Width Scalable font) does not support 8 points or lower font size printing in 203dpi printer. It will be printed in a slightly larger font size instead.
- Some European characters from ISO8859-1 and Codepage 850 device types are not available from the printer. Please refer to the command specifications of the printer for details.

For other functionalities of SATO printers that are not supported by the SATO PDL driver, please approach the technical team of SATO for customization requests at:

<https://sato-globalhelp.zendesk.com/hc/en-001/requests/new>
