Abstract

The genus *Dahlica* Enderlein, 1912 is reported for the first time from Korea with two new species: *Dahlica* (*Dahlica*) *somae* Roh & Byun, **sp. n.** and *Dahlica* (*Dahlica*) *ochrostigma* Roh & Byun, **sp. n.** Adults and genitalia are illustrated, and DNA barcodes for precise identification of the species are also provided.

Keywords

bagworms, DNA barcode, Naryciinae, new species, Psychidae

Introduction

The family Psychidae is a medium-sized family of moths consisting of 241 named genera and 1,350 species (Sobczyk 2011; van Nieuwerkerken et al. 2011). Phylogenetically, Psychidae belong to the oldest clades of the suborder Ditrysia in the order Lepidoptera, and have usually been placed in the superfamily Tineoidea (Davis and Robinson 1998),

with Eriocottidae, Tineidae, Meessiidae, and Dryadulidae as phylogenetically allied groups (Mutanen et al. 2010; Regier et al. 2015). Most species of Psychidae produce characteristic cases or bags at different larval stages (Sugimoto 2009a, 2009b), which gives rise to their common name, bagworms. Parthenogenesis is known in several species of the genus *Dablica* Enderlein, 1912 in the Naryciinae (Grapputo et al. 2005; Elzinga et al. 2013). Identification of these species and classification of the females based on morphological and ecological characters alone is difficult (Grapputo et al. 2005; Elzinga et al. 2013). In Korea, Roh et al. (2016) reviewed the nine known species including a new species, *Psyche yeongwolensis* Byun & Roh, 2016 and recorded a species new for the country, *Proutia maculatella* Saigusa & Sugimoto, 2014. Later, Roh and Byun (2016) recorded *Ceratosticha leptodeta* Meyrick, 1935 new for Korea. Recently, three more species were reported: *Bacotia sakabei* Seino, 1981, (Roh and Byun 2017a), *Bruandella nipponica* (Hori, 1926), and *Proutia nigra* Saigusa & Sugimoto, 2014 (Roh and Byun 2017b). Consequently, 13 species in total are now known from Korea.

The genus *Dablica* was based on the type species *Dablica larviformis* Enderlein, 1912 by Enderlein in 1912 (Sobczyk 2011). The members of *Dablica* are superficially similar to *Siederia* Meier, 1957 (Grapputo et al. 2005), but can be distinguished from the latter by the absence of an epiphysis on the fore-tibia of the male (Herrmann 1988; Herrmann and Weidlich 1999; Rekelj et al. 2014; Arnscheid 2016), the absence of the medial cell in the fore- and hindwings, presence of accessory cells, and six veins arising from the discoidal cell of the hindwing (Rekelj and Predovnik 2014).

Meier (1958) and Sieder (1953) proposed to divide *Dablica* in various subgenera, which were later raised to genus. Recently Arnscheid and Weidlich (2017) reviewed the five allied genera, *Dablica*, *Siederia*, *Brevantennia* Sieder, 1953, *Postsolenobia* Meyer, 1958, and *Praesolenobia* Sieder, 1955, and decided on the basis of the venation of the male hindwings, male forewing scale morphology, presence of an epiphysis in the males, the structure of reproductive organs, and the female antennae to rank these genera again as subgenera of *Dablica*. They diagnosed the subgenus *Dablica* by the following characters: the absence of an epiphysis, presence of six veins from the hindwing discal cell, and the long female antennae, with more than eleven segments (Arnscheid and Weidlich 2017).

Females of the genus *Dablica* are unable to fly because of their degenerate wings (Sauter and Hättenschwiler 1999). The larvae feed on moss, algae, and lichens, which are attached to walls or the bark of trees via a sac constructed of small sand particles (Sauter and Hättenschwiler 1999; Sugimoto 2009a; Arnscheid and Weidlich 2017).

In total, 42 species of the subgenus *Dablica* have been reported worldwide and are distributed throughout the Palearctic region in Europe (41 species) and Asia (one species) (Sobczyk 2011; Arnscheid and Weidlich 2017).

In this study, *Dablica (Dablica) somae* sp. n. and *D. (D.) ochrostigma* sp. n. are described as new species and the genus *Dablica* is reported for the first time from Korea. All available information is presented, including the collection locations, microhabitats, and illustrations of adults and their genitalia. DNA barcodes are also provided for precise identification of each species.

Materials and methods

The material examined in this study is preserved in the Systematic Entomology Laboratory, Hannam University (SEL/HNU), Daejeon, Korea, and the Entomological Collection of the Korea National Arboretum, Pocheon, Korea (KNAE). Specimens were dissected and examined after mounting on slide glass; male genitalia and wing scales in 80 % glycerol solution, females in euparal solution and wing venation on dried condition. Photographs of adults and genitalia were taken using a PAXcam digital camera (PAXcam Microscope Cameras Co., Chicago, IL, USA) attached to a Carl Zeiss Axio Imager A1 microscope (Carl Zeiss Ltd., Cambridge, MA, USA).

Terminology and morphological characters of the adult, wing venation, and genitalia follows Dierl (1964), Kristensen (2003), and Arnscheid and Weidlich (2017) (Figs 1–4) and the terminology for forewing scales (class 1 to 6) follows Sauter (1956). The set-up of the data matrix for morphological characters of the genus *Dahlica* follows Arnscheid (2016) (Table 2).

Genomic DNA was extracted from the legs of dried specimen for males and thorax parts of immersion specimen for females, preserved in 100% alcohol using a Genomic Cell/Tissue Spin Mini Kit (Mbiotech, Inc., Hanam, Korea), according to the manufacturer's protocol. A total of six specimens were sequenced for, the 658 bp fragment of the mitochondrial cytochrome c oxidase I (COI) gene, the DNA barcode, was amplified using the primer pair LepF1 and LepR1 (Hebert et al. 2004). PCR conditions for amplification followed the manufacturer's protocol (Platinum Taq, Invitrogen, Carlsbad City, CA, USA). Amplicons were purified using the QIAquick® PCR purification kit (QIAGEN, Inc.) and directly sequenced at Genotech Corp. (Yuseong-gu, Daejeon, Korea). Contigs were assembled using CodonCode aligner version 2.0.6 (CodonCode Co., Centerville City, MA, USA) and were aligned using MAFFT (Katoh and Toh 2008).

The new barcodes were compared to 18 DNA barcodes of the genera *Dahlica* and *Narycia* downloaded from GenBank (National Center for Biotechnology Information, USA, <http://www.ncbi.nlm.nih.gov/>) (Table 1). A neighbor-joining (NJ) analysis was performed with MEGA 6.0 (Tamura et al 2013) under the K2P model for nucleotide substitutions. Successful sequences were uploaded to BOLD systems (project. KNAE) and submitted to GenBank (Table 1).

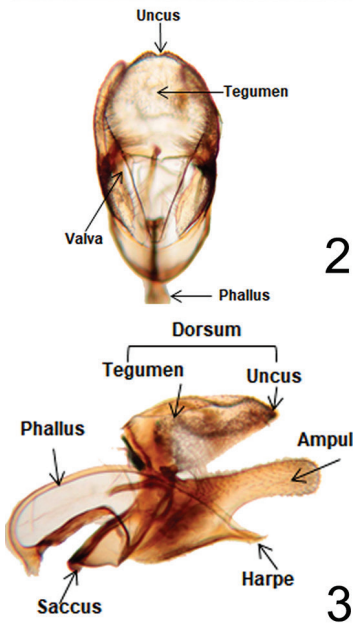

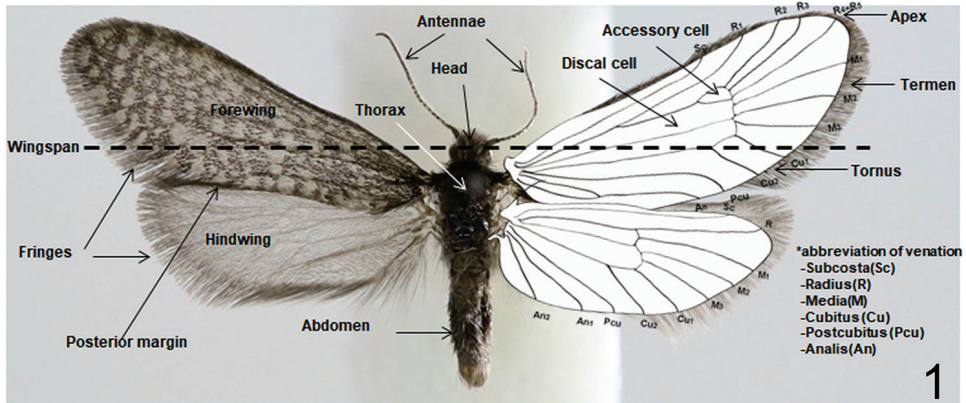

Systematic accounts

Dahlica Enderlein, 1912

Subgenus *Dahlica* Enderlein, 1912

Dahlica Enderlein 1912: 264.

Type species. *Dahlica larviformis* Enderlein, 1912: 264 by monotypy.

Figures 1–4. Terminology of morphological characters. **1** Male (Dierl (1964), Arnscheid and Weidlich (2017)) **2** Male genitalia, dorso-ventral part (Dierl (1964), Kristensen (2003) and Arnscheid and Weidlich (2017)) **3** Ditto, lateral part (Dierl (1964), Kristensen (2003) and Arnscheid and Weidlich (2017)) **4** Female (Arnscheid and Weidlich (2017)).

Key to the males of *Dablica* in Korea

- 1 Hindwing M2 and M3, originate at apical corner of posterior part of discoidal cell (Fig. 28), dorsum of genitalia gently curved to apical part and harpe hooked (Fig. 11) ***D. (D.) somae* sp. n.**
- Hindwing M₃ stalked at 1/4 M₂, dorsum strongly arched to apical part (Fig. 29) and harpe needle shape (Fig. 18) ***D. (D.) ochrostigma* sp. n.**

Table 2. Data matrix for morphological characters (Arnscheid 2016) of *Dablica* species in Korea.

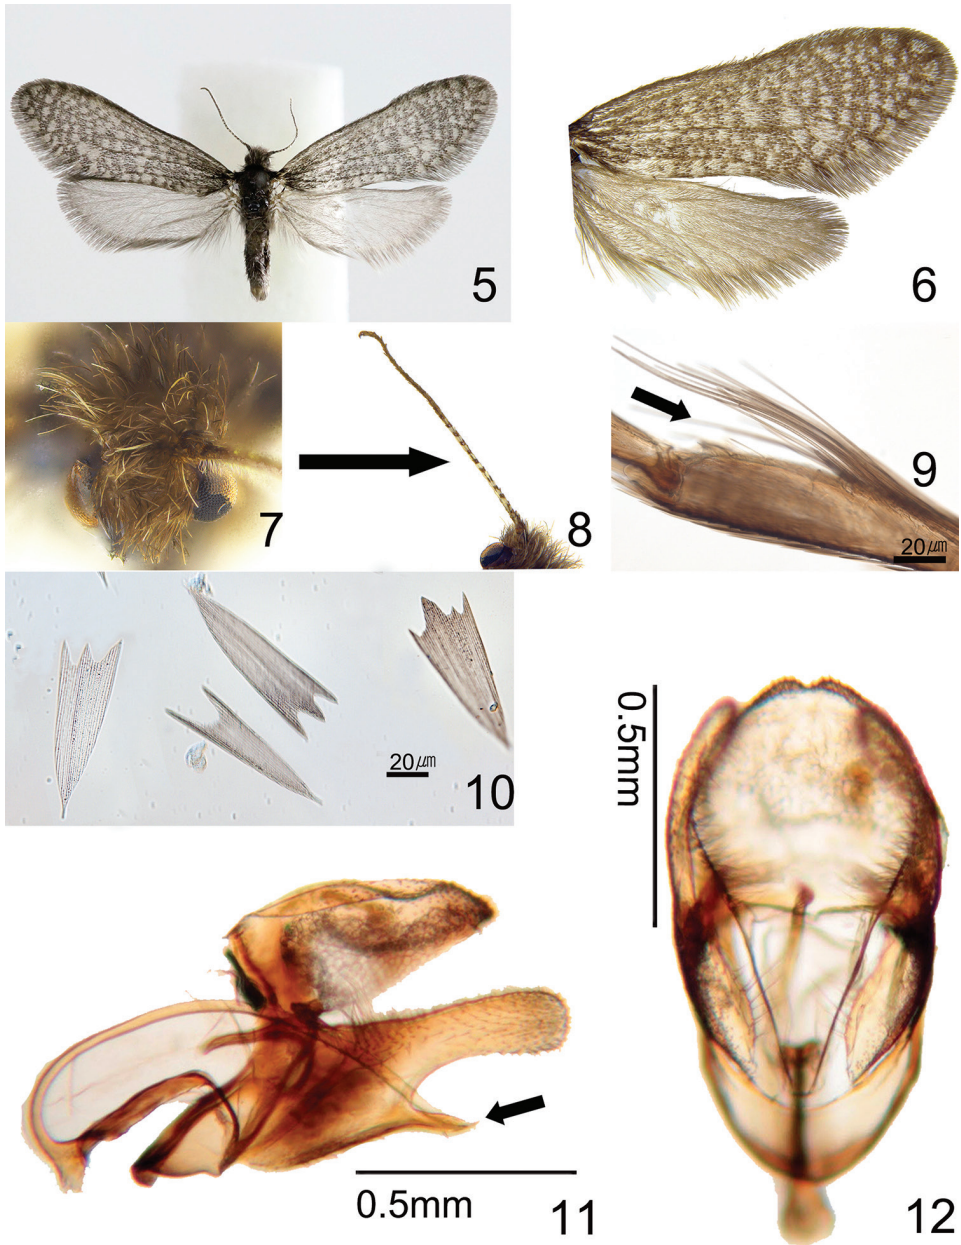

Species	Male wingspan	Scales (classes)	Hindwing venation (M_2/M_3)	Genitalia index
<i>D. (D.) somae</i>	12.3–13.4 mm.	2–4	free	1.46–1.56
<i>D. (D.) ochrostigma</i>	9.8–11.2 mm.	1–2	short stalked	0.79–1.08

Diagnosis. Male of this species is superficially similar to *D. triquetrella* (Hübner, 1813), but can be distinguished by a slightly longer transtilla and a relatively short ampulla of the male genitalia (lateral aspect). This species can be readily differentiated by the veins of the male hindwing; M_2 and M_3 originate at the apical corner of the posterior part of the discoidal cell. Female apophyses posteriores 1.75 times longer than apophyses anteriores.

Description. Adult. Male (Figs 5–12). Wingspan 12.3–13.4 mm (Table 2). Coloration and vestiture: Vertex of head roughly covered with grayish brown hairs. Thoracic notum covered with blackish brown hairs. Upper side of forewing: ground color grayish black; white spots present regularly; scales (Fig. 10) slightly narrow and evenly widened apically; apical margin usually produced into two to four laciniations (classes 2–4) (Table 2). Hindwing covered with grayish white scales; postmarginal part present with slight long shiny white hairs. Structure: head and compound eyes slightly large; ocelli absent. Antennae (Fig. 8) filiform, longer than $2/3$ forewing. Forewing: slightly long and narrow; costa straight; termen shortly arched to posterior margin, discoidal cell 0.64 times as long as forewing; venation (Fig. 28) with nine veins, originating at the discoidal cell; accessory cell present; intercalary cell absent; Sc arising with $3/5$ costa; R_2 and R_3 originating at corner of accessory cell; R_4 and R_5 fused and originating at apical corner of anterior part of the discoidal cell reaching to the apex; M_1 and M_2 parallel; M_2 and M_3 stalked at apical corner of posterior part of the discoidal cell; Cu_1 and Cu_2 parallel. Hindwing (Fig. 28): costa straight; discoidal cell 0.51 times as long as hindwing; Sc straight to $4/5$ costa; R terminating at apex; M_1 and M_2 parallel, M_2 and M_3 originating at apical corner of posterior part of the discoidal cell (Table 2); Cu_1 and Cu_2 parallel to tornus. Legs: epiphysis absent (Fig. 9); femora and tibiae covered with brown hairs; tarsi covered with grayish brown scales.

Female (Figs 24–27). Adult 4.2 mm in length. Coloration: Head, meso-, and metanotum dark brown. Membranous areas of abdomen yellowish brown. Abdomen covered with light brown scales; corethrogynae densely covered with white hairs on ventral part only. Structure: apterous. Head and compound eyes small, antennae slightly developed with basal flagellomeres 17 segmented, bipectinated. Legs well developed with tarsi divided into four tarsomeres; hind legs present with apical spurs.

Male genitalia (Figs 11, 12). In lateral aspect. Genitalia index, 1.46–1.56 (Table 2). Dorsum gently curved. Saccus very short; ampulla narrow and short with club shape, setae present sparsely; harpe short with hooked shape; phallus slender and very long with whip shape. In dorso-ventral aspect, uncus slightly concave; gnathos and juxta absent; valva slightly narrow, apical part of valva densely covered.

Figures 5–12. Male of *Dablica (Dablica) somae*, holotype. **5** Male **6** Close-up of rightwing- pattern **7** Head, frontal view **8** Antenna **9** Absence of foreleg-tibia **10** Scales of forewing (slide No. KNAESSJ01) **11** Genitalia (slide No. KNAESJ01), lateral view **12** Ditto, dorso-ventral view.

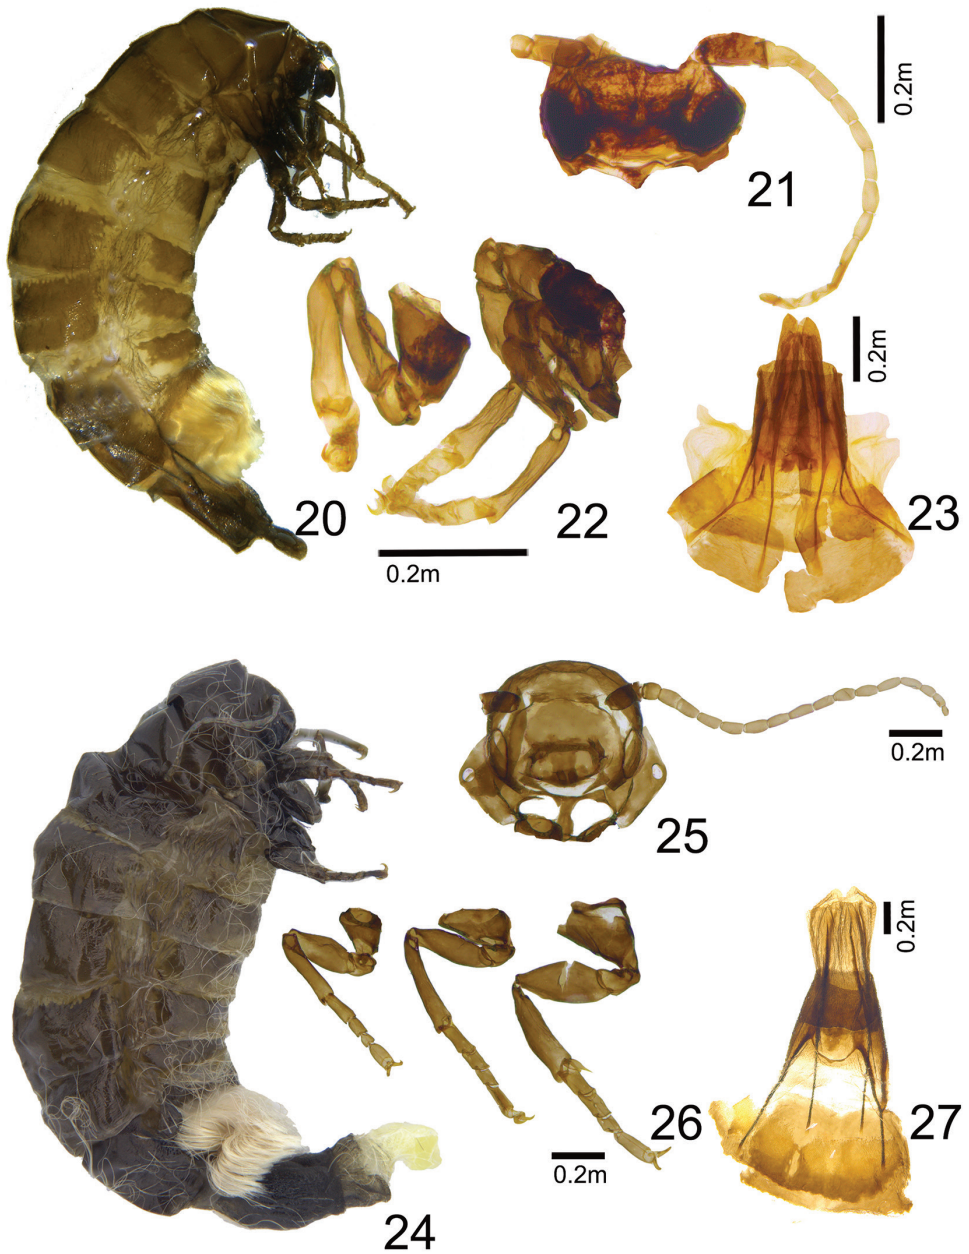

Female genitalia (Fig. 27). Oviscapt and ostium bursae well sclerotized. Apophyses posteriores 1.75 times longer than apophyses anteriores, very slender. Sclerotizations of the seventh sternite present with bundle of hairs

Figures 13–19. Male of *Dablica (Dablica) ochrostigma*. **13** Male, holotype **14** Close-up of rightwing-pattern, Paratype (Korea, Gangwon-do, Taebaek-si, Changjuk-dong, GW, 6.iii.2015) **15** Antenna, ditto **16** Scales of forewing, holotype (slide No. KNAESSJ03) **17** Absence of foreleg-tibia, holotype **18** Genitalia, holotype (slide No. KNAESJ04), lateral view **19** Ditto, dorso-ventral view.

Larval case (Figs 32, 33). Length 4.0 mm. Larvae build their cases by putting together small sand particles, forming oval-shaped cases rather than angular cases.

Distribution. Korea.

Figures 20–27. Females. **20** *Dahlica (Dahlica) ochrostigma* preserved in 70% ethanol, paratype (Korea, Gangwon-do, Taebaek-si, Changjuk-dong, GW, 6.iii.2015) **21** Ditto, head and antenna, macerated **22** Ditto, legs, foreleg to hindleg (left to right), macerated **23** Ditto, genitalia, macerated **24** *Dahlica (Dahlica) somae*, paratype (Korea, Daejeon, Mt. Heungnyongsan, 6.iii.2017) **25** Ditto, head and antenna, macerated **26** Ditto, legs, foreleg to hindleg (left to right), macerated **27** Ditto, genitalia, macerated.

DNA barcode. DNA barcode sequences were generated from three individuals. Multiple alignments using the BLAST tool in the NCBI database showed the following species as nearest neighbor: *Dablica charlottae* with a similarity between 97 and 95%.

Etymology. The species is named in honor of Ms. Da-Som Kim, collector of the material.

Other material. 1♂ **Korea:** Gyeonggi-do, Paju-si, 2.iv.2007, B.W. Lee, genitalia mounted in 80% glycerol solution, genitalia No. KNAESJ06. Deposited at KNAE.

Diagnosis. Male, this species is superficially similar to *D. somae* sp. n., but can be distinguished by slightly shorter antennae, a narrow forewing, and the venation of hindwing M3 stalked at 1/4 of M2. This species can be readily differentiated by the dorsum of male genitalia, which is strongly arched to the apical part and in the shape of a hat, and a very short phallus (lateral aspect). Female, apophyses posteriores 1.16 times longer than apophyses anteriores.

Description. Adult. Male (Figs 13–19). Wingspan 9.8–11.2 mm (Table 2). Coloration and vestiture: Vertex of head roughly covered with short grayish brown hairs. Thoracic notum covered with brown hairs. Upper side of forewing: ground color gray with sparsely yellow spots; scales (Fig. 16) considerably narrow; apical margin usually produced into two to three lacinations (classes 1–2) (Table 2). Postmarginal part of hindwing present with long shiny white hairs. Structure: head slightly small, compound eyes relatively large; ocelli absent. Antennae filiform (Fig. 15), less than 1/2 forewing. Forewing: short and narrow; costa straight; apex strongly arched to termen, discoidal cell 0.67 times as long as forewing; venation (Fig. 29) with nine veins, originating at the discoidal cell; intercalary cell absent and accessory cell present; Sc reaching to 3/5 costa;

Figures 28–29. Wing venation of males. **28** *Dahlia* (*Dahlia*) *somae*, holotype (KNAEVSJ01) **29** *Dahlia* (*Dahlia*) *ochrostigma*, holotype (KNAEVSJ03).

Figures 30–35. Microhabitat and larval cases with pupal exuviae. **30** Microhabitat of *Dahlia* (*Dahlia*) *ochrostigma* (Korea: Gangwon-do, Pyeongchang-gun, Nodong-ri, 6.iii.2015). **31** Ditto, close up **32** Male of *Dahlia* (*Dahlia*) *somae*, larval case with pupal exuviae **33** Female of *D. (D.) somae*, ditto **34** Male of *D. (D.) ochrostigma*, ditto **35** female of *D. (D.) ochrostigma*, ditto.

Figure 36. A Neighbor-joining tree, generated under the Kimura 2 parameter model (MEGA 6, Tamura et al. 2013) for the species of genera *Dahlica* and *Narycia* (DNA barcode data from NCBI). Branch lengths represent the number of substitutions per site as percentage.

R_4 and R_5 fused; R_3 and $R_4 + R_5$ originating at apical corner of anterior part of discoidal cell; M_1 and M_2 parallel; M_2 and M_3 stalked at apical corner of posterior part of the discoidal cell; Cu_1 and Cu_2 parallel. Hindwing (Fig. 29): costa straight; discoidal cell 0.52 times as long as hindwing; Sc straight and reaching to 4/5 costa; R originated at apical corner of anterior part of discoidal cell and reaching the apex; M_1 and M_2 parallel, M_3 stalked at 1/4 M_2 (Table 2); Cu_1 and Cu_2 parallel. Legs covered with shiny brown scales, epiphysis absent (Fig. 17).

Female (Figs 20–23). 4.5 mm in length. Coloration: Head dark-brown. Meso and metanotum red-brown. Membranous areas of abdomen yellow. Abdomen clothed with light brown scales; corethrogyne densely covered with yellowish white hairs at only ventral part. Structure: Apterous. Head slightly small, antennae relatively developed and long. Legs well developed, slightly long, tarsi 4-segmented.

Male genitalia (Figs 18, 19). In lateral aspect. Genitalia index, 0.79–1.08 (Table 2). Dorsum strongly arched to apical part with the shape of a hat. Saccus relatively short; ampulla slightly long and club shape, setae sparsely; harpe short with needle shape; phallus slender and short with whip shape. In dorso-ventral aspect, uncus slightly concave shape; gnathos and juxta absent; valva slightly narrow and apical part produced into weak rounded claviform.

Female genitalia (Fig. 23). Oviscapt and ostium bursae sclerotized. Apophyses posteriores 1.16 times longer than apophyses anteriores, slender. Sclerotizations of seventh sternite present with bundle of hairs.

Larval case (Figs 34, 35). Length 3.6–3.9 mm. Their cases are superficially similar to those of *D. somae* sp. n.

Distribution. Korea.

DNA barcode. DNA barcode sequences were generated from three individuals (Table 1). Multiple alignments using the BLAST tool in the NCBI database showed the following species as nearest neighbor, *Dahlica charlottae* with a similarity between 96 and 94%.

Etymology. The specific name is derived from the Greek words *ochro* and *stigma* (= pale spots), referring to the forewing pattern.

Discussion

The taxonomy of *Dahlica* has until recently been confusing owing to the similar morphology of the species in this genus and those in the allied genera *Siederia*, *Postsolenobia*, *Brevantennia*, and *Praesolenobia*. The proposal by Arnscheid and Weidlich (2017) to treat all these as subgenera of *Dahlica* has partly solved this problem. In this study, two new Korean species of *Dahlica* were reported for the first time with COI barcodes (Table 1). The results of comparison with related taxa, including subgenera of *Dahlica*, revealed no distinct differences (Fig 36). Therefore, the taxonomic positions of the species in genus *Dahlica* needs to be redefined through future systematic studies with additional samples.

Most species of the genus *Dahlica* have been reported from Europe (48 species) to date, only one species, *D. (D.) parthenogenesis* Saigusa, 1961 was collected in Japan (Saigusa 1961). Thus, the two new species described in this study represent the first records for continental East Asia and serve as important basic data for future research on this genus and allied taxa in Asia.

Acknowledgements

We thank Mr. JH Jeon, TH Yoo, and Ms. DS Kim (Systematic Entomology Lab., Hannam University Korea) for their assistance in collecting specimens. This study was carried out with the support of the ‘R&D Program for Forest Science Technology (Project No.: S111616L050120)’ provided by Korea Forest Service (Korea Forestry Promotion Institute) and Korea National Arboretum (Project No. KNA1-1-20, 16-1).
