

**Micronekton in the North
Pacific ... what do we know?**

**Michael P. Seki
NOAA Fisheries
Pacific Islands Fisheries Science Center**

“micronekton” defined ...

- **Small but actively swimming organisms ranging from ca. 2 to 10 cm; mainly mesopelagic (200-1000 m depths)**
- **Taxa too vagile to be caught with conventional plankton nets yet too small to be retained by most large trawls.**
 - **Fishes – mainly mesopelagics and juveniles of epipelagic nekton**
 - **Crustaceans – includes adult euphausiids, pelagic decapods, mysids, hyperiid amphipods**
 - **Cephalopods – small adults and subadults of large oceanics**
- **Many undertake extensive diel vertical migrations**

Why do we care?

- Represents a substantial biomass in the world's oceans
- A critical but poorly understood intermediate (missing?) trophic link between the mesozooplankton & higher trophic levels (i.e., fish, marine mammals, etc.)
- Significant contributors to the “biological pump” (i.e., rapid transport of C_{surface} as well as pollutants, to deep sea).

PICES

North Pacific Marine Science Organization

- Relatively scant attention paid to micronekton as a whole
- In 1997, PICES establishes a WG to assimilate knowledge of micronekton & their sampling in the North Pacific
- Broadly, much of what is known results from research of the 1960s & 70s
- ... most focused on the marginal seas around the basin rim (i.e., we know least about the open ocean)
- ... and little effort expended in comparing relative sampling efficiencies and selectivity of the gears

PICES Scientific Report No. XX

2004

Micronekton of the North Pacific

PICES Working Group 14

Final Report

Version 1.0

Some history and milestones of micronekton research around Hawaii and the Central North Pacific:

- King & Iversen (1962): oceanic Central Pacific & Hawaii – 6' & 10' IKMT; $z_{\max} \sim 350$ m
- Clarke, Young, and others (1972-78): off Hawaii; 6' & 10' IKMT, Cobb trawl; z_{\max} to 1200 m
- Wilson, Boehlert and others (1985-88): Hancock Smts – “engybenthic” micronektonic fauna; qualitative acoustics
- Reid et al. (1991): off Hawaii; Mesopelagic Boundary Community (MBC); IOS-RT 40 m², HU-200 m² trawl; $z_{\max} \sim 500-600$ m
- Benoit-Bird and Au: off Hawaii (2001-2003): MBC, quantitative acoustics, horizontal migration, micro-patches)
- PICES (2004): off Hawaii; 6' IKMT, Cobb trawl, HU-RT gear comparison; quantitative acoustics

SE Hancock Acoustic transects, July 1984 (38 kHz Simrad echo sounder)

Onychoteuthis sp. D & *O. borealijaponica*

- South spawning – north feeding migrations
- Spatially complementary distributions
- Past reports of extensive distribution likely a composite of 2 species

PICES Micronekton Inter-calibration Experiment (MIE)

NOAA ship *Oscar Elton Sette* cruise 04-13

October 6-13, 2004

Cruise objectives:

- to conduct the sampling for a gear comparison and to gain a subtropical perspective of the micronekton community
- use the benign weather and sea conditions to evaluate and refine the protocols, logistics, and design of the experiment

Micronekton Intercalibration Experiment – 1

Gear-types for intercomparison (what is micronekton?):

MIE-1 – “what one defines as micronekton ≠ another”; enabled all size range evaluation of multiple acoustic λ s

MIE-2 – ‘appropriate’ gear of similar mesh sizes; standard gear (RMT 1+8, IKMT?); towed acoustics (high frequencies)

Opisthoproctus soleatus

Oplophorus gracilirostris

Abralia trigonura

What now?

- **Advances in technology**
- **Signal strength (acoustics)**
- **Time series – observation systems**
- **Refined trophic links**
- **Ecosystem roles**
