# **Biological Assessment**

## Biological Assessment for Farmers Mutual Ditch San Juan County, New Mexico

### **Background and Description of Proposed Action**

This Biological Assessment evaluates the effect of the Farmers Mutual Ditch acequia rehabilitation project on all federally listed endangered and threatened species with potential to occur in the project area, in accordance with Section 7 of the Endangered Species Act.

The U.S. Army Corps of Engineers (USACE), Albuquerque District, proposes to rehabilitate the ditch by placing two segments into pipe as part of the Acequia Rehabilitation Program. This program is authorized under Section 1113 of the Water Resources Development Act (WRDA) of 1986 (Public Law 99-662; 33 U.S.C. 2201 et. seq. as amended).

The Farmers Mutual Ditch was chartered in the 1880s and supplies irrigation water for 600 users located along its approximate 22 mile length as it courses through the north floodplain of the San Juan River beginning at Farmington, New Mexico. The ditch has two diversion points: one on the Animas River just below the Farmington municipal sewage treatment plant; and the second diversion on the San Juan River about  $\frac{1}{2}$  mile downstream of the State Highway 371 bridge. The acequia irrigates 4,200 acres of land at an allotted rate of 3.1 acre-feet per acre annually.

Two previous USACE projects rehabilitated the ditch heading (diversion) below the State Highway 371 bridge (USACE 1988) and improved conveyance on 3.2 miles of the ditch in the vicinity of Kirtland by lining it with concrete and replacing gates (USACE 2002).

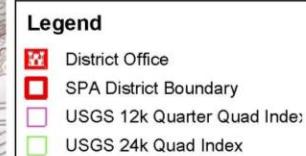

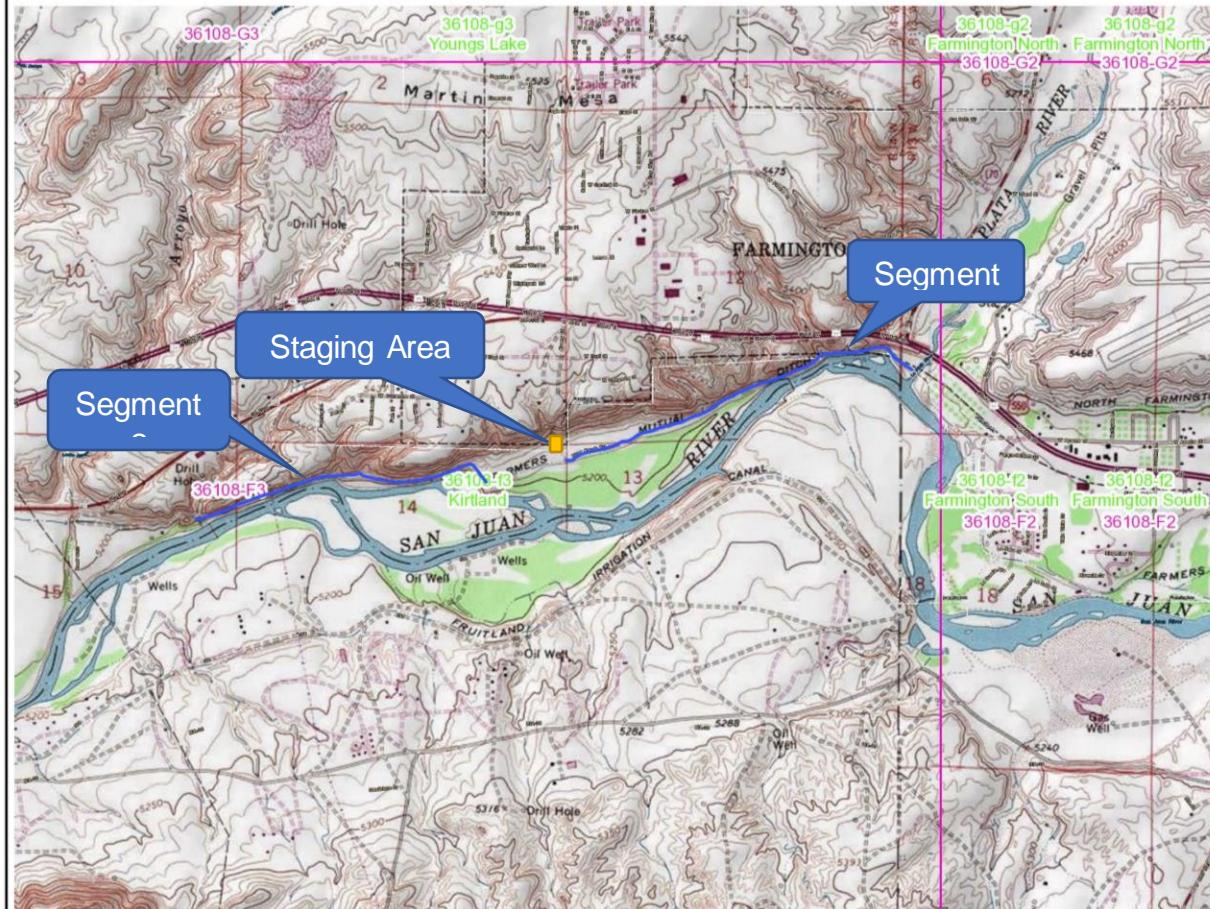

The current project is located west of the city of Farmington along the edge of the San Juan River floodplain (Figure 1). An approximately 2-mile portion of Farmers Mutual Ditch that runs below steep bluffs is affected by rock slides. In the past, the rock slides have completely filled the irrigation canal, reducing the water supply to Association members and necessitating frequent maintenance.

In the preferred alternative for this project, USACE proposes to replace two segments totaling approximately 2 miles of earthen ditch with buried irrigation pipe. Irrigation pipe eliminates entry of erosional material where the ditch is at the base of steep slopes. Piping the ditch would alleviate the need for frequent maintenance to clear channel blockages from debris and would provide for more efficient distribution of irrigation water to the users.

The proposed project would take place during the non-irrigation season, between the end of October and mid-March, which is also outside the nesting season for migratory birds. Equipment would access the ditch by paved roads, existing unpaved maintenance roads paralleling the ditch, or on the adjacent graded ditch berm. A staging area has been identified; it is a barn lot near the access road and is outside the riparian zone.

Figure 1: Location of Farmers Mutual Ditch project.

## Listed Species in the Project Area

The USACE project biologist obtained a species list from IPaC on January 10 and an update on July 10, 2020 (Consultation 02ENNM00-2020-SLI-0342). The Biota Information System of New Mexico (BISON-M) and the New Mexico Rare Plant Website were also consulted. Federal endangered and threatened species are listed in Table 1.

Table 1: Federal endangered and threatened species

Common Name	Scientific Name	Federal Status (USFWS) <sup>a</sup>	State of New Mexico Status (NMGF) <sup>b</sup>
Canada Lynx	<i>Lynx canadensis</i>	T	---
New Mexico Meadow Jumping Mouse	<i>Zapus hudsonius luteus</i>	E	---
Southwestern Willow Flycatcher	<i>Empidonax traillii extimus</i>	E	E
Yellow-billed Cuckoo	<i>Coccyzus americanus</i>	T	---
Colorado Pikeminnow	<i>Ptychocheilus lucius</i>	E	E
Razorback Sucker	<i>Xyrauchen texanus</i>	E	---
Zuni Bluehead Sucker	<i>Catostomus discobolus yarrowi</i>	E	---
Knowlton's Cactus	<i>Pediocactus knowltonii</i>	E	---
Mancos Milk-vetch	<i>Astragalus humillimus</i>	E	---
Mesa Verde Cactus	<i>Sclerocactus mesae-verdae</i>	T	---

Critical habitat for the Colorado pikeminnow is present in the project area, in the river channel. No other critical habitats are present.

Migratory birds of conservation concern include the Pinyon Jay (*Gymnorhinus cyanocephalus*) and Virginia's Warbler (*Vermivora virginiae*). The San Juan River has been noted as wintering habitat for Bald eagles (*Haliaeetus leucocephalus*), which are protected under the Bald and Golden Eagle Protection Act. Several additional species are listed by the New Mexico Department of Game and Fish and will be addressed in the Special Status Species section of the project Environmental Assessment.

The potential of the project to affect these species was evaluated following a reconnaissance visit on June 8 and exploratory bird surveys on June 20 and July 8. Based on the reconnaissance visit, habitat along the ditch itself was deemed marginally suitable for riparian bird species, and likely not utilized for nesting; whereas patches of riparian habitat in the San Juan River floodplain adjacent to but below the ditch were

moderately suitable. Based on the proximity of habitat patches along the ditch to floodplain riparian habitat, and the potential for utilization as foraging habitat, surveys for yellow-billed cuckoo and willow flycatcher were advised.

## Description of Habitat in the Project Area

The ditch banks are vegetated to varying degrees, with patches of sparse to dense coyote willow (*Salix exigua*) intermixed with sparse small tamarisk (*Tamarix* sp.) and Russian olive (*Elaeagnus angustifolia*) trees. A few large cottonwoods (*Populus deltoides* subsp. *vislizeni*) grow on the spoil bank berm between the ditch bank and the floodplain riparian zone below.

Large stretches of the ditch banks are nearly bare from recent maintenance or have young resprouting growth of willows, or are heavily infested with Russian knapweed (*Acroptilon repens*) and hoary cress (*Lepidium* or *Cardaria* sp.), highly invasive species listed by the State of New Mexico as noxious weeds. A few sections of ditch bank have perennial herbaceous vegetation- sedges (*Carex* sp.), non-native creeping bentgrass (*Agrostis stolonifera*), showy milkweed (*Asclepias speciosa*), goldentop (*Euthamia occidentalis*), licorice (*Glycyrrhiza lepidota*) and dogbane (*Apocynum cannabinum*). Upland shrubs including rabbitbrush or chamisa (*Ericameria nauseosa*) and fourwing saltbush (*Atriplex canescens*) are common on the ditch berm slopes.

The adjacent floodplain riparian habitat patches are dominated by Russian olive beneath a mature cottonwood gallery; overstory cottonwood canopy cover is less than 20%. There are occasional Gooodding's willows (*Salix gooddingii*), New Mexico olive (*Forestiera pubescens*) and tamarisk in the shrub layer.

On June 8, tamarisk leaf beetle larvae were observed in tamarisk shrubs along the ditch. By July 8, about 50% of the tamarisk in the project area was brown.

## Project Description and Direct and Indirect Impacts of the Proposed Action

The new pipe would be placed in the current ditch alignment and bedded in sand and gravel. The ditch would be backfilled using onsite inorganic soil materials as much as possible. Direct impacts associated with piping the ditch include soil disturbance and loss of ditch bank vegetation, either by direct removal, disturbance by machinery, or burial. Vegetation removal would be kept to a minimum and no mature cottonwood trees would be removed. Because the project would take place during the late fall through late winter, direct impacts to wildlife would be negligible. Migratory birds would not be affected as they are not present at this time of year.

Indirect impacts of piping the ditch include potential loss of ditch bank hydrophytic vegetation from seepage elimination. The ditch supports patches of willows interspersed

with tamarisk and Russian olive in a narrow band (less than feet wide), particularly along the bluff side of the ditch.

However, periodic rockfall and debris slides cause disturbance to both sides of the ditch. Once the ditch has been piped and covered, natural rockfall would continue, but the need for maintenance would decrease. The top of the spoil bank ditch berm would continue to be serve as a maintenance/access road, but its sloping sides would revegetate over time.

Segment 1 of the ditch is only slightly higher in elevation than the floodplain and mature riparian trees are expected to be able to access groundwater and survive the loss of seepage water when the ditch is piped. Seepage from the ditch is not a significant source of water to the floodplain; the river and groundwater table provide the water that sustains floodplain vegetation.

Ditch segment 2 is perched higher above the floodplain. A few mature cottonwood trees growing on the berm between the ditch and the floodplain riparian zone may not survive the loss of water supply when seepage from the ditch is eliminated. Similar to segment 1, seepage from the ditch is not a significant water source for the floodplain, but does support a band of willows and other riparian vegetation. Indirect loss of approximately 2,400 feet of ditch bank willows and 2-3 mature cottonwoods may result from elimination of seepage from ditch.

## Effects Determination

Potential effects to listed species are summarized in **Table 2** and discussed in text below.

*Table 2: T&E Species Effects Determinations*

Species/Critical Habitat	Effect Determination	Rationale
Canada Lynx <i>Lynx canadensis</i>	No effect	Habitat for the lynx (boreal or subalpine forest) is not present in project area.
New Mexico Meadow Jumping Mouse <i>Zapus hudsonius luteus</i>	No effect	Habitat at project site is unsuitable; no herbaceous or shrub-scrub wetlands present. Herbaceous vegetation along ditch occurs only in a narrow strip and is frequently disturbed; ditch is not a permanent water source and is “perched” above the river, disconnected from floodplain.
Southwestern Willow Flycatcher <i>Empidonax traillii extimus</i>	May affect, not likely to adversely affect	Project would take place outside of nesting season; habitat along ditch is marginal, non-continuous, and largely separated from the floodplain riparian area by the ditch berm. Only minor loss of foraging habitat is anticipated.

		Ditch banks are frequently disturbed due to ongoing maintenance needs and clearing rockfall from ditch. Two surveys during breeding season failed to detect any willow flycatchers.
Yellow-billed Cuckoo <i>Coccyzus americanus</i> , Western U.S. DPS	May affect, not likely to adversely affect	Project would take place outside of nesting season; habitat along ditch is marginal, non-continuous, and largely separated from the floodplain riparian area by the ditch berm. Only minor loss of foraging habitat is anticipated. Ditch banks are frequently disturbed due to ongoing maintenance needs and clearing rockfall from ditch. Two surveys during breeding season failed to detect any cuckoos.
Colorado Pikeminnow <i>Ptychocheilus lucius</i>	No effect	Project would take place during non-irrigation season while the ditch is dry, would not touch the river channel, and would not alter the diversion, flow or circulation of water. No change from baseline conditions.
Colorado Pikeminnow <i>Ptychocheilus Lucius</i> critical habitat	No effect	Project would take place during non-irrigation season while the ditch is dry, would not touch the river channel, and would not alter the diversion, flow or circulation of water. No change from baseline conditions.
Razorback Sucker <i>Xyrauchen texanus</i>	No effect	Project would take place during non-irrigation season while the ditch is dry, would not touch the river channel, and would not alter the diversion, flow or circulation of water. No change from baseline conditions.
Zuni Bluehead Sucker <i>Catostomus discobolus yarrowi</i>	No effect	Project would take place during non-irrigation season while the ditch is dry, would not touch the river channel, and would not alter the diversion, flow or circulation of water. No change from baseline conditions.
Knowlton's Cactus <i>Pediocactus knowltonii</i>	No effect	Habitat for this cactus is not present; project area is too highly disturbed; ditch banks where vegetated present too much competition from hydrophytic vegetation or prevalent noxious/invasive species. No cacti of any species were encountered in botanical survey along the ditch.
Mancos Milk-vetch <i>Astragalus humillimus</i>	No effect	Habitat for this species is not present; project area is too highly disturbed; ditch banks where vegetated present too much competition from hydrophytic vegetation or prevalent noxious/invasive species. No <i>Astragalus</i>

		species were encountered on botanical survey along the ditch.
Mesa Verde Cactus <i>Sclerocactus mesae-verdae</i>	No effect	Habitat for this cactus is not present; project area is too highly disturbed; ditch banks where vegetated present too much competition from hydrophytic vegetation or prevalent noxious/invasive species. No cacti of any species were encountered in botanical survey along the ditch.

## Endangered and Threatened Species Narratives

### Endangered plants: Mancos milk-vetch, Mesa Verde cactus, and Knowlton's cactus

These species are all narrow endemics restricted to specific geologic formations. The Farmers Ditch project site is situated on the Kirtland and Fruitland geologic formation, whereas these endangered plants occur on different formations. No cacti nor Astragalus species were found during the botanical reconnaissance survey conducted by the Corps. The ditch banks have experienced too much disturbance, and the vegetation that occurs on the ditch banks with its prevalence of invasive species presents too much competition for these endangered plant species to survive. Therefore, due to lack of suitable habitat in the project area, **there would be no effect to these three species.**

**Mancos milk-vetch** distribution closely follows a narrow band of Mesozoic (Point Lookout and Cliff House) sandstone along a 10-mile section of the Hogback geologic formation. The distributional range of *A. humillimus* has not changed since the recovery plan was finalized in 1989 (USFWS 2011a).

**Mesa Verde cactus** habitat is sparsely vegetated low rolling clay hills formed from the Mancos or Fruitland shale formations at 1,500-1,700 m (4,900-5,500 ft). The soils are highly alkaline, gypsiferous, and have shrink-swell potentials that make them harsh sites for plant growth (New Mexico Rare Plant Technical Council (NMRPTC) 1999).

**Knowlton's cactus** occurs within a single natural population in northern San Juan County, New Mexico. The site is on rolling, gravelly hills in a piñon-juniper-sagebrush community at about 1,900 m (6,200-6,300 ft) (NMRPTC 1999).

### Endangered fish: Colorado pikeminnow, razorback sucker, and Zuni Bluehead Sucker

These endangered fish **would not be affected** by the proposed action because of the timing of work when the ditch is dry and because aquatic habitat including the river channel and diversion structures would not be affected. There would be no alteration to the diversion, flow or circulation of water resulting from the project.

Critical habitat for the pikeminnow would be unaffected; there would be no alteration of riverine habitats (eddies, backwaters, shorelines, runs, and inundated floodplains for spawning; USFWS 1994) Conditions after project completion would be unchanged from the baseline.

The Zuni bluehead sucker is endemic to the Little Colorado River drainage of west-central New Mexico and east-central Arizona (Propst et al. 2001). Critical habitat has been designated in McKinley and Cibola Counties, NM (USFWS 2016). Habitat for the Zuni bluehead sucker is not present in the San Juan River.

The Razorback sucker and Colorado pikeminnow are endangered warmwater fishes of the Colorado River Basin. Habitat for both species exists in the San Juan River, and critical habitat for the pikeminnow is in the river channel adjacent to Farmers Mutual Ditch. The pikeminnow, formerly known as squawfish, was thought to be extirpated in New Mexico until it was found during a 1987 fisheries survey on the San Juan River below Farmington (USACE 1988). Three wild populations of Colorado pikeminnow are currently found in the Green, upper Colorado, and San Juan River subbasins. The San Juan River Recovery Implementation Program is one of two programs working to recover the pikeminnow and recovery goals for the subbasin have been partially met (USFWS 2011b).

The San Juan River subbasin population of razorback sucker has been consistent in size, but also consists almost entirely of hatchery-reared individuals. Only a small percentage of the population is spawning and juvenile recruitment has rarely been documented (USFWS 2018).

### Endangered Mammals: Canada lynx and New Mexico Meadow Jumping Mouse

Habitat for the Canada lynx occurs at high elevations far from the project area. The lynx inhabits boreal forest or its subalpine counterpart in the Southern Rocky Mountains, and frequents areas with deep winter snow and high population density of snowshoe hares (USFWS 2020).

The New Mexico jumping mouse utilizes riparian communities along streams, wetlands, or ditches that contain persistent emergent herbaceous wetlands or scrub-shrub wetlands composed of willows and alders with an understory of primarily forbs and sedges. It especially uses microhabitats of tall dense sedges on moist soil along the edge of permanent water (USFWS 2014, 2020b). While there are patches of dense herbaceous vegetation along the Farmers Ditch, there are no emergent herbaceous wetlands or shrub-scrub wetlands that have an understory of forbs and sedges as described. The ditch is not a permanent water source that would allow full development of wetland vegetation. Also the ditch banks are frequently disturbed and the ditch is disconnected from the floodplain by its spoil bank berm.

## Endangered and threatened birds: Southwestern willow flycatcher and Yellow-billed cuckoo

The Southwestern Willow Flycatcher (*Empidonax traillii extimus*) and Yellow-billed Cuckoo (*Coccyzus americanus*) are Neotropical migrants that rely on riparian habitat for nesting. Summary information for each species' life history and habitat is provided below. Because the Farmers Mutual Ditch rehabilitation project would take place outside the migration and nesting season, **there would be no direct adverse effects** to these birds.

**Indirect effects** to riparian habitat along the ditch may occur due to the elimination of seepage from the ditch, as described above under Impacts of the Proposed Action. The effect on the flycatcher and cuckoo would be minor loss of foraging habitat, if the birds are present in the project area. Because riparian habitat long the ditch is adjacent to San Juan River floodplain riparian habitat, USACE in discussion with the NMESFO determined that surveys would be prudent to attempt to learn if the birds were using this habitat. Two exploratory surveys conducted using call playback on June 20 and July 8, 2020 did not detect either species. This was not a full protocol set of surveys and early migrant flyctchers or late nesting cuckoos could have been missed.

Based on the absence of direct adverse impacts, non-detection of the birds during exploratory surveys, and potential minor indirect impacts on habitat, the Corps determines that the proposed project **may affect, but is not likely to adversely affect**, the Southwestern willow flycatcher and Yellow-billed cuckoo.

*The Southwestern willow flycatcher* was listed as federally endangered in 1995. The flycatcher occurs in southern California, Arizona, New Mexico, southern portions of Nevada and Utah, and southwestern Colorado (USFWS 1995). These birds are Neotropical migrants, arriving in New Mexico by early to mid-May. Breeding occurs in late May and early June. Young are fledged in late June or early July. The SWFL departs New Mexico for wintering grounds in late September (USFWS 2002).

Nesting habitat for the flycatcher varies greatly by site and includes plant species such as willow (*Salix spp.*), saltcedar (*Tamarix spp.*), box elder (*Acer negundo*), and Russian olive (*Elaeagnus angustifolia*). Nests generally occur adjacent to or over water or saturated substrates (Paxton *et al.* 2007). Along the Middle Rio Grande, breeding territories were found in young and mid-age riparian vegetation dominated by dense growths of willows at least 15 feet high, as well as in mixed native and exotic stands dominated by Russian olive and saltcedar.

There is no designated critical habitat for the flycatcher in San Juan County and habitat utilization by flycatchers along the San Juan is less well documented compared to the Rio

Grande. Flycatchers may occur in riparian habitats along the San Juan during spring or fall migration periods or during the breeding season, but there have been no surveys in the immediate project area other than the two conducted by USACE in 2020. Other surveyors detected non-territorial flycatchers lower in the San Juan Basin during the first survey period in May 2019; survey sites were tributary washes and a perennial pond with riparian vegetation (Ecosphere Environmental Services 2019). These off-channel sites were 9-15 miles distant from the downstream end of the Farmers Ditch project.

*The Western population of the Yellow-billed cuckoo* was listed as a federally threatened species in 2014 (USFWS 2014). Yellow-billed cuckoo has declined precipitously throughout its range in southern Canada, the United States, and northern Mexico. Breeding populations exist in California, Arizona, New Mexico and Colorado, as detailed in Halterman et al (2015). In New Mexico, cuckoos breed on the Gila River and the Middle Rio Grande (Woodward et al. 2003, Ahlers and Moore 2012).

Yellow-billed cuckoos are riparian obligates and nest in dense riparian woodlands with native trees and shrubs in stands 20 hectares or more in extent (Halterman et al., 2015). They arrive in New Mexico beginning in late April and early May and nest from late May through August (Howe, 1986). Mature cottonwood forests with well-developed willow understory appear to be important characteristics of habitat for the Yellow-Billed Cuckoo (Gaines and Laymon, 1984). While willows appear to be a preferred nest tree, cuckoos will also nest in dense saltcedar stands (Howe, 1986). Nests are constructed of sticks and are located in dense foliage. Cuckoos may nest up to three times a year, with a clutch size of two to six eggs. They may occasionally parasitize nests of other birds, particularly when food is abundant. Yellow-billed cuckoos feed primarily on caterpillars but will also consume bird eggs, frogs, lizards, berries, and other fruits (Erlich et al., 1988). They forage primarily in the foliage layer of shrubby and woody vegetation. Populations fluctuate markedly in response to variation in caterpillar abundance. Population declines resulting from loss or disturbance of riparian habitat have been consistently reported in the West (Finch, 1992).

The San Juan River corridor in the Farmington area was included in an initial critical habitat proposal, but this reach was omitted from the final critical habitat (USFWS 2020). Thus, there is no critical habitat for the cuckoo in San Juan County. Similar to the flycatcher, surveys for cuckoo have not been completed in the project area except for those done by USACE.

## Conclusion

This concludes the USACE, Albuquerque District's biological assessment for the Farmers Mutual Ditch acequia rehabilitation project. We are requesting informal consultation and concurrence under section 7 of the Endangered Species Act. In summary, the project may affect, but is not likely to adversely affect the Southwestern willow flycatcher and yellow-billed cuckoo due to project timing outside of nesting season and minor indirect impacts to riparian vegetation along the ditch. The project would have no effect on other listed species with potential to occur in the project area or their critical habitats. The project would not affect endangered plants due to absence of suitable habitat (Knolton's cactus, Mesa Verde cactus, Mancos milk-vetch); would not affect endangered fishes or critical habitat due to project timing and location outside aquatic habitat (Colorado pikeminnow, razorback sucker, Zuni bluehead sucker); and would not affect endangered mammals due to absence of suitable habitat (Canada lynx, New Mexico meadow jumping mouse).

# New Mexico Rare and Endangered Plant Species in San Juan County

NMRPTC 2020

Scientific Name	Common Name	NMRPTC	FWS	State of NM	Habitat and potential occurrence in project area
<i>Abronia bigelovii</i>	tufted sand verbena	R			No: Hills and ridges of gypsum in the Todilto Formation
<i>Aliciella cliffordii</i>	Clifford's glilia	R			No: Red, sandy or clay soils in badlands of the Wingate Formation and the Owl Rock Member of the Chinle Formation
<i>Aliciella formosa</i>	Aztec gilia	R		E	No: Salt desert scrub communities in soils of the Nacimiento Formation
<i>Allium gooddingii</i>	Goodding's onion	R		E	No: Moist drainage bottoms in the shade of spruce-fir and mixed conifer forest
<i>Asclepias sanjuanensis</i>	San Juan milkweed	R			Possible but not found: Sandy loam soils, usually in disturbed sites, in juniper savanna and Great Basin desert scrub
<i>Astragalus chuskanus</i>	Chuska milkvetch	R			No: Degraded Chuska sandstone in openings of Ponderosa pine and montane coniferous forest
<i>Astragalus cliffordii</i>	Clifford's milkvetch	R			No: Rimrock ledges of the Mesa Verde Group, in sagebrush and pinyon-juniper woodland
<i>Astragalus cottamii</i>	Cottam's milkvetch	R			No: Rimrock habitats within weathered depressions and crevices in Cretaceous sandstone in piñon-juniper woodland
<i>Astragalus humillimus</i>	Mancos milkvetch	R	E	E	No: Mesozoic (Point Lookout and Cliff House) sandstone along a 10-mile section of the Hogback
<i>Astragalus micromerius</i>	Chaco milkvetch	R			No: Gypseous or limy sandstone outcrops (usually blended with Todilto gypsum or limestone) in piñon-juniper woodland or Great Basin desert scrub
<i>Astragalus naturitensis</i>	Naturita milkvetch	R			No: Sandstone ledges and rimrock along canyons in piñon-juniper woodland
<i>Astragalus oocalycis</i>	Arboles milkvetch	R			No: Seleniferous clay soils (Mancos Formation) with sagebrush, piñon-juniper woodland, or transitional areas between p-j and ponderosa pine

<i>Erigeron rhizomatus</i>	Zuni fleabane	R	T	E	No: Nearly barren clay hillsides with soils derived from shales of the Chinle or Baca formations
<i>Pediocactus knowltonii</i>	Knowlton cactus	R	E	E	No: occurs naturally on a single site, rolling, gravelly hills in a piñon-juniper-sagebrush community
<i>Phlox cluteana</i>	Navajo Mountain phlox	R			No: Light to heavy shade on sandy soils in ponderosa pine forest
<i>Proatrigplex pleiantha</i>	Mancos saltplant	R			No: Desert badlands of Colorado Plateau on saline clay soils of the Mancos and Fruitland shale formations
<i>Puccinellia parishii</i>	Parish's alkali grass	R		E	No: Alkaline springs, seeps, and seasonally wet areas
<i>Sclerocactus cloverae ssp. brackii</i>	Brack hardwall cactus	R		E	No: Sandy clay strata of the Nacimiento Formation in sparse shadscale scrub
<i>Sclerocactus mesae-verdae</i>	Mesa Verde cactus	R	T	E	No: alkaline, gypsiferous sparsely vegetated low rolling clay hills formed from the Mancos or Fruitland shale formations

# Biota Information System of New Mexico

(BISON-M, 2020)

## All Species San Juan

Taxonomic Group	# Species	Taxonomic Group	# Species
Amphibians	8	Birds	281
Coleoptera; beetles	16	Crustaceans	2
Ephemeroptera; mayflies	21	Fish	25
Lepidoptera; moths and butterflies	125	Mammals	76
Misc. Arachnids	1	Molluscs	17
Odonata; dragonflies	30	Orthoptera; grasshoppers & crickets	56
Reptiles	26	Spiders	2

TOTAL SPECIES: 686
