Influence of the tree diameter, shade-tolerance, altitude and soil type on wood density and its radial variation in Madagascar Rainforest

Tahiana RAMANANTOANDRO
Miora F. RAMANAKOTO
Herimanitra P. RAFIDIMANANTSOA

1. INTRODUCTION

2. MATERIALS AND METHODS

3. RESULTS

4. DISCUSSIONS

5. CONCLUSION

1. INTRODUCTION

Intrinsic factor : genetic, anatomy
(Polge, 1964; Guilley et Nepveu, 1999)

External factor: environment

Altitude, slope (Mazet et
Nepveu, 1991; Ruelle *et al.*,
2007)

Soil properties (Nicault *et al.*,
2009)

Heterogeneity of
wood properties

Growth of the tree
(Wimmer *et al.*, 2002)

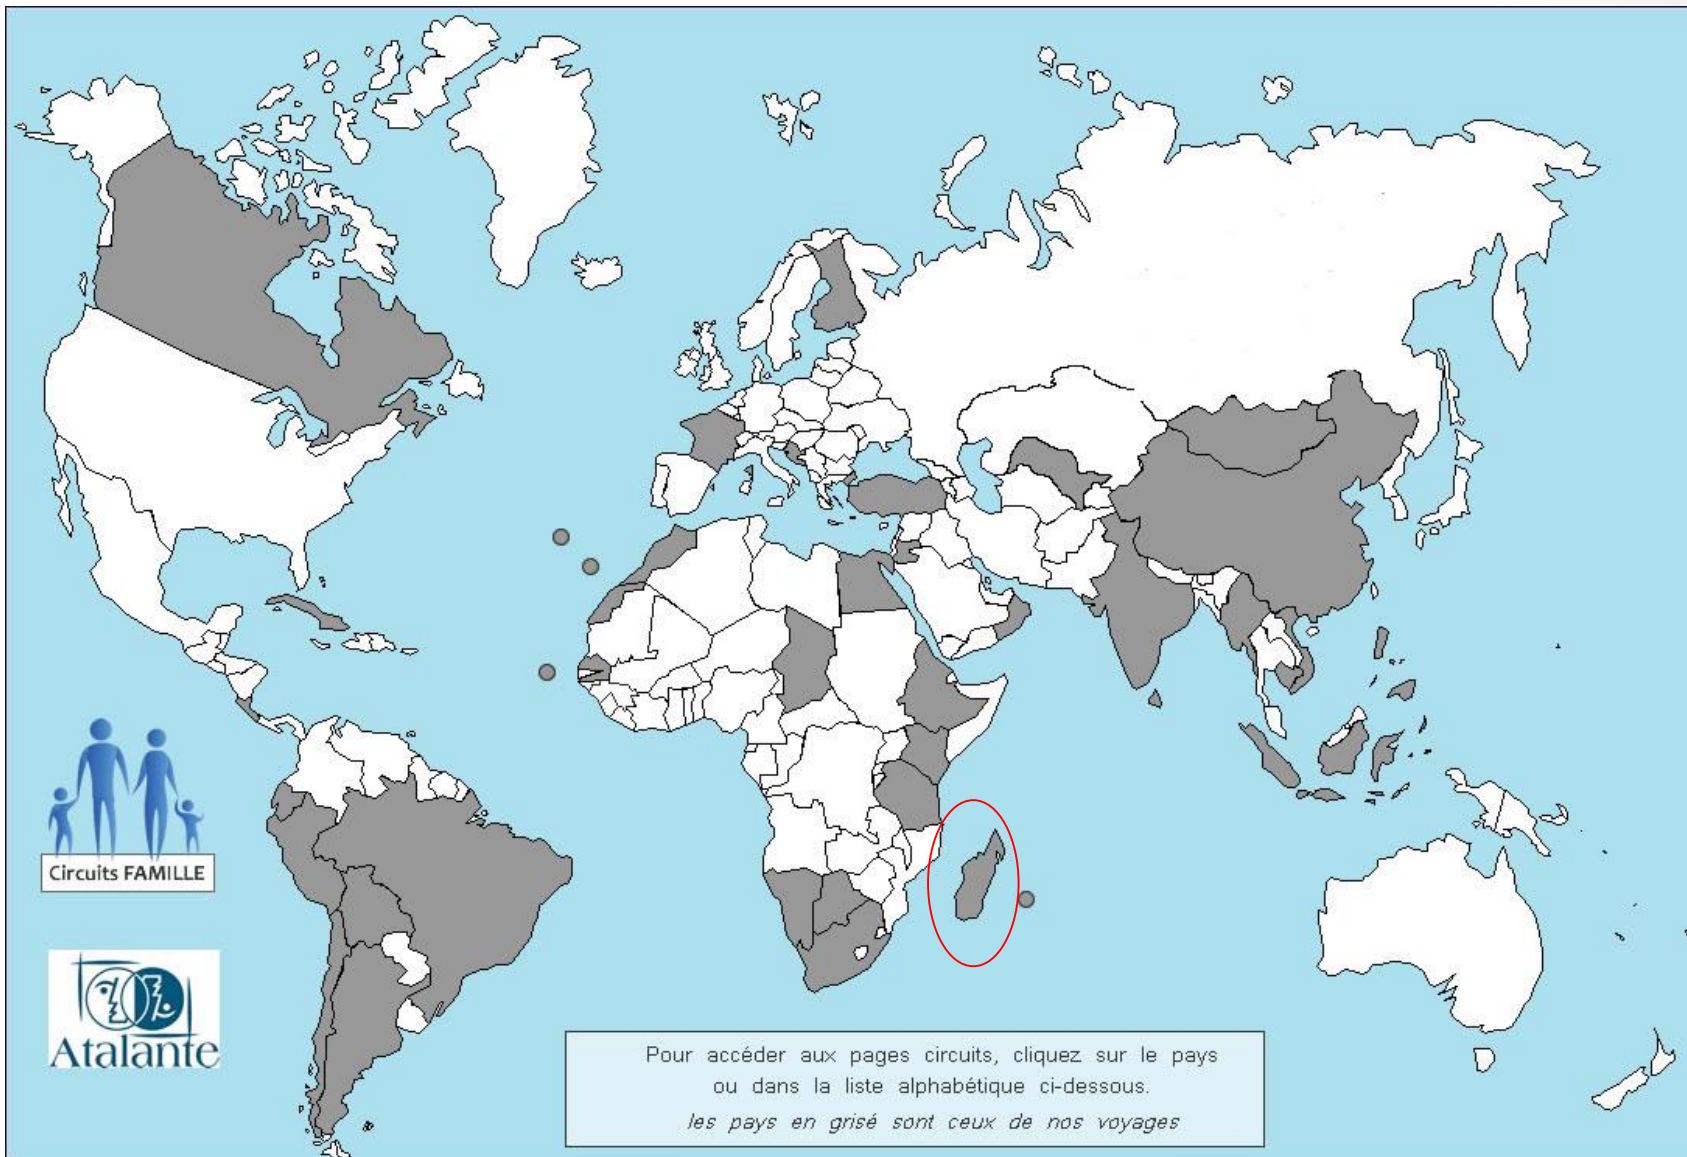

Two levels of the wood density
variability:

→ Within-tree

→ Between trees

2. MATERIALS AND METHODS

Mandraka natural forest
 $T^{\circ} : 17.5^{\circ} \text{ C} (13.7 - 20.2^{\circ} \text{ C})$
 RH = 82%
 Altitude = 1300 m
 9.9 ha
 73 species: 52 genera, 42 families

RESEARCH QUESTIONS

« What are the main factors that have significant effects on wood density and its radial variation in the Mandraka forest ? »

In which extent does the wood density vary in the Mandraka forest?

Is there any effect of the tree diameter and the shade tolerance of the species ?

Is there any effect of local environmental factors (soil property, altitude)?

APPROACH

Variation:
Within tree
Between trees

1

Investigation of the factors

2

Wood density measurements

3

Statistical analysis

1

Study of the factors

« Diameter » et
« Distance to pith »

« Shade tolerance »

« Altitude », « Soil
types »

○ Forest inventory

○ Two diameter classes: $5 \leq D \leq 15\text{cm}$ et $D > 15\text{ cm}$

○ At least 5 trees per diameter class per species

Study of the factors

« Diameter », « distance to pith »

« **Shade tolerance** »

« Altitude », « soil properties »

23 species (abundance: 50 %), 18 families, 20 genera

Primary and secondary forests

Random sampling of the trees

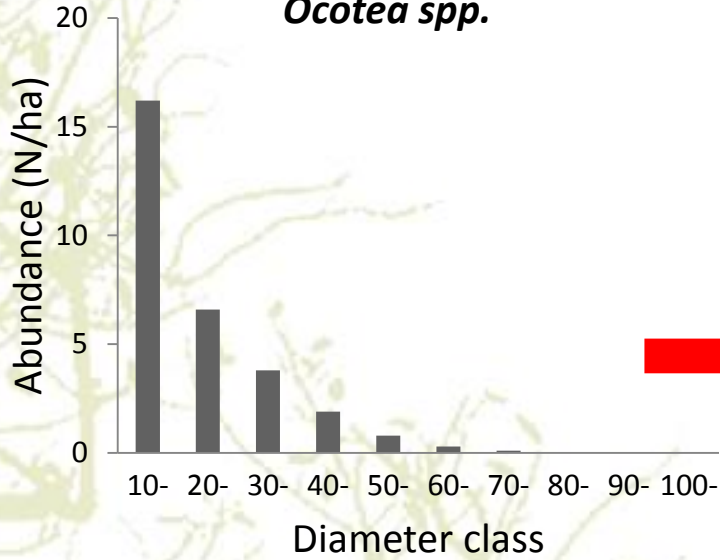

Study of the factors

« Diameter », « distance to pith »

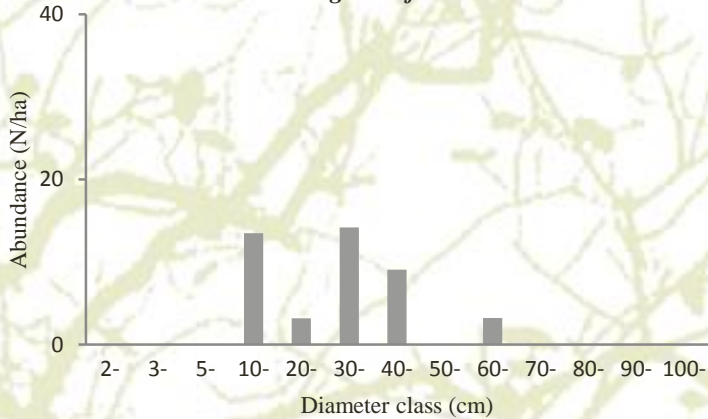

« Shade tolerance »

« Altitude », « Type of soil »

Ocotea spp.

Albizia gummifera

Shade tolerance	Taxa
Héliophilous	<i>Albizzia gummifera</i>
	<i>Nuxia capitata</i>
	<i>Schefflera longipedicellata</i>
	<i>Schefflera vantsilana</i>
	<i>Harungana</i>
	<i>madagascariensis</i>
	<i>Ravensara crassifolia</i>
	<i>Ravensara acuminata</i>
	<i>Anthocleista</i>
	<i>madagascariensis</i>
	<i>Dombeya lucida</i>
<i>Macaranga cuspidata</i>	
	<i>Chrysophyllum boivinianum</i>
	<i>Mussaenda sp.</i>
Sciaphilous	<i>Protorhus ditimena</i>
	<i>Calophyllum sp.</i>
	<i>Ocotea sp.(1)</i>
	<i>Ocotea sp.(2)</i>
	<i>Bosqueia danguyana</i>
	<i>Syzygium cumini</i>
	<i>Uapaca densifolia</i>
	<i>Dilobeia thouarsii</i>
<i>Ilex mitis</i>

Distance to pith Dp	0,00	
Interaction : ST × Dp		
Héliophilous x Dp	0.004	*
Sciaphilous x Dp	-0,003	*

R^2 (model) = 19 % ; R^2 (ST) = 18 % ; R^2 (Dp) = 0,7 % ; R^2 (Interaction) = 0,4 %

4. DISCUSSIONS

HIGH WOOD DENSITY

5. CONTRIBUTION OF THIS RESERACH AND RECOMMANDATIONS

CONTRIBUTIONS OF THIS RESEARCH

Influence of various factors on wood density

Link with btween « Wood science », « Sylviculture », « Soil science »

New data on the shade tolerance of the 23 native species of Mandraka forest

New data on the wood density of 3 species: *Nuxia capitata*, *Erythroxylum corymbosum*, *Mussaenda sp.*

Potential substitution species to *Dalbergia sp.*: *Dilobeia thouarsii*, *Eugenia jambolana*, *Anthocleista madagascariensis*, *Nuxia capitata*

RECOMMANDATIONS

Considering all wood species of Mandraka forest

Wood density measurement

Anatomical studies

A photograph of a river flowing through a lush green forest. The water is white and turbulent as it flows over rocks, creating rapids. The surrounding vegetation is dense and vibrant green.
