## EXECUTIVE SUMMARY

Tanzania's Coastal Forests are of global importance supporting 37 endemic vertebrate species and 554 endemic plants (Burgess, 2000). Among these coastal forests are Pugu and Kazimzumbwi, two forest reserves which lie on the outskirts of Dar es Salaam. Nearby protected areas are Pande GR (to the north) and Ruvu South FR (to the southwest). Together, these four forests form Dar es Salaam's "Greenbelt", encompassing 38,995 hectares and extending from 100-300 metres a.s.l. They are remnants of some of the most ancient forests in the world, and represent the main water catchments for the Msimbazi, Kimani, Nzasa and Nyeburu Rivers. They offer enormous potential for education and recreation for the citizens of Dar es Salaam.

As part of the Forest Justice in Tanzania project, TFCG has been carrying out biodiversity and forest condition surveys in selected forests in the Eastern Arc Mountains and Coastal Forests. The overall aims of the surveys are to document the biodiversity value of the forests and to assess levels of human resource use and disturbance.

This report describes the findings from a series of TFCG surveys conducted in 2011 and 2012 in Pugu and Kazimzumbwi forests. Surveys in 2011 were carried out in June and July over 17 days, followed by a 14-day survey in May and June of 2012. Surveys focused on describing the forests' plant and avian communities, and extent of human disturbance. Survey sites were selected on the basis of vegetation cover, including sample points within relatively dense forest.

### Plants

In total, 343 plant species in 234 genera and 70 families were recorded during the botanical surveys, conducted at four sites including Buyuni (site 1, Table 1), a recently cleared site in Kazimzumbwi forest and three sites in Pugu: Mambisi and Pugu Relini (site 2), historically and recently deforested; Pugu Dunda and Kimani (site 3), recently degraded and being cleared; and Pugu Mpakani and Minaki Bwawani (site 4), less disturbed forest. Of these four sites, Buyuni had the most distinct species assemblage, with a Sorenson shared species index of 0.31-0.36 with the three sites in Pugu forest, while the three sites in Pugu had many species in common with a similarity index of 0.70-0.85. The most species-rich site with 260 species was the less disturbed forest at Pugu Mpakani and Minaki Bwawani.

Of the plant species recorded, 18 are IUCN Red-Listed species above the category "Least Concern" with four Near Threatened, ten Vulnerable, three Endangered, and one Critically Endangered species (Table 1).

**Table 1.** Red-Listed plant species above Least Concern (LC) category recorded during the botanical surveys. Endemic species are bolded, including one endemic at LC level and one data-deficient species.

DD = Data Deficient; NT = Near Threatened; VU = Vulnerable; EN = Endangered; CR = Critically Endangered.

\*If *Fernandoa lutea*, then this is an endangered Tanzania endemic species.

Six other endemic, but not Red-Listed species, were recorded (Table 2).

**Table 2.** Six coastal forest endemic, but not Red-Listed, plant species recorded on botanical surveys.

Family	Scientific name	Site 1	Site 2	Site 3	Site 4
Acanthaceae	<i>Whittfieldia orientalis</i>		x		x
Celastraceae	<i>Pristimera graciflora</i>	x			
Papilionaceae	<i>Millettia puguensis</i>		x		x
Sapotaceae	<i>Manilkara sansibarensis</i>	x	x		
Sterculiaceae	<i>Nesogordonia holtzii</i>		x		x
Violaceae	<i>Rinorea welwitschii</i>		x		

During the surveys, ten endemic plant species (Tables 1-2) were recorded, including two, the liane *Millettia puguensis* and tree *Baphia puguensis*, that are endemic to the Pugu Hills, and six of which, *Xylopia arenaria*, *Manilkara sansibarensis*, *Monanthotaxis trichocarpa*, *Pristimera graciflora*, *Rinorea welwitschii*, and *Nesogordonia holtzii*, are endemic to Tanzania's coastal forests. Two further endemic species, *Haplocoelopsis africana* and *Cissus quadrangularis*, were recorded opportunistically during the survey. One invasive plant species, *Lantana camara*, was recorded with regularity at each of the survey sites.

### **Birds**

The forests continue to be of utmost importance to coastal Tanzania's avifauna. The avian survey yielded a checklist of 105 species in 79 genera and 37 families. Among these were four Red-Listed species above LC level. These were the African crowned eagle, *Stephanoaetus coronatus*, and bateleur, *Terathopius ecaudatus*, both NT; spotted ground thrush, *Zoothera guttata*, (EN); and the east coast akalat, *Sheppardia gunningi* (NT).

### **Forest condition**

Pole and timber extraction, fire, charcoal production, and cultivation continue to be major threats to both forests. While the 2011 disturbance surveys detected more cutting (poles and timber per hectare) than surveys carried out in 2012, in both years, more cut than live trees were recorded. The difference between years could in part be explained by increased protection efforts but also by the virtue of there being less poles and timber available in 2012 than 2011. All transects had at least a few poles (<15cm dbh) still standing; however, six transects contained no live trees (>15cm dbh), only stumps. Charcoal kilns pockmark both reserves. In total, 107 and 72 charcoal kilns or kiln scars were counted along 9 transects in Pugu in 2011 and 2012 respectively; 114 and 48 charcoal kilns or kiln scars were found along 9 transects in Kazimzumbwi in 2011 and 2012 respectively. Fire is a widespread problem in Kazimzumbwi where 169 events of fire were recorded in 2011-2012, while in Pugu, 115 fire events were recorded. Only six snares or traps were found across both survey years suggesting that most of the forests' small mammals may have already been hunted out.

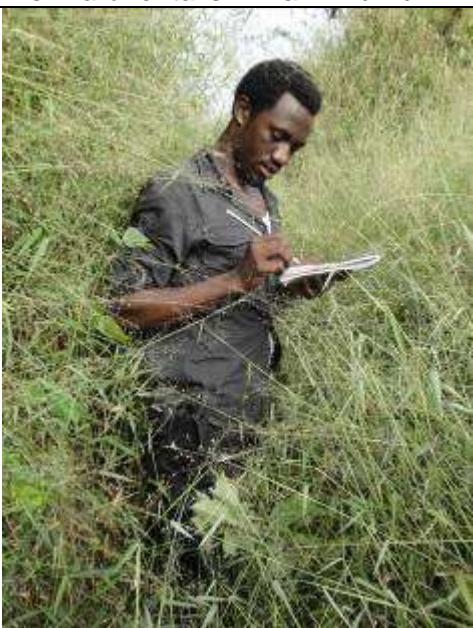

At current rates of deforestation, assessed on the basis of surveys and satellite image analysis carried out by TFCG, the forests of Kazimzumbwi and Pugu will vanish by 2014 and 2017, respectively. Coordinated conservation efforts are urgently needed to save these important and unique forests. This requires a different approach with high level political support and a commitment to enforcing the Forest Act. The Tanzania Forest Service have not demonstrated a capacity to implement this and it is recommended that TANAPA be called in to assist in the conservation of these irreplaceable forests.

*Visimia orientalis* in Kazimzumbwi FR

*Millettia puguensis*, only known from Pugu FR

## **Tanzania Forest Conservation Group**

The Tanzania Forest Conservation Group (TFCG) is a Tanzanian non-governmental organization that has been promoting the conservation of Tanzania's forests since 1985. TFCG's mission is to conserve and restore the biodiversity of globally important forests in Tanzania for the benefit of present and future generations. We achieve this through capacity building, advocacy, research, community development and protected area management, in ways that are sustainable and foster participation, cooperation and partnership.

TFCG supports field-based projects promoting participatory forest management, environmental education, community development, advocacy and research in the Eastern Arc and Coastal Forests. TFCG also supports a community forest conservation network that facilitates linkages between communities involved in participatory forest management. To find out more about TFCG please visit our website <http://www.tfcg.org>.

## **Forest Justice in Tanzania**

Forest Justice in Tanzania (FJT) is a three year project (2011-2013) that aims to promote improved governance and increased accountability in Tanzania's forest sector. The initiative is a partnership between the Community Forest Conservation Network of Tanzania, known as MJUMITA and the Tanzania Forest Conservation Group (TFCG). The project is working through four inter-related strategies, which include 1) monitoring forest governance and forest condition; 2) promoting enforcement; 3) conducting research, analysis and communication; and 4) setting standards. The project is financed by DfID through the Accountability in Tanzania programme (AcT). For more information about the project, please visit <http://www.tfcg.org/ForestJusticeTanzania.html>.

## **Abbreviations and Acronyms**

## **ACKNOWLEDGEMENTS**

### **Funding**

This survey was funded by the Accountability in Tanzania Programme through the project: 'Forest Justice in Tanzania'.

### **Permission**

Permissions to conduct these surveys were kindly provided by the Forestry and Beekeeping Division of the Ministry of Natural Resources and Tourism, the Tanzania Forest Service and the Tanzania Wildlife Research Institute.

### **Survey Team**

Team Leader:	Justine Gwegime
Botanist:	Moses Mwangoka
Ornithologist:	Elia Mulungu
Survey team member:	Habibu Said
Game Warden in 2012:	Hassani Abdallah
Driver in 2012:	Fadhili Tuwa

Field Assistants in 2011: Seif Hamza, Ally Juma and Salum Pazi

Field Assistants in 2012: Enock Peter, Pingu Betele, Hassan Mkalaika, Ally Betele, Omari Hassan, Jumanne Ally, Christophe Mwanyika, Johnathan Lukas, Hussain Jumbe and Mwajuma Hosea.

We are extremely grateful to Kisarawe District and the communities adjacent to Pugu and Kazimzumbwi for their co-operation in carrying out this survey. We are also grateful to Charles Meshack, TFCG Executive Director and Elinasi Monga, Forest Justice - Project Manager for their support during the planning, implementation and reporting of the survey.

### **Report writing**

The report has been written by Justine Gwegime, Habibu Said, Moses Mwangoka and Elia Mulungu.

### **Editing**

The editing of the report was carried out by Katarzyna Nowak and Nike Doggart.

## **1) Introduction**

### **1.1 Background to the surveys**

As part of the Forest Justice in Tanzania project, the Tanzania Forest Conservation Group (TFCG) has been carrying out biodiversity and forest condition surveys in selected forests in the Eastern Arc Mountains and Coastal Forests. The aim of the surveys is to document the biodiversity values of target forests and to assess levels of resource use and disturbance within them.

The overall purpose of the surveys in Pugu and Kazimzumbwi Forest Reserves was to assess the biodiversity value and forest condition of these two forests. The specific objectives were: **1)** To assess the level of disturbance in Pugu and Kazimzumbwi forests; **2)** To document the extent of enduring plant endemism in the forests despite disturbance; and **3)** To provide an up to date checklist of the forests' birds.

The surveys were carried out between 7<sup>th</sup> to 17<sup>th</sup> June 2011 and between 25<sup>th</sup> May and 11<sup>th</sup> June in 2012. During the 2011 survey only Objective 1 was assessed. Some botanical observations were also made but no botanical specimens were collected. During the 2012 survey, the team addressed all three objectives. During both surveys, the team leader was Justine Gwegime.

### **1.2 Report structure**

The report is organized into 7 sections. The report begins with an executive summary followed by an introduction which includes a description of Pugu and Kazimzumbwi Forest Reserves, their value and status. This section also includes a review of previous biological surveys and conservation efforts conducted in these two forests. Finally, this section summarizes the major threats faced by these forests. Section 2 provides more detailed descriptions of both forest reserves, including their location and management. Section 3 describes the botanical survey, Section 4 the avian survey, and Section 5 the disturbance survey, with each of these sections containing background information, objectives, methods, results and discussion. In Section 6, a summary of conclusions and recommendations are given. Section 7 contains a bibliography of references cited within the text, and Section 8 contains the Appendices, made up of transect survey results.

Scientific names of animal and plant species are given, along with their IUCN Red List category of threat, if the species has been evaluated for the Red List (IUCN, 2012). These categories are abbreviated as follows: LC for Least Concern, DD for Data Deficient, NT for Near Threatened, VU for Vulnerable, EN for Endangered and CR for Critically Endangered (*ibid.*).

### **1.3 An overview of Pugu and Kazimzumbwi Forest Reserves**

Pugu and Kazimzumbwi forests in Kisarawe District, Coast Region of Tanzania, are globally important coastal forests. Pugu Forest (previously known as Mogo Forest) became a Reserve in 1947 (Clarke & Dickinson, 1995). It lies in the northeastern part of the Pugu Hills, approximately 25 km southwest of Dar es Salaam and 20 km inland from the Indian Ocean, and adjacent to the Kazimzumbwi Forest Reserve (FR) (gazetted in the 1930s) (*ibid.*). These two forests, thought to be remnants of among the oldest surviving forests in the world, are among East Africa's "Coastal Forests" which once covered the entire Tanzanian coast (Dallu, 2004). Today, there are 66 patches of coastal forest in Tanzania, most of which, like Pugu and Kazimzumbwi, have areas of less than 50 km<sup>2</sup> (Burgess *et al.* 2000a).

Pugu and Kazimzumbwi were originally gazetted as Forest Reserves with the intention of supplying fuelwood and timber to the growing, nearby city of Dar es Salaam (Dallu 2004). They were once contiguous, but became separated by c. 1968, when aerial photos were taken of the area (Clarke & Dickinson, 1995). In Kazimzumbwi, commercial logging occurred up to the mid-1970s, when most commercial timber tree species became too rare to warrant further harvesting. The Kisarawe Forestry Office trialed small plantations of *Cassia* and *Eucalyptus*, as well as rubber *Hevea brasiliensis*, teak *Tectona grandis* and pine *Pinus* sp. but because of

minimal management of these plantations from 1980-1995, they lost commercial value (*ibid.*). Native trees have been intensively felled for charcoal production throughout this period despite efforts by the the Wildlife Conservation Society of Tanzania (WCST) to increase enforcement and protection. Cultivation inside the reserve has also been an ongoing issue resulting in the eviction of illegal squatters in 1994 and 1995, and again in 2010. In Pugu, most trees of commercial value such as *Milicia exelsa* (NT), *Newtonia paucijuga* (VU), *Hymenaea verrucosa*, *Khaya nyasica*, *Brachylaena huillensis* (NT) and *Baphia kirkii* (VU) were removed during the colonial era. Like in Kazimzumbwi, exotics were planted including in the place of existing native vegetation, of which >500 ha were cleared in Pugu to make space for plantations. One of the largest kaolinite deposits in the world is found inside Pugu, where kaolin has been mined since the 1950s.

The forests still support rare coastal animal and plant species, and are considered, along with Ruvu South FR and Pande Game Reserve (GR) to form Dar es Salaam's "Greenbelt Forests", with great recreational and educational potential. Both forests still play an important role in protecting the catchment area for streams flowing through Dar es Salaam.

#### **1.4 Biodiversity and ecological value of Pugu and Kazimzumbwi Forest Reserves**

Within the Eastern African Coastal Forest biodiversity hotspot, Pugu and Kazimzumbwi forests are recognized as important sites for endemic fauna and flora (FBD, 2006; Clarke & Dickinson, 1995). Four key studies which describe the biodiversity value of Pugu and Kazimzumbwi forests include Howell (1981), Clarke and Dickinson's (1995) study of biodiversity in eleven coastal forests in the Coast Region, Hall *et al.*'s (2002) biodiversity survey in Kazimzumbwi Forest Reserve, and Ahrends's (2005) work on patterns of degradation in lowland coastal forests. Burgess and Clarke's 2000 book on the Coastal Forests of Eastern African also provides a valuable synthesis of biodiversity data from Pugu Kazimzumbwi. Other biodiversity research on the area includes work on the bat fauna, particularly around the Kaolin mine (Howell 1976, 1977 and 1979); botanical work in Pugu (Mwasumbi and Middleton 1992 and Halue *et al.*, 1995). Relative to Pugu, Kazimzumbwi Forest Reserve has received less attention from biologists (Mlingwa *et al.*, 1993).

Hall *et al.*'s 2002 study documented eight species of amphibians not previously recorded in Kazimzumbwi forest including *Leptopelis barbouri* (VU), recorded only in selected Eastern Arc forests. The same study also detected seven near-endemic amphibian species, one endemic to coastal and Eastern Arc forests and five endemic to coastal forests.

All of Tanzania's coastal endemic bird species use these two forests including the Fischer's greenbul *Phyllastrephus fischeri* (LC), spotted ground thrush *Zoothera guttata* (EN), east coast akalat *Sheppardia gunningi* (NT), and the southern banded snake-eagle *Circaetus fasciolatus* (NT) (Clarke & Dickinson, 1995; Baker & Baker, 2002; Liz Baker, pers. comm., 2012). Pugu was once ranked 32<sup>nd</sup> of 75 most important forests for threatened bird species in the tropical African and Malagasy region (Collar & Stuart, 1988). At Pugu, at least 83 forest bird species have been recorded including a Pugu endemic sub-species of the pale-breasted illadopsis *Trichastoma rufipennis puguensis* (Mlingwa *et al.* 2000), and coastal forest endemics, Fischer's greenbul *Phyllastrephus fischeri* (LC), little yellow flycatcher *Erythrocercus holochlorus* (LC) and the rare sokoke pipit *Anthus sokokensis* (EN) (Clarke & Dickinson, 1995); at the less-studied Kazimzumbwi, 58 forest birds were recorded by Mlingwa *et al.* in 1993 including the east coast akalat, southern banded snake-eagle and Uluguru violet-backed sunbird *Anthreptes neglectus* (LC). This number is well above the species richness recorded for many other Tanzanian coastal forests such as Kiono, Pande, Kisiju, Rondo, and Litipo (Mlingwa *et al.*, 1993).

A survey by Hall *et al.* (2002) recorded 32 mammal species in Kazimzumbwi FR, of these 7 (22%) are forest-dependent and 11 (34%) are forest dwelling. Rare species that inhabit these forests include the black and rufous elephant shrew *Rhynchocyon petersi petersi* (VU), the Zanzibar galago *Galagooides zanzibaricus* (LC) and the leopard (*Panthera pardus*) (NT).

At least one population of the endemic, critically endangered Rondo galago *G. rondoensis* is still present in these forests, making Pugu and Kazimzumbwi among 9 forests in Tanzania that support the Rondo galago (Perkin, 2004), which relies on evergreen forest patches within Tanzania's coastal forest zone. In Pugu and Kazimzumbwi, this species' estimated abundance is 8 individuals/hectare (*ibid.*); however, this apparent high density may be due to habitat compression, as in Ruvu South. The number per hectare tends to be lower in less disturbed forests like Noto (Perkin, pers. comm., 2012).

Kazimzumbwi and Pugu forests also harbor endemic plant species. Hall *et al.* (2002) recorded *Millettia puguensis* (not yet assessed by the IUCN) and *Baphia puguensis* (EN), endemic to Pugu and Kazimzumbwi forests. Other plant species such as *Dialium holtzii* (VU), *Grewia canocarpa*, *Manilkara sulcata*, *Manilkara sansibarensis*, *Diospyros verrucosa* and *Hyplocloeopsis africana* have been recorded in Pugu and Kazimzumbwi forests and are endemic to the Swahili Regional Centre of Endemism (they have not yet been assessed for the IUCN Red List but are listed in the [Catalogue of Life](#)). These species are increasingly threatened by human disturbance to both forests.

Given the forests' many endemic species, Pugu FR was ranked as a priority area in Ahrend's 2005 study. Both Pugu and Kazimzumbwi support the main water catchment for rivers flowing into Dar es Salaam including the Msimbazi, Kimani, Nzasa and Nyeburu rivers, as well as Minaki, Ng'azi and Dalu dams. The forest reserves are thus considered to be the "mother" of Kisarawe District and play a critical ecological role in relation to the sustainability of Dar es Salaam city (Hall *et al.*, 2002).

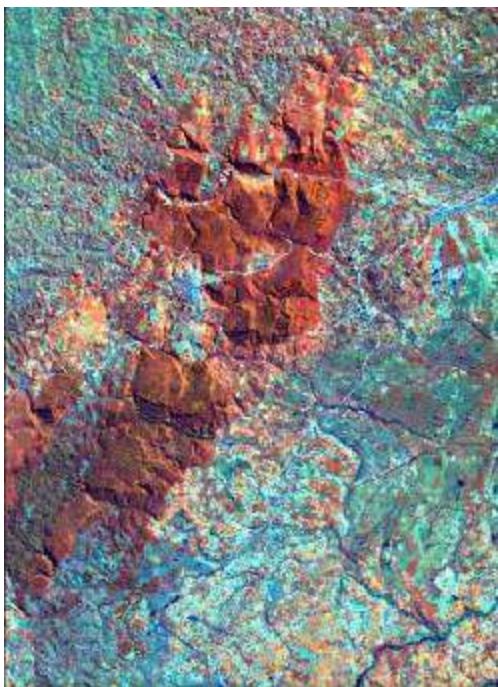

### **1.5 Major threats and disturbances to Pugu and Kazimzumbwi Forest Reserves**

Pugu and Kazimzumbwi Forest Reserves are experiencing high levels of disturbance relative to other patches of coastal forest. Pugu, just 40 years ago, was a much larger forest extending to within 10 km of Dar es Salaam. Despite the 2010 eviction of illegal squatters by the government from both Pugu and Kazimzumbwi Forest Reserves, there has continued to be a steady increase in charcoal production. Timber extraction is limited now as few timber-sized trees remain.

For several decades, particular plant species have been targeted for pole and timber extraction, and charcoal production (Hall and Rodgers 1986). For instance, Ahrends's 2005 study documented the following species as being targeted for charcoal and timber extraction: *Dialium holtzii* (VU), *Albizia* sp., *Antiaris toxicaria*, *Manilkara* sp., *Diospyros* sp. and *Scorodophloeos fischeri*. Some tree species such as *Milicia excelsa* (NT) and *Dalbergia melanoxylon* (NT) were already considered rare in 2002 (Hall *et al.*, 2002).

Meanwhile, other surveys in Pugu and Kazimzumbwi that have highlighted the rapid increase in human disturbance to both forests show how forest fragmentation is leading to the loss of habitat with consequences for both fauna and flora (e.g., WCST, 1999). Agricultural encroachment is a major cause of deforestation, especially in the southern part of Kazimzumbwi Forest Reserve near Chanika village such that there is no forest left in the southern half of the reserve, only thicket. This loss may be due to the close proximity of the Kazimzumbwi border to existing agricultural land and the lack of a buffer zone. Hunting has been reported in Kazimzumbwi forest by Hall *et al.* (2002) with the most commonly trapped species being duiker, suni, dikdik and bush pig. Development of the kaolin mine within Pugu forests has also posed a threat to the forest (Howell 1981 and Richards 1988).

In 2011, WCST and partners initiated a 4-year project, "Piloting REDD in the Pugu and Kazimzumbwi Forests" with the aim of reducing carbon dioxide by curbing deforestation through improved forest management. WCST and partners have engaged with the government and communities; however, the forests continue to face very high deforestation and degradation. In 2013, the WCST-led REDD project was canceled as it became clear that the project partners were unable to implement the complex project. This leaves the forests ever more vulnerable. Forest cover in the reserves is currently estimated at less than 20% (TZ-REDD Newsletter, 2012). Meanwhile, long standing conflicts between the central government (the statutory owner of the protected

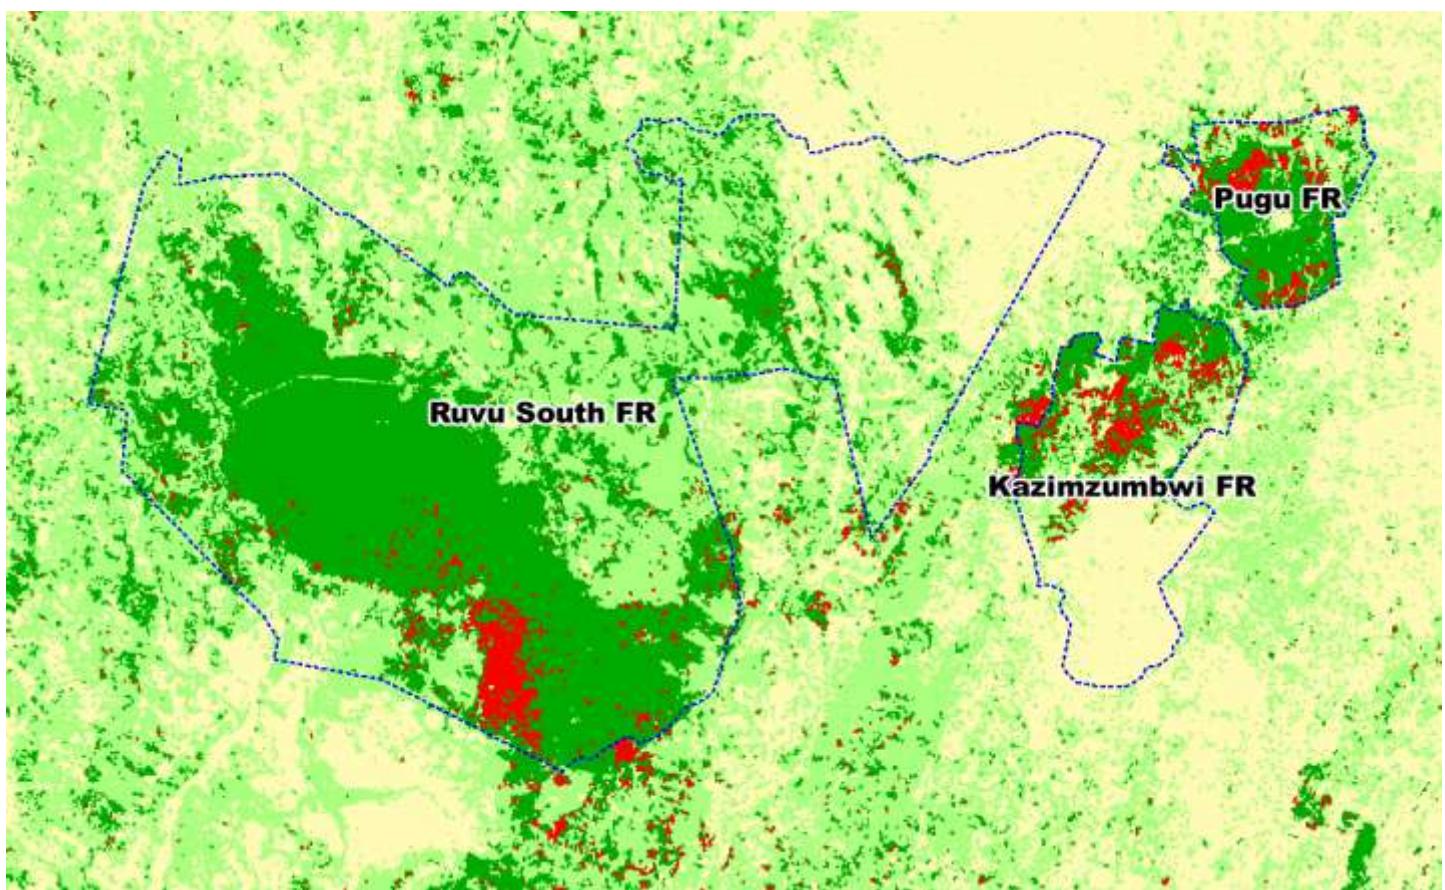

**Figure 2.** Satellite image of Pugu and Kazimzumbwi in 1984.

areas) and local communities, who claim customary rights to the forests, continues and presents an additional challenge (*ibid.*).

At current rates of deforestation, evaluated on the basis of surveys and satellite image analysis by TFCG, forest within Kazimzumbwi Forest Reserve will have been entirely cleared by 2014 and in Pugu Forest Reserve by 2017. This report therefore aims to highlight some key data to be used by relevant stakeholders in coordinated conservation efforts to prioritize and save these forests. These surveys, of plant and avian communities and of human disturbance, were carried out by the Forest Condition Monitoring Officer, Justine Gwegime; botanist, Moses Mwangoka; birder, Elia Mulungu; and Habibu Said, from TFCG through the Forest Justice in Tanzania (FJT) project.

**Figure 3.** Forest cover change analysis using remote sensing images from 2008 and 2010 for three of Dar's greenbelt forests.

**Key**

Red = deforestation between 2008 – 2010,  
Light green = thicket

Dark Green = woodland / forest;  
Yellow = agricultural / grass land.

## 2) Forest Reserve Descriptions

This section provides descriptions of the two forest reserves, pictured in Figure 3.

### 2.1 General description

**Names:** Pugu and Kazimzumbwi Forest Reserves  
Kisarawe District, Coastal Region, Tanzania

**Size:** Pugu Forest Reserve: 2179 hectares ( $21.8 \text{ km}^2$ )  
Kazimzumbwi Forest Reserve: 3550 hectares ( $35.5 \text{ km}^2$ )

**Management:** Management of the two forests is the responsibility of the Tanzania Forest Service.

**NGOs active in the area in 2012:** WCST, MJUMITA and TFCG

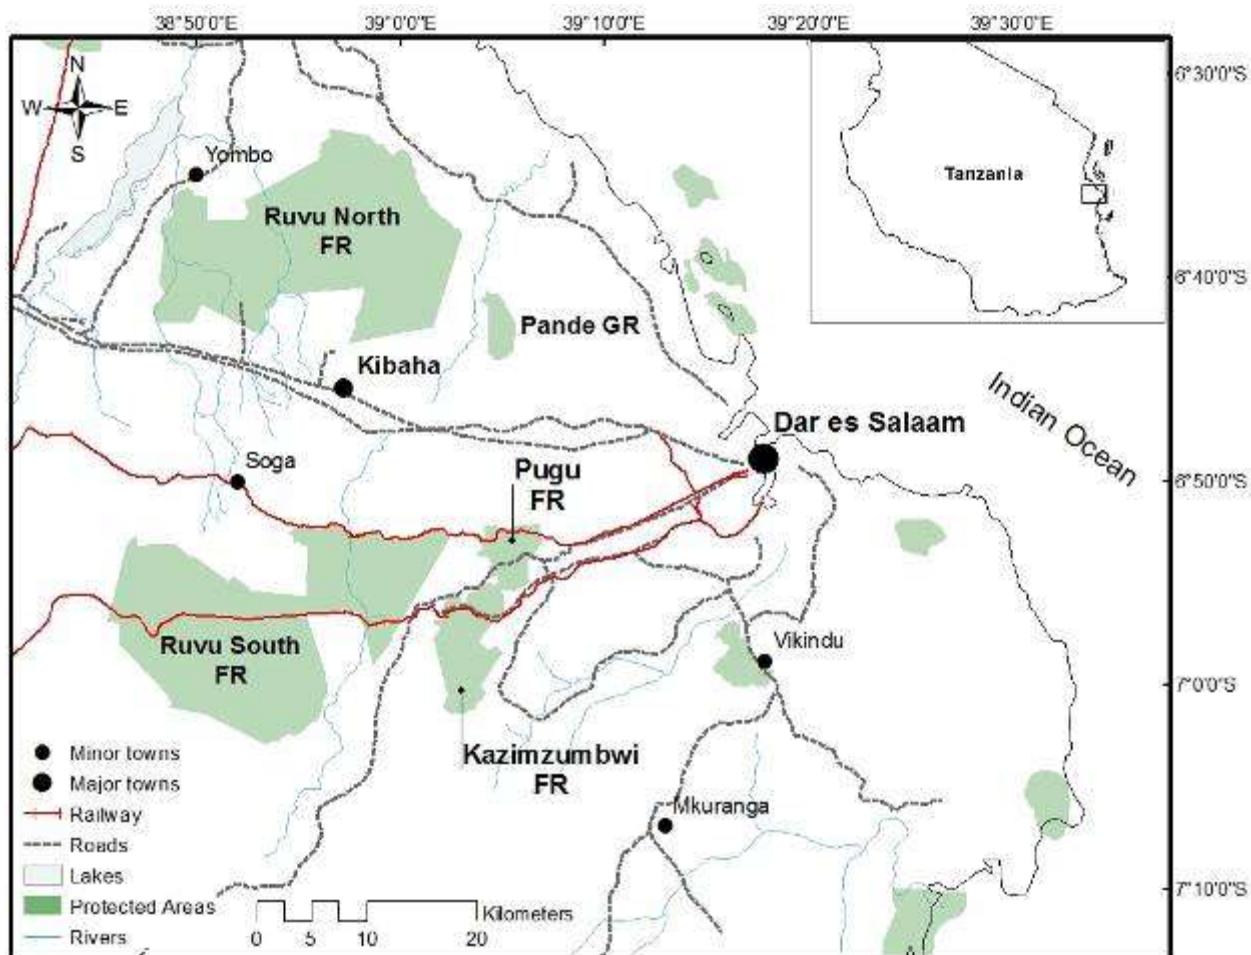

**Status:** Protective Forest Reserves with declaration orders as follows:  
Pugu FR: Declaration Order Cap. 132 of 1947; superseded by Cap. 389 of 1959  
Kazimzumbwi FR: Declaration Order 306 of 24/6/1954; superseded by Cap. 389 of 1959

**Land tenure:** Reserved Land under the authority of the Tanzania Forest Service  
The forests are surrounded by seven villages: Pugu kajungeni, Pugu station, Buyuni, Chanika, Kazimzumbwi, Vigama and Kisarawe

### 2.2 Location

**Coordinates (Lat/Long):** Pugu Forest Reserve:  $6^{\circ}52'S$ - $6^{\circ}55'S$ ,  $39^{\circ}04'E$  -  $39^{\circ}07'E$ .  
Kazimzumbwi Forest Reserve:  $6^{\circ}55'S$ - $7^{\circ}00'S$ ,  $39^{\circ}01'E$ - $39^{\circ}05'E$ .

**Elevation:** Pugu Forest Reserve: 100-305 m a.s.l  
Kazimzumbwi Forest Reserve: 120-280 m a.s.l

**Figure 4.** Map showing the location of Pugu and Kazimzumbwi Forest Reserves.

### 2.3 Climate

Both forests are influenced by the tropical monsoon climate of the Indian Ocean. Temperatures range from 24-31°C varying with elevation. Rainfall has a bimodal pattern, with the annual average exceeding 1000 mm and falling primarily from March to June (Clarke & Dickinson, 1995; Hall et al., 2002).

### 2.4 Vegetation types

The two forests consist of dry forest, dense impenetrable thicket found mainly on ridgetops, and open grassland with poor tree cover (Clarke & Dickinson, 1995). Kazimzumbwi had, at the time of Clarke and Dickinson's 1995 survey, some riverine and groundwater forest along watercourses and steeper-sided valleys, while Pugu had plantation forest of *Cassia siamea*, *Eucalyptus* sp., *Grevillea robusta* and a few teak, *Tectona grandis*, which was being re-colonized by indigenous species.

### **3) Botanical Survey**

#### **3.1 Background**

Botanical surveys in Pugu and Kazimzumbwi Forest Reserves have previously been conducted by, amongst others, by Clarke and Dickinson in 1995, and by Hall *et al.* in 2002. Hall *et al.* found 111 plant species of which 21 were endemics in Kazimzumbwi FR, and Clarke and Dickinson found 25 and 9 endemic species in Pugu and Kazimzumbwi respectively.

#### **3.2 Objectives**

**The objectives of this botanical survey were as follows:**

1. To document the current status of the botanical species composition of Pugu and Kazimzumbwi forests.
2. To document the presence of plant species endemic to the East African coastal forests or to Pugu and/or Kazimzumbwi forests.
3. To identify invasive plant species present in Pugu and Kazimzumbwi forests.

#### **3.3 Methods**

##### **3.3.1 Botanical survey methods**

Surveys were carried out using a combination of botanical collections and field identifications. During the 2011 survey, records are based on observations only and no botanical collections were made. During the 2012 survey specimens were collected from most restricted range or threatened plant species and for those plants where the identification was uncertain. During both surveys most of the survey work was carried out in the vicinity of the disturbance transects described in the following section.

The following analyses are based on presence-absence data for each site. No attempt was made to assess abundance.

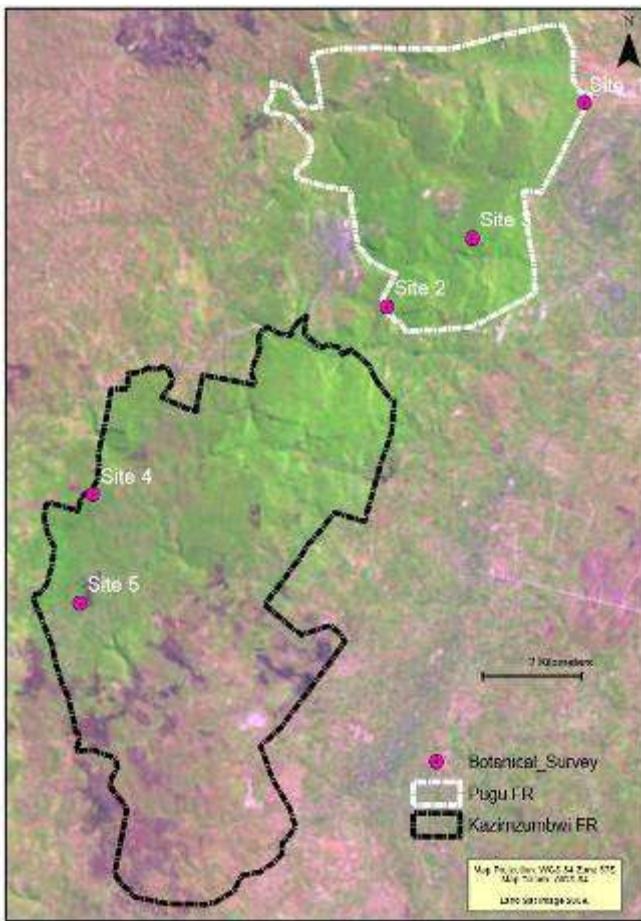

##### **3.3.2 Sampling intensity**

Botanical surveys were carried out over 10 days in 2011 between 7<sup>th</sup> to 17<sup>th</sup> June. In 2012, surveys were carried out over 10 days between 26<sup>th</sup> May and 4<sup>th</sup> June 2012 in Pugu Forest Reserve.

Surveys were carried out in six sites, three in Pugu and three in Kazimzumbwi. These are summarized in Table 3. More detailed descriptions of the six sites are provided in Appendix 39.

**Table 3** Summary description of the botanical survey sites.

Site Number	Site 1	Site 2	Site 3	Site 4	Site 5	Site 6
Forest Reserve	<b>Pugu</b>			<b>Kazimzumbwi</b>		
Site Name(s)	Mambisi and Pugu Relini	Dunda and Kimani	Pugu Mpakani and Minaki Bwawani	Kazimzumbwi Jeshini and Buyuni	Vibura	Chanika
Vegetation category	Mambisi = Historically degraded and Pugu Relini = recently degraded	Dunda = Recently degraded and Kimani = being cleared	Pugu Mpakani and Minaki Bwawani = Less disturbed forest	Kazimzumwi Jeshini = Less disturbed forest and Buyuni = recently deforested	Vibura = Degraded thicket and farmland	Abandoned agricultural land

**Figure 5.** Map showing location of botanical surveys.

A total of 202 botanical collections were made in 2012. These are between collection numbers 7810 and 8012 in Moses Mwangoka's collecting series. Duplicate specimens have been deposited at the Missouri Botanical Gardens, the National Herbarium of Tanzania and the Herbarium at the Forestry Training Institute at Olmotonyi. Collections and provisional identifications have been provided by Moses Mwangoka. These are still awaiting confirmation by Roy Gereau of the Missouri Botanical Gardens. No collections were made during the 2011 survey.

### 3.4 Results

#### 3.4.1 Endemism

A total of 31 plant species endemic to the Swahilian Regional Centre of Endemism *sensu lato* (Burgess 2000) were recorded. Of these, two species, *Millettia puguensis* and *Baphia puguensis*, are endemic to Pugu and Kazimzumbwi Forest Reserves and *Uvaria puguensis* is found in both Pugu and the nearby Pande Game Reserve, a small game reserve in the suburbs of Dar es Salaam. In addition the shrub, *Whitfieldia orientalis* that is endemic to the Eastern Arc Mountains and Coastal forests was also recorded at the Mambisi and Pugu Relini site in 2012.

Overall more endemic species were recorded from Pugu (30) than from Kazimzumbwi (16). Only one of the three species endemic to Pugu and nearby forests was found in Kazimzumbwi. The recently degraded forest at Mambisi and Pugu Relini had the most restricted range species (28). A comparable number of restricted range species was found at Pugu Mpakani and Minaki (25). All three Pugu endemic plant species were found at both Pugu Mpakani / Minaki and Pugu Mambisi/ Pugu Relini.

**Table 4.** Plant species endemic to the Swahilian Regional Centre of Endemism *sensu lato* recorded in Pugu and Kazimzumbwi Forest Reserves in 2011 and 2012.

Site 4 = Buyuni

Site 2 = Pugu Dunda and Kimani  
Site 5 = Vibura

Site 3 = Pugu Mpakani and Minaki  
Site 6 = Chanika

#### Geographical range

E CF = Endemic plants of the Swahilian Regional Centre of Endemism sensu lato (including coastal forests) based on Appendix 3. Of Burgess and Clarke 2000.

#### Collection

MM = Numbering in Moses Mwangoka's botanical collection series.

No coll = No collection made.

### 3.4.2 Threatened species

Thirteen threatened plant species were recorded during the survey of which all species were recorded in Pugu and five were also recorded in Kazimzumbwi. An additional three species considered by IUCN to be near-threatened and seven species considered as least concern were also recorded. It should be noted that there has been an ongoing evaluation of the red list status of Tanzania's plants however the new assessments have not yet been published for all species, and some assessments have not been carried out. As such this does not provide a full picture of the threatened status of the plants found in Pugu and Kazimzumbwi. For example, *Millettia puguensis* is endemic to Pugu and Kazimzumbwi but no assessment has been published for this species although its range is comparable with the Endangered *Baphia puguensis*.

**Table 5.** List of threatened plant species recorded in Pugu and Kazimzumbwi.

#### Collection

MM = Numbering in Moses Mwangoka's botanical collection series.

No coll = No collection made.

In both Mambisi / Pugu Relini and Pugu Mpakani / Minaki Bwawani sites, all thirteen threatened species were recorded. In contrast at Chanika no threatened species were recorded

**Table 6.** Number of threatened plant species recorded at each sample site.

Threat status	Pugu Sites			Kazimzumbwi Sites			Total
Site Number	1	2	3	4	5	6	
Critically Endangered	1	0	1	0	0	0	1
Endangered	2	2	2	1	0	0	2
Vulnerable	10	4	10	4	1	0	10
<b>Total</b>	<b>13</b>	<b>6</b>	<b>13</b>	<b>5</b>	<b>1</b>	<b>0</b>	<b>13</b>

#### 3.4.3 Plant species richness

In total, 414 plant species in 71 families were recorded during the botanical surveys. These are listed in Appendix 40. The identifications of those plants for which specimens were taken is provisional. Overall more than twice as many species were recorded in Pugu (371 species) than in Kazimzumbwi (175).

Pugu Mpakani and Minaki Bwawani (less disturbed forest) was the most species rich site with 321 species, followed by Mambisi and Pugu Rellini (historically and recently degraded) with 305 species (Table 7). The least diverse site was Chanika with only 63 species.

**Table 7.** Comparison of plant species richness between sites.

Site name	Site number	Forest Reserve	Forest condition historical	Species richness
Mambisi & Pugu Rellini	1	Pugu	Historically degraded and recently degraded	305
Pugu Dunda & Kimani	2	Pugu	Recently degraded and being cleared	175
Pugu Mpakani & Minaki Bwawani	3	Pugu	Less disturbed forest	321

Site name	Site number	Forest Reserve	Forest condition historical	Species richness
Buyuni	4	Kazimzumbwi	Recently degraded.	111
Vibura	5	Kazimzumbwi	Historically degraded	79
Chanika	6	Kazimzumbwi	Abandoned agricultural land	63

### 3.4.4 Invasive species

Two invasive alien species were recorded *Lantana camara* and *Stachytarpheta jamaicensis*. *Lantana camara* was recorded in all sites except Site 6 whilst *Stachytarpheta jamaicensis* was recorded in Sites 1 and 3 only.

### 3.5 Discussion

A checklist of 414 plant species was compiled. Of the four survey sites, The most species-rich site with 321 species was the less disturbed forest at Pugu Mpakani and Minaki Bwawani. Of the plant species recorded, 13 are considered threatened according to the IUCN Red-Listed ten Vulnerable, two Endangered, and one Critically Endangered species. 31 plant species endemic to the Swahilian Regional Centre of Endemism *sensu lato* (Burgess 2000) were recorded. Unexpectedly, in Pugu forest, Pugu mpakani, a site found just near the main road, was found to have a high level of endemism relative to other sampling locations; however, the endemic *Milletia puguensis* was recorded cut at this site. The endemic *Baphia puguensis* was recorded frequently at Buyuni site in Kazimzumbwi FR.

The status of several of the Red-Listed species recorded during the surveys need updating. These include *Angylocalyx braunii*, a vulnerable species that is restricted to patches of riverine and moist forest (Lovett & Clarke, 1998a); *Dalbergia vacciniifolia*, a scandent shrub that occurs in patches of dry coastal forest at unusually high altitudes (Lovett & Clarke, 1998b); *Millettia bussei*, restricted to areas of dry coastal forest (Lovett & Clarke, 1998d); *Rothmania macrosiphon*, described as a sometimes scrambling shrub or small tree growing in moist coastal forests (Lovett & Clarke, 1998e); *Chytranthus obliquinervis*, restricted to localised populations on the East African coast and under pressure from cultivation (IUCN, 1998); *Vitex zanzibarensis*, a vulnerable large tree of coastal forest, woodland and thicket found in remaining forest patches in Tanzania and only two sites in Kenya (Lovett & Clarke, 1998f).

Areas in the vicinity of both Pugu and Kazimzumbwi were found to have high fire damage, with one dominant plant species recorded, *Trema orientalis*. This suggests a poor prognosis for the future condition of these two forest reserves and the endemic and threatened species they support. Our findings at Pugu mpakani are consistent with those of Hall *et al.* (2002), who recorded that the Pugu and Kazimzumbwi endemic plant *Baphia puguensis* suffers from pole extraction. In both Pugu and Kazimzumbwi, three further plant species were recorded to be highly extracted for timber and charcoal: *Pterocarpus angolensis*, *Brachystegia sp.* and *Albizia versicolor*. Of these, two (*Brachystegia sp.* and *Pterocarpus angolensis*) were also documented by Hall *et al.* (2002) in Pugu FR. One main invasive species, *Lantana camara*, was recorded with regularity at each of the four sites in our survey. This plant species is capable of preventing all other plants from growing under and near it and can form single-species stands that exclude all other plants as well as all land uses (IUCN Invasive Species Initiative).

## 4) Bird Survey

### 4.1 Background

Pugu and Kazimzumbwi forests are rich in avifauna, including forest and highland species (Baker & Baker, 2002). Both sites are likely feeding stop-over areas between breeding sites such as Rondo, south of the Rufiji, and Kenya's coastal forests where birds overwinter and moult (Neil Baker, Tanzania Bird Atlas, 2012; Baker & Baker, 1992; Baker & Howell, 1992). Records in the Pugu Hills include the white-starred forest robin (LC), a highland species, likely a scarce migrant breeder to the area (Baker, 1984), and observations of distinct behavior, for example the use of tree holes for bathing by forest birds such as the Eastern bearded scrub robin (LC) (Baker, 1983).

### 4.2 Objectives

To provide an updated check-list of birds in Pugu and Kazimzumbwi Forest Reserves and compare it with existing data from other sources.

### 4.3 Methods

Five sites were opportunistically surveyed for birds over 16 days in 2012 by Elia Mulungu.

Site Number	Site 1	Site 2	Site 3	Site 4	Site 5
Forest Reserve	<b>Pugu FR</b>				<b>Kazimzumbwi FR</b>
Site Name(s)	Mambisi and Pugu Relini	Pugu Dunda and Kimani	Pugu Mpakani and Minaki Bwawani	Kazimzumbwi Jeshini and Buyuni	Vibura
Vegetation category	Mambisi = Historically degraded and Pugu Relini = recently degraded	Dunda = Recently degraded and Kimani = being cleared	Pugu Mpakani and Minaki Bwawani = Less disturbed forest	Kazimzumwi Jeshini = Less disturbed forest and Buyuni = recently deforested	Vibura = Degraded thicket and farmland

### 4.4 Results

102 species in 79 genera in 37 families were recorded including four Red-Listed species above LC level. These were the African crowned eagle and Bateleur, both NT, the Spotted ground thrush (EN) and the East Coast akalat (NT).

**Table 8. Bird checklist for Pugu and Kazimzumbwi FRs.** Habitat (H): F = X, FF = Forest Dependent, O = Non forest. Range (R): W = Widespread, CFN = Endemic to the East African Coastal Forests and neighbouring forests including the Eastern Arc Mountains; RL = Red List status. Numbers 1-5 refer to sites with “1” denoting “first recorded at this site”. Site 1=Mambisi and Pugu relini (historically deforested & recently deforested); Site 2=Pugu Dunda and Kimani (recently degraded and being cleared); Site 3=Pugu Mpakani and Minaki bwawani (good forest); Site 4=Kazimzumbwi jeshini and Buyuni (good forest and recently cleared); and Site 5=Vibura and Chanika (degraded and shamba). Red-listed species are in red.

#### **4.6 Discussion**

Our 11-day survey corroborated the richness and distinctiveness of avifauna in Pugu-Kazimzumbwi and the importance of the Pugu Hills to bird conservation along the coast. Of the 102 species we recorded, four are Red-Listed birds including closed moist forest and coastal forest species such as the East Coast akalat (NT) and Spotted ground thrush (EN), and two birds of prey, the African crowned eagle (NT) and Bateleur (NT). We did not record the Southern banded snake-eagle (NT) and Uluguru violet-backed sunbird (LC) previously recorded by Mlingwa et al. (1993).

Mlingwa et al. (1993) recorded 58 bird species in Kazimzumbwi FR on their survey, while the better-studied Pugu FR is said to contribute substantially to supporting the 470 birds in and around Dar es Salaam (within a 50 km radius) of the ~1100 bird species recorded in Tanzania (Wium-Andersen & Reid, 2000).

The invasive Indian house crow *Corvus splendens* (introduced to Zanzibar in the late 19<sup>th</sup> century) and habitat fragmentation along the Tanzania coast are responsible for the decline of birds along the Tanzanian coast. The effectiveness of recent efforts to eradicate the house crow may in part be substantiated in our survey, which did not detect Indian house crows at our specific survey sites in the Pugu Hills although they were observed flying over the forest. As the following section on habitat disturbance details, however, destruction of natural habitat for charcoal production, poles and timber will threaten and displace birds of the Pugu Hills forests perhaps irretrievably.

## 5) Disturbance Survey

### 5.1 Background

Kazimzumbwi and especially Pugu Forest Reserves are well studied forests given their proximity to Dar es Salaam. Also because of their proximity to Tanzania's major urban centre, Ahrends (2005) described Pugu Forest Reserve as one of the most highly disturbed forests in Tanzania's Coast Region. Parts of Kazimzumbwi have been largely deforested.

### 5.2 Objectives

The disturbance surveys were carried out to achieve the following aims:

1. To assess the level of disturbance in Pugu and Kazimzumbwi Forest Reserves by documenting all observations of disturbance and their intensities.
2. To get a general understanding of the level of threats to Pugu's and Kazimzumbwi's endemic plant species.
3. To identify site-specific priorities for conservation and management.

### 5.3 Methods

#### 5.3.1 Sampling intensity

Forest disturbance was measured in 2011 and 2012 at sites classed into six categories: "relatively undisturbed forest" (Pugu mpakani, Minaki bwawani, Kazimzumbwi jeshini, Kimani and portion of Mambisi), "recently deforested" (Pugu relini, part of Mambisi and Pugu-dunda), "historically deforested" (part of Mambisi site), "being cleared" (part of Kimani), "degraded" (Vibura) and "shamba" or farm (Chanika). Sites were classified based on an analysis of remote sensing images including images available on Google Earth. Two sets of 18 1-km disturbance transects encompassing the above disturbance categories or strata were conducted at both Pugu and Kazimzumbwi (Table 9; Appendices 1 and 20). Transects in Pugu forest were named T<sub>n</sub>P, while those in Kazimzumbwi forest are referred to as T<sub>n</sub>K, where, T is transect, n is the transect number, K and P is Kazimzumbwi and Pugu respectively (see Appendices for raw data from each transect). GPS points were recorded at the beginning and end of each transect.

**Table 9.** Number of disturbance transects walked in Pugu and Kazimzumbwi Forest Reserves in 2011 and 2012.

S/ N	Disturbance category	Number of transects 2011	Number of transects 2012	Site name
<b>Pugu Forest Reserve</b>				
1	Relatively undisturbed forest	3 (T1P, T4P, T9P)	2	Pugu mpakani & Minaki bwawani
2	Recently degraded	3 (T2P, T3P, T17P)	3	Pugu dunda & Pugu relini
3	Historically deforested	2 (T6P, T15P, T 16 P)	3	Portion of Mambisi
4	Being cleared	1 (T5P)	1	Portion of Kimani
<b>Kazimzumbwi Forest Reserve</b>				
5	Good forest	2 (T18K)	2	Kazimzumbwi jeshini
6	Recently cleared	2 (T11K, T12 K)	2	Buyuni
7	Degraded	2 (T8K, T14K)	2	Vibura
8	Shamba	3 (T10K, T13K, T7K)	3	Chanika

#### 5.3.2 Transect method

A rope of 50 m long was used to measure 50 m segments along each 1 km transect line. The disturbance transect was therefore sub-divided into 20 50-m segments and data were recorded separately for each segment. The longitude, latitude and altitude of the start and end points of each disturbance transect were recorded using a hand-held GPS (see Appendices). Compass bearing / direction followed was also recorded.

The level of disturbance was assessed for each 50 m segment in terms of the number of incidents of pole cutting, timber cutting, traps and other disturbances in a 10 m strip (5 m on either side of the transect line). For the purpose of this survey, poles were defined as all trees with a diameter at breast height (DBH) of 5-15 cm. Timber trees were defined as all trees exceeding 15 cm DBH. The total area surveyed along each line was 10,000 m<sup>2</sup> or 1 hectare, for a sum of 18 hectares for 18 disturbance transects conducted (9 at each site) for each of the two years.

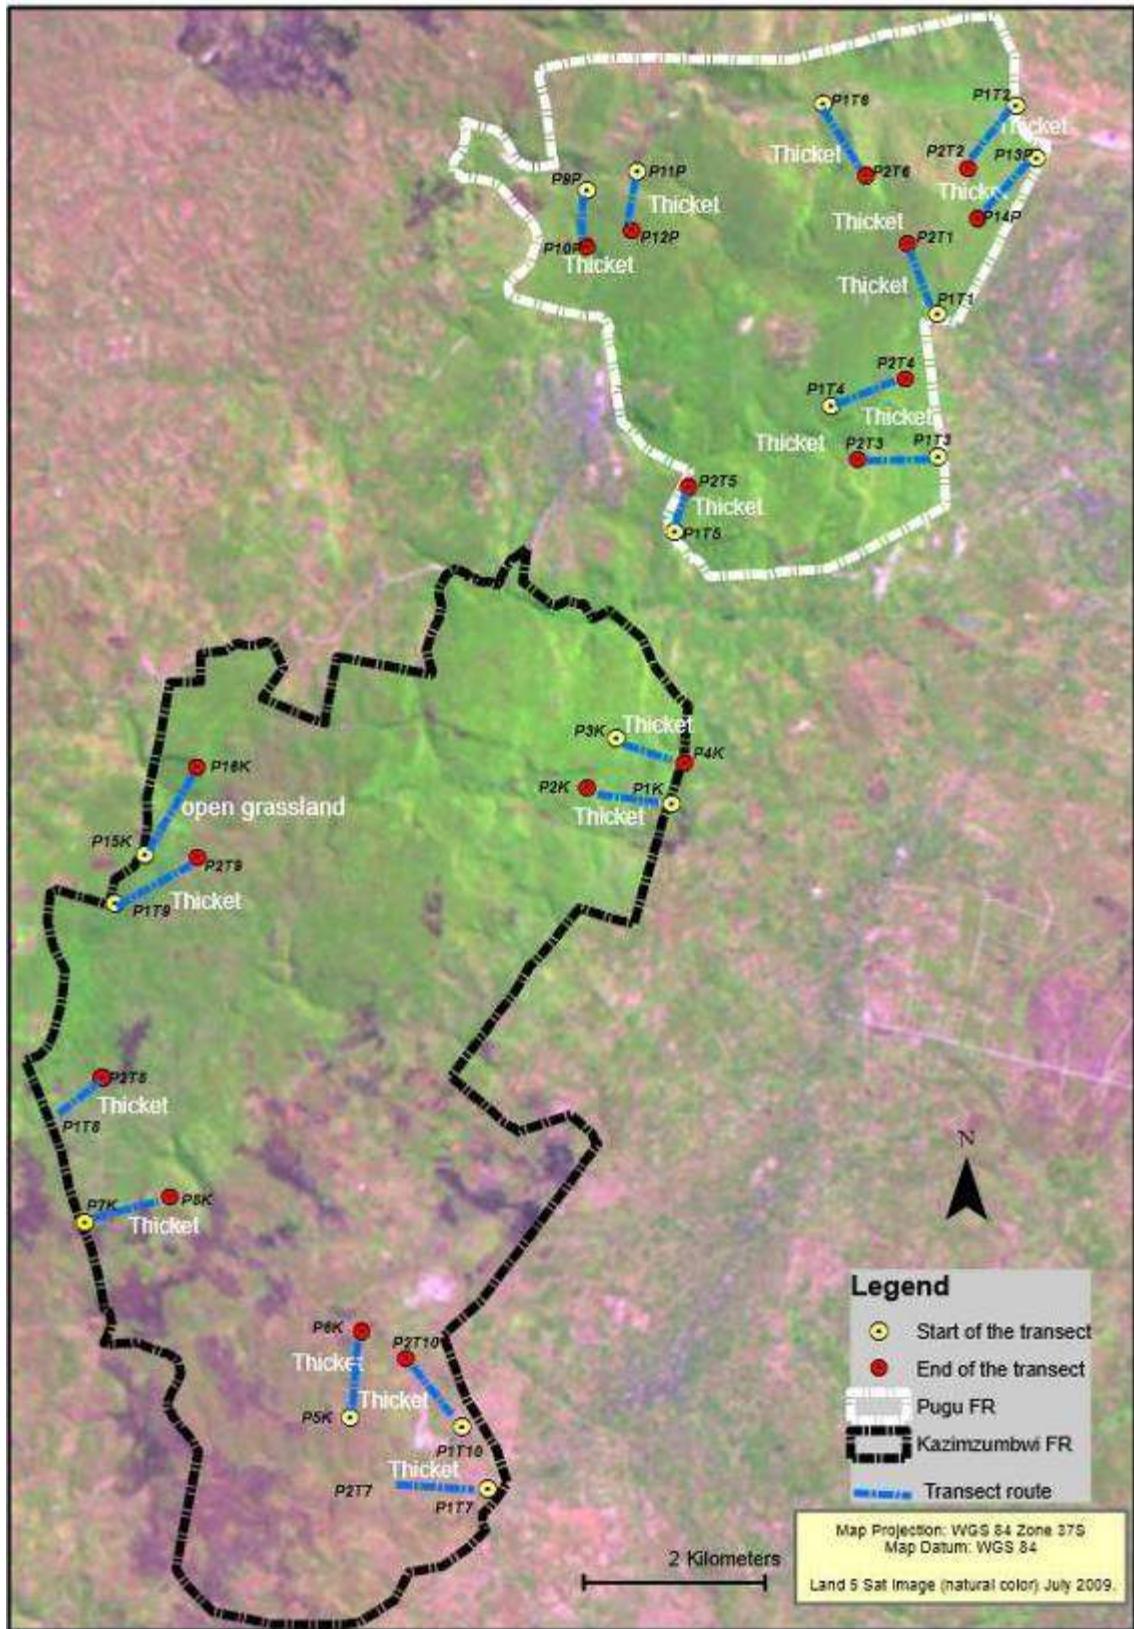

Other forms of anthropogenic disturbance within 5 m either side of each transect were also recorded for every 50m segment. These were defined as follows:

1. Fire damage: area affected by fire; evidence included burnt trees and ground vegetation.
2. Charcoal: area where charcoal was burned in the forest, evidence included small patches of burnt ground with charcoal remains as well as active kilns or kilns under preparation.
3. Pitsaw: an area obviously cleared for pitsaw activities, with pitsaw platform, or remains.
4. Timber/planks/poles: cut timber, planks or cut poles lying on the ground ready for transport.
5. Trapping: animal traps of all varieties whether set or sprung.
6. Cultivation: evidence of crop cultivation (past or present).
7. Grazing: direct evidence or remains of cattle or goat grazing.
8. Footpath: all human used footpaths.
9. Clearing: well-established clearings within the forest created by humans (usually short grassland, potentially previous settlement).

## 5.4 Results

### 5.4.1 Pugu Forest Reserve

The main form of disturbance detected in Pugu was pole cutting. In 2011, Minaki bwawani (T<sub>4</sub>P) and Pugu-dunda (T<sub>3</sub>P) had the most old cut poles. Mambisi area had the highest relative fire damage evinced by the presence of *Trema orientalis*, a pioneer plant species. In some areas such as on transects T<sub>5</sub>P, T<sub>12</sub>K, and T<sub>16</sub>P, we recorded a few snares which suggests that there is still some trapping in Pugu and Kazimzumbwi forests. The botanical survey at Minaki bwawani suggests rapid extraction of several different water-supporting plants surrounding the Minaki dam (transect T<sub>4</sub>P).

**Figure 6.** Map of the location of disturbance transects in Pugu and Kazimzumbwi.

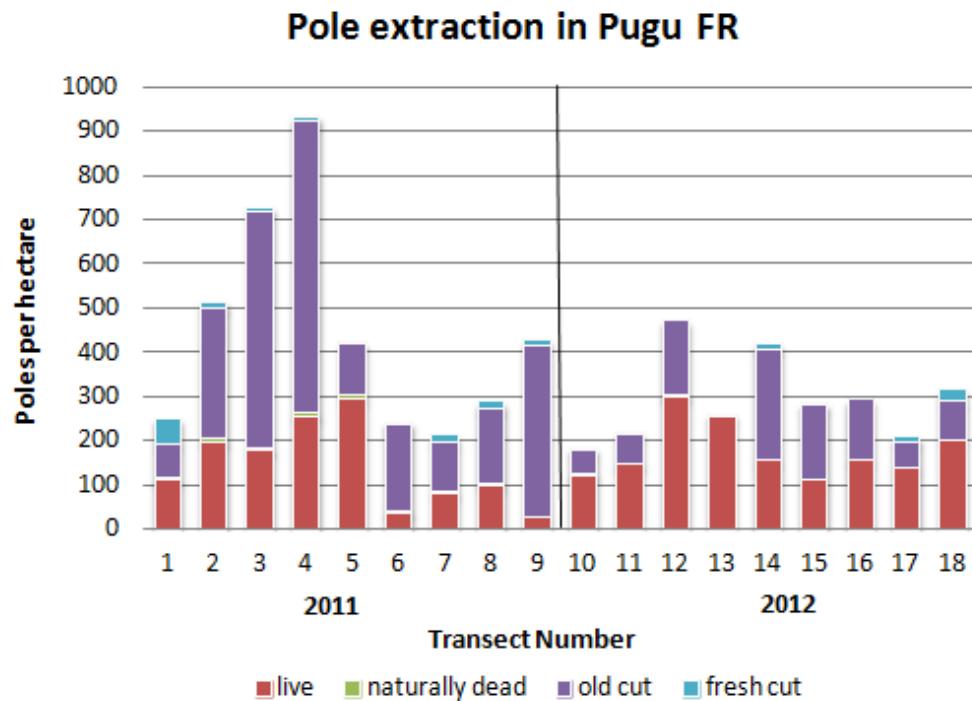

#### 5.4.1.1 Pole extraction

A total of 6641 poles were recorded on transects, 4403 poles in 2011 and 2638 poles in 2012. Less poles were recorded in 2012, however a greater proportion of poles were live than in 2011. In 2011, 64% were old cut poles while in 2012, 60% were live poles (Table 12 and Figure 7).

**Table 10.** Number of live, naturally dead, old cut and fresh cut poles recorded in Pugu FR.

Year	S/N	Transect no.	Transect map label	Total no. of poles sampled	Live poles	Naturally dead poles	Old cut poles	Fresh cut poles	Forest category

#### 5.4.1.2 Timber extraction in Pugu Forest Reserve

A total of 1433 timbers were recorded in Pugu FR, 718 in 2011 and 715 in 2012. Of these, 78% were old cut timber in 2011 and 82% were old cut timber in 2012 (Table 13 and Figure 8); whilst 3.3 % were fresh cut in 2011; and 0.5 % were fresh cut in 2012.

**Table 11.** Number of live, naturally dead, old cut and fresh cut timber recorded in Pugu FR.

Year	S/N	Transect no.	Total no. of timber recorded	Live timber	Naturally dead timber	Old cut timber	Fresh cut timber	Forest category

## 5.4.2 Kazimzumbwi Forest Reserve

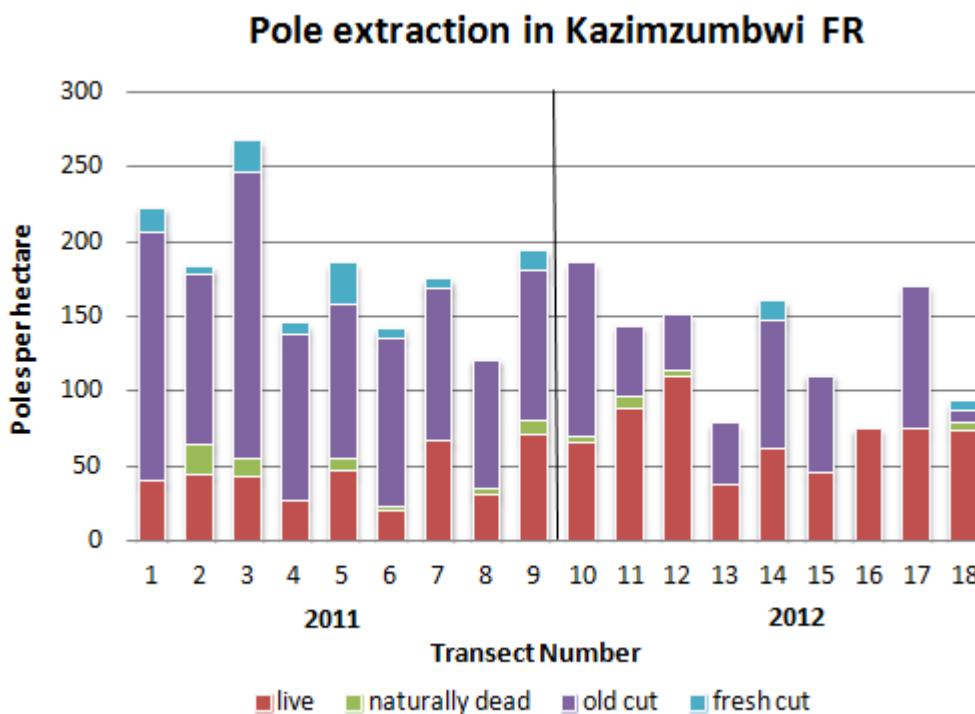

Kazimzumbwi Forest Reserve, in contrast to Pugu, shows high levels of human disturbance in the form of fire damage and agricultural encroachment. Before people were evicted from the Forest Reserve in 1998 and 2010, large portions of the forest were cleared for agriculture. Cultivation, which was recorded on transects T<sub>7</sub>K and T<sub>10</sub>K in 2011, provides an example of this (refer to Appendices 7 and 10). Fire, recorded on most transects in 2011 and 2012, has emerged as a serious obstacle to conserving Kazimzumbwi forest. Sand mining, detected on transects T-K and T<sub>10</sub>K (see Appendices 7 and 10) in 2011, is another form of disturbance in this Forest Reserve. We recorded only a few snares, suggesting that there is still some hunting activity in the forest but that, most likely, the target species have been near-extirpated.

### 5.4.2.1 Pole extraction in Kazimzumbwi Forest Reserve

A total of 2800 poles were recorded, 1634 in 2011 and 1166 in 2012. In 2011, 66% were old cut and 24% were live poles while in 2012, 54% were live and 43% were old cut (Table 14, Figure 10).

**Table 12.** Number of live, naturally dead, old cut and fresh cut poles in Kazimzumbwi FR.

Year	S/N	Transect no.	Transect map label	Total no. of poles sampled	Live poles	Naturally dead poles	Old cut poles	Fresh cut poles	Forest category

#### 5.4.2.2 Timber extraction in Kazimzumbwi Forest Reserve

In Kazimzumbwi Forest Reserve, a total of 904 timbers were recorded, 530 in 2011 and 374 in 2012. Over 82% of timber was old cut in both years (Table 15, Figure 11). The rate of freshly cut trees reduced from 6.6 % in 2011 to 1.6 % in 2012.

**Table 13.** Number of live, naturally dead, old cut and freshly cut timber in Kazimzumbwi FR.

#### 5.4.3 Other disturbances

During this survey, other anthropogenic disturbance such as fire damage, paths, cultivation, snares/traps, charcoal kilns, and mining were also recorded. Nearly double the amount of disturbance events were observed in 2011 than 2012 in both forest reserves. In total, 107 and 72 charcoal kilns or kiln scars were counted along 9 transects in Pugu in 2011 and 2012 respectively; 114 and 48 charcoal kilns or kiln scars were found along 9 transects in Kazimzumbwi in 2011 and 2012 respectively. Fire is a widespread problem in Kazimzumbwi where 169 events of fire were recorded in 2011-2012, while in Pugu, 115 fire events were recorded. Only six snares or traps were found across both survey years suggesting that most of the forests' small mammals have been hunted out.

**Table 14.** Summary of other disturbance events in Pugu FR and Kazimzumbwi FR.

S, R, K, F, P, M, N, C, T and O represent settlement, road/path, charcoal kiln, fire, pitsaw, mining, snares, cultivation, planks/timber/poles and other respectively.

## 5.5 Discussion

Both Pugu and Kazimzumbwi forests are undergoing high levels and rates of disturbance. In 2005, Ahrends described the extent of protection in Pugu FR as “medium”. Given our extensive records of human presence and disturbance, the effectiveness of protection seems low. The dominant types of human activity included pole cutting, fire damage, charcoal making and paths. Relative to a previous survey conducted by Hall *et al.* (2002), the total number of poles we sampled in Kazimzumbwi forest was less. This can probably be explained by the harvesting of pole-sized trees for charcoal production and building materials over the last decade.

Pole cutting is still high in Pugu forest, particularly in Pugu dunda ( $T_3P$ ) and Minaki bwawani ( $T_4P$ ). Signs of agricultural activities were evident in Kazimzumbwi forest, despite the recent 2010 eviction of farmers from the area by the government. Pugu-relini site in Pugu forest shows high rates of timber cutting, perhaps directly related to the fact that the site is found in the vicinity of the forest and is dense with pathways from Pugu Kajiungeni leading into the forest. In Pugu Forest Reserve, the only good forest is found alongside the Dar es Salaam Kisarawe main roads. Effort should be made to strengthen protection in these areas.

Valuable commercial tree species such as *Millicia excelsa* have been overexploited to the extent that, in effect, very few resources remain. Our findings are also consistent with the study of Ahrends (2005), who recorded that *Antiaris toxicaria*, *Manilkara spp.* and *Albizia spp.* have been especially affected by charcoal burning.

In ascending order, the rate of charcoal making was found to be high in four sites: Minaki bwawani, Kazimzumbwi jeshini, Pugu relini and Buyuni site. The distribution of fire incidents differs from one site to another in both Pugu and Kazimzumbwi forests, based on the survey results. For example, Buyuni ( $T_{11}K$ ), Mambisi ( $T_6P$ ), and Vibura ( $T_8K$ ) show high rates of fire damage relative to other transects. From discussions with members from the surrounding community, it appears that the incidents of fire damage increases in the early season of farming activities. Meanwhile, also according to the community, occasional arson is a big problem especially in Mambisi areas. The survey team found *Trema orientalis* to be the dominant plant species in the fire damaged areas. This species is likely to dominate if no immediate efforts are taken to reduce fire incidents.

Little evidence of hunting activity was recorded in the vicinity of both forest reserves. Guinea fowl and elephant shrew snares were seen near Kazimzumbwi in Buyuni site. In Pugu forest, a few snares were seen at Mambisi sites. However, there appear to be few small mammals left to trap in these forests.

Opportunistically, pit sawing was also recorded at Minaki bwawani alongside Minaki dam accounting for the loss of a number of plant species valuable to conserving the water catchment areas of Minaki dam. In Kazimzumbwi forest, findings by Hall *et al.* (2002) highlighted evidence of pitsaws in Buyuni areas consistent with our findings that Buyuni sites now have a dearth of timber. Finally, in several areas at Pugu relini and Minaki bwawani, we recorded a few cases of root harvesting, perhaps for medicinal use.

## **6) Summary of Conclusions and Recommendations**

Our plant and bird surveys suggest a rich flora and fauna in spite of ongoing disturbance; however, the loss of forest cover will most certainly endanger the birds that rely on Pugu Hills for breeding and stop-over during migration, and endemic and rare plant species could disappear.

Our botanical surveys yielded a checklist of 343 plant species, including coastal forest and local endemics and IUCN Red-Listed and threatened species. These findings thus corroborate previous ones (e.g., Clarke & Dickinson, 1995; Hall *et al.*, 2002), which upheld these forests as priority sites. 105 bird species were recorded during 16 days of opportunistic avian surveys, including five IUCN Red-Listed species.

Results from 36 disturbance transects indicate high levels of disturbance in the form of logging, fire damage, charcoal making and, to some extent, agricultural encroachment. These activities have resulted in a rapid decline of several endemic plant species and, possibly, an increase in the abundance of invasive species such as *Lantana camara*.

Attempts to establish joint forest management for Pugu and Kazimzumbwi Forest Reserves have largely failed to address the ongoing deforestation and degradation in the reserves. Community engagement in forest management has been eroded by a number of factors including the peri-urban nature of the surrounding communities; the extreme level of pressure; perceived government indifference and / or powerlessness to apply the law within the reserves.

It is our contention that the only hope for these reserves rests with the intervention of the President and Prime Minister to provide explicit political support for law enforcement for the reserves. Stakeholders at District, Regional and even Ministerial level are neither motivated, nor politically empowered to enforce the law to the degree that is necessary to conserve these forests, given the intense pressures and vested interests in the destruction of the forests. The Tanzania Forest Service does not have the institutional experience nor trained staff to undertake sufficiently effective law enforcement required to conserve these peri-urban forests. This requires an approach more familiar to TANAPA or Wildlife Division.

And finally, we also recommend sustained research and monitoring of the trends of changes in biodiversity and forest condition within these forests.

700-750	GUS	1	1	2	-	-	Antelope area
750-800	GUS	1	1	2	-	-	Duiker trail and <i>Trema orientalis</i>
800-850	GUS	1	1	2	-	-	<i>Trema orientalis</i> dikdik pellets
850-900	GUS	1	1	2	-	-	Very old stumps
900-950	GUS	1	1	2	-	-	-
950-1000	GUS	1	1	2	-	-	-

**Notes:** The area is characterised by thicketed vegetation as a result of excessive harvesting of trees for charcoal production. Additionally, there were human paths/ trails observed but the majority seem to no longer be used which suggests that conservation efforts may now be working.

## Appendix 38. Disturbance Transect no. 18

**Names of recorders:** Justine Gwegime & Habibu Said

**Date of survey:** 7/6/2012

**District:** Kisarawe

**Village:** Buyuni

**Nearest sub-village:** Buyuni

**Village Forest Reserve:** Kazimzumbwi FR

**Transect Number:** 18

**Dominant vegetation:** Open grassland

**Bearing:** SE

### Key to disturbance categories

P	Pitsaw	S	Settlement	T	Timber, planks, poles	R	Path or road
F	Fire damage	B	Bark or root harvesting	K	Charcoal kiln	G	Gunfire
C	Cultivation	M	Mining	N	Traps or snares	O	Other

section (m)	Qty of poles (5 – 15 cm)				Qty of timber (> 15 cm dbh)				Other disturbances

#### Key to

**Pugu Mpakani and Minaki Bwawani (less disturbed forest)** was the most species rich site with 321 species, followed by Mambisi and Pugu Rellini (historically and recently degraded) with 305 species (Table 7). The least diverse site was Chanika with only 63 species.

#### Table 7

Site 1 a = Pugu Relini in 2011

Site 1 b = Pugu Mambisi in 2011

Site 1c = Pugu Relini and Pugu Mambisi in 2012

Site 2 = Pugu Dunda and Kimani

Site 3a = Pugu Mpakani and Minaki Bwawani in 2011

Site 3b = Pugu Mpakani and Minaki Bwawani in 2012

Site 4 = Buyuni in 2011

Site 5 = Vibura in 2011

Site 6 = Chanika in 2011

#### Red List

CR = Critically Endangered

EN = Endangered

VU = Vulnerable

NT = Near threatened

LC = Least Concern

DD = Data Deficient

#### Habitat

F = Forest      W = Woodland

#### Habit

CL = Climber

H = Herb

L = Liana

S = Shrub

T = Tree

#### Geographical range

E CF = Endemic plants of the Swahilian Regional Centre of Endemism sensu lato (including coastal forests) based on Appendix 3. Of Burgess and Clarke 2000.

#### Collection

MM = Numbering in Moses Mwangoka's botanical collection series.

No coll = No collection made.
