

Acute Kidney Injury (AKI): Improving prevention, early detection and management of AKI in Primary and Community Care settings in Dorset

Tuesday 20th October 2015

Springfield Hotel, Grange Road, Wareham, BH20 5AL

NHS Dorset CCG and the Wessex Cardiovascular Strategic Network are pleased to support this collaborative study day. The event has been designed to raise awareness of AKI and promote best practice in primary and community care in the prevention, early detection and care of patients in Dorset.

Acute Kidney Injury (AKI), previously known as acute renal failure, is a sudden loss of kidney function. It is a common and preventable condition. AKI affects patients in every clinical speciality both in primary and secondary care settings. It is a nationally important patient safety issue and is strongly associated with mortality, increased lengths of stay, chronic morbidity and increased healthcare costs.

The science and art of AKI has an extraordinary relevance to our practice in both primary, secondary and community care.

Did you know?

Up to 70% of AKI is 'community acquired' and much is preventable?

That One episode of AKI worsens the stage of CKD and leaves patients vulnerable to a further AKI?

That 1% of the health budget is spent on the treatment of AKI ?

AKI increases 'all cause' mortality by up to 4 times and extends for at least the year following the event?

That it is often preventable ?

Please take time to learn more on a study day with a mix of national and local experts .

Who is this event for?

This event is for healthcare professionals working in primary and community care in Bournemouth, Dorset and Poole, including:

- Community Matrons / Lead District Nurses
- Macmillan GP's
- Prescribing Lead GP's
- Over 75 Lead GP / Nurse Practitioners
