INTRODUCTION

This fourth edition of the Supplement updates the series of four catalogues on the Diptera types in the Canadian National Collection of Insects (CNC). The first part (Cooper 1991), dealt with the Nematocera and catalogued the types deposited in the collection until the end of 1987. The second (Cooper & Cumming 1993), catalogued the primary types of brachyceran Diptera exclusive of the Schizophora until the end of 1991. The third (Cooper & Cumming 2000), catalogued the primary types of Schizophora exclusive of the Tachinidae in the collection until the end of 1994. The fourth part (Cooper & O'Hara 1996), catalogued the primary types of Tachinidae deposited in the CNC until the end of 1994. All four parts are also available as searchable PDF documents on the North America Dipterists Society website (<http://www.nadsdiptera.org/Catalogs/CNCTypes/CNChome.htm>). This supplement brings the total number of species of Diptera represented by name-bearing types in CNC to 5021 (including 4655 species represented by holotypes, lectotypes and neotypes and 366 species represented by syntypes).

The Supplement covers the entire Diptera and includes all primary types published after the dates listed above for each part, as well as those types discovered since or inadvertently missed during the preparation of Parts 1 to 4, or needing some form of correction or update since the original entry. Of particular note, this fourth edition of the Supplement updates several entries from Cooper (1991) and Cooper & Cumming (2000) for species described by Garrett (1925b). In these entries, the type specimens were originally interpreted as syntypes; however, Garrett clearly refers to a “Type” for all but one of the included species (i.e., *Pseudoleria crassata* Garrett), and in the last line of the paper states “Accompanying these types are 385 paratypes.” This statement, along with the explicit type labels Garrett attached to the specimens, clearly indicates his intention to recognize a single specimen as the holotype for the species described in that work.

The format for the Supplement is the same as in the previous parts, with entries listed using the original combination and spelling. Subgeneric names are included if they were used in the original description of a new species. Entries include the following information: name of taxon and author; year of publication; abbreviated reference, including volume, relevant page; and current name of country from which the primary type was collected. Unless otherwise noted, the label data associated with each primary type and allotype are cited in full, with diagonal lines separating information given on separate labels (a diagonal line not followed by a space indicates that the diagonal line is present on the label). The number of paratypes or paralectotypes is given along with their country or province/state of origin. The sex of each specimen is given. Notes about nomenclature, genitalic dissections, major damage to primary types, etc., are included wherever necessary under Remarks.

Unlike Parts 1 to 4, a hardcopy publication of the Supplement is not available. This fourth edition of the Supplement supersedes the first, second and third editions, which were published exclusively on the Internet in January 2000, December 2003 and January 2007, respectively. Users should first search the appropriate Part and then this Supplement to obtain information on the type holdings in the CNC for a particular family. However, users should be aware that the Supplement takes into account recent changes in the family classification of the Diptera (as outlined in Pape et al. 2011), such as the splitting of the traditional Tipuloidea, Sciaroidea and Empidoidea into several additional families. Therefore some generic entries previously listed as Tipulidae may now be found under Limoniidae, some generic entries previously listed as Mycetophilidae may now be found under Keroplatidae, and some generic entries previously listed as Empididae may now be found under Atelestidae, Brachystomatidae or Hybotidae. Additional recent family changes include the splitting of Mythicomyiidae from Bombyliidae, the lumping of Nycteribiidae and Streblidae under Hippoboscidae, and the Tethinidae under Canacidae, and recognition of the Paraleucopidae (see Wheeler 2010), although nomenclatural validation of this family is still in doubt.

Corrections, additions and comments should be forwarded to Scott Brooks (Scott.Brooks@agr.gc.ca), for inclusion in future editions of the Supplement.

BLEPHARICERIDAE

Bibiocephala canadensis Garrett, 1922, Insector Inscit. menstr. 10: 89.

Remarks: The two specimens in the CNC (a male and female) formerly listed as syntypes by Cooper (1991) are actually paralectotypes. The lectotype male was designated by Hogue (1987: 12) and is housed in the Natural History Museum in London.

Philorus markii Garrett, 1925b, Seventy new Diptera. p. 5.
CANADA.

Remarks: This entry updates the listing in Cooper (1991), in which Garrett's type specimens were considered to be syntypes. See comments on Garrett's (1925b) types in the Introduction (p. 6). The Garrett-labelled holotype is not in the CNC and its location, if it still exists, is unknown. The allotype and ten paratypes are deposited in the United States National Museum of Natural History, and another paratype is in the Los Angeles County Museum of Natural History. The single male in the CNC is a paratype. Given this reinterpretation of the type series, Hogue's (1987: 58) designation of the CNC specimen as lectotype is invalid.

Remarks: Holotype specimen was mounted from alcohol.

Gonia sagax Townsend, 1892, Can. Ent. 24: 65. USA.

Neotype ♂: NeoTYPE G. sagax Tns. No.406/ MiddlxCo IV-6 NJ/ SLIDE F.O.M No. 30. (S). Remarks: A neotype was designated by Tothill (1924a: 200) and its presence in the CNC listed by Cooper & O'Hara (1993: 40). However, the neotype is invalid because the original holotype is extant in the Snow Entomological Museum, University of Kansas.

Gymnostylia minor Villeneuve, 1913, Revue zool. afr. 3: 37. KENYA.

Syntype: 1♂.
♂: Brit. E. Africa Kericho, 6500ft. Nyanza Prov. 27.XI.1911 C.M. Dobbs/ 31 C.M.D./ Gymnostylia Dr. Villeneuve det. minor Typ. Villen./ TYPE.

Fabriciella latifrons Tothill, 1924b, Can. Ent. 56: 260, 269. CANADA.

Lectotype ♂: N. W. T. CAN./ HoloTYPE F. latifrons Tothill No. 811.
Paralectotypes: 2♂♂, 2♀♀, Manitoba; 1♀, Northwest Territories; 1♀, Colorado.
Remarks: The type of *latifrons* was cited as a holotype by Cooper and O'Hara (1996: 37), in error. Tothill did not designate a holotype in his original publication, nor did he cite the material upon which the species was based. Type information on *latifrons* Tothill was subsequently provided by Walley (1933: 168), but his mention of a "holotype" is here interpreted as a lectotype designation.

UNPLACED TO FAMILY

Cretaphormia fowleri McAlpine, 1970, Can. Ent. 102: 345. CANADA.

Holotype (fossiliferous puparia): HOLOTYPE *Cretaphormia fowleri* McAlpine, 1969 CNC # 12671/ 817 [on underside of fossil].

Paratypes: 3 (fossiliferous puparia), Alberta.

Remarks: The rock fragment containing the fossil puparia is ironstone from the Edmonton formation (Upper Cretaceous) and was discovered by Mr. Fowler in 1939 near Drumheller, Alberta (E½

Sect. 1, twp. 29, range 20, west of 4th Meridian). Puparium C was designated as holotype and puparia A, B and D as paratypes. These type specimens were deposited in CNC, contrary to the depository cited in the original description.

Presence of holotype in the CNC was overlooked by Cooper & Cumming (2000). The fossil species was originally described in the Calliphoridae, but has an uncertain family placement (see Grimaldi & Cumming 1999: 117).
