FOREWORD

This 11th edition of *World Genera of the Tachinidae (Diptera) and their Regional Occurrence* updates previous lists that have been published consecutively since the first list appeared online in 2005 (O'Hara 2005). New to the previous (tenth) version is a column indicating the number of species per genus. This addition is possible due to the progress we have made towards a catalogue of world Tachinidae. All of our nomenclatural and distributional data is contained in a FileMaker Pro database and the entry of all valid names and distributions of species was completed in 2018. The database is constantly being updated as new information is published and we are also expanding existing entries on valid names to include type data for species names and junior synonyms for species and genera. A screen shot of the database for the valid genus name *Actia* is shown below in Fig. 1. A review of the history, content and purpose of the database as well as a *Preliminary Checklist of the Tachinidae (Diptera) of the World* were published last year (O'Hara *et al.* 2019a,b). A second version of the *Checklist* will be published on the same day as this 11th version of *World Genera* (O'Hara *et al.* 2020).

Our compilation of genera names of world Tachinidae began years ago with the names and distributions given in regional catalogues. The names have been brought up-to-date by incorporating changes and new names from subsequently published papers. The original literature has since been checked to verify the accuracy of names and dates. The catalogues that provided the starting point for our world list of genera were as follows:

Regional catalogues

Nearctic Region	O'Hara & Wood (2004)
Neotropical Region	Guimarães (1971)
Palearctic Region	Herting & Dely-Draskovits (1993)
Afrotropical Region	O'Hara & Cerretti (2016)
Oriental Region	Crosskey (1976, 1977)
Australasian Region	Cantrell & Crosskey (1989)

Country catalogue

China	O'Hara, Shima & Zhang (2009)
-------	------------------------------

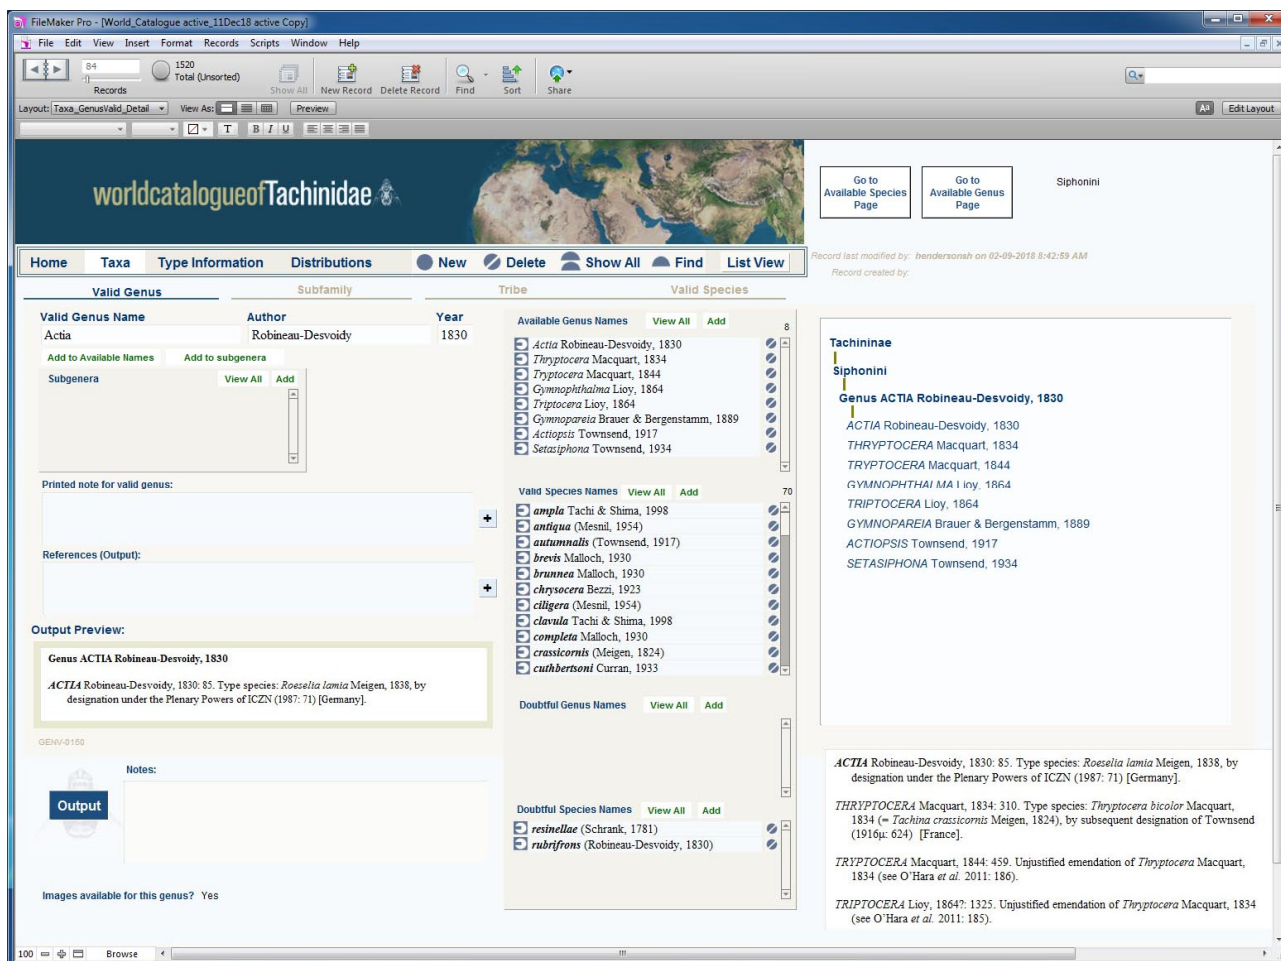

Figure 1. Screen shot of the valid genus page for *Actia* R.-D. in the author's database of world Tachinidae.

All generic names that appear as valid in the regional catalogues above are included in the table below, either as valid names (in black) or invalid names (in light brown; i.e., synonyms). For each invalid name, a reference to the synonymy is given. This is usually the original source of the synonymy but is rarely a later listing. Publications cited in this manner are listed after the table in the References. Each synonym is denoted with an "x" in the table to indicate the catalogue in which the name occurred. New records for regional distributions are also referenced. Currently recognized genera are coded with a "1" for regions in which they occur. The sum of each column is given at the bottom of the table and in the summary table in the Biogeographic Summary section; these sums represent the number of genera known from each region.

For the purposes of this document, the boundary between the Nearctic and Neotropical regions is taken as the United States/ Mexico border to correspond with the geographic coverage of the catalogues by Guimarães (1971) and O'Hara and Wood (2004). The true boundary between these regions is in southern Mexico (Griffiths 1980). The boundary between the Palaearctic and Oriental Regions through China is shown in Map 5 in O'Hara *et al.* (2020: 22).

An asterisk (*) following a generic name denotes a genus described after publication of the corresponding regional catalogue(s). Papers containing these generic names are cited in the References.

BIOGEOGRAPHIC SUMMARY

The following table provides a summary of the number of tachinid species and genera per biogeographic region along with the number and percent of genera endemic to each region. Former versions of this table relied on species numbers given in regional catalogues but the numbers given here are from our database of world Tachinidae (see Foreword).

Number	World	Neotropical ¹	Nearctic ¹	Palearctic	Afrotropical	Oriental	Australasian ²
Species	8592	3088	1305	2112	1130	1222	891
Genera	1477	784	305	416	234	262	231
Endemic genera	1053 ³	595	52	141	104	37	124
Generic endemicity	–	76%	17%	34%	44%	14%	54%

¹ The boundary between the Nearctic and Neotropical Regions is taken as the United States/ Mexico border to correspond with the geographic coverage of the catalogues by Guimarães (1971) and O’Hara and Wood (2004).

² Australasian and Oceanian Regions.

³ Total number of genera found in only one region.

Figure 2 provides a graphical comparison between the number of genera recognized in the world and per biogeographic region in 2005 and 2018. There has been a slight decrease in the overall number of genera from 1528 in 2005 to 1493 in 2018, primarily due to a decrease in the number of recognized genera in the Neotropical Region (down from 822 to 795). The over-split genera of the Neotropical Region are gradually being revised and combined into larger and more meaningful genera at a faster rate than new genera are being described.

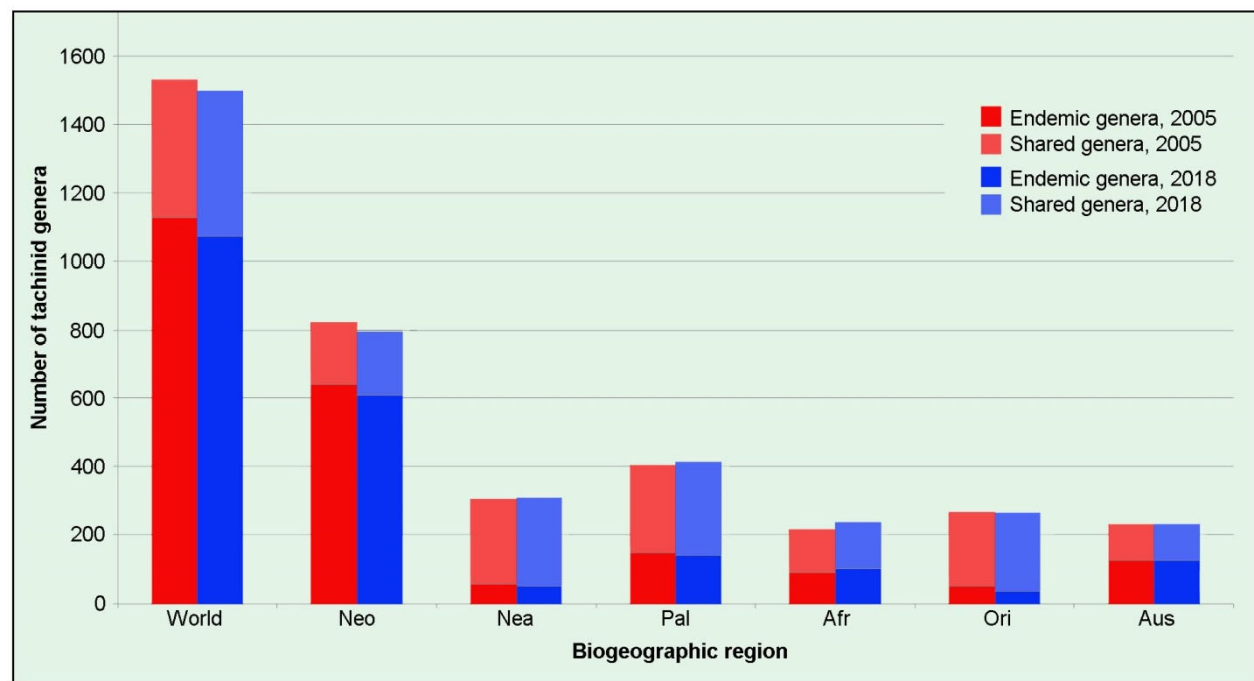

Figure 2. Number of tachinid genera recognized in the world and per biogeographic region in 2005 and 2018, with levels of endemicity (from O’Hara & Henderson 2018).

The Tachinidae are currently thought to have originated in the middle of the Cenozoic Era, perhaps around the Eocene-Oligocene boundary (Cerretti *et al.* 2017), with some major lineages then experiencing “explosive radiation” (Winkler *et al.* 2015). The true extent of this radiation, regardless of when it started or how quickly it progressed, is not easy to quantify because there is no objective means by which to estimate the present size of the family or the number of species that have gone extinct. O’Hara (2013b: 1–2) observed that “One can only guess at the true diversity of the family but at least double the number of valid species is a conservative estimate”. We know there are many undescribed species in such places as Middle and South America, China, Southeast Asia and Australia but whether the total number of extant species is twice the number of described species or ten times this number is a matter of speculation.

The present-day pattern of generic endemism in the Tachinidae was discussed by O’Hara (2013a). The biogeographic regions with the lowest number of endemic genera are the Nearctic and Oriental Regions, which must have functioned in part as corridors for the movement of species between regions during the latter half of the Cenozoic. The Palaearctic Region also served as a dispersal route between the Nearctic, Afrotropical and Oriental Regions, but its huge size and diverse physiography and climate permitted the development of a sizable endemic fauna at both the generic and species levels. The highest levels of generic endemism are found in the Neotropical, Afrotropical and Australasian Regions, which we speculate functioned mostly as cul-de-sac’s during the periods of greatest tachinid radiation. These regions were therefore ideally suited for the evolution of endemic faunas. This notwithstanding, the 76% generic endemism in the Neotropical Region is due in large measure to the over-split nature of the genera.

WORLD SPECIES OF THE TACHINIDAE

The number of tachinid species per genus was included in this list of world genera for the first time in Version 10 (O’Hara & Henderson 2018). A complete list of all genera and species is given in our companion publication, *Preliminary Checklist of the Tachinidae (Diptera) of the World* (O’Hara *et al.* 2020).

Our total for the number of described species of world Tachinidae is currently 8592. This is consistent with the 8500 species estimated by O’Hara (2013b). The footnote to that estimate still applies:

“Pape *et al.* (2011) estimated the number of valid species of Tachinidae at slightly over 9600, but this number included *nomina dubia*. Most of the 1300+ *nomina dubia* in the Tachinidae are old names from the 1800s and many of them are likely senior or junior synonyms of other currently recognized species, at least within the well-known fauna of the Palaearctic Region. The number of valid species of Tachinidae without synonymous *nomina dubia* is here roughly estimated at 8500.” (O’Hara 2013b: 1)

PUBLICATION HISTORY OF WORLD GENERA LIST

This 11th version of *World Genera of the Tachinidae (Diptera) and their Regional Occurrence* replaces Version 1 dated 23 February 2005, Version 2 dated 20 July 2006, Version 3 dated 22 November 2007, Version 4 dated 31 December 2008, Version 5 dated 5 August 2010, Version 6 dated 23 December 2011, Version 7 dated 10 December 2012, Version 8 dated 10 November 2014, Version 9 dated 9 May 2016, and Version 10 dated 18 December 2018. Each version was published online on the date given on its title page. Version 11 incorporates changes in generic concepts and distributions published or discovered since Version 10.

WORLD GENERA OF THE TACHINIDAE

TABLE OF GENERA AND THEIR REGIONAL OCCURRENCE

Abbreviations: Neo, Neotropical; Nea, Nearctic; Pal, Palaearctic; Afr, Afrotropical; Ori, Oriental; Aus, Australasian.
