INTRODUCTION

1. The 1978 Act of the International Convention for the Protection of New Varieties of Plants is applicable, according to its Article 4(1), to all botanical genera and species. Its Article 4(2) provides that “the member States of the Union undertake to adopt all measures necessary for the progressive application of the provisions of this Convention to the largest possible number of botanical genera and species.” The 1991 Act of the Convention provides in its Article 3 that “each Contracting Party which is bound by the Act of 1961/1972 or the Act of 1978 shall apply the provisions of this Convention, (i) at the date on which it becomes bound by this Convention, to all plant genera and species to which it applies, on the said date, the provisions of the Act of 1961/1972 or the Act of 1978 and, (ii) at the latest by the expiration of a period of five years after the said date, to all plant genera and species,” and that “each Contracting Party which is not bound by the Act of 1961/1972 or the Act of 1978 shall apply the provisions of this Convention, (i) at the date on which it becomes bound by this Convention, to at least 15 plant genera or species and, (ii) at the latest by the expiration of a period of 10 years from the said date, to all plant genera and species.”

2. This document surveys the measures for the protection of the various taxa¹ that have been instituted by the member States of the Union and by the States which have filed, pursuant to Article 32(3) of the 1978 Act or to Article 34(3) of the 1991 Act, a request for advice of the Council on the conformity of their laws with the Convention. It also contains additional information which may be useful in the context of this document.

3. This document contains the following parts:

- (a) a main table;
- (b) notes classified by States;
- (c) notes classified by taxa;
- (d) an index of families;
- (e) four indexes of common names.

4. The main table contains the list of the taxa protected in at least one of the States defined above with, for each of them, indications with respect to its protection in each of the States. Explanations of the symbols used for this purpose appear on page 6.

5. The main table contains neither the following States, nor the European Community, which protect the whole or essentially the whole plant kingdom: Argentina, Australia, Bulgaria, Chile, Colombia, Denmark, Ecuador, Estonia, France, Germany, Hungary, Israel, Mexico, Netherlands, New Zealand, Norway, Slovakia, Sweden, United Kingdom, United States of America. Details on the situation in those countries are given in the notes classified by States.

6. The taxa are listed in the alphabetical order of their Latin names, except in the case of complex genera which contain many species and subspecies. These are isolated from the rest

¹ The expression “protected taxon” and the similar expressions mean that titles of protection may be issued for varieties of the taxon concerned.

of the table by dotted lines and are treated differently, for instance with the use of titles, in order to facilitate consultation of the table.

7. The Latin names of the taxa are taken over from the laws and regulations of the States protecting them, except in the following circumstances:

(a) The legislation of a State may not contain Latin names and may therefore specify the protected taxa by means of their common names (in the case of Italy—with respect to certain taxa—Japan and Spain). Where relevant, the Office of the Union has added the Latin name corresponding to the common name.

(b) The legislation of a State may contain a Latin name the scope of which is much greater than that of the corresponding common name which defines the protected taxon. Where relevant, the Office of the Union has completed the Latin name.

(c) Two or more States protecting the same taxon may use different Latin names. Two cases may exist:

(i) The differences are small (presence and absence of authors' names, different spellings, etc.): in this case, the Office of the Union has retained only one Latin name.

(ii) The differences are substantial: where the difference relates to the use of synonyms (for example, *Prunus amygdalus* and *Amygdalus communis*), each designation is the subject of an entry in which the synonym is given in square brackets. Where the difference relates to the rank of the designations used and where, in practice, they cover about the same set of varieties (for example, *Hordeum L.* and *H. vulgare* to designate barley), these designations are the subject of one entry only in which one of them is given in square brackets.

8. For its decisions on the Latin names, the Office of the Union mainly had recourse to the following works:

(a) "Diccionario de Plantas Agrícolas" by E. Sánchez-Monje y Parellada - Ministerio de Agricultura, Servicio de Publicaciones Agrarias, 1980, Madrid;

(b) "Dictionary of Gardening" (second edition (1977)) by P.M. Syng - Oxford University Press;

(c) "Elsevier's Dictionary of Botany - I. Plant Names" by P. Macura - Elsevier Scientific Publishing Company, Amsterdam - Oxford - New York, 1979;

(d) "Elsevier's Dictionary of Trees and Shrubs" by Hugues Vaucher, Biel-Bienne, 1986;

(e) "Flora Agrícola" by E. Sánchez-Monje - Ministerio de Agricultura, Pesca y Alimentación, Secretaría General Técnica, 1991, Madrid;

(f) "ISTA List of Stabilized Plant Names" (second edition (1984));

(g) R. Mansfeld - "Vorläufiges Verzeichnis landwirtschaftlich oder gärtnerisch kultivierter Pflanzenarten" - Akademie-Verlag, Berlin, 1959;

(h) "Zander - Handwörterbuch der Pflanzennamen" (tenth edition (of 1972), twelfth edition (of 1980) and thirteenth edition (of 1984)), Eugen Ulmer Publications, Stuttgart.
The species names stabilized by ISTA are preceded by an asterisk.

9. The common names originate from the national laws and regulations or have been indicated by the competent authorities of the member States, or again have been added by the Office of the Union. In this respect, three types of common names may be distinguished:

(a) true common names (examples: wheat, onion, apple, carnation, poplar);

(b) common names deriving from the corresponding Latin name or from which the Latin name is derived (examples: abutilon, acacia, chrysanthemum, dahlia);

(c) Latin names which, in the absence of true common names, are used in the common language (examples: *Cymbidium*, *Dieffenbachia*, *Romneya*). Such names may also coexist with a true common name (example: *Anthurium* and Tail Flower). As time passes, they may pass into the common language as names of the second type (example: *Gerbera*). These names may be the subject of some changes, of which the most important are phonetic or spelling adaptations (addition of accents in French and Spanish, change of the last syllable, -ia becoming for example -ie in German, etc.) and total or partial translations (for example *Abies sachalinensis* becomes "Sakhalin fir" and *Pelargonium peltatum* becomes "ivy-leaved Pelargonium"). The result is that several variants may be used in one and the same language. Variants may also exist for other reasons. It should be noted in particular that the spelling of compound names is not always consistent in English (example: meadowgrass, meadow-grass and meadow grass).

10. Where relevant, the Office of the Union has added common names of the third type, thereby choosing those which seemed or were likely to prevail in usage. Concerning ornamental species, it is frequent usage to designate them, in the absence of names of the first or second type, by the name of the genus. Thus the species *Allamanda cathartica* is designated by "Allamanda." This usage also prevails in the case of certain genera containing several ornamental species. In that case, in order to reduce the list, the Office of the Union has regrouped in one entry all species concerned where this was possible. Thus, *Abutilon megapotamicum*, *A. x milleri*, *A. ochsenii* and *A. vitifolium* are the subject of one entry only.

11. Attention is drawn to the fact that the relationships between common names and Latin names may be different from one taxon to another: in the case of the genera for instance, the common name may apply either to all species of the genus, or to certain species only. In the case of *Viola*, for instance, violet applies to the whole genus, on the one hand, and more particularly to the small-flowered species, on the other (the large-flowered garden plants being called pansies). The main table and the indexes should therefore not be used without care as glossaries.

12. As the above indications show, the drawing up of the synoptical list of protected taxa has led to some departures from the relevant national laws and regulations, in particular because nomenclatures used are not uniform. In this respect, useful information is given in

the “notes.” In any case, it is recommended to consult these laws and regulations when precise information is needed.

13. The notes classified by States follow the alphabetical order of the codes applicable to countries. The following will be found therein, wherever it has appeared necessary:

(a) general notes relating in particular to the way in which the national list of protected taxa has been established;

(b) special notes relating to a peculiarity of the national list which concerns a given taxon.

14. The notes classified by taxa contain more detailed information on systematics, notably on the synonyms.

15. Some States now provide for protection at the family level. The index of families indicates for each genus mentioned in the main table the corresponding family. Indications given in respect of fungi are without guarantee in view of the great uncertainties of the classification.

16. The indexes of common names contain alphabetical lists of the common names mentioned in the main table with, opposite each of them, the Latin name of the corresponding genus. The compound common names are the subject of a double entry, as far as this is necessary, for example “maidenhair fern” and “fern (maidenhair).” In general, common names identical or very similar to Latin names do not appear in the indexes, neither do species or family names where they contain the name of the corresponding genus.

17. Unless otherwise indicated, the protection of a fruit crop taxon means that both fruiting varieties and rootstocks may be protected.

JP/JAPAN

General Notes

The list of protected taxa appears in the implementing regulations to the revised Seeds and Seedlings Law (Cabinet Order No. 391 of December 22, 1978). That list was extended by several Cabinet Orders. It is divided into eight groups, identified by the figures 1 to 8 in the main table. The groups bear no titles, but the following may be given:

- Group 1: “agricultural” plants
- Group 2: vegetables
- Group 3: fruit crops
- Group 4: fodder plants
- Group 5: herbaceous ornamental plants
- Group 6: woody ornamental plants
- Group 7: aquatic plants
- Group 8: mushrooms.

Each group is subdivided into genera, species and sub-species. The subdivisions are not identified at all in the main table, because they are readily recognizable in most cases from the Latin names.

The inclusion of the name of a taxon in one of the eight groups has no limitative effect on the scope of the name (for example, the fact that *Camellia L.* is listed in Group 6 does not exclude tea (*Camellia sinensis (L.) O. Kuntze*) from protection). The inclusion in a subdivision of a name denoting a taxon of a lower rank than that of the subdivision concerned also has no limitative effect (for example, the Japanese name equivalent to “cherry, flowering cherry” is mentioned in the subdivision “Genera” of Group 3, but the whole genus *Prunus*—and not the subgenus *Cerasus* only—is covered).

Special Note

Brassica napus L., *Brassica rapa L.*: protection is provided for in respect of Rape (*Brassica napus L. partim*; oilseed rape) and Japanese local types (*Brassica campestris L.*—synonymous with *B. rapa L.*—*partim*; leaf-vegetable varieties), and also turnip (*Brassica rapa L.*—including fodder varieties).

NOTES CLASSIFIED BY TAXA

The botanical nomenclature is not an absolute system, mainly because nature cannot be reduced to such a system. Determining the taxonomic rank which should be given to a certain type of plant, defining the borders of a genus or a species, classifying a species within a genus, all these involve some degree of judgement, and thus a risk that different decisions may be taken. This arbitrary element is a source of synonyms, as also is the progress of knowledge when it results in a critical re-examination of earlier decisions.

A list is given below of taxa mentioned in the main table and of their synonyms found mainly in the Diccionario de Plantas Agrícolas, in the Dictionary of Gardening, in Flora Agrícola, in Mansfeld and in Zander (see the introduction to this document). Although certain of these synonyms are today no more than curiosities, having fallen into disuse, others still have a definite importance, being used in scientific works and in practice, notably in commerce. Where relevant, the problems arising from nomenclature are briefly explained. Attention is drawn to the fact that it is the responsibility of the competent authorities of States to define with precision what is covered by a particular denomination for the purposes of plant variety protection.

Prunus L.: this genus has been made into several genera by some botanists. The nomenclature most encountered in practice is the following:

- Amygdalus (almond);
- Armeniaca (apricot);
- Cerasus (cherry);
- Persica (peach);
- Prunus (plum).

As far as the species are concerned, the synonymies are given below. Certain States have defined the protected species by the indication of the genus *Prunus* L. followed by the common name of the species, in particular to avoid problems with nomenclature.

Prunus amygdalus Bartock: syn.: *Amygdalus communis* L., *P. communis* (L.) Arcang. non Huds.

Prunus armeniaca L.: syn.: *Armeniaca vulgaris* Lam.

Prunus avium (L.) L.: syn.: *Cerasus avium* (L.) Moench.

In the States which rely mainly on common names, this species may or may not be protected depending on the interpretation of "plum."

Prunus cerasus L.: syn.: *Cerasus vulgaris* Mill. The subspecies and botanical varieties have also been made into species (*P. acida* K. Koch non Ehrh.; *P. austera* (L.) Ehrh., *Cerasus austera* (L.) Borkh.; *Cerasus marasca* Host, *P. marasca* (Host) Rchb.).

Prunus domestica L., Prunus insititia L.: classification of plums is extremely confused, as most botanists who have dealt with the genus *Prunus* have adopted their own system. On the species level, the most controversial question is whether *P. insititia* constitutes a species or should be considered a subspecies of *P. domestica*. The latter is at present the most commonly recognized, but the former can still be found. In addition, there is controversy over the allocation of the various types of plums to the taxonomic entities that have been defined. For instance, mirabelle belongs to the entity (subspecies or species) *insititia* according to certain authors and to the entity *syriaca* according to others. The various types are not always used in the same manner from one country to another. For example, damson is used solely as a rootstock in France, whereas in the United Kingdom it is also used as a fruiting species for pies, stewing and bottling. Finally, partly as a consequence of the different uses, types identified by a common name in one country may not have a common name in others; thus for example, there is no equivalent of the English name bullace in French. All these factors may influence the scope of application of protection.
