SUMMARY: This study analyses species in the family Eunicidae obtained in the intertidal zones of Veracruz, Mexico. The specimens collected were associated with a sabellariid *Phragmatopoma caudata* Morch, 1863, and collected directly by scuba diving from some coral reefs in Veracruz. Twelve species were found, six of which are reported for the first time in the area: *Eunice mutilata* Webster, 1884, *Eunice panamena* (Chamberlin, 1919), *Eunice pellucida* Kinberg, 1865, *Eunice unifrons* (Verrill, 1900), *Marphysa aransensis* Treadwell, 1939 and *Nematonereis unicornis* (Grube, 1840). Furthermore, the descriptions of two new species of the genera *Eunice* and *Marphysa* are included.

Keywords: Polychaeta, Eunicidae, Veracruz, Golfo de México.

RESUMEN: EUNICIDOS (ANNELIDA: POLYCHAETA) ASOCIADOS CON *PHRAGMATHOPOMA CAUDATA* MORCH, 1863 Y ALGUNOS ARRECIFES CORALINOS DE VERACRUZ, GOLFO DE MÉXICO. – Este estudio analiza las especies de la familia Eunicidae obtenidos de la zona de entremareas de Veracruz, México. Los especímenes fueron recolectados asociadas con formaciones arenosas del sabelárido *Phragmatopoma caudata* Morch, 1863, y directamente por medio de buceo autónomo en algunos arrecifes coralinos en Veracruz. Doce especies fueron encontradas, seis de las cuales se citan por primera vez para el área: *Eunice mutilata* Webster, 1884, *Eunice panamena* (Chamberlin, 1919), *Eunice pellucida* Kinberg, 1865, *Eunice unifrons* (Verrill, 1900), *Marphysa aransensis* Treadwell, 1939 y *Nematonereis unicornis* (Grube, 1840). Además, se incluye la descripción de dos nuevas especies de los géneros *Eunice* y *Marphysa*.

Palabras clave: Polychaeta, Eunicidae, Veracruz, Golfo de México.

INTRODUCTION

The state of Veracruz, located on the eastern coast of Mexico (Gulf of Mexico), possesses a great variety of coastal environments, from sandy beaches, rocky shores, coralline reefs and islands. Although this ecosystem supports a high diversity of habitats, knowledge of the family Eunicidae in these zones is brief. Previously 12 eunicid species were recorded for this area, 7 of these were reported by Rioja (1946, 1958 and 1960): *Eunice anten-*

nata, *Eunice aphroditois*, *Eunice cariboea*, *Eunice rubra*, *Lysidice ninetta*, *Marphysa minima* and *Palola siciliensis*. Later, other researchers extended the list of known eunicid species including: Salazar-Vallejo (1981) reported *E. cariboea*, *Eunice norvegica* and *Paramarphysa longula*; Horta-Puga (1982) mentioned *E. cariboea* and *Nematonereis hebes*; de León-González (1985) reported *L. ninetta* and *P. longula*; Reyes-Barragán and Salazar-Vallejo (1991) reported *Marphysa amadae* and *Marphysa sanguinea* for La Mancha lagoon and Sanchez-Wall

(1992) mentioned *Eunice filamentosa*. The main objective of this study was to increase the knowledge of the polychaete fauna of Veracruz

MATERIAL AND METHODS

Specimens were obtained from a range of investigations carried out along the coast of Veracruz during 1992-2003, and were collected in intertidal sand formations of the polychaete sabellariid *Phragmatopoma caudata*, in Punta Morro, Boquilla de Oro, Villa Rica, rocks of Veracruz Harbour and Villa del Mar Beach. In all localities an area of approximately 25 cm² of sabellariid tubes was sampled, extending to the rock beneath. In the laboratory, the sabellariid tubes were broken apart to extract the associated fauna. Other specimens were collected from dead coral in coralline environments at Sacrificios Island, Santiaguillo Island and La Gallega; and terracotta plates (Pl-1, 2, 3) from Blanca, Hornos and Pajaros Reefs. Furthermore, some specimens were collected from the structure that collects water in the Aquarium of Veracruz. The type and non-type materials were deposited in the Polychaete collection of the Universidad Autonoma de Nuevo Leon (UANL). Table 1 shows a list of sampling stations and locations.

RESULTS

Eunice antennata (Lamarck, 1818)

Eunice antennata Hartman, 1944: 115, Figs. 154-156; Day, 1967: 384, Fig. 17.2 k-q; Imajima, 1967: 433, Fig. 10 a-m; Miura, 1977a: 7, Fig. 3 a-l (in part); 1986: 290, Fig. 17; Fauchald, 1970: 20; Fig. 1 a-c; 1992:57, Fig. 11 a-e; Gardiner, 1976: 181, Fig. 22 c-j; Dueñas, 1981: 93; Ibarzabal, 1989: 7, Fig. 3 a-h; Carrera-Parra & Salazar-Vallejo, 1998a: 1500, Fig. 1 a-e.

Material examined. 53 specimens. Punta Morro, Stn. PM-01 (2), July 2000; Boquilla de Oro, Stn. BO-01 (12), July 2000; Stn. BO-02 (1), July 2000; Stn. BO-04 (12), July 2000; Villa Rica, Stn. Mexico, records of this species are from the peninsula of Baja California, Baja California Sur, Sonora, Nayarit, Guerrero, Oaxaca and the Revillagigedo Islands in the Pacific Ocean, and Veracruz and Quintana Roo in the Atlantic Ocean.

Eunice cariboea Grube, 1856

Eunice (Nigidion) cariboea Hartman, 1944: 123, Pl. 7, Figs. 157-163; Miura, 1977b: 67, Fig. 3 a-n; 1986: 290, Fig. 17; Ibarzabal, 1989: 13: 7 a-f.

Eunice cariboea Fauchald, 1992:98, fig. 29 g-q; Carrera-Parra & Salazar-Vallejo, 1998a: 1501, Fig. 2 f-j; Zanol, *et al.*, 2000: 449.

Material examined. 83 specimens. Villa Rica, Stn. VR-01 (1), July 2000; Aquarium of Veracruz, Stn. AV-01 (1), July 2000; La Gallega Reef, Stn. V-01A (2), 14 November 1992; Stn. V-01A (32), July 2000; Stn. V-01B (46), July 2000; Pajaros Reef, Stn. Pl -1 (1), 16 January 2002.

Distribution. Originally described from Christiansted St. Croix, Virgin Islands. Widely distributed in tropical and subtropical coasts, and in the Western Atlantic it is known from Bermuda to Brazil. In Mexico this species is known from Baja California Sur, Sonora, Sinaloa and Guerrero in the Pacific, and from Veracruz in the Atlantic.

Eunice filamentosa Grube, 1856

Eunice filamentosa Hartman, 1944: 107, pl. 6, Figs. 123; Day, 1967: 392, Fig. 17.5 f-h; Fauchald, 1970: 31, pl. 3, Figs. c-g; 1992: 138, Fig. 45 g-q; Gardiner, 1976: 182, Fig. 22 o-t; Dueñas, 1981: 94; Ibarzabal, 1989: 9, Fig. 4 a-h; Carrera-Parra and Salazar-Vallejo, 1998a: 1502, Fig. 4 g-l; Zanol, *et al.*, 2000: 453.

Material examined. 3 specimens. La Gallega Reef, Stn. V-01A (1), 14 November 1992; Stn. V-01B (2), July 2000.

Distribution. Amphiamerican in tropical and subtropical waters, known also from South Africa. In Mexico this species is known from the peninsula of Baja California, Sonora, Sinaloa and Oaxaca in the Pacific, and from Veracruz and Quintana Roo in the Atlantic.

Eunice mutilata Webster, 1884

Eunice mutilata Webster, 1884: 315, Fig. 36 a-d; Hartman, 1944: 113, pl. 6, Figs. 140-141; Ebbs, 1966: 534, Fig. 10 a-j; Fauchald, 1992: 232, Fig. 77 f-n; Zanol, *et al.*, 2000: 455.

Material examined. 1 specimen. La Gallega Reef, Stn. V-01A (1), July 2000.

Distribution. Amphiamerican in tropical waters. In Mexico this species is known from the Revillagigedo Islands, Jalisco and Nayarit in the Pacific, and in the Atlantic it had been recorded previously only from Quintana Roo. This is the first record in Veracruz.

Eunice panamena (Chamberlin, 1919)

Leodice panamena Chamberlin, 1919: 256, pl. 59, Figs. 4-8, pl. 60, figs. 1-5.

Eunice panamena Fauchald, 1992: 249, Fig. 82 f-l.

Material examined. 8 specimens. Hornos Reef., Stn. Pl -1 (2), 16 June 2002; Stn. Pl -2 (4), 30 May 2003; Stn. Pl -3 (2), 30 May 2003.

Remarks. The specimens reported here have branchiae present from chaetiger 5, palps and antennae with numerous moniliform articulations, dorsal cirri with 3-4 cylindrical articulations, and hammer-headed aciculae. They vary slightly from the original description in the following features: observed specimens have 12 branchial filaments and subacicular hooks starting on chaetiger 24, whereas the holotype (see Fauchald, 1992) has up to 8 branchial filaments and subacicular hooks starting on chaetiger 27.

Distribution. Amphiamerican in tropical waters, and known from the eastern Pacific near Panama. This is the first record from the Atlantic.

Eunice pellucida Kinberg, 1865

Eunice pellucida Fauchald, 1992: 261, Fig. 87 a-f; Carrera-Parra and Salazar-Vallejo, 1998a: 1507.

Material examined. 1 specimen. Hornos Reef, Stn. Pl -1 (1), 14 July 2002

Remarks. This specimen resembles those described by Fauchald (1992) in the following characters: first 4 ventral cirri thick, tapering, basally inflated from chaetiger 5; branchiae starting on chaetiger 5, pectinate, with up to 8 filaments; subacicular hooks yellowish, tridentate, starting on chaetigers 21-23, 1 per parapodium; dorsal cirri without articulations. The specimen differs slightly in the following characters: median antenna reaching chaetiger 11 in syntypes, and reaching chaetiger 3 in the present one; eyes absent in syntypes and present in our specimen; maxilla II with 7 teeth in syntype while this specimen has 5 on the left side and 6 on the right side.

Distribution. Caribbean, from St. Thomas Island. This is the first record from Mexican littoral regions.

Eunice romanvivesi n. sp.

(Fig. 1)

Material examined. 4 specimens. Pajaros Reef, Stn. Pl -1 (1), 30 May 2003; Holotype (UANL 6327) Hornos Reef, Stn. Pl -2, 14 July 2002; Paratypes (UANL 6328) Hornos Reef, Stn. Pl -1 (2), 30 May 2003.

Description. Holotype complete, with 70 chaetigers, 15 mm long, 1 mm wide including parapodia, and yellowish in colour. Prostomium rounded anteriorly, longer than wide. Median sulcus not seen. One pair of rounded black eyes posterior to palps and lateral to the bases of lateral antennae. Ceratophores ring-shaped in all antenniform structures. Palps and antennae with cylindrical articulations basally, becoming drop-shaped distally. Middle antenna longer, reaching chaetiger 5, with 7 articulations; right lateral antenna with 5 articulations, left one with 4; palps with 2 and one, respectively. First ring of peristomium two thirds of total peristomial length. One pair of short and smooth peristomial cirri, reaching middle part of first peristomial ring (Fig. 1A).

First parapodium smaller than others. Dorsal cirri digitiform not articulated, longer than ventral cirri in all chaetigers. Ventral cirri conical on anterior parapodia (Fig. 1B), and digitiform in the middle and

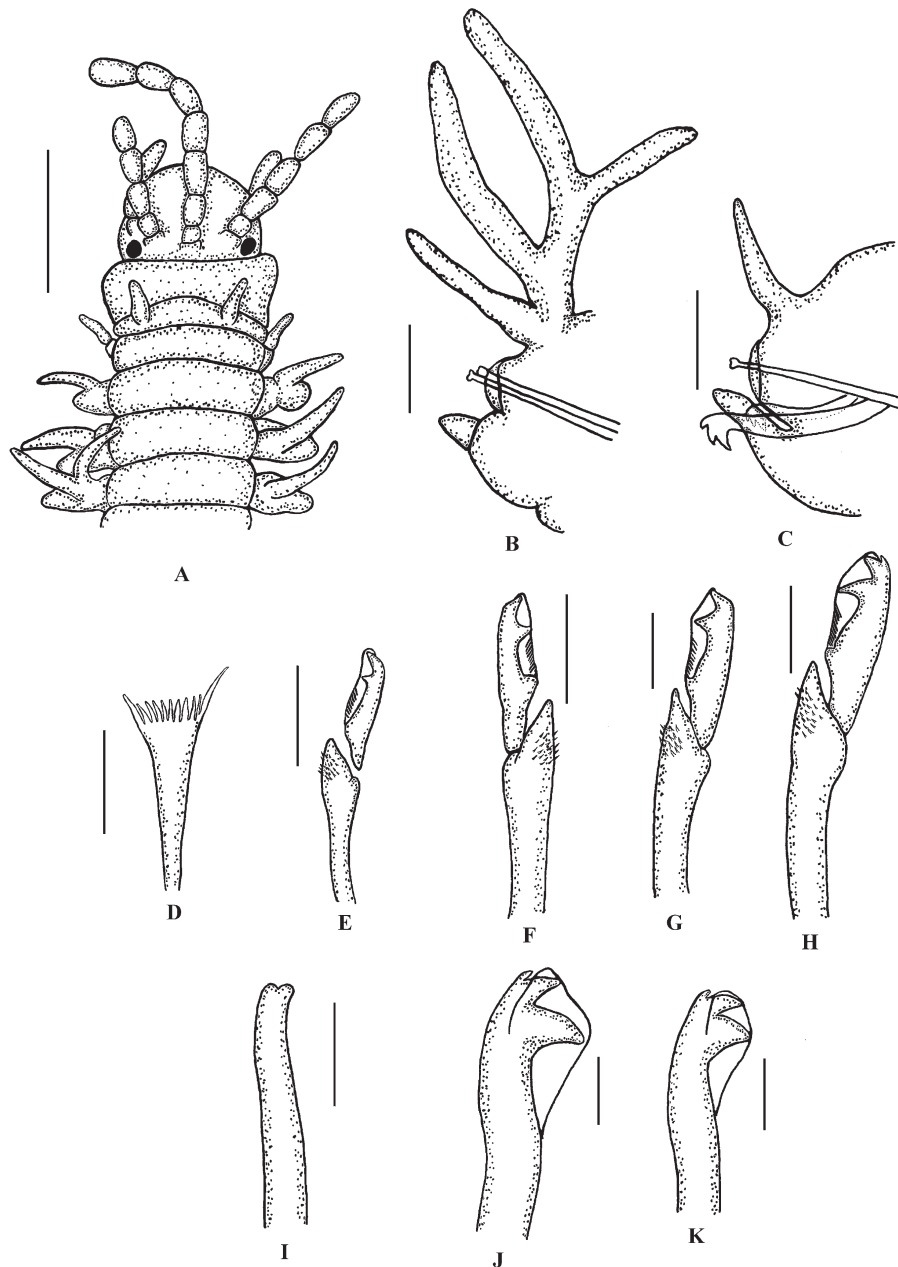

FIG. 1. – *Eunice romanvivesi* n. sp.: A, anterior end, dorsal view; B, chaetiger 10, in anterior view; C, chaetiger 25, in anterior view; D, pectinate chaeta; E, compound falciger from chaetiger 1; F, compound falciger from chaetiger 10; G, compound falciger from chaetiger 25; H, compound falciger from chaetiger 25; I, acicula from chaetiger 10; J, subacicular hook from chaetiger 25; K, subacicular hook from same chaetiger. Scale bars: A = 0.5 mm; B-C = 150 μ m.

posterior ones (Fig. 1C). Branchiae from chaetiger 4 on left side and from chaetiger 5 on right side, to chaetiger 14. Up to 4 branchial filaments until chaetiger 7.

Limbate chaetae marginally serrated. Pectinate chaetae with 9 -10 heterodont teeth present from anterior parapodia, (Fig. 1D). Anterior parapodia with bidentate falcigers, those of first chaetiger smaller (Fig. 1E, F); posterior falcigers bidentate (Fig. 1G), and tridentate, the last one with the pri-

mary fang longer, triangular, directed slightly down; secondary fang triangular, directed obliquely distally; tertiary fang small, triangular (Fig. 1H). All shafts slightly wide distally, marginally spinulate. First chaetiger with 3 yellowish aciculae, distally blunt; from chaetiger 2, with aciculae bifid distally (Fig. 1I), some inferior aciculae tapering distally. Subacicular hooks present from chaetiger 11, 2 per chaetiger, one long and one short, tridentate, yellowish, and hooded (Fig. 1J, K).

Pygidium with terminal anus and 4 anal cirri, dorsal ones larger.

Maxillae not seen on holotype. The paratype (UANL 6328) has the following arrangement: MxI= 1+1; MxII= 5+5; MxIII= 7+0; MxIV= 8+10; and MxV= 1-1. Maxillae III like an arch, not covered by Maxillae II. Maxillae are yellow and soft.

Etymology. The species name is to recognize the valuable support of Miguel Angel Roman-Vives (Aquarium of Veracruz) for the facilities provided during the collection activities in the Marine Park Sistema Arrecifal Veracruzano, Veracruz-Anton Lizardo.

Remarks. One of the main diagnostic characters of *Eunice romanvivesi* n. sp. is the presence of tridentate falcigers. Others species with this kind of chaetae are *Eunice aequalis* (Grube, 1878) from Australia, *Eunice aucklandica* Avernicev (1974) from the Antarctic Ocean, *Eunice elseyi* (Baird, 1869) from Australia, *Eunice havaica* (Kinberg, 1865) from Hawaii, *Eunice martensi* (Grube, 1878) from the Philippines and *Eunice miurai* Carrera-Parra & Salazar-Vallejo (1998b) from the Mexican Caribbean. Only *E. aucklandica*, *E. havaica* and *E. miurai* have both bi- and tridentate falcigers along the body like *E. romanvivesi*. *Eunice aucklandica* and *E. havaica* differ from *E. romanvivesi* mainly in the shape of the acicula and the beginning of subacicular hooks; *E. aucklandica* and *E. havaica* have straight aciculae, tapering and blunt, and subacicular hooks appearing from chaetiger 18 and 19-23 respectively, while *E. romanvivesi* has hammer-headed aciculae, and subacicular hooks from chaetiger 11. *Eunice miurai* differs mainly from *E. romanvivesi* in having articulated peristomial and dorsal cirri, while these characters are smooth in the new species.

Distribution. *Eunice romanvivesi* is only known from the Hornos and Pajaros Reefs in front of Veracruz Harbour.

Eunice unifrons (Verrill, 1900)

Leodice unifrons Treadwell, 1921: 17, Figs. 21-30, pl. 1, Figs. 5-9. *Eunice unifrons* Fauchald, 1992: 330-332, Fig. 113 a-j; Carrera-Parra & Salazar-Vallejo, 1998a: 1506, Fig. 10 g-j.

Material examined. 11 specimens. Blanca Reef, Stn. PI -1 (1), 16 April 2002; Stn. PI -3 (3), 21 May 2002; Stn. PI -1 (2), 21 July 2002; Stn. PI -2 (1), 21 July 2002.

Remarks. Specimens reported here differ slightly from type species redescribed by Fauchald (1992) in having a middle antenna with 10 articulations, reaching chaetiger 7, a lateral antennae with 7 articulations, reaching chaetiger 4, and palps with 3 to 4 articulations, reaching chaetiger 1; subacicular hooks from chaetiger 22 to 28; and maxillary formula: MxI= 1+1, MxII= 7+10, MxIII= 8+0, MxIV= 7+10, MxV= 1+1. In comparison, Fauchald (1992) described the middle and lateral antennae as having 4 articulations, and both reaching to chaetiger 2; subacicular hooks from chaetiger 25 (26-31 in other specimens); and maxillary formula: MxI= 1+1, MxII= 8+8, MxIII= 5+0, MxIV= 8+10, MxV= 1+1.

Distribution. Caribbean Sea and Bermuda. In Mexico this species is known from Quintana Roo. This is the first record from Veracruz.

Lysidice ninetta Audouin and Milne Edwards, 1833

Lysidice ninetta Fauvel, 1923: 411, Fig. 162 a-g; Hartman, 1944: 125; Day, 1967: 403, Fig. 17.8 g -i; Gardiner, 1976: 174, Fig. 21 a -d; Gathof, 1984: 40.6, Fig. 40-3 a-i; George & Hartmann-Schröder, 1985: 106, Fig. 30 a -d; Ibarzabal, 1989: 15, Fig. 8 a-g; Nuñez *et al.*, 1998: 69, Fig. 14 A-G; Salazar-Vallejo & Carrera-Parra, 1998: 1483, Fig. 1 f -h.

Material examined. 53 specimens. Punta Morro, Stn. PM-03 (4), 10 August 1999; Stn. PM-04 (1), July 2000; Boquilla de Oro, Stn. BO-01 (1), 10 August 1999; Stn. BO-01 (6), July 2000; Stn. BO-04 (2), July 2000; Rocks of Veracruz Harbour, Stn. VES-05 (2), July 2000; Villa del Mar beach, Stn. V-04 (4), 11 August 1999; Stn. V-05 (2), July 2000; Stn. V-06 (6), July 2000; Aquarium of Veracruz, Stn. AV-01 (2), July 2000; Pajaros Reef, Stn. PI -2 (2), 30 May 2003; Hornos Reef, Stn. PI -1 (2), 14 April 2002; Stn. PI -1 (6), 30 May 2003; Stn. PI -2 (1), 30 May 2003; Sacrificios Island, Stn. IS-03 (10), July 2000; Santiaguillo Island, Stn. ISA-02 (2), July 2000.

Distribution. In tropical, subtropical and warm temperate waters, the Red Sea, Mediterranean Sea, and the Indian, Atlantic and Pacific Oceans. In Mexico this species is known from Baja California Sur, Revillagigedo Islands, Nayarit and Guerrero in the Pacific, and from Veracruz, Campeche and Quintana Roo in the Atlantic.

Marphysa aransensis Treadwell, 1939

Marphysa aransensis Treadwell, 1939: 5, Figs. 16-17; Hartman, 1956: 285; Salazar-Vallejo *et al.*, 1987: 33; Salazar-Vallejo and Carrera-Parra, 1998: 1485, Fig. 3 a-e.

Material examined. 3 specimens. Punta Morro, Stn. PM-01 (1), 10 August 1999; La Gallega Reef, Stn. V-01 (2), 14 November 1992.

Distribution. This species was originally described from Port Aransas, Texas. In Mexico this

FIG. 2. – *Marphysa veracruzensis* n. sp.: A, anterior end, dorsal view; B, first chaetiger, anterior view; C, chaetiger 10, anterior view; D, chaetiger 20, anterior view; E, chaetiger 50, anterior view; Scale bars: A = 1 mm; B-E = 150 μ m.

species is known from Tamaulipas and Quintana Roo. This is the first record from Veracruz.

Marphysa longula (Ehlers, 1887)

Paramarphysa longula Ehlers, 1887: 99, Pl. 29, Figs. 3-12; Rioja, 1960: 302; Nuñez *et al.*, 1998: 66, Fig. 13 a-h.

Marphysa longula Salazar-Vallejo and Carrera-Parra, 1998: 1489, Fig. 5 f-j.

Material examined. 12 specimens. Punta Morro, Stn. PM-03 (5), 10 August 1999; Rocks of Veracruz Harbour, Stn. VES-02 (2), July 2000; Villa del Mar Beach, Stn. V-03 (1), 09 August 1999; La Gallega Reef, Stn. V-01A (2), 14 November 1992; Hormos Reef, Stn. Pl -1 (1), 30 May 2003; Stn. Pl -2 (1), 30 May 2003.

Distribution. Amphiatlantic. Known from the Canary Islands, Cape Verde Islands, Senegal, Gulf of Guinea, Cuba, Bermuda and Florida. In Mexico this species is known from Veracruz, Yucatan and Quintana Roo in the Atlantic.

Marphysa veracruzensis n. sp.

(Figs. 2, 3)

Material examined. 28 specimens. Boquilla de Oro, Stn. BO-03 (1), 10 August 1999; Villa Rica, Stn. VR-02 (1), 10 August 1999; Stn. VR-03 (1), 10 August 1999; Stn. BO-01 (5), July 2000; Stn. BO-04 (5), July 2000; Villa del Mar beach, Stn. V-03 (1), 11 August 1999; Stn. V-04, Holotype (UANL 6329) and 7 Paratypes (UANL 6330), 9 August 1999; Stn. V-05 (2), 12 July 2000; Stn. V -06 (1), 12 July 2000; Aquarium of Veracruz, Stn. AV-01 (1); 11 July 2000; Sacrificios Island, Stn. IS-03 (2), 13 July 2000.

Description. Holotype complete, with 239 chaetigers, 63 mm long, 1.3 mm wide excluding parapodia, and yellowish iridescent color. Prostomium longer than wide, with a pair of subtriangular superior lips, and median sulcus. Ceratophores ring-shaped in all antenniform structures. Palps and antennae slightly wrinkled. Middle antenna reaches chaetiger 4, lateral antennae reach chaetiger 3, short palps reach chaetiger 1. One pair of black reniform eyes between

lateral antennae and palps. First ring of peristomium about two thirds of total peristomial length (Fig. 2A). No peristomial cirri.

First parapodia smaller than the others (Fig. 2B). Dorsal cirri smooth, always longer than ventral cirri. Postchaetal lobe rounded on first chaetigers (Figs. 2B-C), anterior-middle lobes becomes almost triangular (Figs. 2D-E), posterior lobes not observed (Figs. 3A-B). Ventral cirri absent on posterior parapodia. Pectinate branchiae, with up to 3 filaments, from chaetiger 33 to chaetiger 185, more developed from chaetiger 100.

Limbate chaetae marginally serrated. Pectinate chaetae present from middle parapodia, with 17-18 teeth, heterodont (Fig. 3C); posterior ones isodont with 14 teeth (Fig. 3D). Anterior parapodia with

bidentate falcigers of 3 sizes: a longer one, with the lateral tooth shorter than the distal tooth (Fig. 3E); the middle and small sizes with a lateral and distal tooth triangular, subequal (Figs. 3F-G); all blades with slightly serrated hood. Falcigers on middle and posterior parapodia have only those with a small blade. Shaft slightly wide distally, marginally spinulate. One acicula per parapodium on anterior chaetigers, transitioning to 3 thin aciculae around chaetiger 20. The middle to posterior chaetigers with one acicula per parapodium, blunt-headed, honey-coloured, and darker toward posterior end (Fig. 3H). Subacicular hooks yellowish and bidentate, with hood, present from parapodia 29, and always single. Distal tooth shorter than lateral tooth (Fig. 3I).

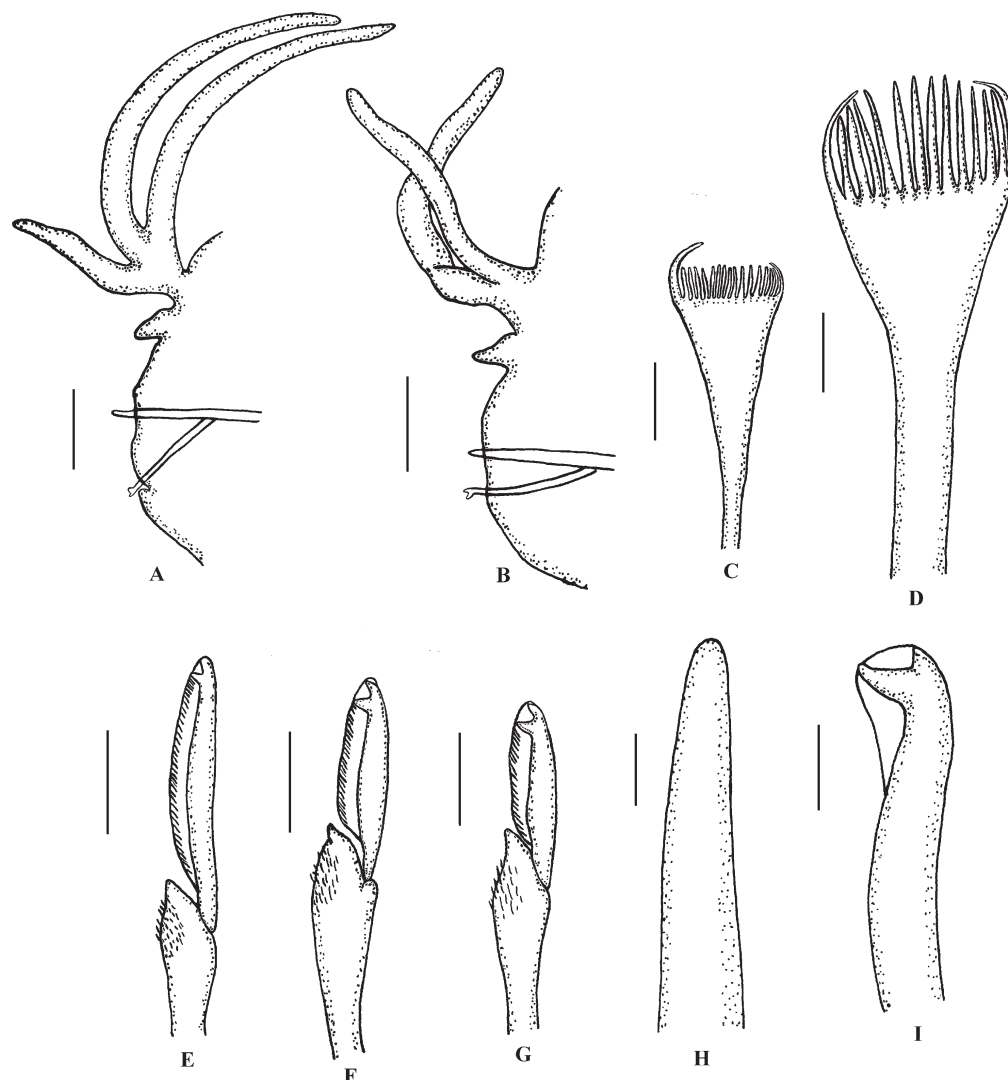

FIG. 3. – *Marphysa veracruzensis* n. sp.: A. chaetiger 100, in anterior view; B. chaetiger 160, anterior view; C. pectinate chaetae from middle parapodium; D. pectinate chaeta from posterior parapodium; E, F, G, compound falciger from chaetiger 10; H, acicula from chaetiger 50; I, subacicular hook from chaetiger 160. Scale bars: A-B = 150 μ m; C-I = 15 μ m.

Two pairs of anal cirri present; dorsal pair as long as last four chaetigers, ventral pair only an eighth of the length of the dorsal pair.

Maxillae decalcified, yellow with black margin, maxillary formula: MxI=1+1, MxII= 3+3, MxIII= 6+0, MxIV= 6+7, MxV= 1+1.

Etymology. The species name is taken from Veracruz, the state from which the type locality is described.

Remarks. The specimens of *Marphysa veracruzensis* vary in some characters: branchiae beginning on chaetiger 17 to 39, maximal number of branchial filaments 2-3, and subacicular hooks starting on chaetiger 24 to 34. All specimens have maxillary decalcified apparatus, with the same formula as the holotype. Only 4 specimens with differences on maxillae II (4+4), and another one with differences on maxillae IV (5+8) were seen. The differences between the beginning of the branchiae and subacicular hooks could be due to differences in the size of the specimens.

Marphysa veracruzensis belongs to a group of species with few branchial filaments and compound chaetae consisting of only bidentate falcigers. The most closely related species are *Marphysa esobaruae* Salazar-Vallejo and Carrera-Parra (1998b), *Marphysa posterobranchiata* Day (1962) and *Marphysa regalis* Verrill (1900). *Marphysa esobaruae* and *M. regalis* have unidentate subacicular hooks from chaetiger 17 and 21, respectively. *Marphysa posterobranchiata*, like *M. veracruzensis* has bidentate subacicular hooks present. Both species differ mainly in the start position of the branchiae, the maximum number of branchial filaments, the maxillary formula and the type of pectinate chaetae. *Marphysa posterobranchiata* has branchiae present from chaetiger 84 in a short length of the body, with only one branchial filament; Maxillae II= 5+5, Maxillae IV= 5+10; with only isodont pectinate chaetae. *M. veracruzensis*, on the other hand, has branchiae beginning from chaetiger 33 in the holotype, but varying in other specimens between chaetigers 17-39; Maxillae II= 3+3, Maxillae IV = 6+7, and pectinate chaetae of two types, heterodont anteriorly and isodont posteriorly.

Distribution. Villa del Mar Beach, Boquilla de Oro, Villa Rica, and Sacrificios Island, and Veracruz, Mexico.

Distribution. In tropical waters around the world. In Mexico this species is known from Baja California Sur, Sonora, Nayarit and Oaxaca in the Pacific, and Veracruz and Quintana Roo in the Atlantic.

ACKNOWLEDGMENTS

The authors are grateful to the Comisión Nacional para el Conocimiento y Uso de la Biodiversidad (CONABIO), projects S035 and AA001, for financial support for this work. We thank the personnel of the Aquarium of Veracruz for the facilities provided during the collection visits in the Parque Arrecifal Veracruzano. J. Ortega and C. Sanchez assisted us in the field. L.F. Carrera-Parra and M. Londoño provided helpful criticisms of the

previous manuscript. We are also indebted to three anonymous reviewers whose comments and insights greatly improved this manuscript.
