Family DIPHYIDAE

Some genera of Calycophorae in which the heteromorph larval nectophore is caducous. In *Sulculeolaria* spp. there may be a succession of four definitive nectophores; in *Chelophyses*, *Dimophyes* and *Eodoxoides* a succession of two; and in *Muggiaeae* only one definitive nectophore. In *Sulculeolaria* the eudoxids are not freed till sexual maturity, if freed at all, and are not known in a free state, whilst in *Dimophyes* they appear to be freed early on.
